

Chapter 1. General

ARTICLE 1.0 — INTRODUCTION

1.0.1.1 Purpose.

(a) **Practical Safeguarding.** The purpose of this *Code* is the practical safeguarding of persons and property from hazards arising from the use of electricity.

(b) **Adequacy.** This *Code* contains provisions that are considered minimum requirements necessary for safety. Compliance therewith and proper maintenance will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use.

FPN No. 1: Hazards often occur because of overloading of wiring systems by methods or usage not in conformity with this *Code*. This occurs because initial wiring did not provide for increases in the use of electricity. An initial adequate installation and reasonable provisions for system changes will provide for future increases in the use of electricity.

FPN No 2: It is highly recommended that a licensed electrical practitioner be consulted for any electrical requirements, including changes. Failure to do so may result in fire, serious injury, or death.

FPN No. 3: Fire hazard, electrocution, serious injury or even death may also occur with lack or improper maintenance of wiring system. Wiring system is recommended to be inspected and tested by a licensed electrical practitioner at least once a year for wiring system of more than three (3) years in installation.

(c) **Intention.** This *Code* is intended for the exclusive use of licensed electrical practitioners (PEE, REE, and RME). This *Code* is not intended as a design specification nor an instruction manual for a non-licensed electrical practitioner, unless under the supervision of a licensed electrical practitioner.

(d) **Relation to Other International Standards.** The requirements in this *Code* address the fundamental principles of protection for safety

contained in Section 131 of International Electrotechnical Commission Standard 60364-1, *Electrical Installations of Buildings*.

FPN: IEC 60364-1, Section 131. Contains fundamental principles of protection for safety that encompass protection against thermal effects, protection against overcurrent, protection against fault currents, and protection against overvoltage. All of these potential hazards are addressed by the requirements in this *Code*.

1.0.1.2 Scope.

(a) **Covered.** This *Code* covers the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways installed within or on, to or from:

(1) Public and private buildings, including but not limited to residential, commercial, industrial, institutional, cultural, agricultural, agro-industrial, planned unit development and all other buildings/premises that may require practical safeguarding of persons and property from the hazards arising from the use of electricity.

- (2) Electric generating plants
- (3) Industrial plants
- (4) Transformer stations
- (5) Permanent and temporary substations, etc.
- (6) Airfields
- (7) Railways switchyards
- (8) Yards, carnival, parks, parking and other lots
- (9) Quarries and mines
- (10) Watercraft
- (11) Dockyards
- (12) Trailers
- (13) Mobile homes and recreational vehicles
- (14) Offshore facilities

(b) **Not Covered.** This *Code* does not cover the following:

- (1) Installations in railway rolling stock, aircraft, or automotive vehicles
- (2) Installations of railways for generation, transformation, transmission, or distribution of power used exclusively for operation of rolling stock

1.0.1.3 Authority.

(a) This *Code* has been approved and adopted by the Board of Electrical Engineering, Professional Regulation Commission.

(b) By virtue of authority vested in the Board under RA 7920, it hereby direct strict adherence to the provisions of this *Code*.

(c) Where deviations from these provisions are necessary, such deviations shall not be made, except with written permission from this government bodies exercising legal jurisdiction applicable only to the particular job for which such permission was granted.

1.0.1.4 Enforcement.

(a) This *Code* is intended for mandatory application by government bodies exercising legal jurisdiction over electrical installations.

(b) These government bodies, only through a licensed electrical practitioner, shall have the responsibility of implementing the provisions of this *Code* in deciding on the approval of equipment and materials and for granting the special permission contemplated in this *Code*, where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.

(c) The authority having jurisdiction may waive specific requirements in this *Code* or permit alternate methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.

(d) This *Code* may require new products, constructions, or materials that may not yet be available at the time this *Code* is adopted. In such event, the authority having jurisdiction may permit the use of the products, constructions, or materials that comply with the most recent previous edition of this *Code* adopted by the jurisdiction.

FPN: Application of electrical products and equipment for additional installation or replacement is suggested to be consulted with a licensed electrical practitioner prior to installation for safety.

1.0.1.5 Mandatory Rules, Permissive Rules, and Explanatory Material.

(a) Mandatory Rules. Mandatory rules of this *Code* are those that identify actions that are specifically required or prohibited and are characterized by the use of the terms shall or shall not.

(b) Permissive Rules. Permissive rules of this *Code* are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the terms shall be permitted or shall not be required.

(c) Explanatory Material. Explanatory material, such as references to other standards, references to related sections of this *Code*, or information related to a Code rule, is included in this *Code* in the form of fine print notes (FPN). Fine print notes are informational only and are not enforceable as requirements of this *Code*.

1.0.1.6 Interpretation. In case of controversy, the recommendation of the Code Committee and concurrence of the Board of Electrical Engineering shall be the final interpretation of any portion of the Philippine Electrical Code Part 1.

1.0.1.7 Examination of Equipment for Safety. For specific items of equipment and materials referred to in this *Code*, examinations for safety made under standard conditions will provide a basis for approval where the record is made generally available through promulgation by organizations properly equipped and qualified for experimental testing, inspections of the run of goods at factories, and service-value determination through field inspections. This avoids the necessity for repetition of examinations by different examiners, frequently with inadequate facilities for such work, and the confusion that would result from conflicting reports as to the suitability of devices and materials examined for a given purpose.

It is the intent of this *Code* that factory-installed internal wiring or the construction of equipment need not be inspected at the time of installation of the equipment, except to detect alterations or damage, if the equipment has been listed by a qualified electrical testing laboratory that is recognized as having the facilities described in the preceding paragraph and that requires suitability for installation in accordance with this *Code*.

FPN No. 1: See requirements in Section 1.10.1.3.

FPN No. 2: Listed is defined in Article 1.0

FPN No. 3: Appendix A contains an informative list of product safety standards for electrical equipment.

FPN No. 4: Application of electrical equipment and devices shall always be consulted with a licensed electrical practitioner.

1.0.1.8 Wiring Planning.

(a) Future Expansion and Convenience. Plans and specifications that provide ample space in raceways, spare raceways, and additional spaces allow for future increases in electric power and communication circuits. Distribution centers located in readily accessible locations provide convenience and safety of operation.

(b) Number of Circuits in Enclosures. It is elsewhere provided in this *Code* that the number of wires and circuits confined in a single enclosure be varyingly restricted. Limiting the number of circuits in a single enclosure will minimize the effects from a short circuit or ground fault in one circuit.

1.0.1.9 Metric Units of Measurement. For the purpose of this *Code*, metric units of measurement are in accordance with the modernized metric system known as the International System of Units (SI).

ARTICLE 1.1 — DEFINITIONS

1.1.1.1 Scope. This article contains only those definitions essential to the proper application of this Code. It is not intended to include commonly defined general terms or commonly defined technical terms from related codes and standards. In general, only those terms that are used in two or more articles are defined in Article 100. Other definitions are included in the article in which they are used but may be referenced in Article 1.0.

Part 1.1.1 of this article contains definitions intended to apply wherever the terms are used throughout this Code. Part 1.1.2 contains definitions applicable only to the parts of articles specifically covering installations and equipment operating at over 600 volts, nominal.

1.1.1 General

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Ampacity. The current, in amperes, that a conductor can carry continuously under the conditions of use without exceeding its temperature rating.

Appliance. Utilization equipment, generally other than industrial, that is normally built in standardized sizes or types and is installed or connected as a unit to perform one or more functions such as clothes washing, air conditioning, food mixing, deep frying, and so forth.

Approved. Acceptable to the authority having jurisdiction.

Askarel. A generic term for a group of nonflammable synthetic chlorinated hydrocarbons used as electrical insulating media. Askarels of various compositional types are used. Under arcing conditions, the gases produced, while consisting predominantly of noncombustible hydrogen chloride, can include varying amounts of combustible gases, depending on the askarel type.

Attachment Plug (Plug Cap) (Plug). A device that, by insertion in a receptacle, establishes a connection between the conductors of the attached flexible cord and the conductors connected permanently to the receptacle.

Authority Having Jurisdiction (AHJ). The organization, office, or individual responsible for approving equipment, materials, an installation, or a procedure.

FPN: The phrase "authority having jurisdiction" is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the AHJ may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the AHJ. In many circumstances, the property owner or his or her designated agent assumes the role of the AHJ; at government installations, the commanding officer or departmental official may be the AHJ.

Automatic. Self-acting, operating by its own mechanism when actuated by some impersonal influence, as, for example, a change in current, pressure, temperature, or mechanical configuration.

Bathroom. An area including a basin with one or more of the following: a toilet, a tub, or a shower.

Bonding (Bonded). The permanent joining of metallic parts to form an electrically conductive path that ensures electrical continuity and the capacity to conduct safely any current likely to be imposed.

Bonding Jumper. A reliable conductor to ensure the required electrical conductivity between metal parts required to be electrically connected.

Bonding Jumper, Equipment. The connection between two or more portions of the equipment grounding conductor.

Bonding Jumper, Main. The connection between the grounded circuit conductor and the equipment grounding conductor at the service.

Bonding Jumper, System. The connection between the grounded circuit conductor and the equipment grounding conductor at a separately derived system.

Branch Circuit. The circuit conductors between the final overcurrent device protecting the circuit and the outlet(s).

Branch Circuit, Appliance. A branch circuit that supplies energy to one or more outlets to which appliances are to be connected and that

has no permanently connected luminaires (lighting fixtures) that are not a part of an appliance.

Branch Circuit, General-Purpose. A branch circuit that supplies two or more receptacles or outlets for lighting and appliances.

Branch Circuit, Individual. A branch circuit that supplies only one utilization equipment.

Branch Circuit, Multiwire. A branch circuit that consists of two or more ungrounded conductors that have a voltage between them, and a grounded conductor that has equal voltage between it and each ungrounded conductor of the circuit and that is connected to the neutral or grounded conductor of the system.

● **Building.** A structure that stands alone or that is cut off from adjoining structures by fire walls with all openings therein protected by approved fire doors.

● **Cabinet.** An enclosure that is designed for either surface mounting or flush mounting and is provided with a frame, mat, or trim in which a swinging door or doors are or can be hung.

Circuit Breaker. A device designed to open and close a circuit by nonautomatic means and to open the circuit automatically on a predetermined overcurrent without damage to itself when properly applied within its rating.

FPN: The automatic opening means can be integral, direct acting with the circuit breaker, or remote from the circuit breaker.

Adjustable (as applied to circuit breakers). A qualifying term indicating that the circuit breaker can be set to trip at various values of current, time, or both, within a predetermined range.

Instantaneous Trip (as applied to circuit breakers). A qualifying term indicating that no delay is purposely introduced in the tripping action of the circuit breaker.

Inverse Time (as applied to circuit breakers). A qualifying term indicating that there is purposely introduced a delay in the tripping

action of the circuit breaker, which delay decreases as the magnitude of the current increases.

Nonadjustable (as applied to circuit breakers). A qualifying term indicating that the circuit breaker does not have any adjustment to alter the value of current at which it will trip or the time required for its operation.

Setting (of circuit breakers). The value of current, time, or both, at which an adjustable circuit breaker is set to trip.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Conductor, Bare. A conductor having no covering or electrical insulation whatsoever.

Conductor, Covered. A conductor encased within material of composition or thickness that is not recognized by this Code as electrical insulation.

Conductor, Insulated. A conductor encased within material of composition and thickness that is recognized by this Code as electrical insulation.

Conduit Body. A separate portion of a conduit or tubing system that provides access through a removable cover(s) to the interior of the system at a junction of two or more sections of the system or at a terminal point of the system.

Boxes such as FS and FD or larger cast or sheet metal boxes are not classified as conduit bodies.

Connector, Pressure (Solderless). A device that establishes a connection between two or more conductors or between one or more conductors and a terminal by means of mechanical pressure and without the use of solder.

Continuous Load. A load where the maximum current is expected to continue for 3 hours or more.

Controller. A device or group of devices that serves to govern, in some predetermined manner, the electric power delivered to the apparatus to which it is connected.

Cooking Unit, Counter-Mounted. A cooking appliance designed for mounting in or on a counter and consisting of one or more heating elements, internal wiring, and built-in or mountable controls.

Coordination (Selective). Localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the choice of overcurrent protective devices and their ratings or settings.

Copper-Clad Aluminum Conductors. Conductors drawn from a copper-clad aluminum rod with the copper metallurgically bonded to an aluminum core. The copper forms a minimum of 10 percent of the cross-sectional area of a solid conductor or each strand of a stranded conductor.

Cutout Box. An enclosure designed for surface mounting that has swinging doors or covers secured directly to and telescoping with the walls of the box proper.

Dead Front. Without live parts exposed to a person on the operating side of the equipment.

Demand Factor. The ratio of the maximum demand of a system, or part of a system, to the total connected load of a system or the part of the system under consideration.

Device. A unit of an electrical system that is intended to carry or control but not utilize electric energy.

Disconnecting Means. A device, or group of devices, or other means by which the conductors of a circuit can be disconnected from their source of supply.

Dusttight. Constructed so that dust will not enter the enclosing case under specified test conditions.

Duty, Continuous. Operation at a substantially constant load for an indefinitely long time.

Duty, Intermittent. Operation for alternate intervals of (1) load and no load; or (2) load and rest; or (3) load, no load, and rest.

Duty, Periodic. Intermittent operation in which the load conditions are regularly recurrent.

Duty, Short-Time. Operation at a substantially constant load for a short and definite, specified time.

Duty, Varying. Operation at loads, and for intervals of time, both of which may be subject to wide variation.

Dwelling Unit. A single unit, providing complete and independent living facilities for one or more persons, including permanent provisions for living, sleeping, cooking, and sanitation.

Dwelling, One-Family. A building that consists solely of one dwelling unit.

Dwelling, Two-Family. A building that consists solely of two dwelling units.

Dwelling, Multifamily. A building that contains three or more dwelling units.

Electric Sign. A fixed, stationary, or portable self-contained, electrically illuminated utilization equipment with words or symbols designed to convey information or attract attention.

Electrical Practitioner, Licensed. One who has undergone training in electrical engineering and has complied with the requirements of Republic Act 7920 or otherwise known as the New Electrical Engineering Law.

Electrical Practitioner, Non-Licensed. An electrical practitioner that has not complied with the requirements of RA 7920 or a qualified person with relevant education and experience to enable him or her to perceive risks and to avoid hazards which electricity can create.

● **Enclosed.** Surrounded by a case, housing, fence, or wall(s) that prevents persons from accidentally contacting energized parts.

Enclosure. The case or housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage.

FPN: See Table 4.30.7.11 for examples of enclosure types.

| **Energized.** Electrically connected to a source of voltage.

● **Equipment.** A general term including material, fittings, devices, appliances, luminaires (fixtures), apparatus, and the like used as a part of, or in connection with, an electrical installation.

● **Explosionproof Apparatus.** Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see ANSI/UL 1203-1999, Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.

Exposed (as applied to live parts). Capable of being inadvertently touched or approached nearer than a safe distance by a person. It is applied to parts that are not suitably guarded, isolated, or insulated.

Exposed (as applied to wiring methods). On or attached to the surface or behind panels designed to allow access.

● **Externally Operable.** Capable of being operated without exposing the operator to contact with live parts.

Feeder. All circuit conductors between the service equipment, the source of a separately derived system, or other power supply source and the final branch-circuit overcurrent device.

Festoon Lighting. A string of outdoor lights that is suspended between two points.

● **Fitting.** An accessory such as a locknut, bushing, or other part of a wiring system that is intended primarily to perform a mechanical rather than an electrical function.

● **Garage.** A building or portion of a building in which one or more self-propelled vehicles can be kept for use, sale, storage, rental, repair, exhibition, or demonstration purposes.

FPN: For commercial garages, repair and storage, see Article 5.11.

● **Ground.** A conducting connection, whether intentional or accidental, between an electrical circuit or equipment and the earth or to some conducting body that serves in place of the earth.

Grounded. Connected to earth or to some conducting body that serves in place of the earth.

Grounded, Effectively. Intentionally connected to earth through a ground connection or connections of sufficiently low impedance and having sufficient current-carrying capacity to prevent the buildup of voltages that may result in undue hazards to connected equipment or to persons.

| **Grounded, Solidly.** Connected to ground without inserting any resistor or impedance device.

Grounded Conductor. A system or circuit conductor that is intentionally grounded.

● **Ground-Fault Circuit Interrupter (GFCI).** A device intended for the protection of personnel that functions to de-energize a circuit or portion thereof within an established period of time when a current to ground exceeds the values established for a Class A device.

FPN: Class A ground-fault circuit interrupters trip when the current to ground has a value in the range of 4 mA to 6 mA. For further information, see UL 943, Standard for Ground-Fault Circuit Interrupters.

Ground-Fault Protection of Equipment. A system intended to provide protection of equipment from damaging line-to-ground fault currents by operating to cause a disconnecting means to open all ungrounded conductors of the faulted circuit. This protection is provided at current levels less than those required to protect conductors from damage through the operation of a supply circuit overcurrent device.

Grounding Conductor. A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes.

Grounding Conductor, Equipment. The conductor used to connect the non-current-carrying metal parts of equipment, raceways, and other enclosures to the system grounded conductor, the grounding electrode conductor, or both, at the service equipment or at the source of a separately derived system.

Grounding Electrode. A device that establishes an electrical connection to the earth.

Grounding Electrode Conductor. The conductor used to connect the grounding electrode(s) to the equipment grounding conductor, to the grounded conductor, or to both, at the service, at each building or structure where supplied by a feeder(s) or branch circuit(s), or at the source of a separately derived system.

Guarded. Covered, shielded, fenced, enclosed, or otherwise protected by means of suitable covers, casings, barriers, rails, screens, mats, or platforms to remove the likelihood of approach or contact by persons or objects to a point of danger.

Guest Room. An accommodation combining living, sleeping, sanitary, and storage facilities within a compartment.

Guest Suite. An accommodation with two or more contiguous rooms comprising a compartment, with or without doors between such rooms, that provides living, sleeping, sanitary, and storage facilities.

Handhole Enclosure. An enclosure identified for use in underground systems, provided with an open or closed bottom, and

sized to allow personnel to reach into, but not enter, for the purpose of installing, operating, or maintaining equipment or wiring or both.

Hoistway. Any shaftway, hatchway, well hole, or other vertical opening or space in which an elevator or dumbwaiter is designed to operate.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.

FPN: Some examples of ways to determine suitability of equipment for a specific purpose, environment, or application include investigations by a qualified testing laboratory (listing and labeling), an inspection agency, or other organizations concerned with product evaluation.

In Sight From (Within Sight From, Within Sight). Where this Code specifies that one equipment shall be “in sight from,” “within sight from,” or “within sight,” and so forth, of another equipment, the specified equipment is to be visible and not more than 15 m distant from the other.

Interrupting Rating. The highest current at rated voltage that a device is intended to interrupt under standard test conditions.

FPN: Equipment intended to interrupt current at other than fault levels may have its interrupting rating implied in other ratings, such as horsepower or locked rotor current.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Labeled. Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials, and by whose labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

Lighting Outlet. An outlet intended for the direct connection of a lampholder, a luminaire (lighting fixture), or a pendant cord terminating in a lampholder.

Listed. Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services, that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services, and whose listing states that the equipment, material, or services either meets appropriate designated standards or has been tested and found suitable for a specified purpose.

FPN: The means for identifying listed equipment may vary for each organization concerned with product evaluation, some of which do not recognize equipment as listed unless it is also labeled. Use of the system employed by the listing organization allows the authority having jurisdiction to identify a listed product.

Live Parts. Conductor or conductive part intended to be energized in normal use.

Location, Damp. Locations protected from weather and not subject to saturation with water or other liquids but subject to moderate degrees of moisture. Examples of such locations include partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements, some barns, and some cold-storage warehouses.

Location, Dry. A location not normally subject to dampness or wetness. A location classified as dry may be temporarily subject to dampness or wetness, as in the case of a building under construction.

Location, Wet. Installations under ground or in concrete slabs or masonry in direct contact with the earth; in locations subject to saturation with water or other liquids, such as vehicle washing areas; and in unprotected locations exposed to weather.

Luminaire. A complete lighting unit consisting of a lamp or lamps together with the parts designed to distribute the light, to position and protect the lamps and ballast (where applicable), and to connect the lamps to the power supply.

Metal-Enclosed Power Switchgear. A switchgear assembly completely enclosed on all sides and top with sheet metal (except for

ventilating openings and inspection windows) containing primary power circuit switching, interrupting devices, or both, with buses and connections. The assembly may include control and auxiliary devices. Access to the interior of the enclosure is provided by doors, removable covers, or both.

Motor Control Center. An assembly of one or more enclosed sections having a common power bus and principally containing motor control units.

Multioutlet Assembly. A type of surface, flush, or freestanding raceway designed to hold conductors and receptacles, assembled in the field or at the factory.

Nonautomatic. Action requiring personal intervention for its control. As applied to an electric controller, nonautomatic control does not necessarily imply a manual controller, but only that personal intervention is necessary.

Nonlinear Load. A load where the wave shape of the steady-state current does not follow the wave shape of the applied voltage.

FPN: Electronic equipment, electronic/electric-discharge lighting, adjustable-speed drive systems, and similar equipment may be nonlinear loads.

Outlet. A point on the wiring system at which current is taken to supply utilization equipment.

Outline Lighting. An arrangement of incandescent lamps, electric discharge lighting, or other electrically powered light sources to outline or call attention to certain features such as the shape of a building or the decoration of a window.

Overcurrent. Any current in excess of the rated current of equipment or the ampacity of a conductor. It may result from overload, short circuit, or ground fault.

FPN: A current in excess of rating may be accommodated by certain equipment and conductors for a given set of conditions. Therefore, the rules for overcurrent protection are specific for particular situations.

Overload. Operation of equipment in excess of normal, full-load rating, or of a conductor in excess of rated ampacity that, when it persists for a sufficient length of time, would cause damage or dangerous overheating. A fault, such as a short circuit or ground fault, is not an overload.

Panelboard. A single panel or group of panel units designed for assembly in the form of a single panel, including buses and automatic overcurrent devices, and equipped with or without switches for the control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box placed in or against a wall, partition, or other support; and accessible only from the front.

Plenum. A compartment or chamber to which one or more air ducts are connected and that forms part of the air distribution system.

Power Outlet. An enclosed assembly that may include receptacles, circuit breakers, fuseholders, fused switches, buses, and watt-hour meter mounting means; intended to supply and control power to mobile homes, recreational vehicles, park trailers, or boats or to serve as a means for distributing power required to operate mobile or temporarily installed equipment.

Premises Wiring (System). That interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed, that extends from the service point or source of power, such as a battery, a solar photovoltaic system, or a generator, transformer, or converter windings, to the outlet(s). Such wiring does not include wiring internal to appliances, luminaires (fixtures), motors, controllers, motor control centers, and similar equipment.

Raceway. An enclosed channel of metal or nonmetallic materials designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this Code. Raceways include, but are not limited to, rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor

raceways, cellular metal floor raceways, surface raceways, wireways, and busways.

Rainproof. Constructed, protected, or treated so as to prevent rain from interfering with the successful operation of the apparatus under specified test conditions.

Raintight. Constructed or protected so that exposure to a beating rain will not result in the entrance of water under specified test conditions.

Receptacle. A receptacle is a contact device installed at the outlet for the connection of an attachment plug. A single receptacle is a single contact device with no other contact device on the same yoke. A multiple receptacle is two or more contact devices on the same yoke.

Receptacle Outlet. An outlet where one or more receptacles are installed.

Remote-Control Circuit. Any electric circuit that controls any other circuit through a relay or an equivalent device.

Sealable Equipment. Equipment enclosed in a case or cabinet that is provided with a means of sealing or locking so that live parts cannot be made accessible without opening the enclosure. The equipment may or may not be operable without opening the enclosure.

