YMC Phases for Biochromatography

Historically, small molecules have played the major role in diagnosis and therapy. However with the recent developments in the fields of genomics, proteomics and metabolomics, biological molecules have become an important tool for the treatment of diseases or help understanding biological processes.

YMC has always played an important role in the provision of materials for bioseparations. With the constant driving force of innovation, the focus has always been on column design and stationary phase manufacturing. As a consequence, YMC offers state of the art reversed phase, ion-exchange, size exclusion and normal phase/HILIC columns and bulk materials.

Determination of DBC*

* Application data by courtesy YMC Co., Ltd.

Before determination, equilibrate the column with equilibration buffer.

Step 1: Load

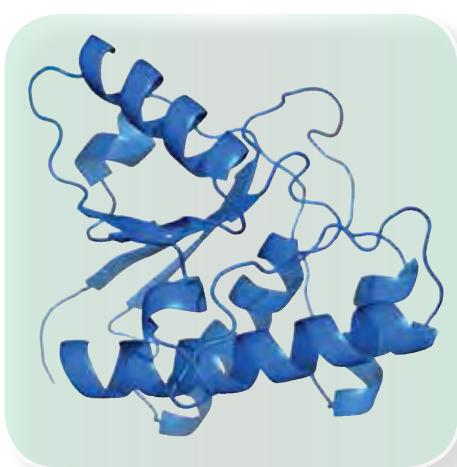

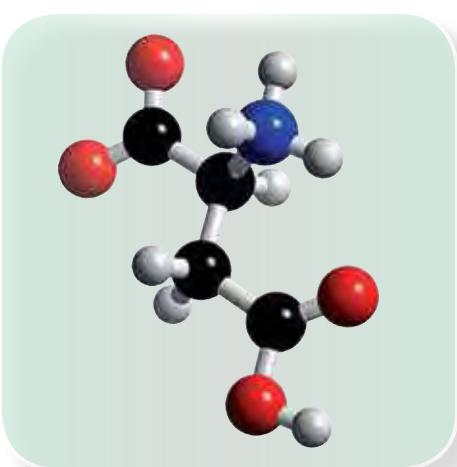

A protein solution of known concentration is continuously loaded at the desired flow rate and the absorbance of the eluate is monitored until full saturation is achieved (100% UV absorbance of the pure sample solutions).

Step 2: Wash

Wash the column with equilibration buffer until no more protein elutes (0% UV absorbance).

Step 3: Elute

The DBC of the medium is a measure of the volume of protein solution that has been applied up to a specific breakthrough point (usually 5 or 10%).

IEX

YMC-BioPro: IEX-Columns

Ion exchange chromatography (IEX) is widely used for analysis and purification of biomolecules. YMC-BioPro ion exchange columns are specifically designed for separation of proteins, peptides and nucleic acids.

YMC-BioPro IEX columns are based on 5 µm porous and non-porous hydrophilic polymer beads with low nonspecific adsorption.

They also show higher binding capacity and higher recovery of biomolecules compared to conventional IEX-columns.

The completely spherical, monodisperse beads, together with optimal packing technology, provide high theoretical plate numbers and symmetrical peak shapes!

High binding capacity and high recovery for porous type

The porous version of YMC-BioPro show high dynamic binding capacity and excellent recovery, making them useful for semi-preparative separations of proteins and antibodies.

Comparison of dynamic binding capacity (DBC) for BSA

	Dynamic binding capacity (mg/ml-gel, 10% breakthrough)	Eluted amount (mg/ml-gel)	Recovery* (%)
YMC-BioPro QA	126	120	95
Mono Q (GE Healthcare)	100	35	35
BioAssist Q (Tosoh Bioscience)	73	58	79

* Recovery: (Eluted amount/Dynamic binding capacity) x 100

Compared with conventional porous polymer anion exchange columns, YMC-BioPro QA gives higher DBC and recovery rates. This indicates that YMC-BioPro has a much lower nonspecific adsorption compared to conventional columns.

SEC

YMC Column for SEC: YMC-Pack Diol

Size Exclusion Chromatography (SEC) also referred to as Gel Permeation Chromatography (GPC) is a mode of liquid chromatography in which the components of a mixture are separated according to differences in their size. It is an important tool for the analysis and separation of natural and synthetic biopolymers. The column

packing for SEC is a rigid, totally porous silica gel that is derivatised with 1,2-dihydroxypropylsilane and has pores of known size. The variety of available pore sizes allows the analysis of compounds over a broad range of molecular weights, starting from about 1000 g/mol for oligomers and going up to 1,000,000 g/mol.

What is special about YMC SEC columns?

