

provides otolaryngologic treatment for cancer

[Dr. Richard Isaacs](#) has been a valuable part of Kaiser Permanente since 1995 and possesses Advanced Certification in Head and Neck Oncologic Surgery, with specialties in orbital, nasal, and maxillofacial surgery, as well as thyroid and parathyroid surgery. He works as a regional resource for the management of advanced tumors of the head and neck and provides the otolaryngologic procedure for tumors at the skull base.

In addition, he is trained in Facial Plastic and Reconstructive surgery and has an interest in post-tumor facial reconstruction and facial reanimation surgery.

But what is this otolaryngologic procedure used for head tumors? Let us briefly explain to get a better appreciation of what Dr. Isaacs offers for patients with this kind of problem.

Otolaryngology simply refers to medical attention given to ear, nose and throat conditions. Whereas in the recent past, EENT put all these three together, that is, including the eye, ENT (perhaps, a shorter and simpler way) now only refers to the said vital three organs of the human anatomy, especially because they are connected and related not only in terms of distance to one another but also in their functions.