Separately Derived System. A premises wiring system whose power is derived from a source of electric energy or equipment other than a service. Such systems have no direct electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another system.

Service. The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

Service Cable. Service conductors made up in the form of a cable.

Service Conductors. The conductors from the service point to the service disconnecting means.

● **Service Drop.** The overhead service conductors from the last pole or other aerial support to and including the splices, if any, connecting to the service-entrance conductors at the building or other structure.

Service-Entrance Conductors, Overhead System. The service conductors between the terminals of the service equipment and a point usually outside the building, clear of building walls, where joined by tap or splice to the service drop.

Service-Entrance Conductors, Underground System. The service conductors between the terminals of the service equipment and the point of connection to the service lateral.

FPN: Where service equipment is located outside the building walls, there may be no service-entrance conductors or they may be entirely outside the building.

Service Equipment. The necessary equipment, usually consisting of a circuit breaker(s) or switch(es) and fuse(s) and their accessories, connected to the load end of service conductors to a building or other structure, or an otherwise designated area, and intended to constitute the main control and cutoff of the supply.

Service Lateral. The underground service conductors between the street main, including any risers at a pole or other structure or from transformers, and the first point of connection to the service-entrance conductors in a terminal box or meter or other enclosure, inside or outside the building wall. Where there is no terminal box, meter, or other enclosure, the point of connection is considered to be the point of entrance of the service conductors into the building.

Service Point. The point of connection between the facilities of the serving utility and the premises wiring.

● **Show Window.** Any window used or designed to be used for the display of goods or advertising material, whether it is fully or partly enclosed or entirely open at the rear and whether or not it has a platform raised higher than the street floor level.

Signaling Circuit. Any electric circuit that energizes signaling equipment.

Solar Photovoltaic System. The total components and subsystems that, in combination, convert solar energy into electrical energy suitable for connection to a utilization load.

● **Special Permission.** The written consent of the authority having jurisdiction.

Structure. That which is built or constructed.

Supplementary Overcurrent Protective Device. A device intended to provide limited overcurrent protection for specific applications and utilization equipment such as luminaires (lighting fixtures) and appliances. This limited protection is in addition to the protection provided in the required branch circuit by the branch circuit overcurrent protective device.

Switch, Bypass Isolation. A manually operated device used in conjunction with a transfer switch to provide a means of directly connecting load conductors to a power source and of disconnecting the transfer switch.

Switch, General-Use. A switch intended for use in general distribution and branch circuits. It is rated in amperes, and it is capable of interrupting its rated current at its rated voltage.

Switch, General-Use Snap. A form of general-use switch constructed so that it can be installed in device boxes or on box covers, or otherwise used in conjunction with wiring systems recognized by this Code.

Switch, Isolating. A switch intended for isolating an electric circuit from the source of power. It has no interrupting rating, and it is intended to be operated only after the circuit has been opened by some other means.

Switch, Motor-Circuit. A switch rated in horsepower that is capable of interrupting the maximum operating overload current of a motor of the same horsepower rating as the switch at the rated voltage.

Switch, Transfer. An automatic or nonautomatic device for transferring one or more load conductor connections from one power source to another.

Switchboard. A large single panel, frame, or assembly of panels on which are mounted on the face, back, or both, switches, overcurrent and other protective devices, buses, and usually instruments. Switchboards are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets.

Thermally Protected (as applied to motors). The words Thermally Protected appearing on the nameplate of a motor or motor-compressor indicate that the motor is provided with a thermal protector.

Thermal Protector (as applied to motors). A protective device for assembly as an integral part of a motor or motor-compressor that, when properly applied, protects the motor against dangerous overheating due to overload and failure to start.

FPN: The thermal protector may consist of one or more sensing elements integral with the motor or motor-compressor and an external control device.

Utilization Equipment. Equipment that utilizes electric energy for electronic, electromechanical, chemical, heating, lighting, or similar purposes.

Ventilated. Provided with a means to permit circulation of air sufficient to remove an excess of heat, fumes, or vapors.

Volatile Flammable Liquid. A flammable liquid having a flash point below 38°C, or a flammable liquid whose temperature is above its flash point, or a Class II combustible liquid that has a vapor pressure not exceeding 276 kPa at 38°C and whose temperature is above its flash point.

Voltage (of a circuit). The greatest root-mean-square (rms) (effective) difference of potential between any two conductors of the circuit concerned.

FPN: Some systems, such as 3-phase 4-wire, single-phase 3-wire, and 3-wire direct current, may have various circuits of various voltages.

Voltage, Nominal. A nominal value assigned to a circuit or system for the purpose of conveniently designating its voltage class (e.g., 120/240 volts, 480Y/277 volts, 600 volts). The actual voltage at which a circuit operates can vary from the nominal within a range that permits satisfactory operation of equipment.

FPN: See ANSI C84.1-1995, Voltage Ratings for Electric Power Systems and Equipment (60 Hz).

Voltage to Ground. For grounded circuits, the voltage between the given conductor and that point or conductor of the circuit that is grounded; for ungrounded circuits, the greatest voltage between the given conductor and any other conductor of the circuit.

Watertight. Constructed so that moisture will not enter the enclosure under specified test conditions.

Weatherproof. Constructed or protected so that exposure to the weather will not interfere with successful operation.

FPN: Rainproof, raintight, or watertight equipment can fulfill the requirements for weatherproof where varying weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

1.1.2 Over 600 Volts, Nominal

Whereas the preceding definitions are intended to apply wherever the terms are used throughout this Code, the following definitions are applicable only to parts of the article specifically covering installations and equipment operating at over 600 volts, nominal.

Electronically Actuated Fuse. An overcurrent protective device that generally consists of a control module that provides current sensing, electronically derived time-current characteristics, energy to initiate tripping, and an interrupting module that interrupts current when an overcurrent occurs. Electronically actuated fuses may or may not operate in a current-limiting fashion, depending on the type of control selected.

Fuse. An overcurrent protective device with a circuit-opening fusible part that is heated and severed by the passage of overcurrent

through it.

FPN: A fuse comprises all the parts that form a unit capable of performing the prescribed functions. It may or may not be the complete device necessary to connect it into an electrical circuit.

Controlled Vented Power Fuse. A fuse with provision for controlling discharge circuit interruption such that no solid material may be exhausted into the surrounding atmosphere.

FPN: The fuse is designed so that discharged gases will not ignite or damage insulation in the path of the discharge or propagate a flashover to or between grounded members or conduction members in the path of the discharge where the distance between the vent and such insulation or conduction members conforms to manufacturer's recommendations.

Expulsion Fuse Unit (Expulsion Fuse). A vented fuse unit in which the expulsion effect of gases produced by the arc and lining of the fuseholder, either alone or aided by a spring, extinguishes the arc.

Nonvented Power Fuse. A fuse without intentional provision for the escape of arc gases, liquids, or solid particles to the atmosphere during circuit interruption.

Power Fuse Unit. A vented, nonvented, or controlled vented fuse unit in which the arc is extinguished by being drawn through solid material, granular material, or liquid, either alone or aided by a spring.

Vented Power Fuse. A fuse with provision for the escape of arc gases, liquids, or solid particles to the surrounding atmosphere during circuit interruption.

Multiple Fuse. An assembly of two or more single-pole fuses.

Switching Device. A device designed to close, open, or both, one or more electric circuits.

Circuit Breaker. A switching device capable of making, carrying, and interrupting currents under normal circuit conditions, and also of making, carrying for a specified time, and interrupting currents under specified abnormal circuit conditions, such as those of short circuit.

Cutout. An assembly of a fuse support with either a fuseholder, fuse

carrier, or disconnecting blade. The fuseholder or fuse carrier may include a conducting element (fuse link) or may act as the disconnecting blade by the inclusion of a nonfusible member.

Disconnecting (or Isolating) Switch (Disconnecter, Isolator). A mechanical switching device used for isolating a circuit or equipment from a source of power.

Disconnecting Means. A device, group of devices, or other means whereby the conductors of a circuit can be disconnected from their source of supply.

Interrupter Switch. A switch capable of making, carrying, and interrupting specified currents.

Oil Cutout (Oil-Filled Cutout). A cutout in which all or part of the fuse support and its fuse link or disconnecting blade is mounted in oil with complete immersion of the contacts and the fusible portion of the conducting element (fuse link) so that arc interruption by severing of the fuse link or by opening of the contacts will occur under oil.

Oil Switch. A switch having contacts that operate under oil (or askarel or other suitable liquid).

Regulator Bypass Switch. A specific device or combination of devices designed to bypass a regulator.

ARTICLE 1.2 — PERMITS AND INSPECTION CERTIFICATES

1.2.1 Electrical Permits

1.2.1.1 Electrical Permit Needed Before Work is Started. Before starting any installation work, alternation, repair or extension on any electrical system, the owners, lessors, operators, occupants, or licensed electrical practitioners shall obtain Electrical Permit for buildings, trailers, mobile homes, or other premises from the Office of the Local Building Official, and for watercrafts from the Maritime Industry Authority (Marina). In securing the electrical permit, the services of a

licensed electrical practitioner is required under the New Electrical Engineering Law (RA 7920).

1.2.1.2 Requirement for Electrical Permit: Signatures and submittals.

(a) The Electrical Permit shall include the following minimum information:

1. Applicant.
2. Professional Electrical Engineer who signed and sealed electrical plans and specifications.
3. Licensed Electrical Practitioner who is in-charge of electrical works.
4. Building Owner.
5. Lot Owner.
6. Building Official

(b) Five (5) sets of complete electrical plans and specifications signed and sealed by Professional Electrical Engineer.

1.2.1.3 Electrical Permit to Be Issued Immediately.

(a) The application, upon receipt, shall be checked immediately by the local building official or his representatives for compliance with the requirements. If complying, the Electrical Permits shall be issued upon payment of the corresponding electrical fees.

(b) If the project is extensive and required more time for checking and for computations of fees, the issuance of the Electrical Permit need not be issued immediately. The delay shall not be longer than five (5) working days after which time application together with the accompanying plans shall be considered as complying with all the requirement and the electrical permit shall be issued immediately thereafter.

1.2.1.4 Posting of Electrical Permit. A copy of the Electrical Permit, upon issuance, shall be posted at a conspicuous location at the job site and shall not be removed until final inspection and approval of the work shall have been made.

Licensed Electrical Practitioner in-charge of the design, and the licensed electrical practitioner in-charge of the installation shall post a copy of their respective Professional Regulation Commission (PRC) identification card together with the electrical permit at all times.

1.2.2 Electrical Inspection

1.2.2.1 Application for Inspection. An application for inspection shall be filed with the government authority concerned before a preliminary and/or final inspection is done.

1.2.2.2 Certificate of Inspection. No electrical installation, alteration, and/or addition shall be connected or reconnected to any power supply or any other source of electrical energy without a Certificate of Final Electrical Inspection/Completion obtained from the local building official signed by their respective licensed electrical practitioner.

1.2.3 Special

1.2.3.1 Temporary Installation. For temporary electrical installation, the same procedure as stated above shall be followed. At the end of the period covered by the certificate of inspection, the temporary installation shall be removed. Extended use of the temporary installation shall require a new approval electrical permit.

1.2.3.3 Special Permission Required. Electrical equipment and wiring not specifically covered or mentioned in the various articles of this *Code* shall require special permission and written approval of a licensed electrical practitioner under the enforcing government authority concerned, prior to installation.

1.2.3.4 Reconnection of Disconnected Services. In cases where service has been cut off for more than one (1) year, a new certificate of final electrical inspection shall be required before reconnection.

1.3.1 General

1.3.1.1 Drawing Sheet Sizes.

(a) Electrical plans and drawings shall be drawn on drawing sheets of the following standard sizes:

760 mm	x	1 000 mm
600 mm	x	900 mm
500 mm	x	760 mm

(b) In cases such as projects of large magnitude, exemption in the use of the standard drawing sheets may be granted by the office of the local building official. Refer to Appendix E.

(c) For a dwelling unit having a floor area of not more than 50 square meters with a total load not exceeding 3 680 VA, a drawing sheet of size 297 mm x 420 mm (A3 size) is permitted.

1.3.1.2 Drawing Scale. Appropriate metric drawing scales shall be used.

1.3.1.3. Graphic Scale. Since the size of the drawing sheet can be changed photographically, graphic scale shall be shown on each drawing sheet.

FPN: Graphic scale denotes nominal or average plan scale and remains true when plans are photographically reduced.

1.3.2 Plans and Specifications

1.3.2.1 Plan Requirements.

(a) **Location and Site Plans.** Location and site plans, with proposed structure and owner's land drawn to appropriate metric scale shall show:

(1) Bordering areas showing public or well-known streets, landmarks and/or structures which need not be drawn to scale unless they extend into the area concerned;

(2) Location of service drop, service equipment and nearest pole of the utility company furnishing electrical energy; location of the meter as well as sizes of service entrance wires, conduits and service equipment; and

(3) Clearance of the path or run of service drops and entrance wires to adjacent existing and/or proposed structures.

(b) **Legend or Symbols.** Refer to Appendix A – Electrical Symbols

(c) **General Notes and/or Specifications.** General Notes and/or Specifications, written on the plans or submitted on separate standard size sheets shall show:

(1) Nature of electrical service, including number of phases, number of wires, voltage and frequency;

(2) Type of wiring;

a. Service entrance

b. Feeders, sub-feeders and branch circuit wires for lighting and/or power load

c. Fire alarm system, if required by law

d. Signaling and communication

(3) Special equipment to be installed, indicating ratings and classification of service or duty cycle of;

a. Rectifiers

b. Heaters

c. X-ray apparatus

d. Electric welding equipment

e. Others

(4) System or method of grounding;

(5) Type and rating of main disconnecting means, overcurrent protection (OCP) and branch circuit wiring;

(6) Clearances of service drop, burial depth for service lateral,

mounting height and clearance for service equipment, mounting height and clearance for kWh meter.

(d) Electrical Layout. Floor plan showing location of equipment and devices, and their interconnection wiring.

(1) Plan for Power. Layout and wiring plans for power on the floor plans drawn to scale, shall show:

- a. Sizes and location of service entrance conductors, raceways, metering equipment, main switchboard, layout of feeders and distribution panels or switches and their sizes, types and ratings;
- b. Complete circuits of motors and other electrical equipment, their controlling devices, their locations and ratings;
- c. Complete wiring of emergency power system, if any;
- d. Nature of processes/activities carried out in each room or area

FPN: In residences, apartment houses and small commercial establishments, layout of equipment and motors of one horsepower or less may be incorporated in the layout for General Lighting and Receptacle Outlets. In general, layout of motors and power outlets not exceeding a total of ten, may be included in the lighting layout provided such inclusion will not make reading, interpretation and/or checking of said plan difficult.

(2) Plan for Lighting and Receptacle Outlets. Layout and wiring plans for general lighting and receptacle outlets on floor plans drawn to scale, shall show:

- a. Location, type and rating of lighting fixtures, indicating illumination in lux in each room or area. In residences, hotels, apartment houses, and churches, the illumination level in each room or area need not be shown nor computed;
- b. Location of switches for each fixtures or group of fixtures;
- c. Location of receptacle outlets and appliances to be served and their ratings;
- d. Complete circuits of the lighting and receptacle outlets;
- e. Complete wiring of emergency lighting system, if any;
- f. A separate drawing showing layout of receptacle outlets may be made at the discretion of the design engineer.

(3) Plan for Fire Alarm Circuits. Layout and wiring plans of fire alarm station, fire alarm bell, fire alarm control panel, and other shall be drawn to scale and show:

- a. Location of outlets, equipment and/or apparatus and controls;
- b. Complete circuit showing no. and size of raceway and wire;

(e) Schedule of Loads. Schedule of load in tabulated form shall indicate:

(1) Motor Loads;

- a. Motors as numbered or identified in power layout
- b. Type of motor
- c. Horsepower/kilowatt/kilovolt ampere rating
- d. Voltage rating
- e. Full-load current rating
- f. Frequency rating other than 60 hertz
- g. Number of phases
- h. Type and size of wiring
- i. Protective device rating

(2) Lighting and Receptacle Loads;

- a. Panel as numbered in the feeder diagram
- b. Circuit designation number
- c. Number of lighting outlets in each circuit
- d. Number of switches in each circuit
- e. Number of receptacles outlets (convenience outlets)
- f. Voltage of circuit
- g. Type and size of wiring
- h. Protective device rating

(3) Other Loads.

- a. Designation number on plan
- b. Description of load
- c. Classification of service duty, if required
- d. Rating of kilovolt-ampere or kilowatt
- e. Phase loading indicating full load line current
- f. Voltage rating
- g. Type and size of wiring
- h. Protective device rating

(f) Design Analysis. Design analysis shall be included on the drawings or shall be submitted on separate sheets of standard size, and shall show:

(1) Branch circuits, sub-feeders, feeders, busways, and service entrance;

(2) Types, ratings, and trip settings of overload protective devices;

(3) Calculation of short circuit current for determining the interrupting capacity of overcurrent protection device for residential, commercial, and industrial establishment;

(4) Calculation of voltage drops.

(g) One Line Diagram. One line diagram shall indicate:

(1) Lighting and Receptacle Outlet Loads;

- a.** Single line or schematics diagram of lighting and receptacles panelboards showing mains and branch circuit rating;
- b.** Size of conductors for feeders.

(2) Motor Loads;

- a.** Rating in kilowatts/horsepower/kilovolt ampere
- b.** Full load current
- c.** Locked rotor current
- d.** Phase connection for 1-phase motor on a 3-phase system
- e.** Rated voltage
- f.** Type and size of wiring, indicating load in amperes
- g.** Electric motors shall be numbered consecutively to correspond to their numbers in the layout

(3) Feeders and Subfeeders;

- a.** Identification and/or labeling of feeders and subfeeders
- b.** Size and type of wires and raceway
- c.** Protective devices and controls
- d.** The allowable ampacity of the conductor over the designed load current in amperes expressed as a ratio and indicated along side

the conductor

(4) Load Center.

a. Identification and/or labeling of load center showing type and rating of transformer, switches, circuit breaker and other related devices

b. Incoming and outgoing feeders, type, size and voltage

c. Equipment grounding

1.3.2.2 Title Block. Title block or nameplate of plans and drawing shall be a standard strip of 40 mm high at the bottom of the sheet. It shall contain the following:

(a) Name and location of installation or project;

(b) Name, signature and address of owner/manager/operator;

(c) Title of sheet;

(d) Name, signature and seal of Professional Electrical Engineer together with Professional Regulation Commission professional license number and validity, Professional Tax Receipt Number, and Tax Identification Number;

(e) Scale used, date drawn; and

(f) Sheet number.

1.3.2.3 Other Details.

(a) Exposed conductors shall show:

(1) Means of support and types of insulators; and

(2) Spacings and clearances.

(b) Auxiliary gutters, wireways, busways, cabinets, boxes, metallic raceways, underground installations, other than specified in the Code shall show:

(1) Installation details;

(2) Conductor supports, separators, and attachments where required by this *Code*; and

(3) Dimensions and description or specifications.

(c) Private pole installations shall show:

(1) Construction and installation details and dimensions;

(2) Pole top wiring details including line hardware; and

(3) Guying details.

(d) Low energy power and low voltage power installation shall show:

(1) Details of battery installation and/or other source of low voltage or low energy power;

(2) Equipment, wiring, actuating mechanism and protective devices; and

(3) Ventilation details whenever necessary.

1.3.3 Substation Plans and Specifications

1.3.3.1 Indoor Substation. Indoor substation plans shall show:

(a) Location and dimensions of;

(1) Substation in building plan drawn to scale,

(2) Building with respect to entire compound or property,

(3) Incoming and outgoing lines, and

(4) Windows, doors, and other openings.

(b) Substation structural requirements;

(1) Materials and construction of walls, floors, roof, windows, enclosures, doors, and their dimensions, and

(2) Ventilation and drainage systems and other safeguards.

(c) Substation electrical requirements such as;

(1) Plan view showing location and sizes of equipment installed,

(2) Clearances and spacings between exposed current-carrying and noncurrent-carrying portions and grounding equipment, and

(3) Grounding system.

(d) Cross sectional views showing;

(1) Horizontal and vertical clearances between exposed parts and adjacent surfaces,

(2) Horizontal and vertical clearances of exposed parts from floor/ceiling,

(3) Finished floor level and ground level.

(e) Miscellaneous;

(1) Specification of equipment,

(2) Wiring of lighting and remote control systems,

(3) One-line diagram(s) of entire installation with voltage indicated,

(4) Computations on size of wires, busbar, transformer, fuses, switches and breaker, and

(5) Class of insulation or insulators.

1.3.3.2 Outdoor Substation. Outdoor substation plans shall show same items as indoor substation except that in lieu of walls and roof,

details of fence and supporting steel structure shall be shown in accordance with the latest edition of the Philippine Electrical Code, Part 2.

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

1.10.1 General

1.10.1.1 Scope. This article covers general requirements for the examination and approval, installation and use, access to and spaces about electrical conductors and equipment; enclosures intended for personnel entry; and tunnel installations.

1.10.1.2 Approval. The conductors and equipment required or permitted by this Code shall be acceptable only if approved.

FPN: See 1.0.1.7, Examination of Equipment for Safety, and 1.10.1.3, Examination, Identification, Installation, and Use of Equipment. See definitions of Approved, Identified, Labeled, and Listed.

1.10.1.3 Examination, Identification, Installation, and Use of Equipment.

(a) Examination. In judging equipment, considerations such as the following shall be evaluated:

(1) Suitability for installation and use in conformity with the provisions of this Code

FPN: Suitability of equipment use may be identified by a description marked on or provided with a product to identify the suitability of the product for a specific purpose, environment, or application. Suitability of equipment may be evidenced by listing or labeling.

(2) Mechanical strength and durability, including, for parts designed to enclose and protect other equipment, the adequacy of the protection thus provided

(3) Wire-bending and connection space

(4) Electrical insulation

(5) Heating effects under normal conditions of use and also under abnormal conditions likely to arise in service

(6) Arcing effects

(7) Classification by type, size, voltage, current capacity, and specific use

(8) Other factors that contribute to the practical safeguarding of persons using or likely to come in contact with the equipment

(b) Installation and Use. Listed or labeled equipment shall be installed and used in accordance with any instructions included in the listing or labeling.

1.10.1.4 Voltages. Throughout this Code, the voltage considered shall be that at which the circuit operates. The voltage rating of electrical equipment shall not be less than the nominal voltage of a circuit to which it is connected.

1.10.1.5 Conductors. Conductors normally used to carry current shall be of copper unless otherwise provided in this Code. Where the conductor material is not specified, the material and the sizes given in this Code shall apply to copper conductors. Where other materials are used, the size shall be changed accordingly.

FPN: For aluminum and copper-clad aluminum conductors, see 3.10.1.15.

1.10.1.6 Conductor Sizes. Conductor sizes are expressed in square millimetres (mm²) for stranded or in millimetres diameter (mm dia.) for solid.

1.10.1.7 Insulation Integrity. Completed wiring installations shall be free from short circuits and from grounds other than as required or permitted in Article 2.50.

1.10.1.8 Wiring Methods. Only wiring methods recognized as suitable are included in this Code. The recognized methods of wiring shall be permitted to be installed in any type of building or occupancy, except as otherwise provided in this Code.

1.10.1.9 Interrupting Rating. Equipment intended to interrupt current at fault levels shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.

Equipment intended to interrupt current at other than fault levels shall have an interrupting rating at nominal circuit voltage sufficient for the current that must be interrupted.

1.10.1.10 Circuit Impedance and Other Characteristics. The overcurrent protective devices, the total impedance, the component short-circuit current ratings, and other characteristics of the circuit to be protected shall be selected and coordinated to permit the circuit-protective devices used to clear a fault to do so without extensive damage to the electrical components of the circuit. This fault shall be assumed to be either between two or more of the circuit conductors or between any circuit conductor and the grounding conductor or enclosing metal raceway. Listed products applied in accordance with their listing shall be considered to meet the requirements of this section.