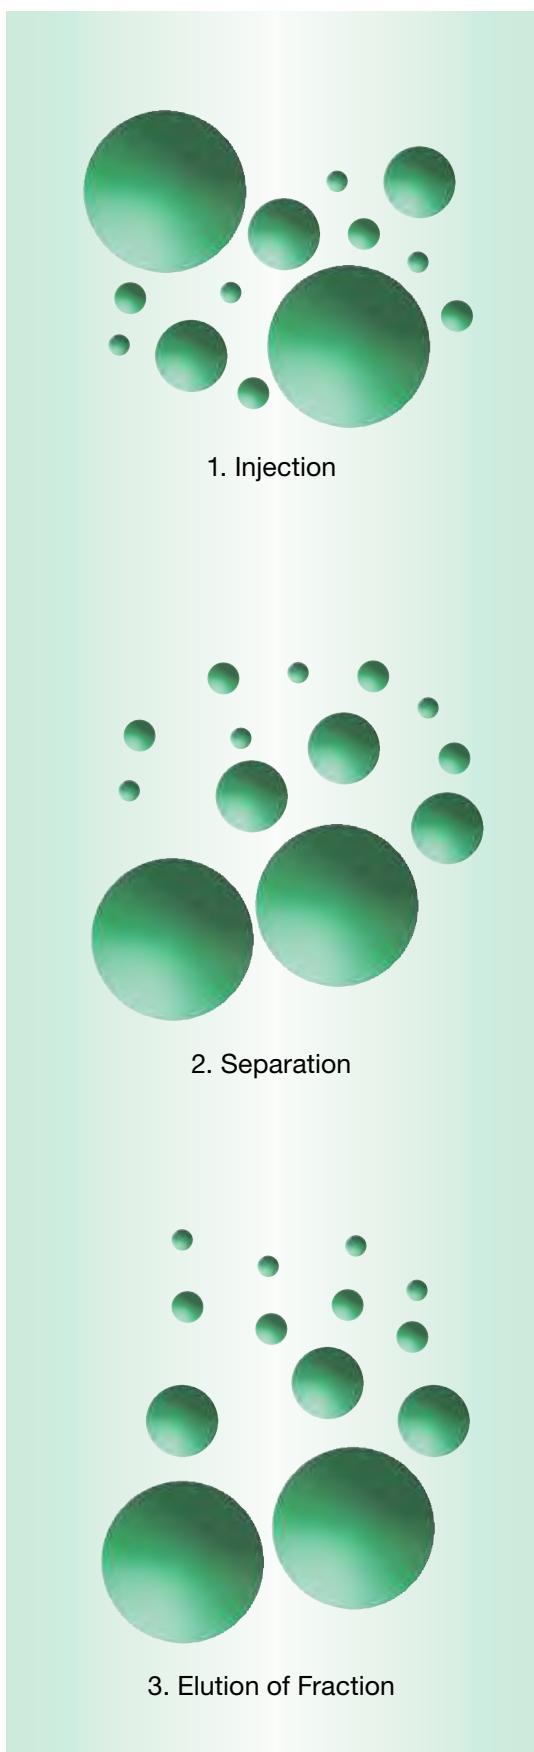

- Method development
- Scaleability
- Reproducibility
- Cost-efficiency

YMC-Pack Diol is available in four porosities and is, therefore, suitable for separation and molecular weight determination of a wide range of peptides, proteins, oligonucleotides, carbohydrates and other biopolymers with molecular weights of 10,000 to several hundred thousand.

Furthermore, YMC offers a wide range of column dimensions suitable for analytical determinations to preparative separations.

pore size / nm	6	12	20	30
particle size / µm	3; 5	3; 5	3; 5	3; 5
surface area / m ² g ⁻¹	650	330	175	100

Principles of separation

Molecules with shapes such as rigid rods, random chains and spheres but with the same molecular weight behave differently in SEC. The principle of separation is based on differences in the hydrodynamic radius of the molecules in solution.

Molecules with a larger radius elute earlier and those with the smallest radius are retained longer.

The separation limit is such that only those compounds which differ by more than 10% in MW can be separated by SEC.

