

SIEMENS Train Interior Concept – a convincing alternative

Germany has always been a technology hub of quality engineering and design. In line with previous versions of their high-speed trains, SIEMENS were looking to create another concept for the German market and were looking to translate the brief into convincing visuals to move into the next stage of development with the backing of key investors.

Practical solution with design heritage

CADMATE had provided CAD and technical assistance. The concept was created to match the brief as well as some alternative designs to explore options. Interior seating, cabins areas and an on-board café / business lounge area were some of the features in the concepts.