1.10.1.11 Deteriorating Agents. Unless identified for use in the operating environment, no conductors or equipment shall be located in damp or wet locations; where exposed to gases, fumes, vapors, liquids, or other agents that have a deteriorating effect on the conductors or equipment; or where exposed to excessive temperatures.

FPN No. 1: See 3.0.1.6 for protection against corrosion.

FPN No. 2: Some cleaning and lubricating compounds can cause severe deterioration of many plastic materials used for insulating and structural applications in equipment.

Equipment identified only as “dry locations,” “Type 1,” or “indoor use only” shall be protected against permanent damage from the weather during building construction.

1.10.1.12 Mechanical Execution of Work. Electrical equipment shall be installed in a neat and workmanlike manner.

FPN: Accepted industry practices are described in ANSI/NECA 1-2000, Standard Practices for Good Workmanship in Electrical Contracting, and other ANSI-approved installation standards.

(a) Unused Openings. Unused cable or raceway openings in boxes, raceways, auxiliary gutters, cabinets, cutout boxes, meter socket enclosures, equipment cases, or housings shall be effectively closed to afford protection substantially equivalent to the wall of the equipment. Where metallic plugs or plates are used with nonmetallic enclosures, they shall be recessed at least 6 mm from the outer surface of the enclosure.

(b) Subsurface Enclosures. Conductors shall be racked to provide ready and safe access in underground and subsurface enclosures into which persons enter for installation and maintenance.

(c) Integrity of Electrical Equipment and Connections. Internal parts of electrical equipment, including busbars, wiring terminals, insulators, and other surfaces, shall not be damaged or contaminated by foreign materials such as paint, plaster, cleaners, abrasives, or corrosive residues. There shall be no damaged parts that may adversely affect safe operation or mechanical strength of the equipment such as parts that are broken; bent; cut; or deteriorated by corrosion, chemical action, or overheating.

1.10.1.13 Mounting and Cooling of Equipment.

(a) Mounting. Electrical equipment shall be firmly secured to the surface on which it is mounted. Wooden plugs driven into holes in masonry, concrete, plaster, or similar materials shall not be used.

(b) Cooling. Electrical equipment that depends on the natural circulation of air and convection principles for cooling of exposed surfaces shall be installed so that room airflow over such surfaces is not prevented by walls or by adjacent installed equipment. For equipment designed for floor mounting, clearance between top surfaces and adjacent surfaces shall be provided to dissipate rising warm air.

Electrical equipment provided with ventilating openings shall be installed so that walls or other obstructions do not prevent the free circulation of air through the equipment.

1.10.1.14 Electrical Connections. Because of different characteristics of dissimilar metals, devices such as pressure terminal or pressure

splicing connectors and soldering lugs shall be identified for the material of the conductor and shall be properly installed and used. Conductors of dissimilar metals shall not be intermixed in a terminal or splicing connector where physical contact occurs between dissimilar conductors (such as copper and aluminum, copper and copper-clad aluminum, or aluminum and copper-clad aluminum), unless the device is identified for the purpose and conditions of use. Materials such as solder, fluxes, inhibitors, and compounds, where employed, shall be suitable for the use and shall be of a type that will not adversely affect the conductors, installation, or equipment.

FPN: Many terminations and equipment are marked with a tightening torque.

(a) Terminals. Connection of conductors to terminal parts shall ensure a thoroughly good connection without damaging the conductors and shall be made by means of pressure connectors (including set-screw type), solder lugs, or splices to flexible leads. Connection by means of wire-binding screws or studs and nuts that have upturned lugs or the equivalent shall be permitted for 5.5 mm² (2.6 mm dia.) or smaller conductors.

Terminals for more than one conductor and terminals used to connect aluminum shall be so identified.

(b) Splices. Conductors shall be spliced or joined with splicing devices identified for the use or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined so as to be mechanically and electrically secure without solder and then be soldered. All splices and joints and the free ends of conductors shall be covered with an insulation equivalent to that of the conductors or with an insulating device identified for the purpose.

Wire connectors or splicing means installed on conductors for direct burial shall be listed for such use.

(c) Temperature Limitations. The temperature rating associated with the ampacity of a conductor shall be selected and coordinated so as not to exceed the lowest temperature rating of any connected termination, conductor, or device. Conductors with temperature ratings higher than specified for terminations shall be permitted to be used for ampacity adjustment, correction, or both.

(1) Equipment Provisions. The determination of termination

provisions of equipment shall be based on 1.10.1.14(c)(1)a or (c)(1)b. Unless the equipment is listed and marked otherwise, conductor ampacities used in determining equipment termination provisions shall be based on Table 3.10.1.16 as appropriately modified by 3.10.1.15(b)(6).

a. Termination provisions of equipment for circuits rated 100 amperes or less, or marked for 2.0 mm² (1.6 mm dia.) through 38 mm² conductors, shall be used only for one of the following:

1. Conductors rated 60°C (140°F).

2. Conductors with higher temperature ratings, provided the ampacity of such conductors is determined based on the 60°C (140°F) ampacity of the conductor size used.

3. Conductors with higher temperature ratings if the equipment is listed and identified for use with such conductors.

4. For motors marked with design letters B, C, or D, conductors having an insulation rating of 75°C (167°F) or higher shall be permitted to be used, provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity.

b. Termination provisions of equipment for circuits rated over 100 amperes, or marked for conductors larger than 38 mm², shall be used only for one of the following:

1. Conductors rated 75°C (167°F)

2. Conductors with higher temperature ratings, provided the ampacity of such conductors does not exceed the 75°C (167°F) ampacity of the conductor size used, or up to their ampacity if the equipment is listed and identified for use with such conductors

(2) Separate Connector Provisions. Separately installed pressure connectors shall be used with conductors at the ampacities not exceeding the ampacity at the listed and identified temperature rating of the connector.

FPN: With respect to 1.10.1.14(c)(1) and (c)(2), equipment markings or listing information may additionally restrict the sizing and temperature ratings of connected conductors.

1.10.1.15 High-Leg Marking. On a 4-wire, delta-connected system where the midpoint of one phase winding is grounded, only the

conductor or busbar having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color or by other effective means. Such identification shall be placed at each point on the system where a connection is made if the grounded conductor is also present.

1.10.1.16 Flash Protection. Switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner before examination, adjustment, servicing, or maintenance of the equipment.

FPN No. 1: NFPA 70E-2004, Standard for Electrical Safety in the Workplace, provides assistance in determining severity of potential exposure, planning safe work practices, and selecting personal protective equipment.

FPN No. 2: ANSI Z535.4-1998, Product Safety Signs and Labels, provides guidelines for the design of safety signs and labels for application to products.

1.10.1.18 Arcing Parts. Parts of electric equipment that in ordinary operation produce arcs, sparks, flames, or molten metal shall be enclosed or separated and isolated from all combustible material.

FPN: For hazardous (classified) locations, see Articles 5.0 through 5.17. For motors, see 4.30.1.14.

1.10.1.19 Light and Power from Railway Conductors. Circuits for lighting and power shall not be connected to any system that contains trolley wires with a ground return.

Exception: Such circuit connections shall be permitted in car houses, power houses, or passenger and freight stations operated in connection with electric railways.

1.10.1.21 Marking. The manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified shall be placed on all electric equipment.

Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in this Code. The marking shall be of sufficient durability to withstand the environment involved.

1.10.1.22 Identification of Disconnecting Means. Each disconnecting means shall be legibly marked to indicate its purpose unless located and arranged so the purpose is evident. The marking shall be of sufficient durability to withstand the environment involved. Where circuit breakers or fuses are applied in compliance with the series combination ratings marked on the equipment by the manufacturer, the equipment enclosure(s) shall be legibly marked in the field to indicate the equipment has been applied with a series combination rating. The marking shall be readily visible and state the following:

CAUTION
SERIES COMBINATION SYSTEM RATED ____ AMPERES
IDENTIFIED REPLACEMENT COMPONENTS REQUIRED

FPN: See 2.40.7.7(b) for interrupting rating marking for end-use equipment.

1.10.1.23 Current Transformers. Unused current transformers associated with potentially energized circuits shall be short-circuited.

1.10.2 600 Volts, Nominal, or Less

1.10.2.1 Spaces About Electrical Equipment. Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment. Enclosures housing electrical apparatus that are controlled by a lock(s) shall be considered accessible to licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner.

(a) Working Space. Working space for equipment operating at 600 volts, nominal, or less to ground and likely to require examination, adjustment, servicing, or maintenance while energized shall comply with the dimensions of 1.10.2.1(a)(1), (a)(2), and (a)(3) or as required or permitted elsewhere in this Code.

(1) Depth of Working Space. The depth of the working space in

the direction of live parts shall not be less than that specified in Table 1.10.2.1(a)(1) unless the requirements of 1.10.2.1(a)(1)a, (a)(1)b, or (a)(1)c are met. Distances shall be measured from the exposed live parts or from the enclosure or opening if the live parts are enclosed.

Table 1.10.2.1(a)(1) Working Spaces

Nominal Voltage to Ground	Minimum Clear Distance (mm)		
	Condition 1	Condition 2	Condition 3
0–150	900	900	900
151–600	900	1 000	1 200

Note: Where the conditions are as follows:

Condition 1 — Exposed live parts on one side of the working space and no live or grounded parts on the other side of the working space, or exposed live parts on both sides of the working space that are effectively guarded by insulating materials.

Condition 2 — Exposed live parts on one side of the working space and grounded parts on the other side of the working space. Concrete, brick, or tile walls shall be considered as grounded.

Condition 3 — Exposed live parts on both sides of the working space.

a. **Dead-Front Assemblies.** Working space shall not be required in the back or sides of assemblies, such as dead-front switchboards or motor control centers, where all connections and all renewable or adjustable parts, such as fuses or switches, are accessible from locations other than the back or sides. Where rear access is required to work on nonelectrical parts on the back of enclosed equipment, a minimum horizontal working space of 750 mm shall be provided.

b. **Low Voltage.** By special permission, smaller working spaces shall be permitted where all exposed live parts operate at not greater than 30 volts rms, 42 volts peak, or 60 volts dc.

c. **Existing Buildings.** In existing buildings where electrical equipment is being replaced, Condition 2 working clearance shall be permitted between dead-front switchboards, panelboards, or motor control centers located across the aisle from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment on both sides of the aisle from being open at the same time and licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner who are authorized will service the installation.

(2) **Width of Working Space.** The width of the working space in front of the electric equipment shall be the width of the equipment or 750 mm, whichever is greater. In all cases, the work space shall permit at least a 90 degree opening of equipment doors or hinged panels.

(3) **Height of Working Space.** The work space shall be clear and extend from the grade, floor, or platform to the height required by 1.10.2.1(e). Within the height requirements of this section, other equipment that is associated with the electrical installation and is located above or below the electrical equipment shall be permitted to extend not more than 150 mm beyond the front of the electrical equipment.

(b) Clear Spaces. Working space required by this section shall not be used for storage. When normally enclosed live parts are exposed for inspection or servicing, the working space, if in a passageway or general open space, shall be suitably guarded.

(c) Entrance to Working Space.

(1) **Minimum Required.** At least one entrance of sufficient area shall be provided to give access to working space about electrical equipment.

(2) **Large Equipment.** For equipment rated 1 200 amperes or more that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to the required working space not less than 600 mm wide and 2 000 mm high at each end of the working space. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

A single entrance to the required working space shall be permitted where either of the conditions in 1.10.2.1(c)(2)a or (c)(2)b is met.

a. **Unobstructed Exit.** Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.

b. **Extra Working Space.** Where the depth of the working space is twice that required by 1.10.2.1(a)(1), a single entrance shall be permitted. It shall be located so that the distance from the equipment

to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 1.10.2.1(a)(1) for equipment operating at that voltage and in that condition.

(d) Illumination. Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed indoors. Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source or as permitted by 2.10.3.21(a)(1), Exception No. 1, for switched receptacles. In electrical equipment rooms, the illumination shall not be controlled by automatic means only.

(e) Headroom. The minimum headroom of working spaces about service equipment, switchboards, panelboards, or motor control centers shall be 2 000 mm. Where the electrical equipment exceeds 2 000 m in height, the minimum headroom shall not be less than the height of the equipment.

Exception: In existing dwelling units, service equipment or panelboards that do not exceed 200 amperes shall be permitted in spaces where the headroom is less than 2 000 mm.

(f) Dedicated Equipment Space. All switchboards, panelboards, distribution boards, and motor control centers shall be located in dedicated spaces and protected from damage.

Exception: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.

(1) Indoor. Indoor installations shall comply with 1.10.2.1(f)(1)a through (f)(1)d.

a. Dedicated Electrical Space. The space equal to the width and depth of the equipment and extending from the floor to a height of 1 800 m above the equipment or to the structural ceiling, whichever is lower, shall be dedicated to the electrical installation. No piping, ducts, leak protection apparatus, or other equipment foreign to the electrical installation shall be located in this zone.

Exception: Suspended ceilings with removable panels shall be

permitted within the 1 800 mm zone.

b. Foreign Systems. The area above the dedicated space required by 1.10.2.1(f)(1)a shall be permitted to contain foreign systems, provided protection is installed to avoid damage to the electrical equipment from condensation, leaks, or breaks in such foreign systems.

c. Sprinkler Protection. Sprinkler protection shall be permitted for the dedicated space where the piping complies with this section.

d. Suspended Ceilings. A dropped, suspended, or similar ceiling that does not add strength to the building structure shall not be considered a structural ceiling.

(2) Outdoor. Outdoor electrical equipment shall be installed in suitable enclosures and shall be protected from accidental contact by unauthorized personnel, or by vehicular traffic, or by accidental spillage or leakage from piping systems. The working clearance space shall include the zone described in 1.10.2.1(a). No architectural appurtenance or other equipment shall be located in this zone.

1.10.2.2 Guarding of Live Parts.

(a) Live Parts Guarded Against Accidental Contact. Except as elsewhere required or permitted by this Code, live parts of electrical equipment operating at 50 volts or more shall be guarded against accidental contact by approved enclosures or by any of the following means:

(1) By location in a room, vault, or similar enclosure that is accessible only to licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner.

(2) By suitable permanent, substantial partitions or screens arranged so that only licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner have access to the space within reach of the live parts. Any openings in such partitions or screens shall be sized and located so that persons are not likely to come into accidental contact with the live parts or to bring conducting objects into contact with them.

(3) By location on a suitable balcony, gallery, or platform elevated and arranged so as to exclude unqualified persons.

(4) By elevation of 2 400 mm or more above the floor or other working surface.

(b) Prevent Physical Damage. In locations where electric equipment is likely to be exposed to physical damage, enclosures or guards shall be so arranged and of such strength as to prevent such damage.

(c) Warning Signs. Entrances to rooms and other guarded locations that contain exposed live parts shall be marked with conspicuous warning signs forbidding unqualified persons to enter.

FPN: For motors, see 4.30.12.2 and 4.30.12.3. For over 600 volts, see 1.10.3.5.

1.10.3 Over 600 Volts, Nominal

1.10.3.1 General. Conductors and equipment used on circuits over 600 volts, nominal, shall comply with Part 1.10.1 and with the following sections, which supplement or modify Part 1.10.1. In no case shall the provisions of this part apply to equipment on the supply side of the service point.

1.10.3.2 Enclosure for Electrical Installations. Electrical installations in a vault, room, or closet or in an area surrounded by a wall, screen, or fence, access to which is controlled by a lock(s) or other approved means, shall be considered to be accessible to licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner only. The type of enclosure used in a given case shall be designed and constructed according to the nature and degree of the hazard(s) associated with the installation.

For installations other than equipment as described in 1.10.3.2(d), a wall, screen, or fence shall be used to enclose an outdoor electrical installation to deter access by persons who are not qualified. A fence shall not be less than 2 100 mm in height or a combination of 1 800 mm or more of fence fabric and a 300 mm or more extension utilizing three or more strands of barbed wire or equivalent. The

distance from the fence to live parts shall be not less than given in Table 1.10.3.2.

Table 1.10.3.2 Minimum Distance from Fence to Live Parts

Nominal Voltage	Minimum Distance to Live Parts (m)
601 – 13,799	3.05
13,800 – 230,000	4.57
Over 230,000	5.49

Note: For clearances of conductors for specific system voltages and typical BIL ratings, see ANSI C2-2002, National Electrical Safety Code.

FPN: See Article 4.50 for construction requirements for transformer vaults.

(a) Fire Resistivity of Electrical Vaults. The walls, roof, floors, and doorways of vaults containing conductors and equipment over 600 volts, nominal, shall be constructed of materials that have adequate structural strength for the conditions, with a minimum fire rating of 3 hours. The floors of vaults in contact with the earth shall be of concrete that is not less than 100 mm thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed on it and a minimum fire resistance of 3 hours. For the purpose of this section, studs and wallboards shall not be considered acceptable.

(b) Indoor Installations.

(1) In Places Accessible to Unqualified Persons. Indoor electrical installations that are accessible to unqualified persons shall be made with metal-enclosed equipment. Metal-enclosed switchgear, unit substations, transformers, pull boxes, connection boxes, and other similar associated equipment shall be marked with appropriate caution signs. Openings in ventilated dry-type transformers or similar openings in other equipment shall be designed so that foreign objects inserted through these openings are deflected from energized parts.

(2) In Places Accessible to Licensed Electrical Practitioner or Non-Licensed Electrical Practitioner Under the Supervision of a Licensed Electrical Practitioner Only. Indoor electrical installations considered accessible only to licensed electrical practitioner or non-

licensed electrical practitioner under the supervision of a licensed electrical practitioner in accordance with this section shall comply with 1.10.3.5, 1.10.3.7, and 4.90.2.4.

(c) Outdoor Installations.

(1) In Places Accessible to Unqualified Persons. Outdoor electrical installations that are open to unqualified persons shall comply with Parts 2.25.1, 2.25.2, and 2.25.3.

FPN: For clearances of conductors for system voltages over 600 volts, nominal, see ANSI C2-2002, National Electrical Safety Code.

(2) In Places Accessible to Licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner Only. Outdoor electrical installations that have exposed live parts shall be accessible to licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner only in accordance with the first paragraph of this section and shall comply with 1.10.3.5, 1.10.3.7, and 4.90.2.4.

(d) Enclosed Equipment Accessible to Unqualified Persons. Ventilating or similar openings in equipment shall be designed such that foreign objects inserted through these openings are deflected from energized parts. Where exposed to physical damage from vehicular traffic, suitable guards shall be provided. Nonmetallic or metal-enclosed equipment located outdoors and accessible to the general public shall be designed such that exposed nuts or bolts cannot be readily removed, permitting access to live parts. Where nonmetallic or metal-enclosed equipment is accessible to the general public and the bottom of the enclosure is less than 2 400 mm above the floor or grade level, the enclosure door or hinged cover shall be kept locked. Doors and covers of enclosures used solely as pull boxes, splice boxes, or junction boxes shall be locked, bolted, or screwed on. Underground box covers that weigh over 45.4 kg shall be considered as meeting this requirement.

1.10.3.3 Work Space About Equipment. Sufficient space shall be provided and maintained about electric equipment to permit ready and safe operation and maintenance of such equipment. Where energized

parts are exposed, the minimum clear work space shall not be less than 2 000 mm high (measured vertically from the floor or platform) or less than 900 mm wide (measured parallel to the equipment). The depth shall be as required in 1.10.3.5(a). In all cases, the work space shall permit at least a 90 degree opening of doors or hinged panels.

1.10.3.4 Entrance and Access to Work Space.

(a) Entrance. At least one entrance not less than 600 mm wide and 2 000 mm high shall be provided to give access to the working space about electric equipment. Where the entrance has a personnel door(s), the door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

(1) Large Equipment. On switchboard and control panels exceeding 1 800 mm in width, there shall be one entrance at each end of the equipment. A single entrance to the required working space shall be permitted where either of the conditions in 1.10.3.4(a)(1)a or (a)(1)b is met.

a. Unobstructed Exit. Where the location permits a continuous and unobstructed way of exit travel, a single entrance to the working space shall be permitted.

b. Extra Working Space. Where the depth of the working space is twice that required by 1.10.3.5(a), a single entrance shall be permitted. It shall be located so that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 1.10.3.5(a) for equipment operating at that voltage and in that condition.

(2) Guarding. Where bare energized parts at any voltage or insulated energized parts above 600 volts, nominal, to ground are located adjacent to such entrance, they shall be suitably guarded.

(b) Access. Permanent ladders or stairways shall be provided to give safe access to the working space around electric equipment installed on platforms, balconies, or mezzanine floors or in attic or roof rooms or spaces.

1.10.3.5 Work Space and Guarding.

(a) Working Space. Except as elsewhere required or permitted in this Code, the minimum clear working space in the direction of access to live parts of electrical equipment shall not be less than specified in Table 1.10.3.5(a). Distances shall be measured from the live parts, if such are exposed, or from the enclosure front or opening if such are enclosed.

Exception: Working space shall not be required in back of equipment such as dead-front switchboards or control assemblies where there are no renewable or adjustable parts (such as fuses or switches) on the back and where all connections are accessible from locations other than the back. Where rear access is required to work on de-energized parts on the back of enclosed equipment, a minimum working space of 750 mm horizontally shall be provided.

Table 1.10.3.5(a) Minimum Depth of Clear Working Space at Electrical Equipment

Nominal Voltage to Ground	Minimum Clear Distance (mm)		
	Condition 1	Condition 2	Condition 3
601–2500 V	900	1 200	1 500
2501–9000 V	1 200	1 500	1 800
9001–25,000 V	1 500	1 800	2 700
25,001V–75 kV	1 800	2 400	3 000
Above 75 kV	2 400	3 000	3 600

Note: Where the conditions are as follows:

Condition 1 — Exposed live parts on one side of the working space and no live or grounded parts on the other side of the working space, or exposed live parts on both sides of the working space that are effectively guarded by insulating materials.

Condition 2 — Exposed live parts on one side of the working space and grounded parts on the other side of the working space. Concrete, brick, or tile walls shall be considered as grounded.

Condition 3 — Exposed live parts on both sides of the working space.

(b) Separation from Low-Voltage Equipment. Where switches, cutouts, or other equipment operating at 600 volts, nominal, or less are installed in a vault, room, or enclosure where there are exposed live parts or exposed wiring operating at over 600 volts, nominal, the high-

voltage equipment shall be effectively separated from the space occupied by the low-voltage equipment by a suitable partition, fence, or screen.

Exception: Switches or other equipment operating at 600 volts, nominal, or less and serving only equipment within the high-voltage vault, room, or enclosure shall be permitted to be installed in the high-voltage vault, room or enclosure without a partition, fence, or screen if accessible to licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner only.

(c) Locked Rooms or Enclosures. The entrance to all buildings, vaults, rooms, or enclosures containing exposed live parts or exposed conductors operating at over 600 volts, nominal, shall be kept locked unless such entrances are under the observation of a licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner at all times.

Where the voltage exceeds 600 volts, nominal, permanent and conspicuous warning signs shall be provided, reading as follows:

DANGER — HIGH VOLTAGE — KEEP OUT

(d) Illumination. Illumination shall be provided for all working spaces about electrical equipment. The lighting outlets shall be arranged so that persons changing lamps or making repairs on the lighting system are not endangered by live parts or other equipment.

The points of control shall be located so that persons are not likely to come in contact with any live part or moving part of the equipment while turning on the lights.

(e) Elevation of Unguarded Live Parts. Unguarded live parts above working space shall be maintained at elevations not less than required by Table 1.10.3.5(e).

(f) Protection of Service Equipment, Metal-Enclosed Power Switchgear, and Industrial Control Assemblies. Pipes or ducts foreign to the electrical installation and requiring periodic maintenance or whose malfunction would endanger the operation of the electrical system shall not be located in the vicinity of the service equipment, metal-enclosed power switchgear, or industrial control assemblies.