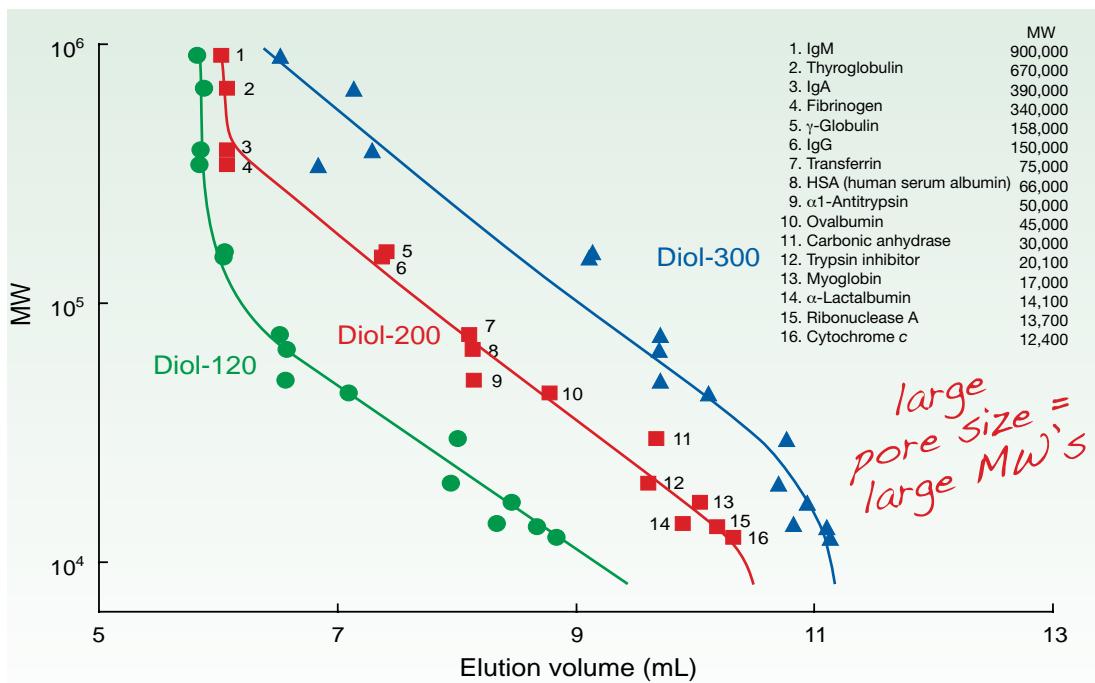

**small molecules = long retention time
bigger molecules = short retention time**

Large molecules exit the column more rapidly as they cannot permeate the porous structure of stationary phase. Smaller ones with the lowest hydrodynamic volume elute with longer retention times because they are able to penetrate some or all of the pores of the stationary phase. Molecules of intermediate size elute in an intermediate position.

Retention mechanism for peptides and proteins

ON-OFF mechanism

By monitoring the dependency between the retention time of analytes and the percentage of organic solvent being used, an interesting difference in behaviour between small organic molecules and proteins is revealed.

Small organic molecules such as butylparaben are retained/eluted by a distribution mechanism

as shown in the linear relationship between retention time and percentage of organic modifier. This is in sharp contrast to the retention behaviour of peptides and proteins, e.g. lysozyme. These are retained/eluted by an adsorption-desorption (on-off) mechanism and as a result the pore size has to be carefully considered.

Chromatographers know the problems during method development: “Which phase is suitable and allows a simple and robust separation?”

In the field of biochromatography, phase selection is a key to success!

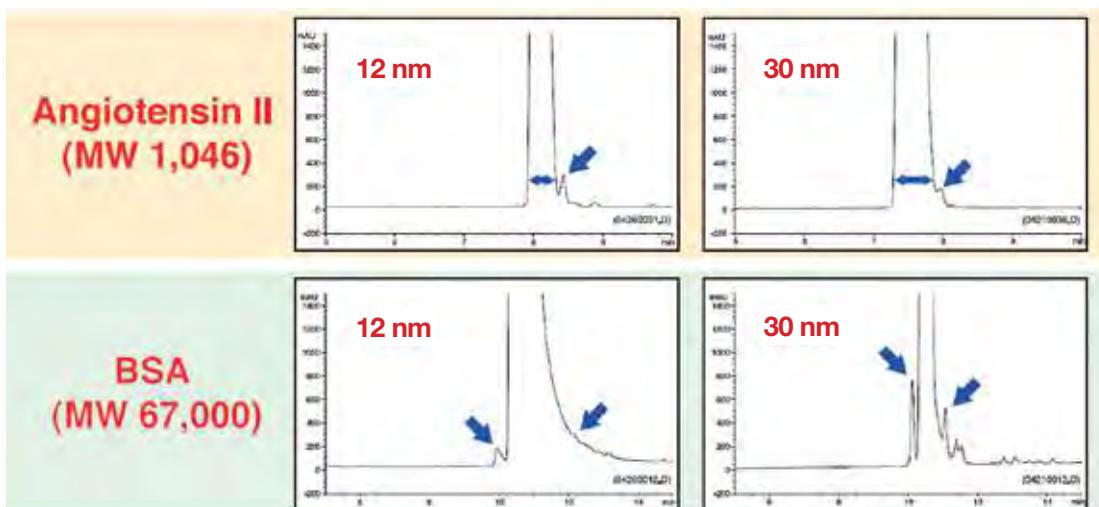

With the YMC's "Column Selection Tool" for Bio-LC, stationary phase selection is almost too easy.