Protection shall be provided where necessary to avoid damage from condensation leaks and breaks in such foreign systems. Piping and other facilities shall not be considered foreign if provided for fire protection of the electrical installation.

Table 1.10.3.5(e) Elevation of Unguarded Live Parts Above Working Space

Nominal Voltage Between Phases	Elevation (mm)
601–7500 V	2 700
7501–35,000 V	2 900
Over 35 kV	2 900 + 9.5 /kV above 35kV

1.10.3.7 Circuit Conductors. Circuit conductors shall be permitted to be installed in raceways; in cable trays; as metal-clad cable, as bare wire, cable, and busbars; or as Type MV cables or conductors as provided in 3.0.2.7, 3.0.2.9, 3.0.2.10, and 3.0.2.20. Bare live conductors shall conform with 4.90.2.4.

Insulators, together with their mounting and conductor attachments, where used as supports for wires, single-conductor cables, or busbars, shall be capable of safely withstanding the maximum magnetic forces that would prevail when two or more conductors of a circuit were subjected to short-circuit current.

Exposed runs of insulated wires and cables that have a bare lead sheath or a braided outer covering shall be supported in a manner designed to prevent physical damage to the braid or sheath. Supports for lead-covered cables shall be designed to prevent electrolysis of the sheath.

1.10.3.11 Temperature Limitations at Terminations. Conductors shall be permitted to be terminated based on the 90°C temperature rating and ampacity as given in Table 3.10.1.67 through Table 3.10.1.86, unless otherwise identified.

1.10.4 Tunnel Installations over 600 Volts, Nominal

1.10.4.1 General.

(a) **Covered.** The provisions of this part shall apply to the installation and use of high-voltage power distribution and utilization equipment that is portable, mobile, or both, such as substations, trailers, cars, mobile shovels, draglines, hoists, drills, dredges, compressors, pumps, conveyors, underground excavators, and the like.

(b) **Other Articles.** The requirements of this part shall be additional to, or amendatory of, those prescribed in Articles 1.0 through 4.90 of this Code. Special attention shall be paid to Article 2.50.

(c) **Protection Against Physical Damage.** Conductors and cables in tunnels shall be located above the tunnel floor and so placed or guarded to protect them from physical damage.

1.10.4.2 Overcurrent Protection. Motor-operated equipment shall be protected from overcurrent in accordance with Parts 4.30.3, 4.30.4, and 4.30.5. Transformers shall be protected from overcurrent in accordance with 4.50.1.3.

1.10.4.3 Conductors. High-voltage conductors in tunnels shall be installed in metal conduit or other metal raceway, Type MC cable, or other approved multiconductor cable. Multiconductor portable cable shall be permitted to supply mobile equipment.

1.10.4.4 Bonding and Equipment Grounding Conductors.

(a) **Grounded and Bonded.** All non-current-carrying metal parts of electric equipment and all metal raceways and cable sheaths shall be effectively grounded and bonded to all metal pipes and rails at the portal and at intervals not exceeding 300 m throughout the tunnel.

(b) **Equipment Grounding Conductors.** An equipment grounding conductor shall be run with circuit conductors inside the metal raceway or inside the multiconductor cable jacket. The equipment grounding conductor shall be permitted to be insulated or bare.

1.10.4.5 Transformers, Switches, and Electrical Equipment. All

transformers, switches, motor controllers, motors, rectifiers, and other equipment installed below ground shall be protected from physical damage by location or guarding.

1.10.4.6 Energized Parts. Bare terminals of transformers, switches, motor controllers, and other equipment shall be enclosed to prevent accidental contact with energized parts.

1.10.4.7 Ventilation System Controls. Electrical controls for the ventilation system shall be arranged so that the airflow can be reversed.

1.10.4.8 Disconnecting Means. A switch or circuit breaker that simultaneously opens all ungrounded conductors of the circuit shall be installed within sight of each transformer or motor location for disconnecting the transformer or motor. The switch or circuit breaker for a transformer shall have an ampere rating not less than the ampacity of the transformer supply conductors. The switch or circuit breaker for a motor shall comply with the applicable requirements of Article 4.30.

1.10.4.9 Enclosures. Enclosures for use in tunnels shall be dripproof, weatherproof, or submersible as required by the environmental conditions. Switch or contactor enclosures shall not be used as junction boxes or as raceways for conductors feeding through or tapping off to other switches, unless the enclosures comply with 3.12.1.8.

1.10.5 Manholes and Other Electric Enclosures Intended for Personnel Entry, All Voltages

1.10.5.1 General. Electric enclosures intended for personnel entry and specifically fabricated for this purpose shall be of sufficient size to provide safe work space about electric equipment with live parts that is likely to require examination, adjustment, servicing, or maintenance while energized. Such enclosures shall have sufficient size to permit ready installation or withdrawal of the conductors employed without damage to the conductors or to their insulation. They shall comply with the provisions of this part.

Exception: Where electric enclosures covered by 1.10.5 are part of an

industrial wiring system operating under conditions of maintenance and supervision that ensure that only licensed electrical practitioner or non-licensed electrical practitioner under the supervision of a licensed electrical practitioner monitor and supervise the system, they shall be permitted to be designed and installed in accordance with appropriate engineering practice. If required by the authority having jurisdiction, design documentation shall be provided.

1.10.5.2 Strength. Manholes, vaults, and their means of access shall be designed under qualified engineering supervision and shall withstand all loads likely to be imposed on the structures.

FPN: See ANSI C2-2002, National Electrical Safety Code, for additional information on the loading that can be expected to bear on underground enclosures.

1.10.5.3 Cabling Work Space. A clear work space not less than 900 mm wide shall be provided where cables are located on both sides, and not less than 750 mm where cables are only on one side. The vertical headroom shall not be less than 1 800 mm unless the opening is within 300 mm, measured horizontally, of the adjacent interior side wall of the enclosure.

Exception: A manhole containing only one or more of the following shall be permitted to have one of the horizontal work space dimensions reduced to 600 mm where the other horizontal clear work space is increased so the sum of the two dimensions is not less than 1 800 mm:

- (1) Optical fiber cables as covered in Article 7.70*
- (2) Power-limited fire alarm circuits supplied in accordance with 7.60.3.1(a)*
- (3) Class 2 or Class 3 remote-control and signaling circuits, or both, supplied in accordance with 7.25.3.1.*

1.10.5.4 Equipment Work Space. Where electric equipment with live parts that is likely to require examination, adjustment, servicing, or maintenance while energized is installed in a manhole, vault, or other enclosure designed for personnel access, the work space and associated requirements in 1.10.2.1 shall be met for installations operating at 600 volts or less. Where the installation is over 600 volts, the work space and associated requirements in 1.10.3.5 shall be met. A manhole access cover that weighs over 45 kg (100 lb) shall be

considered as meeting the requirements of 1.10.3.5(c).

1.10.5.5 Bending Space for Conductors. Bending space for conductors operating at 600 volts or below shall be provided in accordance with the requirements of 3.14.2.14. Conductors operating over 600 volts shall be provided with bending space in accordance with 3.14.4.2(a) and 3.14.4.2(b), as applicable. All conductors shall be cabled, racked up, or arranged in an approved manner that provides ready and safe access for persons to enter for installation and maintenance.

Exception: Where 3.14.4.2(b) applies, each row or column of ducts on one wall of the enclosure shall be calculated individually, and the single row or column that provides the maximum distance shall be used.

1.10.5.6 Access to Manholes.

(a) Dimensions. Rectangular access openings shall not be less than 650 mm × 550 mm. Round access openings in a manhole shall not be less than 650 mm in diameter.

Exception: A manhole that has a fixed ladder that does not obstruct the opening or that contains only one or more of the following shall be permitted to reduce the minimum cover diameter to 600 mm:

- (1) Optical fiber cables as covered in Article 7.70*
- (2) Power-limited fire alarm circuits supplied in accordance with 7.60.3.1*
- (3) Class 2 or Class 3 remote-control and signaling circuits, or both, supplied in accordance with 7.25.3.1*

(b) Obstructions. Manhole openings shall be free of protrusions that could injure personnel or prevent ready egress.

(c) Location. Manhole openings for personnel shall be located where they are not directly above electric equipment or conductors in the enclosure. Where this is not practicable, either a protective barrier or a fixed ladder shall be provided.

(d) Covers. Covers shall be over 45 kg (100 lb) or otherwise designed to require the use of tools to open. They shall be designed or

restrained so they cannot fall into the manhole or protrude sufficiently to contact electrical conductors or equipment within the manhole.

(e) Marking. Manhole covers shall have an identifying mark or logo that prominently indicates their function, such as “electric.”

1.10.5.7 Access to Vaults and Tunnels.

(a) Location. Access openings for personnel shall be located where they are not directly above electric equipment or conductors in the enclosure. Other openings shall be permitted over equipment to facilitate installation, maintenance, or replacement of equipment.

(b) Locks. In addition to compliance with the requirements of 1.10.3.5, if applicable, access openings for personnel shall be arranged such that a person on the inside can exit when the access door is locked from the outside, or in the case of normally locking by padlock, the locking arrangement shall be such that the padlock can be closed on the locking system to prevent locking from the outside.

1.10.5.8 Ventilation. Where manholes, tunnels, and vaults have communicating openings into enclosed areas used by the public, ventilation to open air shall be provided wherever practicable.

1.10.5.9 Guarding. Where conductors or equipment, or both, could be contacted by objects falling or being pushed through a ventilating grating, both conductors and live parts shall be protected in accordance with the requirements of 1.10.2.2(a)(2) or 1.10.3.2(b)(1), depending on the voltage.

1.10.5.10 Fixed Ladders. Fixed ladders shall be corrosion resistant.

Chapter 2. Wiring and Protection

ARTICLE 2.0 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

2.0.1.1 Scope. This article provides requirements for the following:

- (1) Identification of terminals
- (2) Grounded conductors in premises wiring systems
- (3) Identification of grounded conductors

FPN: See Article 1.0 for definitions of Grounded Conductor and Grounding Conductor.

2.0.1.2 General. All premises wiring systems, other than circuits and systems exempted or prohibited by 2.10.1.10, 2.15.1.7, 2.50.2.2, 2.50.2.3, 2.50.8.3, 5.3.3.56, 5.17.4.4, 6.68.1.11, 6.68.1.21, and 6.90.5.1 Exception, shall have a grounded conductor that is identified in accordance with 2.0.1.6.

The grounded conductor, where insulated, shall have insulation that is (1) suitable, other than color, for any ungrounded conductor of the same circuit on circuits of less than 1000 volts or impedance grounded neutral systems of 1 kV and over, or (2) rated not less than 600 volts for solidly grounded neutral systems of 1 kV and over as described in 2.50.10.5(a).

2.0.1.3 Connection to Grounded System. Premises wiring shall not be electrically connected to a supply system unless the latter contains, for any grounded conductor of the interior system, a corresponding conductor that is grounded. For the purpose of this section, electrically connected shall mean connected so as to be capable of carrying current, as distinguished from connection through electromagnetic induction.

2.0.1.6 Means of Identifying Grounded Conductors.

(a) Sizes 14 mm² or Smaller. An insulated grounded conductor of 14 mm² or smaller shall be identified by a continuous white or gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Wires that have their outer covering finished to show a white or gray color but have colored tracer threads in the braid identifying the source of manufacture shall be considered as meeting the provisions of this section. Insulated grounded conductors shall also be permitted to be identified as follows:

(1) The grounded conductor of a mineral-insulated, metal-sheathed cable shall be identified at the time of installation by distinctive marking at its terminations.

(2) A single-conductor, sunlight-resistant, outdoor-rated cable used as a grounded conductor in photovoltaic power systems as permitted by 6.90.4.1 shall be identified at the time of installation by distinctive white marking at all terminations.

(3) Fixture wire shall comply with the requirements for grounded conductor identification as specified in 4.2.1.8.

(4) For aerial cable, the identification shall be as above, or by means of a ridge located on the exterior of the cable so as to identify it.

(b) Sizes Larger Than 14 mm². An insulated grounded conductor larger than 14 mm² shall be identified by one of the following means:

(1) By a continuous white or gray outer finish.

(2) By three continuous white stripes along its entire length on other than green insulation.

(3) At the time of installation, by a distinctive white or gray marking at its terminations. This marking shall encircle the conductor or insulation.

(c) Flexible Cords. An insulated conductor that is intended for use as a grounded conductor, where contained within a flexible cord, shall be identified by a white or gray outer finish or by methods permitted by 4.0.2.3.

(d) Grounded Conductors of Different Systems. Where grounded conductors of different systems are installed in the same raceway, cable, box, auxiliary gutter, or other type of enclosure, each grounded

conductor shall be identified by system. Identification that distinguishes each system grounded conductor shall be permitted by one of the following means:

(1) One system grounded conductor shall have an outer covering conforming to 2.0.1.6(a) or 2.0.1.6(b).

(2) The grounded conductor(s) of other systems shall have a different outer covering conforming to 2.0.1.6(a) or 2.0.1.6(b) or by an outer covering of white or gray with a readily distinguishable colored stripe other than green running along the insulation.

(3) Other and different means of identification as allowed by 2.0.1.6(a) or 2.0.1.6(b) that will distinguish each system grounded conductor.

This means of identification shall be permanently posted at each branch-circuit panelboard.

(e) Grounded Conductors of Multiconductor Cables. The insulated grounded conductors in a multiconductor cable shall be identified by a continuous white or gray outer finish or by three continuous white stripes on other than green insulation along its entire length. Multiconductor flat cable 22 mm² or larger shall be permitted to employ an external ridge on the grounded conductor.

Exception No. 1: Where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, grounded conductors in multiconductor cables shall be permitted to be permanently identified at their terminations at the time of installation by a distinctive white marking or other equally effective means.

Exception No. 2: The grounded conductor of a multiconductor varnished-cloth-insulated cable shall be permitted to be identified at its terminations at the time of installation by a distinctive white marking or other equally effective means.

FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

2.0.1.7 Use of Insulation of a White or Gray Color or with Three Continuous White Stripes.

(a) General. The following shall be used only for the grounded circuit conductor, unless otherwise permitted in 2.0.1.7(b) and 2.0.1.7(c):

- (1) A conductor with continuous white or gray covering
- (2) A conductor with three continuous white stripes on other than green insulation
- (3) A marking of white or gray color at the termination

(b) Circuits of Less Than 50 Volts. A conductor with white or gray color insulation or three continuous white stripes or having a marking of white or gray at the termination for circuits of less than 50 volts shall be required to be grounded only as required by 2.50.2.1(a).

(c) Circuits of 50 Volts or More. The use of insulation that is white or gray or that has three continuous white stripes for other than a grounded conductor for circuits of 50 volts or more shall be permitted only as in (1) through (3).

(1) If part of a cable assembly and where the insulation is permanently reidentified to indicate its use as an ungrounded conductor, by painting or other effective means at its termination, and at each location where the conductor is visible and accessible. Identification shall encircle the insulation and shall be a color other than white, gray, or green.

(2) Where a cable assembly contains an insulated conductor for single-pole, 3-way or 4-way switch loops and the conductor with white or gray insulation or a marking of three continuous white stripes is used for the supply to the switch but not as a return conductor from the switch to the switched outlet. In these applications, the conductor with white or gray insulation or with three continuous white stripes shall be permanently reidentified to indicate its use by painting or other effective means at its terminations and at each location where the conductor is visible and accessible.

(3) Where a flexible cord, having one conductor identified by a white or gray outer finish or three continuous white stripes or by any other means permitted by 4.0.2.3, is used for connecting an appliance or equipment permitted by 4.0.1.7. This shall apply to flexible cords

connected to outlets whether or not the outlet is supplied by a circuit that has a grounded conductor.

FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

2.0.1.9 Means of Identification of Terminals. The identification of terminals to which a grounded conductor is to be connected shall be substantially white in color. The identification of other terminals shall be of a readily distinguishable different color.

Exception: Where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installations, terminals for grounded conductors shall be permitted to be permanently identified at the time of installation by a distinctive white marking or other equally effective means.

2.0.1.10 Identification of Terminals.

(a) Device Terminals. All devices, excluding panelboards, provided with terminals for the attachment of conductors and intended for connection to more than one side of the circuit shall have terminals properly marked for identification, unless the electrical connection of the terminal intended to be connected to the grounded conductor is clearly evident.

Exception: Terminal identification shall not be required for devices that have a normal current rating of over 30 amperes, other than polarized attachment plugs and polarized receptacles for attachment plugs as required in 2.0.1.10(b).

(b) Receptacles, Plugs, and Connectors. Receptacles, polarized attachment plugs, and cord connectors for plugs and polarized plugs shall have the terminal intended for connection to the grounded conductor identified as follows:

(1) Identification shall be by a metal or metal coating that is substantially white in color or by the word white or the letter W located adjacent to the identified terminal.

(2) If the terminal is not visible, the conductor entrance hole for the connection shall be colored white or marked with the word white or the letter W.

FPN: See 2.50.6.17 for identification of wiring device equipment grounding conductor terminals.

(c) Screw Shells. For devices with screw shells, the terminal for the grounded conductor shall be the one connected to the screw shell.

(d) Screw Shell Devices with Leads. For screw shell devices with attached leads, the conductor attached to the screw shell shall have a white or gray finish. The outer finish of the other conductor shall be of a solid color that will not be confused with the white or gray finish used to identify the grounded conductor.

FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

(e) Appliances. Appliances that have a single-pole switch or a single-pole overcurrent device in the line or any line-connected screw shell lampholders, and that are to be connected by (1) a permanent wiring method or (2) field-installed attachment plugs and cords with three or more wires (including the equipment grounding conductor), shall have means to identify the terminal for the grounded circuit conductor (if any).

2.0.1.11 Polarity of Connections. No grounded conductor shall be attached to any terminal or lead so as to reverse the designated polarity.

ARTICLE 2.10 — BRANCH CIRCUITS

2.10.1 General Provisions

2.10.1.1 Scope. This article covers branch circuits except for branch circuits that supply only motor loads, which are covered in Article 4.30. Provisions of this article and Article 4.30 apply to branch circuits with combination loads.

2.10.1.2 Other Articles for Specific-Purpose Branch Circuits. Branch circuits shall comply with this article and also with the

applicable provisions of other articles of this Code. The provisions for branch circuits supplying equipment listed in Table 2.10.1.2 amend or supplement the provisions in this article and shall apply to branch circuits referred to therein.

2.10.1.3 Rating. Branch circuits recognized by this article shall be rated in accordance with the maximum permitted ampere rating or setting of the overcurrent device. The rating for other than individual branch circuits shall be 15, 20, 30, 40, and 50 amperes. Where conductors of higher ampacity are used for any reason, the ampere rating or setting of the specified overcurrent device shall determine the circuit rating.

Exception: Multioutlet branch circuits greater than 50 amperes shall be permitted to supply nonlighting outlet loads on industrial premises where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the equipment.

2.10.1.4 Multiwire Branch Circuits.

(a) General. Branch circuits recognized by this article shall be permitted as multiwire circuits. A multiwire circuit shall be permitted to be considered as multiple circuits. All conductors shall originate from the same panelboard or similar distribution equipment.

FPN: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic neutral currents.

(b) Devices or Equipment. Where a multiwire branch circuit supplies more than one device or equipment on the same yoke, a means shall be provided to disconnect simultaneously all ungrounded conductors supplying those devices or equipment at the point where the branch circuit originates.

Table 2.10.1.2 Specific-Purpose Branch Circuits

Equipment	Article	Section
Air-conditioning and refrigerating equipment		4.40.1.6, 4.40.4.1,
Audio signal processing, amplification, and reproduction equipment		4.40.4.2 6.40.1.8
Busways		
Circuits and equipment operating at less than 50 volts	7.20	3.68.2.8
Central heating equipment other than fixed electric space-heating equipment		4.22.2.3
Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits	7.25	
Closed-loop and programmed power distribution	7.80	
Cranes and hoists		
Electric signs and outline lighting		6.10.5.2
Electric welders	6.30	6.0.1.6
Elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chair lifts		6.20.7.1
Fire alarm systems	7.60	
Fixed electric heating equipment for pipelines and vessels		4.27.1.4
Fixed electric space-heating equipment		4.24.1.3
Fixed outdoor electric deicing and snow-melting equipment		4.26.1.4
Information technology equipment		
Infrared lamp industrial heating equipment		6.45.1.5 4.22.4.9,
Induction and dielectric heating equipment	6.65	4.24.1.3
Marinas and boatyards		
Mobile homes, manufactured homes, and mobile home parks	5.50	5.55.1.19
Motion picture and television studios and similar locations	5.30	

Table 2.10.1.2 (Continued)

Equipment	Article	Section
Motors, motor circuits, and controllers	4.30	
Pipe organs		6.50.1.7
Recreational vehicles and recreational vehicle parks	5.51	
Switchboards and panelboards		4.8.4.3
Theaters, audience areas of motion picture and television studios, and similar locations		5.20.3.1, 5.20.4.3, 5.20.5.2
X-ray equipment		6.60.1.2, 5.17.5.3

(c) Line-to-Neutral Loads. Multiwire branch circuits shall supply only line-to-neutral loads.

Exception No. 1: A multiwire branch circuit that supplies only one utilization equipment.

Exception No. 2: Where all ungrounded conductors of the multiwire branch circuit are opened simultaneously by the branch-circuit overcurrent device.

FPN: See 3.0.1.13(b) for continuity of grounded conductor on multiwire circuits.

2.10.1.5 Identification for Branch Circuits.

(a) Grounded Conductor. The grounded conductor of a branch circuit shall be identified in accordance with 2.0.1.6.

(b) Equipment Grounding Conductor. The equipment grounding conductor shall be identified in accordance with 2.50.6.10.

(c) Ungrounded Conductors. Where the premises wiring system has branch circuits supplied from more than one nominal voltage system, each ungrounded conductor of a branch circuit, where accessible, shall be identified by system. The means of identification shall be permitted to be by separate color coding, marking tape,

tagging, or other approved means and shall be permanently posted at each branch-circuit panelboard or similar branch-circuit distribution equipment.

2.10.1.6 Branch-Circuit Voltage Limitations. The nominal voltage of branch circuits shall not exceed the values permitted by 2.10.1.6(a) through 2.10.1.6(e).

(a) Occupancy Limitation. In dwelling units and guest rooms or guest suites of hotels, motels, and similar occupancies, the voltage shall not exceed 230 volts, nominal, between conductors that supply the terminals of the following:

- (1) Luminaires (lighting fixtures)
- (2) Cord-and-plug-connected loads 1440 volt-amperes, nominal, or less or less than ¼ hp

(b) 230 Volts Between Conductors. Circuits not exceeding 230 volts, nominal, between conductors shall be permitted to supply the following:

- (1) The terminals of lampholders applied within their voltage ratings
- (2) Auxiliary equipment of electric-discharge lamps
- (3) Cord-and-plug-connected or permanently connected utilization equipment

(c) 277 Volts to Ground. Circuits exceeding 230 volts, nominal, between conductors and not exceeding 277 volts, nominal, to ground shall be permitted to supply the following:

- (1) Listed electric-discharge luminaires (lighting fixtures)
- (2) Listed incandescent luminaires (lighting fixtures), where supplied at 230 volts or less from the output of a stepdown autotransformer that is an integral component of the luminaire (fixture) and the outer shell terminal is electrically connected to a grounded conductor of the branch circuit
- (3) Luminaires (lighting fixtures) equipped with mogul-base screw shell lampholders
- (4) Lampholders, other than the screw shell type, applied within their voltage ratings
- (5) Auxiliary equipment of electric-discharge lamps

(6) Cord-and-plug-connected or permanently connected utilization equipment

(d) 600 Volts Between Conductors. Circuits exceeding 277 volts, nominal, to ground and not exceeding 600 volts, nominal, between conductors shall be permitted to supply the following:

(1) The auxiliary equipment of electric-discharge lamps mounted in permanently installed luminaires (fixtures) where the luminaires (fixtures) are mounted in accordance with one of the following:

- a. Not less than a height of 6 700 mm on poles or similar structures for the illumination of outdoor areas such as highways, roads, bridges, athletic fields, or parking lots
- b. Not less than a height of 5 500 mm on other structures such as tunnels

(2) Cord-and-plug-connected or permanently connected utilization equipment other than luminaires (fixtures)

FPN: See 4.10.13.6 for auxiliary equipment limitations.