As shown in the table (below), the C18 column with 12 nm pore size is suitable for small peptides up to a MW 5000. The best efficiency for large peptides or small proteins can be obtained by employing a C8 phase characterised by a 20 nm pore size.

Furthermore, most proteins are eluted effectively by a C4 column with 30 nm.

However, the separation may also be influenced by the hydrophobicity of the peptide/protein and the nature of the column's bonded phase. Therefore, for initial method development, it might be useful, in the first instance, to follow the arrow shown in the table for method optimisation.

Comparision of peaks on C4 with 12 nm and 30 nm pore sizes

For smaller peptides a small pore size is more successful. Larger molecules are separated much better with larger pore sizes!

Peptide and Protein Applications

Peptides mapping

Improved durability when used with TFA solution

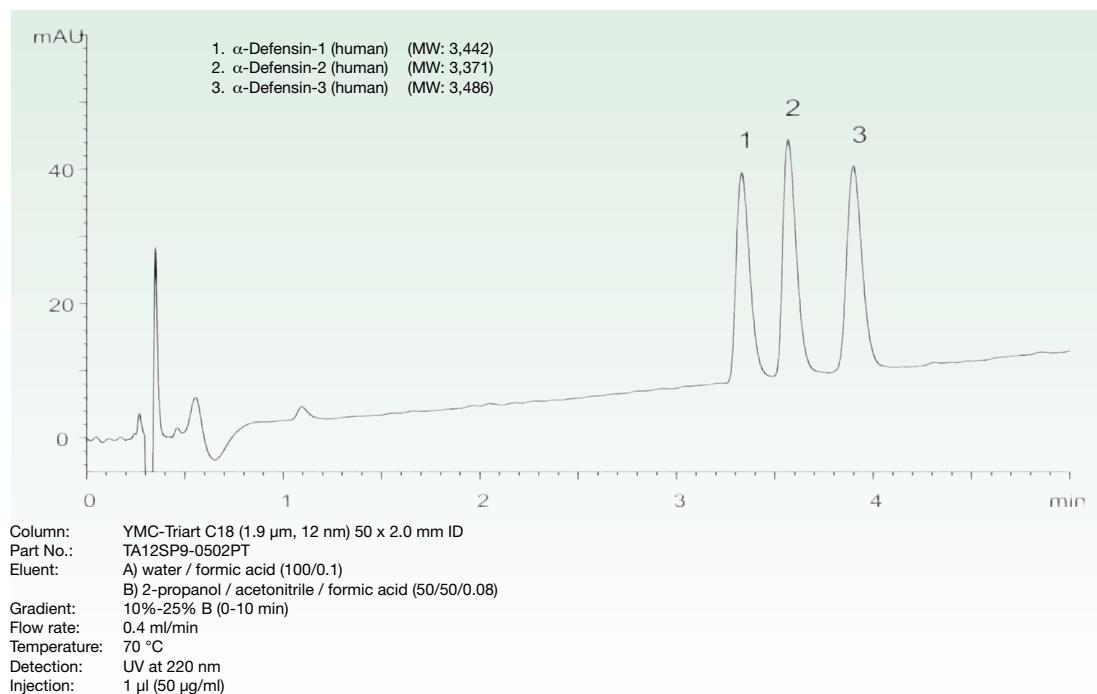

The selectivity of YMC-Pack Protein-RP is different from that seen with conventional wide pore butyl phases and it is specifically suited for the protein analysis.

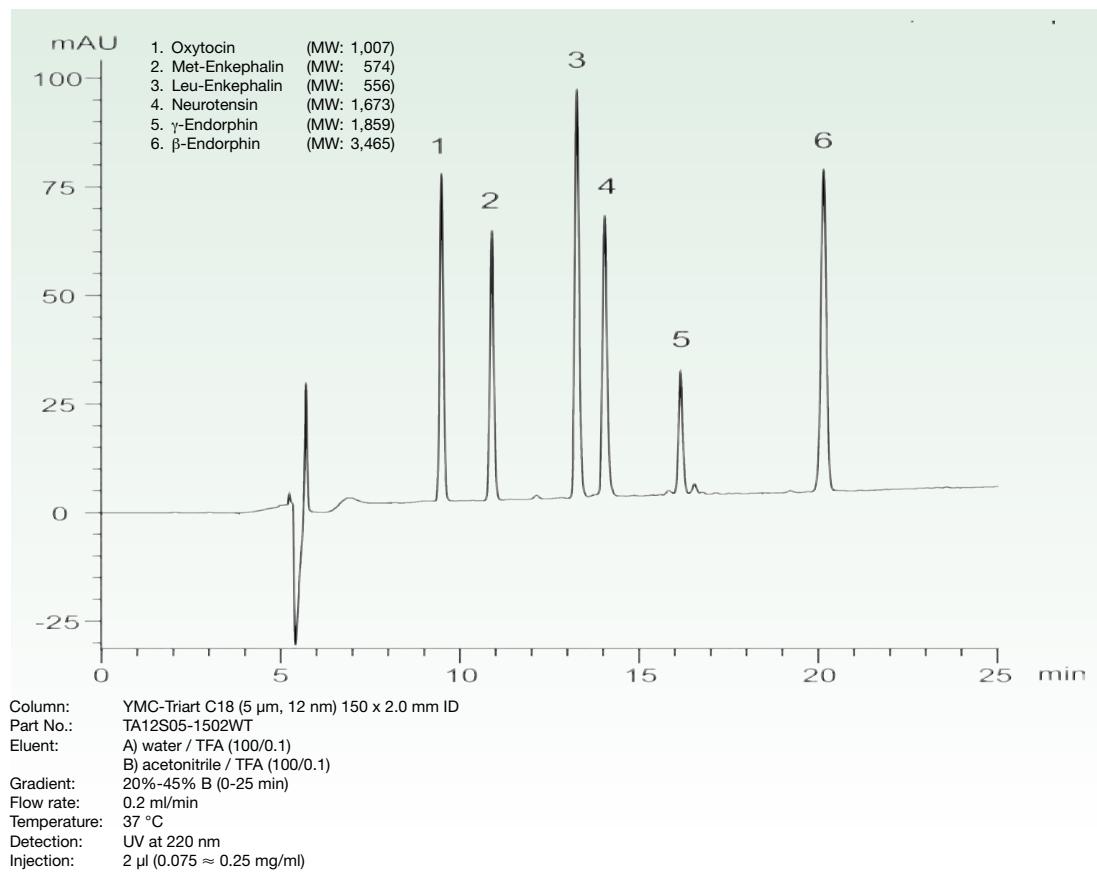

In the applications below it effectively separates both low molecular weight compounds and high molecular weight proteins, with equally good peak shapes being obtained.

HILIC

Hydrophilic Interaction Chromatography (HILIC)

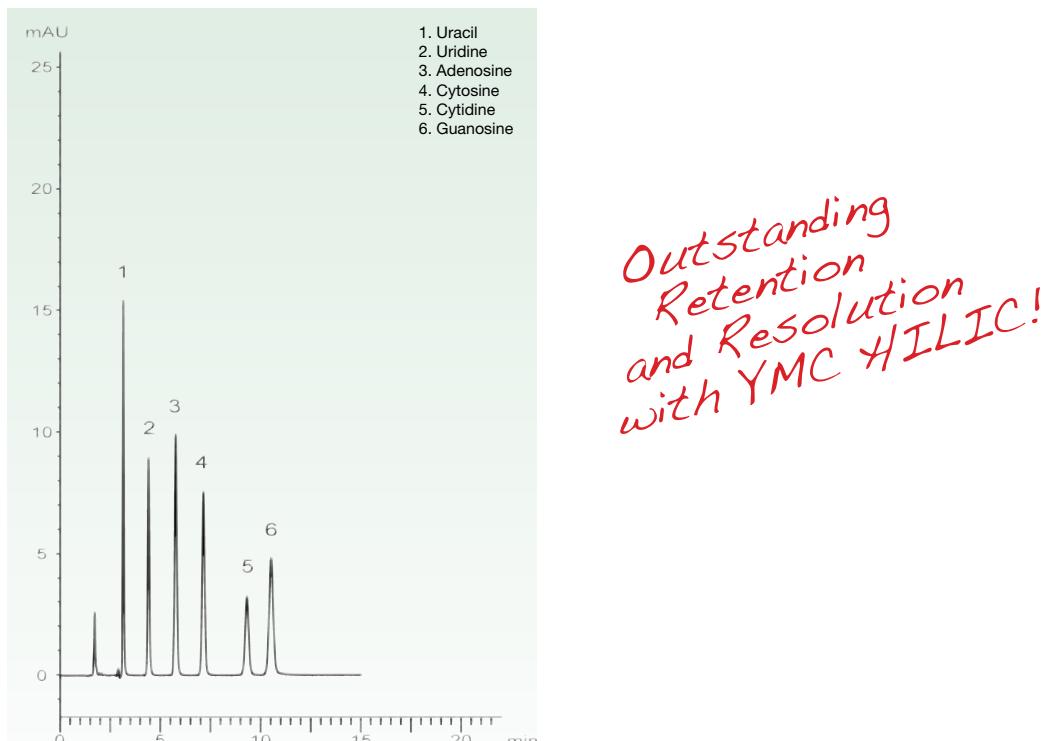

Hydrophilic Interaction Chromatography is a technique which has attracted more and more attention since it offers an alternative approach for the separation of highly polar compounds. The method itself, although it has been known for more than 25 years, has become more popular recently due to the introduction of several specialised HILIC phases. However it is not well known that HILIC separations can be ac-

complished using any highly polar stationary phase. This opens up a large range of materials which are suitable for HILIC separations. HILIC separations traditionally use a highly polar stationary phase and a non polar mobile phase e.g. functionalised silica with a hydrophilic coating and an acetonitrile/water mixture (90/10) for small molecules but application to larger biomolecules is becoming increasingly more popular.