Exception No. 1 to (b), (c), and (d): For lampholders of infrared industrial heating appliances as provided in 4.22.2.5.

Exception No. 2 to (b), (c), and (d): For railway properties as described in 1.10.1.19.

(e) Over 600 Volts Between Conductors. Circuits exceeding 600 volts, nominal, between conductors shall be permitted to supply utilization equipment in installations where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation.

2.10.1.7 Branch Circuit Receptacle Requirements.

(a) Receptacle Outlet Location. Receptacle outlets shall be located in branch circuits in accordance with Part 2.10.3.

(b) Multiple Branch Circuits. Where two or more branch circuits supply devices or equipment on the same yoke, a means to

simultaneously disconnect the ungrounded conductors supplying those devices shall be provided at the point at which the branch circuits originate.

2.10.1.8 Ground-Fault Circuit-Interrupter Protection for Personnel.

FPN: See 2.15.1.9 for ground-fault circuit-interrupter protection for personnel on feeders.

(a) Dwelling Units. All 125-volt and/or 250 volts, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (8) shall have ground-fault circuit-interrupter protection for personnel.

(1) Bathrooms

(2) Garages, and also accessory buildings that have a floor located at or below grade level not intended as habitable rooms and limited to storage areas, work areas, and areas of similar use

Exception No. 1 to (2): Receptacles that are not readily accessible.

Exception No. 2 to (2): A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 4.0.1.7(a)(6), (a)(7), or (a)(8).

Receptacles installed under the exceptions to 2.10.1.8(a)(2) shall not be considered as meeting the requirements of 2.10.3.3(g)

(3) Outdoors. Receptacles installed under the exceptions to 2.10.1.8(a)(5) shall not be considered as meeting the requirements of 2.10.3.3(g).

(4) Crawl spaces — at or below grade level

(5) Unfinished basements — for purposes of this section, unfinished basements are defined as portions or areas of the basement not intended as habitable rooms and limited to storage areas, work areas, and the like

Exception No. 1 to (5): Receptacles that are not readily accessible.

Exception No. 2 to (5): A single receptacle or a duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug connected in accordance with 4.0.1.7(a)(6), (a)(7), or (a)(8).

Exception No. 3 to (5): A receptacle supplying only a permanently installed fire alarm or burglar alarm system shall not be required to have ground-fault circuit-interrupter protection.

(6) Kitchens — where the receptacles are installed to serve the countertop surfaces

(7) Laundry, utility, and wet bar sinks — where the receptacles are installed within 1 800 mm of the outside edge of the sink

(8) Boathouses

(b) Other Than Dwelling Units. All 125-volt and/or 250 volts, single-phase, 15- and 20-ampere receptacles installed in the locations specified in (1) through (5) shall have ground-fault circuit-interrupter protection for personnel:

(1) Bathrooms

(2) Commercial and institutional kitchens — for the purposes of this section, a kitchen is an area with a sink and permanent facilities for food preparation and cooking

(3) Rooftops

(4) Outdoors in public spaces—for the purpose of this section a public space is defined as any space that is for use by, or is accessible to, the public

Exception to (3) and (4): Receptacles that are not readily accessible and are supplied from a dedicated branch circuit for electric snow-melting or deicing equipment shall be permitted to be installed in accordance with the applicable provisions of Article 4.26.

(5) Outdoors, where installed to comply with 2.10.3.14

(c) Boat Hoists. Ground-fault circuit-interrupter protection for personnel shall be provided for outlets that supply boat hoists installed in dwelling unit locations and supplied by 125-volt and/or 250 volts, 15- and 20-ampere branch circuits.

2.10.1.9 Circuits Derived from Autotransformers. Branch circuits shall not be derived from autotransformers unless the circuit supplied has a grounded conductor that is electrically connected to a grounded conductor of the system supplying the autotransformer.

Exception No. 1: An autotransformer shall be permitted without the connection to a grounded conductor where transforming from a nominal 208 volts to a nominal 240-volt supply or similarly from 240 volts to 208 volts.

Exception No. 2: In industrial occupancies, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, autotransformers shall be permitted to supply nominal 600-volt loads from nominal 480-volt systems, and 480-volt loads from nominal 600-volt systems, without the connection to a similar grounded conductor.

2.10.1.10 Ungrounded Conductors Tapped from Grounded Systems. Two-wire dc circuits and ac circuits of two or more ungrounded conductors shall be permitted to be tapped from the ungrounded conductors of circuits that have a grounded neutral conductor. Switching devices in each tapped circuit shall have a pole in each ungrounded conductor. All poles of multipole switching devices shall manually switch together where such switching devices also serve as a disconnecting means as required by the following:

- (1) 4.10.8.2 for double-pole switched lampholders
- (2) 4.10.10.2(b) for electric-discharge lamp auxiliary equipment switching devices
- (3) 4.22.3.2(b) for an appliance
- (4) 4.24.3.2 for a fixed electric space-heating unit
- (5) 4.30.7.5 for a motor controller
- (6) 4.30.9.3 for a motor

2.10.1.11 Branch Circuits Required. Branch circuits for lighting and for appliances, including motor-operated appliances, shall be provided to supply the loads calculated in accordance with 2.20.2.1. In addition, branch circuits shall be provided for specific loads not covered by 2.20.2.1 where required elsewhere in this Code and for dwelling unit loads as specified in 2.10.1.11(c).

(a) Number of Branch Circuits. The minimum number of branch circuits shall be determined from the total calculated load and the size or rating of the circuits used. In all installations, the number of circuits shall be sufficient to supply the load served. In no case shall the load on any circuit exceed the maximum specified by 2.20.2.9.

(b) Load Evenly Proportioned Among Branch Circuits. Where the load is calculated on the basis of volt-amperes per square meter or per square foot, the wiring system up to and including the branch-circuit panelboard(s) shall be provided to serve not less than the calculated load. This load shall be evenly proportioned among multioutlet branch circuits within the panelboard(s). Branch-circuit overcurrent devices and circuits shall only be required to be installed to serve the connected load.

(c) Dwelling Units.

(1) Small-Appliance Branch Circuits. In addition to the number of branch circuits required by other parts of this section, two or more 20-ampere small-appliance branch circuits shall be provided for all receptacle outlets specified by 2.10.3.3(b).

(2) Laundry Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one additional 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s) required by 2.10.3.3(f). This circuit shall have no other outlets.

(3) Bathroom Branch Circuits. In addition to the number of branch circuits required by other parts of this section, at least one 20-ampere branch circuit shall be provided to supply bathroom receptacle outlet(s). Such circuits shall have no other outlets.

Exception: Where the 20-ampere circuit supplies a single bathroom, outlets for other equipment within the same bathroom shall be permitted to be supplied in accordance with 2.10.2.5(a)(1) and (a)(2).

FPN: See Examples D1(a), D1(b), D2(b), and D4(a) in Appendix D.

2.10.1.12 Arc-Fault Circuit-Interrupter Protection.

(a) Definition: Arc-Fault Circuit Interrupter. An arc-fault circuit interrupter is a device intended to provide protection from the effects of arc faults by recognizing characteristics unique to arcing and by functioning to de-energize the circuit when an arc fault is detected.

(b) Dwelling Unit Bedrooms. All 115-volt and/or 230-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit bedrooms shall be protected by a listed arc-fault circuit interrupter, combination type installed to provide protection of the branch circuit. This requirement shall become effective January 1, 2014.

FPN: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.

Exception: The location of the arc-fault circuit interrupter shall be permitted to be at other than the origination of the branch circuit in compliance with (a) and (b):

(a) The arc-fault circuit interrupter installed within 1800 mm of the branch circuit overcurrent device as measured along the branch circuit conductors.

(b) The circuit conductors between the branch circuit overcurrent device and the arc-fault circuit interrupter shall be installed in a metal raceway or a cable with a metallic sheath.

2.10.1.18 Guest Rooms and Guest Suites. Guest rooms and guest suites that are provided with permanent provisions for cooking shall have branch circuits and outlets installed to meet the rules for dwelling units.

2.10.2 Branch-Circuit Ratings

2.10.2.1 Conductors — Minimum Ampacity and Size.

(a) Branch Circuits Not More Than 600 Volts.

(1) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. Where a branch circuit supplies continuous loads or any combination of continuous and

noncontinuous loads, the minimum branch-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the branch circuit conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

FPN No. 1: See 3.10.1.15 for ampacity ratings of conductors.

FPN No. 2: See Part 4.30.2 for minimum rating of motor branch-circuit conductors.

FPN No. 3: See 3.10.1.10 for temperature limitation of conductors.

FPN No. 4: Conductors for branch circuits as defined in Article 1.0, sized to prevent a voltage drop exceeding 3 percent at the farthest outlet of power, heating, and lighting loads, or combinations of such loads, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent, provide reasonable efficiency of operation. See FPN No. 2 of 2.15.1.2(a)(3) for voltage drop on feeder conductors.

(2) Multioutlet Branch Circuits. Conductors of branch circuits supplying more than one receptacle for cord-and-plug-connected portable loads shall have an ampacity of not less than the rating of the branch circuit.

(3) Household Ranges and Cooking Appliances. Branch-circuit conductors supplying household ranges, wall-mounted ovens, counter-mounted cooking units, and other household cooking appliances shall have an ampacity not less than the rating of the branch circuit and not less than the maximum load to be served. For ranges of 8¾ kW or more rating, the minimum branch-circuit rating shall be 40 amperes.

Exception No. 1: Tap conductors supplying electric ranges, wall-mounted electric ovens, and counter-mounted electric cooking units from a 50-ampere branch circuit shall have an ampacity of not less than 20 and shall be sufficient for the load to be served. These tap conductors include any conductors that are a part of the leads supplied with the appliance that are smaller than the branch circuit conductors. The taps shall not be longer than necessary for servicing the appliance.

Exception No. 2: The neutral conductor of a 3-wire branch circuit supplying a household electric range, a wall-mounted oven, or a counter-mounted cooking unit shall be permitted to be smaller than

the ungrounded conductors where the maximum demand of a range of 8¾ kW or more rating has been calculated according to Column C of Table 2.20.3.16, but such conductor shall have an ampacity of not less than 70 percent of the branch-circuit rating and shall not be smaller than 5.5 mm² (2.6 mm dia.).

(4) Other Loads. Branch-circuit conductors that supply loads other than those specified in 2.10.1.2 and other than cooking appliances as covered in 2.10.2.1(a)(3) shall have an ampacity sufficient for the loads served and shall not be smaller than 2.0 mm² (1.6 mm dia.).

Exception No. 1: Tap conductors shall have an ampacity sufficient for the load served. In addition, they shall have an ampacity of not less than 15 for circuits rated less than 40 amperes and not less than 20 for circuits rated at 40 or 50 amperes and only where these tap conductors supply any of the following loads:

(a) Individual lampholders or luminaires (fixtures) with taps extending not longer than 450 mm beyond any portion of the lampholder or luminaire (fixture).

(b) A fixture having tap conductors as provided in 4.10.11.4.

(c) Individual outlets, other than receptacle outlets, with taps not over 450 mm long.

(d) Infrared lamp industrial heating appliances.

(e) Nonheating leads of deicing and snow-melting cables and mats.

Exception No. 2: Fixture wires and flexible cords shall be permitted to be smaller than 2.0 mm² (1.6 mm dia.) as permitted by 2.40.1.5.

(b) Branch Circuits Over 600 Volts. The ampacity of conductors shall be in accordance with 3.10.1.15 and 3.10.1.16, as applicable. Branch-circuit conductors over 600 volts shall be sized in accordance with 2.10.2.1(b)(1) or (b)(2).

(1) General. The ampacity of branch-circuit conductors shall not be less than 125 percent of the designed potential load of utilization equipment that will be operated simultaneously.

(2) Supervised Installations. For supervised installations, branch-circuit conductor sizing shall be permitted to be determined by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner under

engineering supervision. Supervised installations are defined as those portions of a facility where both of the following conditions are met:

a. Conditions of design and installation are provided under engineering supervision.

b. Licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner with documented training and experience in over 600-volt systems provide maintenance, monitoring, and servicing of the system.

2.10.2.2 Overcurrent Protection. Branch-circuit conductors and equipment shall be protected by overcurrent protective devices that have a rating or setting that complies with 2.10.2.2(a) through (d).

(a) Continuous and Noncontinuous Loads. Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly, including the overcurrent devices protecting the branch circuit(s), is listed for operation at 100 percent of its rating, the ampere rating of the overcurrent device shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

(b) Conductor Protection. Conductors shall be protected in accordance with 2.40.1.4. Flexible cords and fixture wires shall be protected in accordance with 2.40.1.5.

(c) Equipment. The rating or setting of the overcurrent protective device shall not exceed that specified in the applicable articles referenced in Table 2.40.1.3 for equipment.

(d) Outlet Devices. The rating or setting shall not exceed that specified in 2.10.2.3 for outlet devices.

2.10.2.3 Outlet Devices. Outlet devices shall have an ampere rating that is not less than the load to be served and shall comply with 2.10.2.3(a) and (b).

(a) Lampholders. Where connected to a branch circuit having a rating in excess of 20 amperes, lampholders shall be of the heavy-duty type. A heavy-duty lampholder shall have a rating of not less than 660 watts if of the admedium type, or not less than 750 watts if of any other type.

(b) Receptacles.

(1) Single Receptacle on an Individual Branch Circuit. A single receptacle installed on an individual branch circuit shall have an ampere rating not less than that of the branch circuit.

Exception No. 1: A receptacle installed in accordance with 4.30.7.1(b).

Exception No. 2: A receptacle installed exclusively for the use of a cord-and-plug-connected arc welder shall be permitted to have an ampere rating not less than the minimum branch-circuit conductor ampacity determined by 6.30.2.1(a) for arc welders.

FPN: See the definition of receptacle in Article 1.0.

(2) Total Cord-and-Plug-Connected Load. Where connected to a branch circuit supplying two or more receptacles or outlets, a receptacle shall not supply a total cord-and-plug-connected load in excess of the maximum specified in Table 2.10.2.3(b)(2).

Table 2.10.2.3(b)(2) Maximum Cord-and-Plug-Connected Load to Receptacle

Circuit Rating (Amperes)	Receptacle Rating (Amperes)	Maximum Load (Amperes)
15 or 20	15	12
20	20	16
30	30	24

(3) Receptacle Ratings. Where connected to a branch circuit supplying two or more receptacles or outlets, receptacle ratings shall conform to the values listed in Table 2.10.2.3(b)(3), or where larger than 50 amperes, the receptacle rating shall not be less than the branch-circuit rating.

Exception No. 1: Receptacles for one or more cord-and-plug-connected arc welders shall be permitted to have ampere ratings not less than the minimum branch-circuit conductor ampacity permitted by 6.30.2.1(a) or (b) as applicable for arc welders.

Exception No. 2: The ampere rating of a receptacle installed for electric discharge lighting shall be permitted to be based on 4.10.6.9(c).

Table 2.10.2.3(b)(3) Receptacle Ratings for Various Size Circuits

Circuit Rating (Amperes)	Receptacle Rating (Amperes)
15	Not over 15
20	15 or 20
30	30
40	40 or 50
50	50

(4) Range Receptacle Rating. The ampere rating of a range receptacle shall be permitted to be based on a single range demand load as specified in Table 2.20.3.16.

2.10.2.5 Permissible Loads. In no case shall the load exceed the branch-circuit ampere rating. An individual branch circuit shall be permitted to supply any load for which it is rated. A branch circuit supplying two or more outlets or receptacles shall supply only the loads specified according to its size as specified in 2.10.2.5(a) through (d) and as summarized in 2.10.2.6 and Table 2.10.2.6.

(a) 15- and 20-Ampere Branch Circuits. A 15- or 20-ampere branch circuit shall be permitted to supply lighting units or other utilization equipment, or a combination of both, and shall comply with 2.10.2.5(a)(1) and (a)(2).

Exception: The small appliance branch circuits, laundry branch circuits, and bathroom branch circuits required in a dwelling unit(s) by 2.10.1.11(c)(1), (c)(2), and (c)(3) shall supply only the receptacle outlets specified in that section.

(1) **Cord-and-Plug-Connected Equipment Not Fastened in Place.** The rating of any one cord-and-plug-connected utilization equipment not fastened in place shall not exceed 80 percent of the branch-circuit ampere rating.

(2) **Utilization Equipment Fastened in Place.** The total rating of utilization equipment fastened in place, other than luminaires (lighting fixtures), shall not exceed 50 percent of the branch-circuit ampere rating where lighting units, cord-and-plug-connected utilization equipment not fastened in place, or both, are also supplied.

(b) 30-Ampere Branch Circuits. A 30-ampere branch circuit shall be permitted to supply fixed lighting units with heavy-duty lampholders in other than a dwelling unit(s) or utilization equipment in any occupancy. A rating of any one cord-and-plug-connected utilization equipment shall not exceed 80 percent of the branch-circuit ampere rating.

(c) 40- and 50-Ampere Branch Circuits. A 40- or 50-ampere branch circuit shall be permitted to supply cooking appliances that are fastened in place in any occupancy. In other than dwelling units, such circuits shall be permitted to supply fixed lighting units with heavy-duty lampholders, infrared heating units, or other utilization equipment.

(d) Branch Circuits Larger Than 50 Amperes. Branch circuits larger than 50 amperes shall supply only nonlighting outlet loads.

2.10.2.6 Branch-Circuit Requirements — Summary.

The requirements for circuits that have two or more outlets or receptacles, other than the receptacle circuits of 2.10.1.11(c)(1) and (c)(2), are summarized in Table 2.10.2.6. This table provides only a summary of minimum requirements. See 2.10.2.1, 2.10.2.2, and 2.10.2.3 for the specific requirements applying to branch circuits.

2.10.2.7 Common Area Branch Circuits. Branch circuits in dwelling units shall supply only loads within that dwelling unit or loads associated only with that dwelling unit. Branch circuits required for the purpose of lighting, central alarm, signal, communications, or other needs for public or common areas of a two-family or multifamily dwelling shall not be supplied from equipment that supplies an individual dwelling unit.

Table 2.10.2.6 Summary of Branch-Circuit Requirements

Circuit Rating	15 A	20 A	30 A	40 A	50 A
Conductors (min. size):					
Circuit wires ¹	14	12	10	8	6
Taps	14	14	14	12	12
Fixture wires and cords — see 2.40.1.5					
Overcurrent Protection	15 A	20 A	30 A	40 A	50 A
Outlet devices:					
Lampholders permitted	Any type	Any type	Heavy duty	Heavy duty	Heavy duty
Receptacle rating ²	15 max. A	15 or 20 A	30 A	40 or 50 A	50 A
Maximum Load	15 A	20 A	30 A	40 A	50 A
Permissible load	See 2.10.2.5(a)	See 2.10.2.5(a)	See 2.10.2.5(b)	See 2.10.2.5(c)	See 2.10.2.5(c)

¹These gauges are for copper conductors.²For receptacle rating of cord-connected electric-discharge luminaires (lighting fixtures), see 4.10.6.9(c).

2.10.3 Required Outlets

2.10.3.1 General. Receptacle outlets shall be installed as specified in 2.10.3.3 through 2.10.3.14.

(a) Cord Pendants. A cord connector that is supplied by a permanently connected cord pendant shall be considered a receptacle outlet.

(b) Cord Connections. A receptacle outlet shall be installed wherever flexible cords with attachment plugs are used. Where flexible cords are permitted to be permanently connected, receptacles shall be permitted to be omitted for such cords.

(c) Appliance Outlets. Appliance receptacle outlets installed in a dwelling unit for specific appliances, such as laundry equipment, shall be installed within 1 800 mm of the intended location of the appliance.

2.10.3.3 Dwelling Unit Receptacle Outlets. This section provides requirements for 125-volt, 15- and 20-ampere receptacle outlets. Receptacle outlets required by this section shall be in addition to any receptacle that is part of a luminaire (lighting fixture) or appliance, located within cabinets or cupboards, or located more than 1 700 mm above the floor.

Permanently installed electric baseboard heaters equipped with factory-installed receptacle outlets or outlets provided as a separate assembly by the manufacturer shall be permitted as the required outlet or outlets for the wall space utilized by such permanently installed heaters. Such receptacle outlets shall not be connected to the heater circuits.

FPN: Listed baseboard heaters include instructions that may not permit their installation below receptacle outlets.

(a) General Provisions. In every kitchen, family room, dining room, living room, parlor, library, den, sunroom, bedroom, recreation room, or similar room or area of dwelling units, receptacle outlets shall be installed in accordance with the general provisions specified in 2.10.3.3(a)(1) through (a)(3).

(1) Spacing. Receptacles shall be installed so that no point measured horizontally along the floor line in any wall space is more than 1 800 mm from a receptacle outlet.

(2) Wall Space. As used in this section, a wall space shall include the following:

a. Any space 600 mm or more in width (including space measured around corners) and unbroken along the floor line by doorways, fireplaces, and similar openings

b. The space occupied by fixed panels in exterior walls, excluding sliding panels

c. The space afforded by fixed room dividers such as freestanding bar-type counters or railings

(3) Floor Receptacles. Receptacle outlets in floors shall not be counted as part of the required number of receptacle outlets unless located within 450 mm of the wall.

(b) Small Appliances.

(1) Receptacle Outlets Served. In the kitchen, pantry, breakfast room, dining room, or similar area of a dwelling unit, the two or more 20-ampere small-appliance branch circuits required by 2.10.1.11(c)(1) shall serve all wall and floor receptacle outlets covered by 2.10.3.3(a), all countertop outlets covered by 2.10.3.3(c), and receptacle outlets for refrigeration equipment.

Exception No. 1: In addition to the required receptacles specified by 2.10.3.3, switched receptacles supplied from a general-purpose branch circuit as defined in 2.10.3.21(a)(1), Exception No. 1, shall be permitted.

Exception No. 2: The receptacle outlet for refrigeration equipment shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.

(2) No Other Outlets. The two or more small-appliance branch circuits specified in 2.10.3.3(b)(1) shall have no other outlets.

Exception No. 1: A receptacle installed solely for the electrical supply to and support of an electric clock in any of the rooms specified in 2.10.3.3(b)(1).

Exception No. 2: Receptacles installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units.

(3) **Kitchen Receptacle Requirements.** Receptacles installed in a kitchen to serve countertop surfaces shall be supplied by not fewer than two small-appliance branch circuits, either or both of which shall also be permitted to supply receptacle outlets in the same kitchen and in other rooms specified in 2.10.3.3(b)(1). Additional small-appliance branch circuits shall be permitted to supply receptacle outlets in the kitchen and other rooms specified in 2.10.3.3(b)(1). No small-appliance branch circuit shall serve more than one kitchen.

(c) **Countertops.** In kitchens and dining rooms of dwelling units, receptacle outlets for counter spaces shall be installed in accordance with 2.10.3.3(c)(1) through (c)(5).

(1) **Wall Counter Spaces.** A receptacle outlet shall be installed at each wall counter space that is 300 mm or wider. Receptacle outlets shall be installed so that no point along the wall line is more than 600 mm measured horizontally from a receptacle outlet in that space.

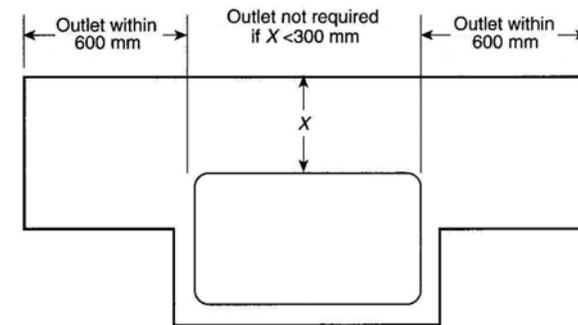

Exception: Receptacle outlets shall not be required on a wall directly behind a range or sink in the installation described in Figure 2.10.3.3.

(2) **Island Counter Spaces.** At least one receptacle shall be installed at each island counter space with a long dimension of 600 mm or greater and a short dimension of 300 mm or greater. Where a rangetop or sink is installed in an island counter and the width of the counter behind the rangetop or sink is less than 300 mm, the rangetop or sink is considered to divide the island into two separate countertop spaces as defined in 2.10.3.3(c)(4).

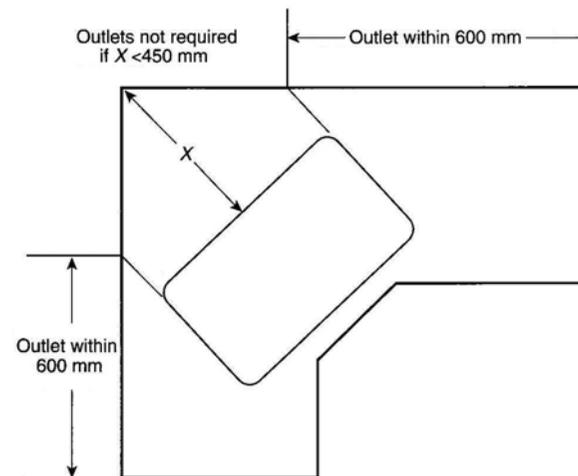

(3) **Peninsular Counter Spaces.** At least one receptacle outlet shall be installed at each peninsular counter space with a long dimension of 600 mm or greater and a short dimension of 300 mm or greater. A peninsular countertop is measured from the connecting edge.

(4) **Separate Spaces.** Countertop spaces separated by rangetops, refrigerators, or sinks shall be considered as separate countertop spaces in applying the requirements of 2.10.3.3(c)(1), (c)(2), and (c)(3).

(5) **Receptacle Outlet Location.** Receptacle outlets shall be located above, but not more than 500 mm above, the countertop. Receptacle outlets rendered not readily accessible by appliances fastened in place, appliance garages, sinks, or rangetops as covered in 2.10.3.3(c)(1), Exception, or appliances occupying dedicated space shall not be considered as these required outlets.

Sink or range extending from face of counter

Sink or range mounted in corner

Figure 2.10.3.3 Determination of Area Behind Sink or Range.

Exception to (5): To comply with the conditions specified in (1) or (2), receptacle outlets shall be permitted to be mounted not more than 300 mm below the countertop. Receptacles mounted below a countertop in accordance with this exception shall not be located where the countertop extends more than 150 mm beyond its support base.

(1) *Construction for the physically impaired*

(2) *On island and peninsular countertops where the countertop is flat across its entire surface (no backsplashes, dividers, etc.) and there are no means to mount a receptacle within 500 mm above the countertop, such as an overhead cabinet*

(d) Bathrooms. In dwelling units, at least one receptacle outlet shall be installed in bathrooms within 900 mm of the outside edge of each basin. The receptacle outlet shall be located on a wall or partition that is adjacent to the basin or basin countertop.

Exception: The receptacle shall not be required to be mounted in the wall or partition where it is installed on the side or face of the basin cabinet not more than 300 mm below the countertop.

(e) Outdoor Outlets. For a one-family dwelling and each unit of a two-family dwelling that is at grade level, at least one receptacle outlet accessible at grade level and not more than 2 000 mm above grade shall be installed at the front and back of the dwelling.

For each dwelling unit of a multifamily dwelling where the dwelling unit is located at grade level and provided with individual exterior entrance/egress, at least one receptacle outlet accessible from grade level and not more than 2 000 mm above grade shall be installed. See 2.10.1.8(a)(3).

(f) Laundry Areas. In dwelling units, at least one receptacle outlet shall be installed for the laundry.

Exception No. 1: In a dwelling unit that is an apartment or living area in a multifamily building where laundry facilities are provided on the premises and are available to all building occupants, a laundry receptacle shall not be required.

Exception No. 2: In other than one-family dwellings where laundry facilities are not to be installed or permitted, a laundry receptacle shall not be required.

(g) Basements and Garages. For a one-family dwelling, at least one receptacle outlet, in addition to any provided for laundry equipment, shall be installed in each basement and in each attached garage, and in each detached garage with electric power. See 2.10.1.8(a)(2) and (a)(5). Where a portion of the basement is finished into one or more habitable rooms, each separate unfinished portion shall have a receptacle outlet installed in accordance with this section.

(h) Hallways. In dwelling units, hallways of 3 000 mm or more in length shall have at least one receptacle outlet.

As used in this subsection, the hall length shall be considered the length along the centerline of the hall without passing through a doorway.

2.10.3.11 Guest Rooms or Guest Suites.

(a) General. Guest rooms or guest suites in hotels, motels, and similar occupancies shall have receptacle outlets installed in accordance with 2.10.3.3(a) and 2.10.3.3(d). Guest rooms or guest suites provided with permanent provisions for cooking shall have receptacle outlets installed in accordance with all of the applicable rules in 2.10.3.3.

(b) Receptacle Placement. In applying the provisions of 2.10.3.3(a), the total number of receptacle outlets shall not be less than the minimum number that would comply with the provisions of that section. These receptacle outlets shall be permitted to be located conveniently for permanent furniture layout. At least two receptacle outlets shall be readily accessible. Where receptacles are installed behind the bed, the receptacle shall be located to prevent the bed from contacting any attachment plug that may be installed or the receptacle shall be provided with a suitable guard.

2.10.3.13 Show Windows. At least one receptacle outlet shall be installed directly above a show window for each 3 600 linear mm or major fraction thereof of show window area measured horizontally at its maximum width.

2.10.3.14 Heating, Air-Conditioning, and Refrigeration Equipment Outlet. A 125-volt and/or 250 volts, single-phase, 15- or

20-ampere-rated receptacle outlet shall be installed at an accessible location for the servicing of heating, air-conditioning, and refrigeration equipment. The receptacle shall be located on the same level and within 7 600 mm of the heating, air-conditioning, and refrigeration equipment. The receptacle outlet shall not be connected to the load side of the equipment disconnecting means.

Exception: A receptacle outlet shall not be required at one- and two-family dwellings for the service of evaporative coolers.

FPN: See 2.10.1.8 for ground-fault circuit-interrupter requirements.

2.10.3.21 Lighting Outlets Required. Lighting outlets shall be installed where specified in 2.10.3.21(a), (b), and (c).

(a) Dwelling Units. In dwelling units, lighting outlets shall be installed in accordance with 2.10.3.21(a)(1), (a)(2), and (a)(3).

(1) Habitable Rooms. At least one wall switch-controlled lighting outlet shall be installed in every habitable room and bathroom.

Exception No. 1: In other than kitchens and bathrooms, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets.

Exception No. 2: Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that will allow the sensor to function as a wall switch.

(2) Additional Locations. Additional lighting outlets shall be installed in accordance with (a)(2)a, (a)(2)b, and (a)(2)c.

a. At least one wall switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power.

b. For dwelling units, attached garages, and detached garages with electric power, at least one wall switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of outdoor entrances or exits with grade level access. A vehicle door in a garage shall not be considered as an outdoor entrance or exit.

c. Where one or more lighting outlet(s) are installed for interior stairways, there shall be a wall switch at each floor level, and landing level that includes an entryway, to control the lighting outlet(s) where the stairway between floor levels has six risers or more.

Exception to (a)(2)a, (a)(2)b, and (a)(2)c: In hallways, stairways, and at outdoor entrances, remote, central, or automatic control of lighting shall be permitted.

(3) Storage or Equipment Spaces. For attics, underfloor spaces, utility rooms, and basements, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed where these spaces are used for storage or contain equipment requiring servicing. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

(b) Guest Rooms or Guest Suites. In hotels, motels, or similar occupancies, guest rooms or guest suites shall have at least one wall switch-controlled lighting outlet installed in every habitable room and bathroom.

Exception No. 1: In other than bathrooms and kitchens where provided, one or more receptacles controlled by a wall switch shall be permitted in lieu of lighting outlets.

Exception No. 2: Lighting outlets shall be permitted to be controlled by occupancy sensors that are (1) in addition to wall switches or (2) located at a customary wall switch location and equipped with a manual override that will allow the sensor to function as a wall switch.

(c) Other Than Dwelling Units. For attics and underfloor spaces containing equipment requiring servicing, such as heating, air-conditioning, and refrigeration equipment, at least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

ARTICLE 2.15 — FEEDERS

2.15.1.1 Scope. This article covers the installation requirements, overcurrent protection requirements, minimum size, and ampacity of conductors for feeders supplying branch-circuit loads.

Exception: Feeders for electrolytic cells as covered in 6.68.1.3(c)(1) and (c)(4).

2.15.1.2 Minimum Rating and Size.

(a) Feeders Not More Than 600 Volts.

(1) General. Feeder conductors shall have an ampacity not less than required to supply the load as calculated in Parts 2.20.3, 2.20.4, and 2.20.5. The minimum feeder-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.

Exception: Where the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the allowable ampacity of the feeder conductors shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

The size of the feeder circuit grounded conductor shall not be smaller than that required by 2.50.6.13, except that 2.50.6.13(f) shall not apply where grounded conductors are run in parallel.

Additional minimum sizes shall be as specified in 2.15.1.2(a)(2) and (a)(3) under the conditions stipulated.

(2) Ampacity Relative to Service Conductors. The feeder conductor ampacity shall not be less than that of the service conductors where the feeder conductors carry the total load supplied by service conductors with an ampacity of 55 amperes or less.

(3) Individual Dwelling Unit or Mobile Home Conductors. Feeder conductors for individual dwelling units or mobile homes need not be larger than service conductors. Paragraph 3.10.1.15(b)(6) shall be permitted to be used for conductor size.

FPN No. 1: See Examples D1 through D12 in Appendix D.

FPN No. 2: Conductors for feeders as defined in Article 1.0, sized to prevent a voltage drop exceeding 3 percent at the farthest outlet of power, heating, and lighting loads, or combinations of such loads, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent, will provide reasonable efficiency of operation.

FPN No. 3: See 2.10.2.1(a), FPN No. 4, for voltage drop for branch circuits.

(b) **Feeders Over 600 Volts.** The ampacity of conductors shall be in accordance with 3.10.1.15 and 3.10.1.60 as applicable. Where installed, the size of the feeder circuit grounded conductor shall not be smaller than that required by 2.50.6.13, except that 2.50.6.13(f) shall not apply where grounded conductors are run in parallel. Feeder conductors over 600 volts shall be sized in accordance with 2.15.1.2(b)(1), (b)(2), or (b)(3).

(1) Feeders Supplying Transformers. The ampacity of feeder conductors shall not be less than the sum of the nameplate ratings of the transformers supplied when only transformers are supplied.

(2) Feeders Supplying Transformers and Utilization Equipment. The ampacity of feeders supplying a combination of transformers and utilization equipment shall not be less than the sum of the nameplate ratings of the transformers and 125 percent of the designed potential load of the utilization equipment that will be operated simultaneously.

(3) Supervised Installations. For supervised installations, feeder conductor sizing shall be permitted to be determined by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. Supervised installations are defined as those portions of a facility where all of the following conditions are met:

a. Conditions of design and installation are provided under engineering supervision.

b. Licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner with documented training and experience in over 600-volt systems provide maintenance, monitoring, and servicing of the system.

2.15.1.3 Overcurrent Protection. Feeders shall be protected against overcurrent in accordance with the provisions of Part 2.40.1. Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not

be less than the noncontinuous load plus 125 percent of the continuous load.

Exception No. 1: Where the assembly, including the overcurrent devices protecting the feeder(s), is listed for operation at 100 percent of its rating, the ampere rating of the overcurrent device shall be permitted to be not less than the sum of the continuous load plus the noncontinuous load.

Exception No. 2: Overcurrent protection for feeders over 600 volts, nominal, shall comply with Part 2.40.11.

2.15.1.4 Feeders with Common Neutral.

(a) Feeders with Common Neutral. Two or three sets of 3-wire feeders or two sets of 4-wire or 5-wire feeders shall be permitted to utilize a common neutral.

(b) In Metal Raceway or Enclosure. Where installed in a metal raceway or other metal enclosure, all conductors of all feeders using a common neutral shall be enclosed within the same raceway or other enclosure as required in 3.0.1.20.

2.15.1.5 Diagrams of Feeders. If required by the authority having jurisdiction, a diagram showing feeder details shall be provided prior to the installation of the feeders. Such a diagram shall show the area in square feet of the building or other structure supplied by each feeder, the total calculated load before applying demand factors, the demand factors used, the calculated load after applying demand factors, and the size and type of conductors to be used.

2.15.1.6 Feeder Conductor Grounding Means. Where a feeder supplies branch circuits in which equipment grounding conductors are required, the feeder shall include or provide a grounding means, in accordance with the provisions of 2.50.7.5, to which the equipment grounding conductors of the branch circuits shall be connected.

2.15.1.7 Ungrounded Conductors Tapped from Grounded Systems. Two-wire dc circuits and ac circuits of two or more ungrounded conductors shall be permitted to be tapped from the ungrounded conductors of circuits having a grounded neutral

conductor. Switching devices in each tapped circuit shall have a pole in each ungrounded conductor.

2.15.1.9 Ground-Fault Circuit-Interrupter Protection for Personnel. Feeders supplying 15- and 20-ampere receptacle branch circuits shall be permitted to be protected by a ground-fault circuit interrupter in lieu of the provisions for such interrupters as specified in 2.10.1.8 and 5.90.1.6(a).

2.15.1.10 Ground-Fault Protection of Equipment. Each feeder disconnect rated 1000 amperes or more and installed on solidly grounded wye electrical systems of more than 150 volts to ground, but not exceeding 600 volts phase-to-phase, shall be provided with ground-fault protection of equipment in accordance with the provisions of 2.30.7.6.

FPN: For buildings that contain healthcare occupancies, see the requirements of 5.17.2.8.

Exception No. 1: The provisions of this section shall not apply to a disconnecting means for a continuous industrial process where a nonorderly shutdown will introduce additional or increased hazards.

Exception No. 2: The provisions of this section shall not apply to fire pumps.

Exception No. 3: The provisions of this section shall not apply if ground-fault protection of equipment is provided on the supply side of the feeder.

2.15.1.11 Circuits Derived from Autotransformers. Feeders shall not be derived from autotransformers unless the system supplied has a grounded conductor that is electrically connected to a grounded conductor of the system supplying the autotransformer.

Exception No. 1: An autotransformer shall be permitted without the connection to a grounded conductor where transforming from a nominal 208 volts to a nominal 240-volt supply or similarly from 240 volts to 208 volts.

Exception No. 2: In industrial occupancies, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the

installation, autotransformers shall be permitted to supply nominal 600-volt loads from nominal 480-volt systems, and 480-volt loads from nominal 600-volt systems, without the connection to a similar grounded conductor.

2.15.1.12 Identification for Feeders.

(a) **Grounded Conductor.** The grounded conductor of a feeder shall be identified in accordance with 2.0.1.6.

(b) **Equipment Grounding Conductor.** The equipment grounding conductor shall be identified in accordance with 2.50.6.10.

(c) **Ungrounded Conductors.** Where the premises wiring system has feeders supplied from more than one nominal voltage system, each ungrounded conductor of a feeder, where accessible, shall be identified by system. The means of identification shall be permitted to be by separate color coding, marking tape, tagging, or other approved means and shall be permanently posted at each feeder panelboard or similar feeder distribution equipment.

ARTICLE 2.20 — BRANCH-CIRCUIT, FEEDER, AND SERVICE CALCULATIONS

2.20.1 General

2.20.1.1 Scope. This article provides requirements for calculating branch-circuit, feeder, and service loads. Part 2.20.1 provides for general requirements for calculation methods. Part 2.20.2 provides calculation methods for branch circuit loads. Parts 2.20.3 and 2.20.4 provide calculation methods for feeders and services. Part 2.20.5 provides calculation methods for farms.

FPN: See Figure 2.20.1.1 for information on the organization of Article 2.20.

2.20.1.3 Application of Other Articles. In other articles applying to the calculation of loads in specialized applications, there are requirements provided in Table 2.20.1.3 that are in addition to, or modifications of, those within this article.

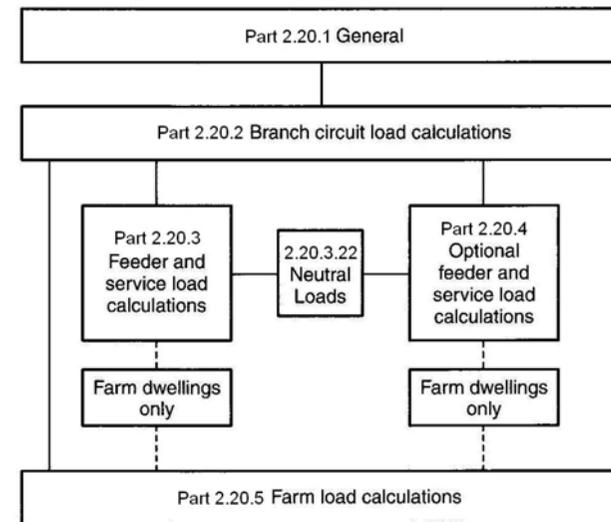

Figure 2.20.1.1 Branch-Circuit, Feeder, and Service Calculation Methods.

Table 2.20.1.3 Additional Load Calculation References

Calculation	Article	Section (or Part)
Air-Conditioning and Refrigerating Equipment, Branch-Circuit Conductor Sizing	4.40	Part 4.40.4
Cranes and Hoists, Rating and Size of Conductors	6.10	6.10.2.4
Electric Welders, ampacity calculations	6.30	6.30.2.1, 6.30.3.1

Theaters, Stage Switchboard Feeders	5.20	5.20.2.7

2.20.1.5 Calculations.

(a) **Voltages.** Unless other voltages are specified, for purposes of calculating branch-circuit and feeder loads, nominal system voltages of 115, 115/230, 208Y/120, 230, 347, 400Y/230, 460Y/265, 460, 600Y/347, and 600 volts shall be used.

(b) **Fractions of an Ampere.** Where calculations result in a fraction of an ampere that is less than 0.5, such fractions shall be permitted to be dropped.

2.20.2 Branch Circuit Load Calculations

2.20.2.1 General. Branch-circuit loads shall be calculated as shown in 2.20.2.3, 2.20.2.5, and 2.20.2.7.

2.20.2.3 Lighting Load for Specified Occupancies. A unit load of not less than that specified in Table 2.20.2.3 for occupancies specified therein shall constitute the minimum lighting load. The floor area for each floor shall be calculated from the outside dimensions of the building, dwelling unit, or other area involved. For dwelling units, the calculated floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use.

FPN: The unit values herein are based on minimum load conditions and 100 percent power factor and may not provide sufficient capacity for the installation contemplated.

2.20.2.5 Other Loads — All Occupancies. In all occupancies, the minimum load for each outlet for general-use receptacles and outlets not used for general illumination shall not be less than that calculated in 2.20.2.5(a) through (l), the loads shown being based on nominal branch-circuit voltages.

Exception: The loads of outlets serving switchboards and switching frames in telephone exchanges shall be waived from the calculations.

(a) **Specific Appliances or Loads.** An outlet for a specific appliance or other load not covered in 2.20.2.5(b) through (l) shall be calculated based on the ampere rating of the appliance or load served.

Table 2.20.2.3 General Lighting Loads by Occupancy

Type of Occupancy	Unit Load
	Volt-Amperes per Square Meter
Armories and auditoriums	11
Banks	39 ^b
Barber shops and beauty parlors	33
Churches	11
Clubs	22
Court rooms	22
Dwelling units ^a	33
Garages — commercial (storage)	6
Hospitals	22
Hotels and motels, including apartment houses without provision for cooking by tenants ^a	22
Industrial commercial (loft) buildings	22
Lodge rooms	17
Office buildings	39 ^b
Restaurants	22
Schools	33
Stores	33
Warehouses (storage)	3
In any of the preceding occupancies except one-family dwellings and individual dwelling units of two-family and multifamily dwellings:	
Assembly halls and auditoriums	11
Halls, corridors, closets, stairways	6
Storage spaces	3

^aSee 2.20.2.5(j).

^bSee 2.20.2.5(k).

(b) **Electric Dryers and Household Electric Cooking Appliances.** Load calculations shall be permitted as specified in 2.20.3.15 for electric dryers and in 2.20.3.16 for electric ranges and other cooking appliances.

(c) **Motor Loads.** Outlets for motor loads shall be calculated in accordance with the requirements in 4.30.2.2, 4.30.2.4, and 4.40.1.6.

(d) Luminaires (Lighting Fixtures). An outlet supplying luminaire(s) [lighting fixture(s)] shall be calculated based on the maximum volt-ampere rating of the equipment and lamps for which the luminaire(s) [fixture(s)] is rated.

(e) Heavy-Duty Lampholders. Outlets for heavy-duty lampholders shall be calculated at a minimum of 600 volt-amperes.

(f) Sign and Outline Lighting. Sign and outline lighting outlets shall be calculated at a minimum of 1200 volt-amperes for each required branch circuit specified in Section 6.0.1.5(a).

(g) Show Windows. Show windows shall be calculated in accordance with either of the following:

(1) The unit load per outlet as required in other provisions of this section

(2) At 200 volt-amperes per 300 mm of show window

(h) Fixed Multioutlet Assemblies. Fixed multioutlet assemblies used in other than dwelling units or the guest rooms or guest suites of hotels or motels shall be calculated in accordance with (h)(1) or (h)(2). For the purposes of this section, the calculation shall be permitted to be based on the portion that contains receptacle outlets.

(1) Where appliances are unlikely to be used simultaneously, each 1 500 mm or fraction thereof of each separate and continuous length shall be considered as one outlet of not less than 180 volt-amperes.

(2) Where appliances are likely to be used simultaneously, each 300 mm or fraction thereof shall be considered as an outlet of not less than 180 volt-amperes.

(i) Receptacle Outlets. Except as covered in 2.20.2.5(j) and (k), receptacle outlets shall be calculated at not less than 180 volt-amperes for each single or for each multiple receptacle on one yoke. A single piece of equipment consisting of a multiple receptacle comprised of four or more receptacles shall be calculated at not less than 90 volt-amperes per receptacle. This provision shall not be applicable to the receptacle outlets specified in 2.10.1.11(c)(1) and (c)(2).

(j) Dwelling Occupancies. In one-family, two-family, and multifamily dwellings and in guest rooms or guest suites of hotels and motels, the outlets specified in (j)(1), (j)(2), and (j)(3) are included in the general lighting load calculations of 2.20.2.3. No additional load calculations shall be required for such outlets.

(1) All general-use receptacle outlets of 20-ampere rating or less, including receptacles connected to the circuits in 2.10.1.11(c)(3)

(2) The receptacle outlets specified in 2.10.3.3(e) and (g)

(3) The lighting outlets specified in 2.10.3.21(a) and (b)

(k) Banks and Office Buildings. In banks or office buildings, the receptacle loads shall be calculated to be the larger of (1) or (2):

(1) The computed load from 2.20.2.5

(2) 11 volt-amperes/m²

(l) Other Outlets. Other outlets not covered in 2.20.2.5(a) through (k) shall be calculated based on 180 volt-amperes per outlet.