Nucleosides and bases

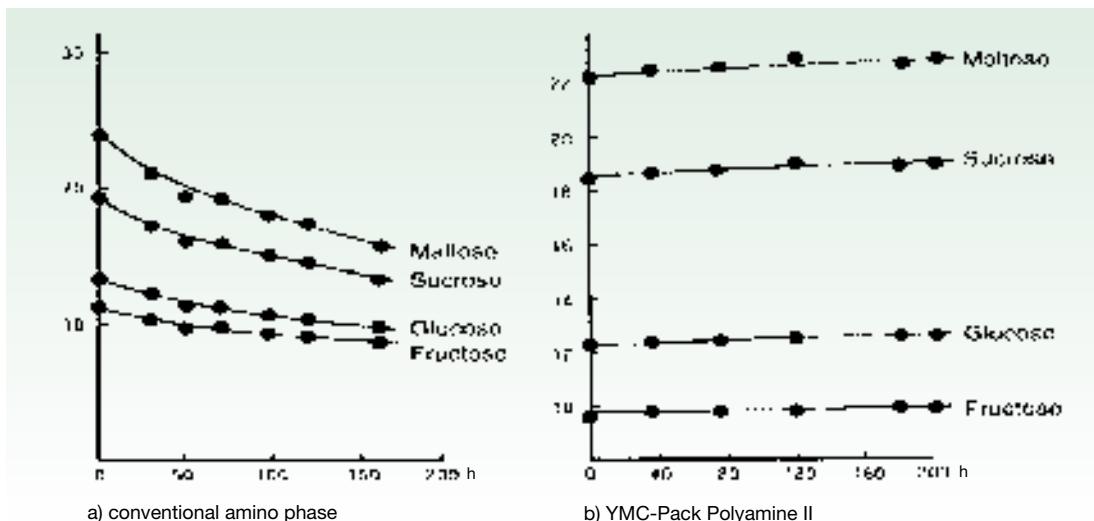

YMC-Pack Polyamine II

YMC-Pack Polyamine II is a unique phase, based on ultrapure YMC silica as a support material. The functionality of the stationary phase is achieved by a covalently bonded polymer layer containing secondary (2°) and tertiary (3°) amino groups. The 2° and 3° amino groups of YMC-Pack Polyamine II are only weakly nucleophilic, exhibiting a significantly reduced reactivity towards carbonyl compounds.

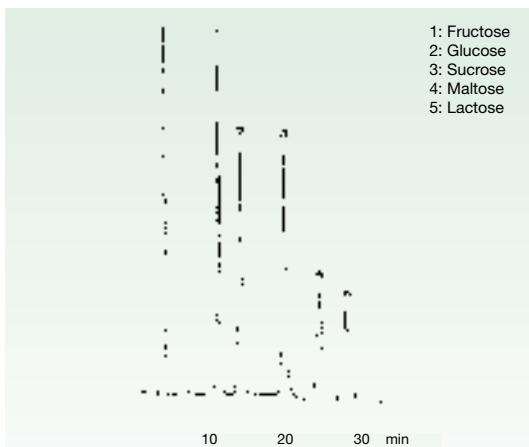

Therefore, unlike conventional amino phases with primary n-propylamino ligands, YMC-Pack Polyamine II does not form Schiff' bases or other stable condensation products. In addition, the 2° and 3° amino groups of the polymer layer are to a large extent resistant to oxidation and hydrolysis (as shown in the figure below).

ECO Column ID 10-50 mm

General

ECO columns are glass columns for almost all types of soft gel and low pressure (pressure limit 5 - 30 bar) liquid chromatography applications. With a choice of one or two adjustable length plungers, they are available in two forms: AB (aqueous buffer) for use with aqueous buffers and cold room applications and SR (solvent resistant) for all forms of normal and reversed phase chromatography.

ECO columns are produced by high-precision CNC manufacturing. They are competitively priced and equipped with a screw-lock system which makes it possible to open and seal the column simply and quickly. Each column passes a quality control pressure test. A water-jacketed option can be supplied on request.

Characteristics

- Pressure limit: 5 - 30 bar (depending on diameter)
- Temperature range: aqueous buffer version (AB): 4 - 40 °C
solvent resistant version (SR): 4 - 40 °C
- Wetted parts: borosilicate glass
aqueous buffer version (AB): POM, sintered glass frit and Viton® seal (ID 10 - 50 mm)
POM, polyethylene frit and EPDM seal (ID 70 - 80 mm)
solvent resistant version (SR): PVDF, sintered glass frit and Kalrez® seal (ID 10 - 50 mm)
PVDF, stainless steel frit and Karlez® seal (ID 70 - 80 mm)
- Diameters: 10 mm, 15 mm, 25 mm, 50 mm, 70 mm, 80 mm
- Bed lengths: 120 mm, 200 mm, 450 mm, 750 mm, 1000 mm
- Height adjustment: Adjustable plunger provides up to 120 mm bed height adjustment (2 adjustable plungers supplied on request).
- Connections: The columns are supplied with different adaptors to allow direct connection to any LC-system.

Packing Adaptors

The ECO series packing adaptors consist of a column coupler and an empty glass body. These must be of the same diameter as the column to be packed and must be used as packing adaptors, not for extending the length of a column body. The length of the additional glass body used should be selected to allow:

- Double the volume of slurry compared to the required packed bed volume if packing silica materials
- Triple the volume of slurry for softer packing materials

The product manual supplied with each column contains detailed examples of dry packing and slurry packing techniques.

For ordering information please see next page.

ECO^{PLUS} Glass Columns

- Suitable for universal use
- Biocompatible
- Simple to use
- Compatible to any LC system
- Height-adjustable pistons at both ends
- Suitable for cold rooms from 4 - 40 °C
(with polyethylene piston and EPDM O ring)
- SR-Version resistant to organic solvents
(SR = Solvent Resistant)

General

Biochromatography is widely applied in high-performance downstream processing techniques that can be used for a range of compounds, such as proteins, peptides or nucleic acids. When using various chromatographic techniques such as ion exchange, affinity or gel permeation chromatography, increasingly high-performance separation media are used and, as a result, higher demands are made on the quality of the column hardware. ECO^{PLUS} glass columns meet the highest criteria for professional laboratory use. Particular attention has been paid to the column volume ranges that are as wide as possible (0.4 - 982 ml) and to the

high pressure resistance (up to 80 bar / 1160 psi), so that high flow rates and performance/efficiency can be achieved.

We have selected high-quality, inert materials to make sure ECO^{PLUS} glass columns are biocompatible and offer the best conditions for high recovery with no loss of bio-activity of your biomolecules. Thanks to the "Quick-Lock" seal and the two adjustable pistons, the columns are fully adjustable and easy to use.

Given the wide range of diameters, frit porosities and lengths available, you can use ECO^{PLUS} glass columns for the most diverse of applications.

„Quick-Lock“ Fitting

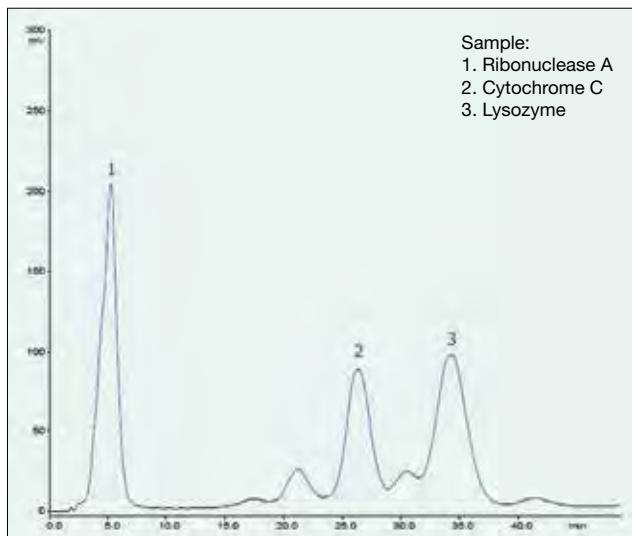

No more than a quarter turn is needed to seal the column. Piston height adjustment is done by turning the locked "Quick-Lock" fitting.