2.20.2.7 Loads for Additions to Existing Installations.

(a) Dwelling Units. Loads added to an existing dwelling unit(s) shall comply with the following as applicable:

(1) Loads for structural additions to an existing dwelling unit or for a previously unwired portion of an existing dwelling unit, either of which exceeds 46.5 m² (500 ft²), shall be calculated in accordance with 2.20.2.3 and 2.20.2.5.

(2) Loads for new circuits or extended circuits in previously wired dwelling units shall be calculated in accordance with either 2.20.2.3 or 2.20.2.5, as applicable.

(b) Other Than Dwelling Units. Loads for new circuits or extended circuits in other than dwelling units shall be calculated in accordance with either 2.20.2.3 or 2.20.2.5, as applicable.

2.20.2.9 Maximum Loads. The total load shall not exceed the rating of the branch circuit, and it shall not exceed the maximum loads specified in 2.20.2.9(a) through (c) under the conditions specified therein.

(a) Motor-Operated and Combination Loads. Where a circuit supplies only motor-operated loads, Article 4.30 shall apply. Where a circuit supplies only air-conditioning equipment, refrigerating equipment, or both, Article 4.40 shall apply. For circuits supplying loads consisting of motor-operated utilization equipment that is fastened in place and has a motor larger than hp in combination with other loads, the total calculated load shall be based on 125 percent of the largest motor load plus the sum of the other loads.

(b) Inductive Lighting Loads. For circuits supplying lighting units that have ballasts, transformers, or autotransformers, the calculated load shall be based on the total ampere ratings of such units and not on the total watts of the lamps.

(c) Range Loads. It shall be permissible to apply demand factors for range loads in accordance with Table 2.20.3.16, including Note 4.

2.20.3 Feeder and Service Load Calculations

2.20.3.1 General. The calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits supplied, as determined by Part II of this article, after any applicable demand factors permitted by Parts III or IV or required by Part V have been applied.

FPN: See Examples D1(a) through D10 in Appendix D. See 2.20.2.9(b) for the maximum load in amperes permitted for lighting units operating at less than 100 percent power factor.

2.20.3.3 General Lighting. The demand factors specified in Table 2.20.3.3 shall apply to that portion of the total branch-circuit load calculated for general illumination. They shall not be applied in determining the number of branch circuits for general illumination.

2.20.3.4 Show-Window and Track Lighting.

(a) Show Windows. For show-window lighting, a load of not less than 660 volt-amperes/linear meter shall be included for a show window, measured horizontally along its base.

FPN: See 2.20.2.5(g) for branch circuits supplying show windows.

Table 2.20.3.3 Lighting Load Demand Factors

Type of Occupancy	Portion of Lighting Load to Which Demand Factor Applies (Volt-Amperes)	Demand Factor (Percent)
Dwelling units	First 3000 or less at	100
	From 3001 to 120,000 at	35
	Remainder over 120,000 at	25
Hospitals*	First 50,000 or less at	40
	Remainder over 50,000 at	20
Hotels and motels, including apartment houses without provision for cooking by tenants*	First 20,000 or less at	50
	From 20,001 to 100,000 at	40
	Remainder over 100,000 at	30
Warehouses (storage)	First 12,500 or less at	100
	Remainder over 12,500 at	50
All others	Total volt-amperes	100

*The demand factors of this table shall not apply to the calculated load of feeders or services supplying areas in hospitals, hotels, and motels where the entire lighting is likely to be used at one time, as in operating rooms, ballrooms, or dining rooms.

(b) Track Lighting. For track lighting in other than dwelling units or guest rooms or guest suites of hotels or motels, an additional load of 150 volt-amperes shall be included for every 600 mm of lighting track or fraction thereof. Where multicircuit track is installed, the load shall be considered to be divided equally between the track circuits.

2.20.3.5 Receptacle Loads — Other Than Dwelling Units. Receptacle loads calculated in accordance with 2.20.2.5(h) and (i) shall be permitted to be made subject to the demand factors given in Table 2.20.3.3 or Table 2.20.3.5.

Table 2.20.3.5 Demand Factors for Non-dwelling Receptacle Loads

Portion of Receptacle Load to Which Demand Factor Applies (Volt-Amperes)	Demand Factor (Percent)
First 10 kVA or less at	100
Remainder over 10 kVA at	50

2.20.3.11 Motors. Motor loads shall be calculated in accordance with 4.30.2.4, 4.30.2.5, and 4.30.2.6 and with 4.40.1.6 for hermetic refrigerant motor compressors.

2.20.3.12 Fixed Electric Space Heating. Fixed electric space heating loads shall be calculated at 100 percent of the total connected load. However, in no case shall a feeder or service load current rating be less than the rating of the largest branch circuit supplied.

Exception: Where reduced loading of the conductors results from units operating on duty-cycle, intermittently, or from all units not operating at the same time, the authority having jurisdiction may grant permission for feeder and service conductors to have an ampacity less than 100 percent, provided the conductors have an ampacity for the load so determined.

2.20.3.13 Small Appliance and Laundry Loads — Dwelling Unit.

(a) Small Appliance Circuit Load. In each dwelling unit, the load shall be calculated at 1 500 volt-amperes for each 2-wire small-appliance branch circuit required by 2.10.1.11(c)(1). Where the load is subdivided through two or more feeders, the calculated load for each shall include not less than 1 500 volt-amperes for each 2-wire small-appliance branch circuit. These loads shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 2.20.3.3.

Exception: The individual branch circuit permitted by 2.10.3.3(b)(1), Exception No. 2, shall be permitted to be excluded from the calculation required by 2.20.3.13.

(b) Laundry Circuit Load. A load of not less than 1500 volt-amperes shall be included for each 2-wire laundry branch circuit installed as required by 2.10.1.11(c)(2). This load shall be permitted to be included with the general lighting load and subjected to the demand factors provided in Table 2.20.3.3.

2.20.3.14 Appliance Load — Dwelling Unit(s). It shall be permissible to apply a demand factor of 75 percent to the nameplate rating load of four or more appliances fastened in place, other than electric ranges, clothes dryers, space-heating equipment, or air-conditioning equipment, that are served by the same feeder or service in a one-family, two-family, or multifamily dwelling.

2.20.3.15 Electric Clothes Dryers — Dwelling Unit(s). The load for household electric clothes dryers in a dwelling unit(s) shall be either 5 000 watts (volt-amperes) or the nameplate rating, whichever is larger, for each dryer served. The use of the demand factors in Table 2.20.3.15 shall be permitted. Where two or more single-phase dryers are supplied by a 3-phase, 4-wire feeder or service, the total load shall be calculated on the basis of twice the maximum number connected between any two phases.

Table 2.20.3.15 Demand Factors for Household Electric Clothes Dryers

Number of Dryers	Demand Factor (Percent)
1–4	100%
5	85%
6	75%
7	65%
8	60%
9	55%
10	50%
11	47%
12–22	% = 47 – (number of dryers - 11)
23	35%
24–42	% = 35 – [0.5 × (number of dryers - 23)]
43 and over	25%

2.20.3.16 Electric Ranges and Other Cooking Appliances — Dwelling Unit(s). The load for household electric ranges, wall-mounted ovens, counter-mounted cooking units, and other household cooking appliances individually rated in excess of $1\frac{3}{4}$ kW shall be permitted to be calculated in accordance with Table 2.20.3.16. Kilovolt-amperes (kVA) shall be considered equivalent to kilowatts (kW) for loads calculated under this section.

Where two or more single-phase ranges are supplied by a 3-phase, 4-wire feeder or service, the total load shall be calculated on the basis of twice the maximum number connected between any two phases.

FPN No. 1: See Example D8 in Appendix D.

FPN No. 2: See Table 2.20.3.17 for commercial cooking equipment.

FPN No. 3: See the examples in Appendix D.

Table 2.20.3.16 Demand Factors and Loads for Household Electric Ranges, Wall-Mounted Ovens, Counter-Mounted Cooking Units, and Other Household Cooking Appliances over 1¼ kW Rating (Column C to be used in all cases except as otherwise permitted in Note 3.)

Number of Appliances	Demand Factor (Percent) (See Notes)		Column C Maximum Demand (kW) (See Notes) (Not over 12 kW Rating)
	Column A (Less than 3½ kW Rating)	Column B (3½ kW to 8¾ kW Rating)	
1	80	80	8
2	75	65	11
3	70	55	14
4	66	50	17
5	62	45	20
6	59	43	21
7	56	40	22
8	53	36	23
9	51	35	24
10	49	34	25
11	47	32	26
12	45]	32	27
13	43	32	28
14	41	32	29
15	40	32	30

Table 2.20.3.16 (Continued)

Number of Appliances	Demand Factor (Percent) (See Notes)		Column C Maximum Demand (kW) (See Notes) (Not over 12 kW Rating)
	Column A (Less than 3½ kW Rating)	Column B (3½ kW to 8¾ kW Rating)	
16	39	28	31
17	38	28	32
18	37	28	33
19	36	28	34
20	35	28	35
21	34	26	36
22	33	26	37
23	32	26	38
24	31	26	39
25	30	26	40
26–30	30	24	15 kW + 1 kW for each range
31–40	30	22	
41–50	30	20	25 kW + ¾ kW for each range
51–60	30	18	
61 and over	30	16	

1. Over 12 kW through 27 kW ranges all of same rating. For ranges individually rated more than 12 kW but not more than 27 kW, the maximum demand in Column C shall be increased 5 percent for each additional kilowatt of rating or major fraction thereof by which the rating of individual ranges exceeds 12 kW.

2. Over 8¾ kW through 27 kW ranges of unequal ratings. For ranges individually rated more than 8¾ kW and of different ratings, but none exceeding 27 kW, an average value of rating shall be calculated by adding together the ratings of all ranges to obtain the total connected load

(using 12 kW for any range rated less than 12 kW) and dividing by the total number of ranges. Then the maximum demand in Column C shall be increased 5 percent for each kilowatt or major fraction thereof by which this average value exceeds 12 kW.

3. Over 1 $\frac{3}{4}$ kW through 8 $\frac{3}{4}$ kW. In lieu of the method provided in Column C, it shall be permissible to add the nameplate ratings of all household cooking appliances rated more than 1 $\frac{3}{4}$ kW but not more than 8 $\frac{3}{4}$ kW and multiply the sum by the demand factors specified in Column A or B for the given number of appliances. Where the rating of cooking appliances falls under both Column A and Column B, the demand factors for each column shall be applied to the appliances for that column, and the results added together.

4. Branch-Circuit Load. It shall be permissible to calculate the branch-circuit load for one range in accordance with Table 2.20.3.16. The branch-circuit load for one wall-mounted oven or one counter-mounted cooking unit shall be the nameplate rating of the appliance. The branch-circuit load for a counter-mounted cooking unit and not more than two wall-mounted ovens, all supplied from a single branch circuit and located in the same room, shall be calculated by adding the nameplate rating of the individual appliances and treating this total as equivalent to one range.

5. This table also applies to household cooking appliances rated over 1 $\frac{3}{4}$ kW and used in instructional programs.

2.20.3.17 Kitchen Equipment — Other Than Dwelling Unit(s). It shall be permissible to calculate the load for commercial electric cooking equipment, dishwasher booster heaters, water heaters, and other kitchen equipment in accordance with Table 2.20.3.17. These demand factors shall be applied to all equipment that has either thermostatic control or intermittent use as kitchen equipment. These demand factors shall not apply to space-heating, ventilating, or air-conditioning equipment.

However, in no case shall the feeder or service calculated load be less than the sum of the largest two kitchen equipment loads.

Table 2.20.3.17 Demand Factors for Kitchen Equipment — Other Than Dwelling Unit(s)

Number of Units of Equipment	Demand Factor (Percent)
1	100
2	100
3	90
4	80
5	70
6 and over	65

2.20.3.21 Noncoincident Loads. Where it is unlikely that two or more noncoincident loads will be in use simultaneously, it shall be permissible to use only the largest load(s) that will be used at one time for calculating the total load of a feeder or service.

2.20.3.22 Feeder or Service Neutral Load.

(a) Basic Calculation. The feeder or service neutral load shall be the maximum unbalance of the load determined by this article. The maximum unbalanced load shall be the maximum net calculated load between the neutral and any one ungrounded conductor.

Exception: For 3-wire, 2-phase or 5-wire, 2-phase systems, the maximum unbalanced load shall be the maximum net calculated load between the neutral and any one ungrounded conductor multiplied by 140 percent.

(b) Permitted Reductions. A service or feeder supplying the following loads shall be permitted to have an additional demand factor of 70 percent applied to the amount in 2.20.3.22(b)(1) or portion of the amount in 2.20.3.22(b)(2) determined by the basic calculation:

(1) A feeder or service supplying household electric ranges, wall-mounted ovens, counter-mounted cooking units, and electric dryers, where the maximum unbalanced load has been determined in accordance with Table 2.20.3.16 for ranges and Table 2.20.3.15 for dryers

(2) That portion of the unbalanced load in excess of 200 amperes where the feeder or service is supplied from a 3-wire dc or single-phase ac system, or a 4-wire, 3-phase; 3-wire, 2-phase system, or a 5-wire, 2-phase system

(c) Prohibited Reductions. There shall be no reduction of the neutral or grounded conductor capacity applied to the amount in 2.20.3.22(c)(1), or portion of the amount in (c)(2), from that determined by the basic calculation:

(1) Any portion of a 3-wire circuit consisting of 2-phase wires and the neutral of a 4-wire, 3-phase, wye-connected system

(2) That portion consisting of nonlinear loads supplied from a 4-wire, wye-connected, 3-phase system

FPN No. 1: See Examples D1(a), D1(b), D2(b), D4(a), and D5(a) in Appendix D.
 FPN No. 2: A 3-phase, 4-wire, wye-connected power system used to supply power to nonlinear loads may necessitate that the power system design allow for the possibility of high harmonic neutral currents.

2.20.4 Optional Feeder and Service Load Calculations

2.20.4.1 General. Optional feeder and service load calculations shall be permitted in accordance with Part 2.20.4.

2.20.4.3 Dwelling Unit.

(a) Feeder and Service Load. This section applies to a dwelling unit having the total connected load served by a single 120/240-volt or 208Y/120-volt set of 3-wire service or feeder conductors with an

ampacity of 100 or greater. It shall be permissible to calculate the feeder and service loads in accordance with this section instead of the method specified in Part 2.20.3. The calculated load shall be the result of adding the loads from 2.20.4.3(b) and (c). Feeder and service-entrance conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 2.20.3.22.

(b) General Loads. The general calculated load shall be not less than 100 percent of the first 10 kVA plus 40 percent of the remainder of the following loads:

(1) 33 volt-amperes/m² for general lighting and general-use receptacles. The floor area for each floor shall be calculated from the outside dimensions of the dwelling unit. The calculated floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use.

(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in 2.20.3.13.

(3) The nameplate rating of all appliances that are fastened in place, permanently connected, or located to be on a specific circuit, ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and water heaters.

(4) The nameplate ampere or kVA rating of all motors and of all low-power-factor loads.

(c) Heating and Air-Conditioning Load. The largest of the following six selections (load in kVA) shall be included:

(1) 100 percent of the nameplate rating(s) of the air conditioning and cooling.

(2) 100 percent of the nameplate rating(s) of the heating when a heat pump is used without any supplemental electric heating.

(3) 100 percent of the nameplate ratings of electric thermal storage and other heating systems where the usual load is expected to be continuous at the full nameplate value. Systems qualifying under this selection shall not be calculated under any other selection in 2.20.4.3(c).

(4) 100 percent of the nameplate rating(s) of the heat pump compressor and 65 percent of the supplemental electric heating for central electric space heating systems. If the heat pump compressor is

prevented from operating at the same time as the supplementary heat, it does not need to be added to the supplementary heat for the total central space heating load.

(5) 65 percent of the nameplate rating(s) of electric space heating if less than four separately controlled units.

(6) 40 percent of the nameplate rating(s) of electric space heating if four or more separately controlled units.

2.20.4.4 Existing Dwelling Unit. This section shall be permitted to be used to determine if the existing service or feeder is of sufficient capacity to serve additional loads. Where the dwelling unit is served by a 120/240-volt or 208Y/120-volt, 3-wire service, it shall be permissible to calculate the total load in accordance with 2.20.4.4(a) or (b).

(a) Where Additional Air-Conditioning Equipment or Electric Space-Heating Equipment Is Not to Be Installed. The following formula shall be used for existing and additional new loads.

Load (kVA)	Percent of Load
First 8 kVA of load at	100
Remainder of load at	40

Load calculations shall include the following:

(1) General lighting and general-use receptacles at 33 volt-amperes/m² as determined by 2.20.2.3

(2) 1500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in 2.20.3.13

(3) Household range(s), wall-mounted oven(s), and counter-mounted cooking unit(s)

(4) All other appliances that are permanently connected, fastened in place, or connected to a dedicated circuit, at nameplate rating

(b) Where Additional Air-Conditioning Equipment or Electric Space-Heating Equipment Is to Be Installed. The following formula shall be used for existing and additional new loads. The larger connected load of air-conditioning or space-heating, but not both, shall be used.

Load	Percent of Load
Air-conditioning equipment	100
Central electric space heating	100
Less than four separately controlled space-heating units	100
First 8 kVA of all other loads	100
Remainder of all other loads	40

Other loads shall include the following:

- (1) General lighting and general-use receptacles at 33 volt-amperes/m² as determined by 2.20.2.3
- (2) 1 500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in 2.20.3.13
- (3) Household range(s), wall-mounted oven(s), and counter-mounted cooking unit(s)
- (4) All other appliances that are permanently connected, fastened in place, or connected to a dedicated circuit, including four or more separately controlled space-heating units, at nameplate rating

2.20.4.5 Multifamily Dwelling.

(a) Feeder or Service Load. It shall be permissible to calculate the load of a feeder or service that supplies three or more dwelling units of a multifamily dwelling in accordance with Table 2.20.4.5 instead of Part 2.20.3 if all the following conditions are met:

- (1) No dwelling unit is supplied by more than one feeder.
- (2) Each dwelling unit is equipped with electric cooking equipment.

Exception: When the calculated load for multifamily dwellings without electric cooking in Part 2.20.3 exceeds that calculated under Part 2.20.4 for the identical load plus electric cooking (based on 8 kW per unit), the lesser of the two loads shall be permitted to be used.

- (3) Each dwelling unit is equipped with either electric space heating or air conditioning, or both. Feeders and service conductors

whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 2.20.3.22.

(b) House Loads. House loads shall be calculated in accordance with Part III of this article and shall be in addition to the dwelling unit loads calculated in accordance with Table 2.20.4.5.

Table 2.20.4.5 Optional Calculations — Demand Factors for Three or More Multifamily Dwelling Units

Number of Dwelling Units	Demand Factor (Percent)
3–5	45
6–7	44
8–10	43
11	42
12–13	41
14–15	40
16–17	39
18–20	38
21	37
22–23	36
24–25	35
26–27	34
28–30	33
31	32
32–33	31
34–36	30
37–38	29
39–42	28
43–45	27
46–50	26
51–55	25
56–61	24
62 and over	23

(c) **Connected Loads.** The calculated load to which the demand factors of Table 2.20.4.5 apply shall include the following:

(1) 33 volt-amperes/m² for general lighting and general-use receptacles.

(2) 1 500 volt-amperes for each 2-wire, 20-ampere small-appliance branch circuit and each laundry branch circuit specified in 2.20.3.13.

(3) The nameplate rating of all appliances that are fastened in place, permanently connected or located to be on a specific circuit, ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, water heaters, and space heaters. If water heater elements are interlocked so that all elements cannot be used at the same time, the maximum possible load shall be considered the nameplate load.

(4) The nameplate ampere or kilovolt-ampere rating of all motors and of all low-power-factor loads.

(5) The larger of the air-conditioning load or the space-heating load.

2.20.4.6 Two Dwelling Units. Where two dwelling units are supplied by a single feeder and the calculated load under Part 2.20.3 exceeds that for three identical units calculated under 2.20.4.5, the lesser of the two loads shall be permitted to be used.

2.20.4.7 Schools. The calculation of a feeder or service load for schools shall be permitted in accordance with Table 2.20.4.7 in lieu of Part III of this article where equipped with electric space heating, air conditioning, or both. The connected load to which the demand factors of Table 2.20.4.7 apply shall include all of the interior and exterior lighting, power, water heating, cooking, other loads, and the larger of the air-conditioning load or space-heating load within the building or structure.

Feeders and service-entrance conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 2.20.3.22. Where the building or structure load is calculated by this optional method, feeders within the building or structure shall have ampacity as permitted in Part 2.20.3 of this article; however, the ampacity of an individual feeder shall not be required to be larger than the ampacity for the entire building.

This section shall not apply to portable classroom buildings.

Table 2.20.4.7 Optional Method — Demand Factors for Feeders and Service-Entrance Conductors for Schools

Connected Load		Demand Factor (Percent)
First 33 VA/m ²	(3 VA/ft ²) at	100
Plus,		
Over 33 to 220 VA/m ²	(3 to 20 VA/ft ²) at	75
Plus,		
Remainder over 220 VA/m ²	(20 VA/ft ²) at	25

2.20.4.8 Determining Existing Loads. The calculation of a feeder or service load for existing installations shall be permitted to use actual maximum demand to determine the existing load under all of the following conditions:

(1) The maximum demand data is available for a 1-year period.

Exception: If the maximum demand data for a 1-year period is not available, the calculated load shall be permitted to be based on the maximum demand (measure of average power demand over a 15-minute period) continuously recorded over a minimum 30-day period using a recording ammeter or power meter connected to the highest loaded phase of the feeder or service, based on the initial loading at the start of the recording. The recording shall reflect the maximum demand of the feeder or service by being taken when the building or space is occupied and shall include by measurement or calculation the larger of the heating or cooling equipment load, and other loads that may be periodic in nature due to seasonal or similar conditions.

(2) The maximum demand at 125 percent plus the new load does not exceed the ampacity of the feeder or rating of the service.

(3) The feeder has overcurrent protection in accordance with 2.40.1.4, and the service has overload protection in accordance with 2.30.7.1.

2.20.4.9 New Restaurants. Calculation of a service or feeder load, where the feeder serves the total load, for a new restaurant shall be permitted in accordance with Table 2.20.4.9 in lieu of Part 2.20.3.

The overload protection of the service conductors shall be in accordance with 2.30.7.1 and 2.40.1.4.

Feeder conductors shall not be required to be of greater ampacity than the service conductors.

Service or feeder conductors whose calculated load is determined by this optional calculation shall be permitted to have the neutral load determined by 2.20.3.22.

Table 2.20.4.9 Optional Method — Permitted Load Calculations for Service and Feeder Conductors for New Restaurants

Total Connected Load (kVA)	All Electric Restaurant Calculated Loads (kVA)	Not All Electric Restaurant Calculated Loads (kVA)
0–200	80%	100%
201–325	10% (amount over 200) + 160.0	50% (amount over 200) + 200.0
326–800	50% (amount over 325) + 172.5	45% (amount over 325) + 262.5
Over 800	50% (amount over 800) + 410.0	20% (amount over 800) + 476.3

Note: Add all electrical loads, including both heating and cooling loads, to calculate the total connected load. Select the one demand factor that applies from the table, then multiply the total connected load by this single demand factor.

2.20.5 Farm Load Calculation

2.20.5.1 General. Farm loads shall be calculated in accordance with Part 2.20.5.

2.20.5.3 Farm Loads — Buildings and Other Loads.

(a) Dwelling Unit. The feeder or service load of a farm dwelling unit shall be calculated in accordance with the provisions for dwellings in Parts 2.20.3 or 2.20.4. Where the dwelling has electric heat and the farm has electric grain-drying systems, Part 2.20.4 shall not be used to calculate the dwelling load where the dwelling and farm load are supplied by a common service.

(b) Other Than Dwelling Unit. Where a feeder or service supplies a farm building or other load having two or more separate branch circuits, the load for feeders, service conductors, and service equipment shall be calculated in accordance with demand factors not less than indicated in Table 2.20.5.3.