GLASS COLUMNS

Application Examples

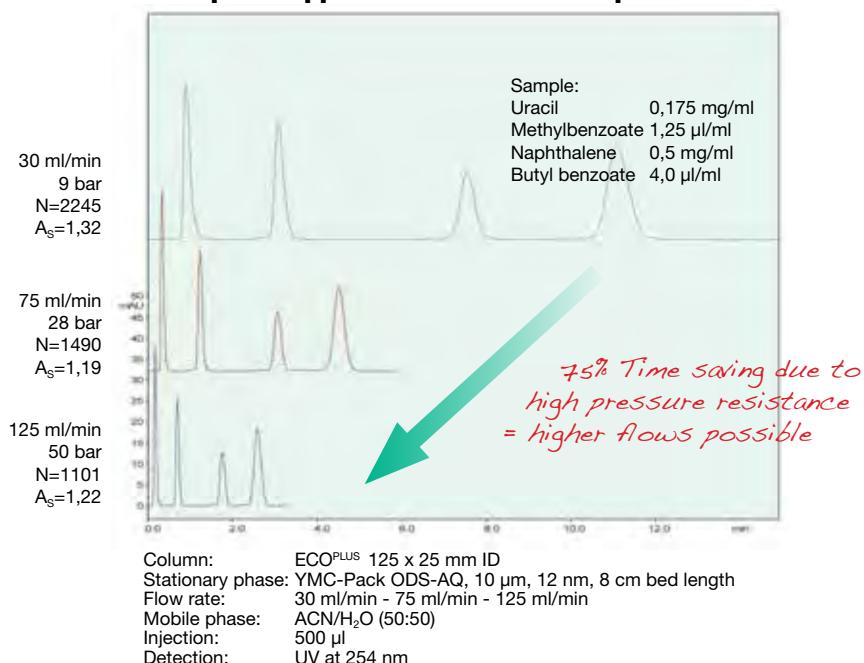

In reversed phase and adsorption chromatography, the possibilities for using glass columns are often limited due to high back pressures generated by small particles. The high pressure resistance of the ECO^{PLUS} glass columns allow you to achieve high flow rates for demanding separations. The example shows that this enables a considerable acceleration of the separation, which means that you can achieve significant time savings.

GLASS COLUMNS

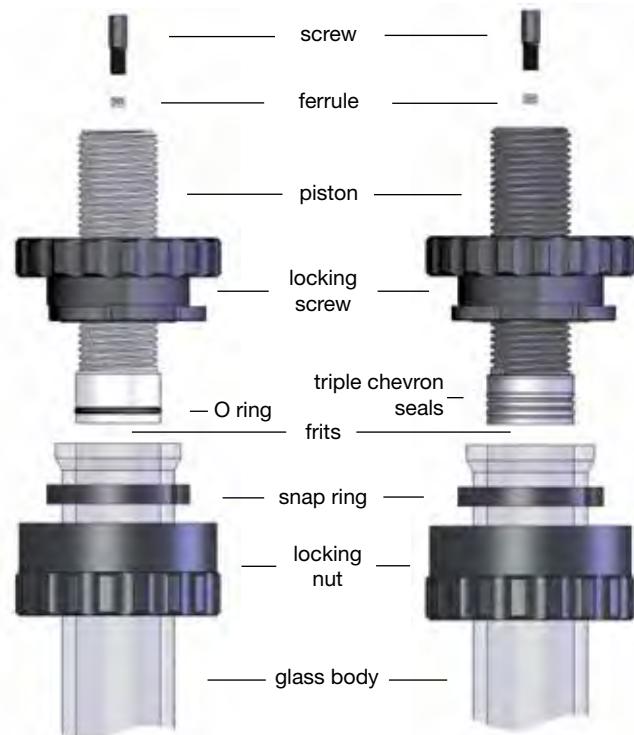

Product options

ECO^{PLUS} laboratory glass columns are routinely available in three different lengths (125, 250, 500 mm) and three combinations of pistons (Short, Short/long, Long) in order to accommodate different volume configurations.

The modular construction allows for a range of piston variations to provide the ideal column volume.

Standard Version for aqueous buffers (AB)

Optional Version Solvent Resistant (SR)

ECO^{PLUS} glass columns are multi-purpose columns for all liquid chromatography applications (with pressure limits of 30 to 80 bar (435 to 1160 psi) - depending on column diameter as shown in the table on page 6). ECO^{PLUS} glass columns are available in two versions:

Standard-Version

(AB = Aqueous Buffer) for aqueous buffers and applications in cold rooms.

Optional-Version

(SR = Solvent Resistant) for normal and reversed phase chromatography.

The height-adjustable pistons (standard) at each end of the ECO^{PLUS} glass column with Teflon ribs (SR-version) are suitable for the entire spectrum of normal phase and reversed phase chromatography as well as biochromatography above ambient temperature.

All ECO^{PLUS} glass columns are made with high-precision CNC machines and undergo several rigorous quality controls before they are delivered.

GLASS COLUMNS

Accessories / Replacement parts

To allow packing of a glass column, you can use the ECO^{PLUS} column coupler to join a glass body to a column. For this to work, it must have the same inside diameter as the column.

The length of the extra glass body required for column packing depends on the packing material being used and can be calculated from the packing instructions for the chosen packing material.

Column couplers consist of:

- ECO^{PLUS} connection screw with Teflon insert (assembled)
- Column coupler counter screw with snap ring
- Counter nut (bayonet) with snap ring
- AB-version has two sets (4 items) of Viton® O rings
- SR-version has two Kalrez® O rings