Table 2.20.5.3 Method for Calculating Farm Loads for Other Than Dwelling Unit

Ampere Load at 240 Volts Maximum	Demand Factor (Percent)
Loads expected to operate simultaneously, but not less than 125 percent full-load current of the largest motor and not less than the first 60 amperes of load	100
Next 60 amperes of all other loads	50
Remainder of other load	25

2.20.5.4 Farm Loads — Total. Where supplied by a common service, the total load of the farm for service conductors and service equipment shall be calculated in accordance with the farm dwelling unit load and demand factors specified in Table 2.20.5.4. Where there is equipment in two or more farm equipment buildings or for loads having the same function, such loads shall be calculated in accordance with Table 2.20.5.3 and shall be permitted to be combined as a single load in Table 2.20.5.4 for calculating the total load.

Table 2.20.5.4 Method for Calculating Total Farm Load

Individual Loads Calculated in Accordance with Table 2.20.5.3	Demand Factor (Percent)
Largest load	100
Second largest load	75
Third largest load	65
Remaining loads	50

Note: To this total load, add the load of the farm dwelling unit calculated in accordance with Parts 2.20.3 or 2.20.4.

**ARTICLE 2.25 — OUTSIDE BRANCH CIRCUITS
AND FEEDERS**

2.25.1.1 Scope. This article covers requirements for outside branch circuits and feeders run on or between buildings, structures, or poles on the premises; and electric equipment and wiring for the supply of utilization equipment that is located on or attached to the outside of buildings, structures, or poles.

FPN: For additional information on wiring over 600 volts, see ANSI C2-2002, National Electrical Safety Code.

2.25.1.2 Other Articles. Application of other articles, including additional requirements to specific cases of equipment and conductors, is shown in Table 2.25.1.2.

2.25.1 General

2.25.1.3 Calculation of Loads 600 Volts, Nominal, or Less.

(a) Branch Circuits. The load on outdoor branch circuits shall be as determined by 2.20.2.1.

(b) Feeders. The load on outdoor feeders shall be as determined by Part 2.20.3.

2.25.1.4 Conductor Covering. Where within 3 000 mm of any building or structure other than supporting poles or towers, open individual (aerial) overhead conductors shall be insulated or covered. Conductors in cables or raceways, except Type MI cable, shall be of the rubber-covered type or thermoplastic type and, in wet locations, shall comply with 3.10.1.8. Conductors for festoon lighting shall be of the rubber-covered or thermoplastic type.

Exception: Equipment grounding conductors and grounded circuit conductors shall be permitted to be bare or covered as specifically permitted elsewhere in this Code.

Table 2.25.1.2 Other Articles

Equipment/Conductors	Article
Branch circuits	2.10
Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits	7.25
Communications circuits	8.0
Community antenna television and radio distribution systems	8.20
Conductors for general wiring	3.10
Electrically driven or controlled irrigation machines	6.75
Electric signs and outline lighting	6.0
Feeders	2.15
Fire alarm systems	7.60
Fixed outdoor electric deicing and snow-melting equipment	4.26
Floating buildings	5.53
Grounding	2.50
Hazardous (classified) locations	5.0
Hazardous (classified) locations — specific	5.10
Marinas and boatyards	5.55
Messenger supported wiring	3.96
Mobile homes, manufactured homes, and mobile home parks	5.50
Open wiring on insulators	3.98
Over 600 volts, general	4.90
Overcurrent protection	2.40
Radio and television equipment	8.10
Services	2.30
Solar photovoltaic systems	6.90
Swimming pools, fountains, and similar installations	6.80
Use and identification of grounded conductors	2.0

2.25.1.5 Size of Conductors 600 Volts, Nominal, or Less. The ampacity of outdoor branch-circuit and feeder conductors shall be in accordance with 3.10.1.15 based on loads as determined under 2.20.2.1 and Part 2.20.3.

2.25.1.6 Conductor Size and Support.

(a) Overhead Spans. Open individual conductors shall not be smaller than the following:

(1) For 600 volts, nominal, or less, 5.5 mm² (2.6 mm dia.) copper or 8.0 mm² (3.2 mm dia.) aluminum for spans up to 15 m in length, and 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum for a longer span unless supported by a messenger wire

(2) For over 600 volts, nominal, 14 mm² copper or 22 mm² aluminum where open individual conductors, and 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum where in cable.

(b) **Festoon Lighting.** Overhead conductors for festoon lighting shall not be smaller than 3.5 mm² (2.0 mm dia.) unless the conductors are supported by messenger wires. In all spans exceeding 12 m, the conductors shall be supported by messenger wire. The messenger wire shall be supported by strain insulators. Conductors or messenger wires shall not be attached to any fire escape, downspout, or plumbing equipment.

2.25.1.7 Lighting Equipment Installed Outdoors.

(a) **General.** For the supply of lighting equipment installed outdoors, the branch circuits shall comply with Article 2.10 and 2.25.1.7(b) through (d).

(b) **Common Neutral.** The ampacity of the neutral conductor shall not be less than the maximum net computed load current between the neutral and all ungrounded conductors connected to any one phase of the circuit.

(c) **277 Volts to Ground.** Circuits exceeding 120 volts, nominal, between conductors and not exceeding 277 volts, nominal, to ground shall be permitted to supply luminaires (lighting fixtures) for illumination of outdoor areas of industrial establishments, office buildings, schools, stores, and other commercial or public buildings where the luminaires (fixtures) are not less than 900 mm from windows, platforms, fire escapes, and the like.

(d) **600 Volts Between Conductors.** Circuits exceeding 277 volts, nominal, to ground and not exceeding 600 volts, nominal, between conductors shall be permitted to supply the auxiliary equipment of electric-discharge lamps in accordance with 2.10.1.6(d)(1).

2.25.1.10 Wiring on Buildings. The installation of outside wiring on surfaces of buildings shall be permitted for circuits of not over 600 volts, nominal, as open wiring on insulators, as multiconductor cable, as Type MC cable, as Type MI cable, as messenger supported wiring, in rigid metal conduit, in intermediate metal conduit, in rigid nonmetallic conduit, in cable trays, as cablebus, in wireways, in auxiliary gutters, in electrical metallic tubing, in flexible metal conduit, in liquidtight flexible metal conduit, in liquidtight flexible nonmetallic conduit, and in busways. Circuits of over 600 volts, nominal, shall be installed as provided in 3.0.2.7.

2.25.1.11 Circuit Exits and Entrances. Where outside branch and feeder circuits leave or enter a building, the requirements of 2.30.4.13 and 2.30.4.15 shall apply.

2.25.1.12 Open-Conductor Supports. Open conductors shall be supported on glass or porcelain knobs, racks, brackets, or strain insulators.

2.25.1.14 Open-Conductor Spacings.

(a) **600 Volts, Nominal, or Less.** Conductors of 600 volts, nominal, or less, shall comply with the spacings provided in Table 2.30.4.12(c).

(b) **Over 600 Volts, Nominal.** Conductors of over 600 volts, nominal, shall comply with the spacings provided in Sections 1.10.3.7 and 4.90.2.4.

(c) **Separation from Other Circuits.** Open conductors shall be separated from open conductors of other circuits or systems by not less than 100 mm.

(d) **Conductors on Poles.** Conductors on poles shall have a separation of not less than 300 mm where not placed on racks or brackets. Conductors supported on poles shall provide a horizontal climbing space not less than the following:

(1) Power conductors below communications conductors — 750 mm

(2) Power conductors alone or above communications conductors:

a. 300 volts or less — 600 mm

b. Over 300 volts — 750 mm

(3) Communications conductors below power conductors — same as power conductors

(4) Communications conductors alone — no requirement

2.25.1.15 Supports over Buildings. Supports over a building shall be in accordance with 2.30.2.8.

2.25.1.16 Attachment to Buildings.

(a) Point of Attachment. The point of attachment to a building shall be in accordance with 2.30.2.5.

(b) Means of Attachment. The means of attachment to a building shall be in accordance with 2.30.2.6.

2.25.1.17 Masts as Supports. Where a mast is used for the support of final spans of feeders or branch circuits, it shall be of adequate strength or be supported by braces or guys to withstand safely the strain imposed by the overhead drop. Where raceway-type masts are used, all raceway fittings shall be identified for use with masts. Only the feeder or branch circuit conductors specified within this section shall be permitted to be attached to the feeder and/or branch circuit mast.

2.25.1.18 Clearance from Ground. Overhead spans of open conductors and open multiconductor cables of not over 600 volts, nominal, shall have a clearance of not less than the following:

(1) 3 000 mm — above finished grade, sidewalks, or from any platform or projection from which they might be reached where the voltage does not exceed 150 volts to ground and accessible to pedestrians only

(2) 3 600 mm — over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground

(3) 4 500 mm — for those areas listed in the 3 600 mm classification where the voltage exceeds 300 volts to ground

(4) 5 500 mm — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles, such as cultivated, grazing, forest, and orchard

2.25.1.19 Clearances from Buildings for Conductors of Not Over 600 Volts, Nominal.

(a) Above Roofs. Overhead spans of open conductors and open multiconductor cables shall have a vertical clearance of not less than 2 400 mm above the roof surface. The vertical clearance above the roof level shall be maintained for a distance not less than 900 mm in all directions from the edge of the roof.

Exception No. 1: The area above a roof surface subject to pedestrian or vehicular traffic shall have a vertical clearance from the roof surface in accordance with the clearance requirements of 2.25.1.18.

Exception No. 2: Where the voltage between conductors does not exceed 300, and the roof has a slope of 100 mm in 300 mm or greater, a reduction in clearance to 900 mm shall be permitted.

Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm shall be permitted if (1) not more than 1 800 mm of the conductors, 1 200 mm horizontally, pass above the roof overhang and (2) they are terminated at a through-the-roof raceway or approved support.

Exception No. 4: The requirement for maintaining the vertical clearance 900 mm from the edge of the roof shall not apply to the final conductor span where the conductors are attached to the side of a building.

(b) From Nonbuilding or Nonbridge Structures. From signs, chimneys, radio and television antennas, tanks, and other nonbuilding or nonbridge structures, clearances — vertical, diagonal, and horizontal — shall not be less than 900 mm.

(c) **Horizontal Clearances.** Clearances shall not be less than 900 mm.

(d) **Final Spans.** Final spans of feeders or branch circuits shall comply with 2.25.1.19(d)(1), (d)(2), and (d)(3).

(1) Clearance from Windows. Final spans to the building they supply, or from which they are fed, shall be permitted to be attached to the building, but they shall be kept not less than 900 mm from windows that are designed to be opened, and from doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.

Exception: Conductors run above the top level of a window shall be permitted to be less than the 900 mm requirement.

(2) Vertical Clearance. The vertical clearance of final spans above, or within 900 mm measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with 2.25.1.18.

(3) Building Openings. The overhead branch-circuit and feeder conductors shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they obstruct entrance to these buildings' openings.

(e) **Zone for Fire Ladders.** Where buildings exceed three stories or 15 m in height, overhead lines shall be arranged, where practicable, so that a clear space (or zone) at least 1 800 mm wide will be left either adjacent to the buildings or beginning not over 2 400 mm from them to facilitate the raising of ladders when necessary for fire fighting.

2.25.1.20 Mechanical Protection of Conductors. Mechanical protection of conductors on buildings, structures, or poles shall be as provided for services in 2.30.4.11.

2.25.1.21 Multiconductor Cables on Exterior Surfaces of Buildings. Supports for multiconductor cables on exterior surfaces of buildings shall be as provided in 2.30.4.12.

2.25.1.22 Raceways on Exterior Surfaces of Buildings or Other Structures. Raceways on exteriors of buildings or other structures shall be arranged to drain and shall be raintight in wet locations.

Exception: Flexible metal conduit, where permitted in 3.48.2.3(1), shall not be required to be raintight.

2.25.1.24 Outdoor Lampholders. Where outdoor lampholders are attached as pendants, the connections to the circuit wires shall be staggered. Where such lampholders have terminals of a type that puncture the insulation and make contact with the conductors, they shall be attached only to conductors of the stranded type.

2.25.1.25 Location of Outdoor Lamps. Locations of lamps for outdoor lighting shall be below all energized conductors, transformers, or other electric utilization equipment, unless either of the following apply:

(1) Clearances or other safeguards are provided for relamping operations.

(2) Equipment is controlled by a disconnecting means that can be locked in the open position.

2.25.1.26 Vegetation as Support. Vegetation such as trees shall not be used for support of overhead conductor spans.

2.25.2 More Than One Building or Other Structure

2.25.2.1 Number of Supplies. Where more than one building or other structure is on the same property and under single management, each additional building or other structure that is served by a branch circuit or feeder on the load side of the service disconnecting means shall be supplied by only one feeder or branch circuit unless permitted in 2.25.2.1(a) through (e). For the purpose of this section, a multiwire branch circuit shall be considered a single circuit.

(a) **Special Conditions.** Additional feeders or branch circuits shall be permitted to supply the following:

- (1) Fire pumps
- (2) Emergency systems
- (3) Legally required standby systems
- (4) Optional standby systems
- (5) Parallel power production systems

(6) Systems designed for connection to multiple sources of supply for the purpose of enhanced reliability

(b) Special Occupancies. By special permission, additional feeders or branch circuits shall be permitted for either of the following:

(1) Multiple-occupancy buildings where there is no space available for supply equipment accessible to all occupants

(2) A single building or other structure sufficiently large to make two or more supplies necessary

(c) Capacity Requirements. Additional feeders or branch circuits shall be permitted where the capacity requirements are in excess of 2000 amperes at a supply voltage of 600 volts or less.

(d) Different Characteristics. Additional feeders or branch circuits shall be permitted for different voltages, frequencies, or phases or for different uses, such as control of outside lighting from multiple locations.

(e) Documented Switching Procedures. Additional feeders or branch circuits shall be permitted to supply installations under single management where documented safe switching procedures are established and maintained for disconnection.

2.25.2.2 Disconnecting Means. Means shall be provided for disconnecting all ungrounded conductors that supply or pass through the building or structure.

2.25.2.3 Location. The disconnecting means shall be installed either inside or outside of the building or structure served or where the conductors pass through the building or structure. The disconnecting means shall be at a readily accessible location nearest the point of entrance of the conductors. For the purposes of this section, the requirements in 2.30.1.6 shall be utilized.

Exception No. 1: For installations under single management, where documented safe switching procedures are established and maintained for disconnection, and where the installation is monitored by qualified individuals, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 2: For buildings or other structures qualifying under the provisions of Article 6.85, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 3: For towers or poles used as lighting standards, the disconnecting means shall be permitted to be located elsewhere on the premises.

Exception No. 4: For poles or similar structures used only for support of signs installed in accordance with Article 6.0, the disconnecting means shall be permitted to be located elsewhere on the premises.

2.25.2.4 Maximum Number of Disconnects.

(a) General. The disconnecting means for each supply permitted by 2.25.2.1 shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six disconnects per supply grouped in any one location.

Exception: For the purposes of this section, disconnecting means used solely for the control circuit of the ground-fault protection system, or the control circuit of the power-operated supply disconnecting means, installed as part of the listed equipment, shall not be considered a supply disconnecting means.

(b) Single-Pole Units. Two or three single-pole switches or breakers capable of individual operation shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with handle ties or a master handle to disconnect all ungrounded conductors with no more than six operations of the hand.

2.25.2.5 Grouping of Disconnects.

(a) General. The two to six disconnects as permitted in 2.25.2.4 shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six disconnecting means permitted in 2.25.2.4, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.

(b) Additional Disconnecting Means. The one or more additional disconnecting means for fire pumps or for emergency, legally required standby or optional standby system permitted by 2.25.2.1 shall be installed sufficiently remote from the one to six disconnecting means for normal supply to minimize the possibility of simultaneous interruption of supply.

2.25.2.6 Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's supply disconnecting means.

Exception: In a multiple-occupancy building where electric supply and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the supply disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

2.25.2.7 Suitable for Service Equipment. The disconnecting means specified in 2.25.2.2 shall be suitable for use as service equipment.
Exception: For garages and outbuildings on residential property, a snap switch or a set of 3-way or 4-way snap switches shall be permitted as the disconnecting means.

2.25.2.8 Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through it or supplying it, a permanent plaque or directory shall be installed at each feeder and branch-circuit disconnect location denoting all other services, feeders, or branch circuits supplying that building or structure or passing through that building or structure and the area served by each.

Exception No. 1: A plaque or directory shall not be required for large-capacity multibuilding industrial installations under single management, where it is ensured that disconnection can be accomplished by establishing and maintaining safe switching procedures.

Exception No. 2: This identification shall not be required for branch circuits installed from a dwelling unit to a second building or structure.

2.25.2.9 Disconnect Construction. Disconnecting means shall meet the requirements of 2.25.2.9(a) through (d).

Exception: For garages and outbuildings on residential property, snap switches or sets of 3-way or 4-way snap switches shall be permitted as the disconnecting means.

(a) Manually or Power Operable. The disconnecting means shall consist of either (1) a manually operable switch or a circuit breaker equipped with a handle or other suitable operating means or (2) a power-operable switch or circuit breaker, provided the switch or circuit breaker can be opened by hand in the event of a power failure.

(b) Simultaneous Opening of Poles. Each building or structure disconnecting means shall simultaneously disconnect all ungrounded supply conductors that it controls from the building or structure wiring system.

(c) Disconnection of Grounded Conductor. Where the building or structure disconnecting means does not disconnect the grounded conductor from the grounded conductors in the building or structure wiring, other means shall be provided for this purpose at the location of disconnecting means. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose.

In a multisection switchboard, disconnects for the grounded conductor shall be permitted to be in any of the switchboard, provided any such switchboard is marked.

(d) Indicating. The building or structure disconnecting means shall plainly indicate whether it is in the open or closed position.

2.25.2.10 Rating of Disconnect. The feeder or branch-circuit disconnecting means shall have a rating of not less than the load to be supplied, determined in accordance with Parts 2.20.1 and 2.20.2 for branch circuits, Parts 2.20.3 or 2.20.4 for feeders, or Part 2.20.5 for farm loads. In no case shall the rating be lower than specified in 2.25.2.10(a), (b), (c), or (d).

(a) **One-Circuit Installation.** For installations to supply only limited loads of a single branch circuit, the branch circuit disconnecting means shall have a rating of not less than 15 amperes.

(b) **Two-Circuit Installations.** For installations consisting of not more than two 2-wire branch circuits, the feeder or branch-circuit disconnecting means shall have a rating of not less than 30 amperes.

(c) **One-Family Dwelling.** For a one-family dwelling, the feeder disconnecting means shall have a rating of not less than 100 amperes, 3-wire.

(d) **All Others.** For all other installations, the feeder or branch-circuit disconnecting means shall have a rating of not less than 60 amperes.

2.25.2.11 Access to Overcurrent Protective Devices. Where a feeder overcurrent device is not readily accessible, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of a lower ampere rating than the feeder overcurrent device.

2.25.3 Over 600 Volts

2.25.3.1 Sizing of Conductors. The sizing of conductors over 600 volts shall be in accordance with 2.10.2.1(b) for branch circuits and 2.15.1.2(b) for feeders.

2.25.3.2 Isolating Switches. Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute a building disconnecting means, an isolating switch with visible break contacts and meeting the requirements of 2.30.8.5(b), (c), and (d) shall be installed on the supply side of the disconnecting means and all associated equipment.

Exception: The isolating switch shall not be required where the disconnecting means is mounted on removable truck panels or metal-enclosed switchgear units that cannot be opened unless the circuit is disconnected and that, when removed from the normal operating position, automatically disconnect the circuit breaker or switch from all energized parts.

2.25.3.3 Location. A building or structure disconnecting means shall be located in accordance with 2.25.2.3, or it shall be electrically operated by a similarly located remote-control device.

2.25.3.4 Type. Each building or structure disconnect shall simultaneously disconnect all ungrounded supply conductors it controls and shall have a fault-closing rating not less than the maximum available short-circuit current available at its supply terminals.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault closing rating of the disconnecting means.

2.25.3.11 Clearances over Roadways, Walkways, Rail, Water, and Open Land.

(a) **22 kV Nominal to Ground or Less.** The clearances over roadways, walkways, rail, water, and open land for conductors and live parts up to 22 kV nominal to ground or less shall be not less than the values shown in Table 2.25.3.11.

(b) **Over 22 kV Nominal to Ground.** Clearances for the categories shown in Table 2.25.3.11 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

(c) **Special Cases.** For special cases, such as where crossings will be made over lakes, rivers, or areas using large vehicles such as mining operations, specific designs shall be engineered considering the special circumstances and shall be approved by the authority having jurisdiction.

FPN: For additional information, see ANSI C2-2002, National Electrical Safety Code.

2.25.3.12 Clearances over Buildings and Other Structures.

(a) **22 kV Nominal to Ground or Less.** The clearances over buildings and other structures for conductors and live parts up to 22 kV, nominal, to ground or less shall be not less than the values shown in Table 2.25.3.12.

(b) Over 22 kV Nominal to Ground. Clearances for the categories shown in Table 2.25.3.12 shall be increased by 10 mm (0.4 in.) per kV above 22,000 volts.

FPN: For additional information, see ANSI C2-2002, National Electrical Safety Code.

Table 2.25.3.11 Clearances over Roadways, Walkways, Rail, Water, and Open Land

Location	Clearance (m)
Open land subject to vehicles, cultivation, or grazing	5.6
Roadways, driveways, parking lots, and alleys	5.6
Walkways	4.1
Rails	8.1
Spaces and ways for pedestrians and restricted traffic	4.4
Water areas not suitable for boating	5.2

Table 2.25.3.12 Clearances over Buildings and Other Structures

Clearance from Conductors or Live Parts from:	Horizontal (m)	Vertical (m)
Building walls, projections, and windows	2.3	—
Balconies, catwalks, and similar areas accessible to people	2.3	4.1
Over or under roofs or projections not readily accessible to people	—	3.8
Over roofs accessible to vehicles but not trucks	—	4.1
Over roofs accessible to trucks	—	5.6
Other structures	2.3	—

ARTICLE 2.30 — SERVICES

2.30.1 General

2.30.1.1 Scope. This article covers service conductors and equipment for control and protection of services and their installation requirements.

FPN: See Figure 2.30.1.1.

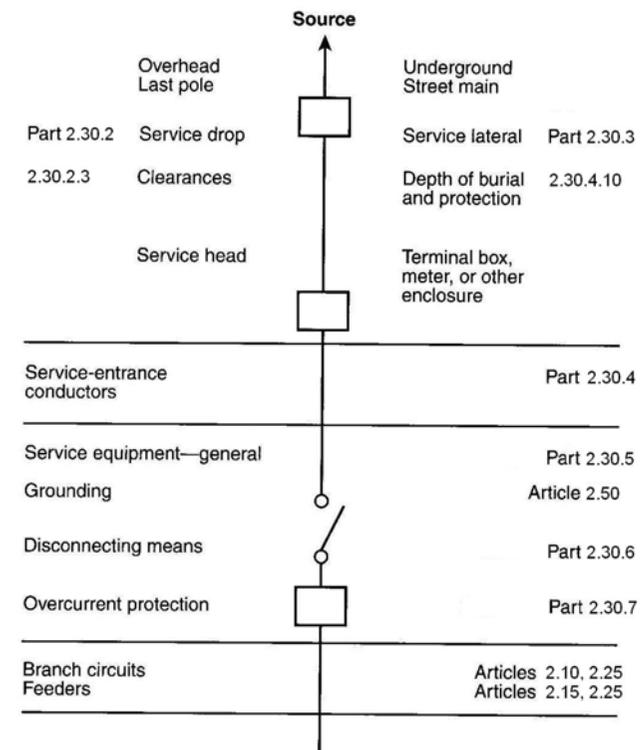

Figure 2.30.1.1 Services.

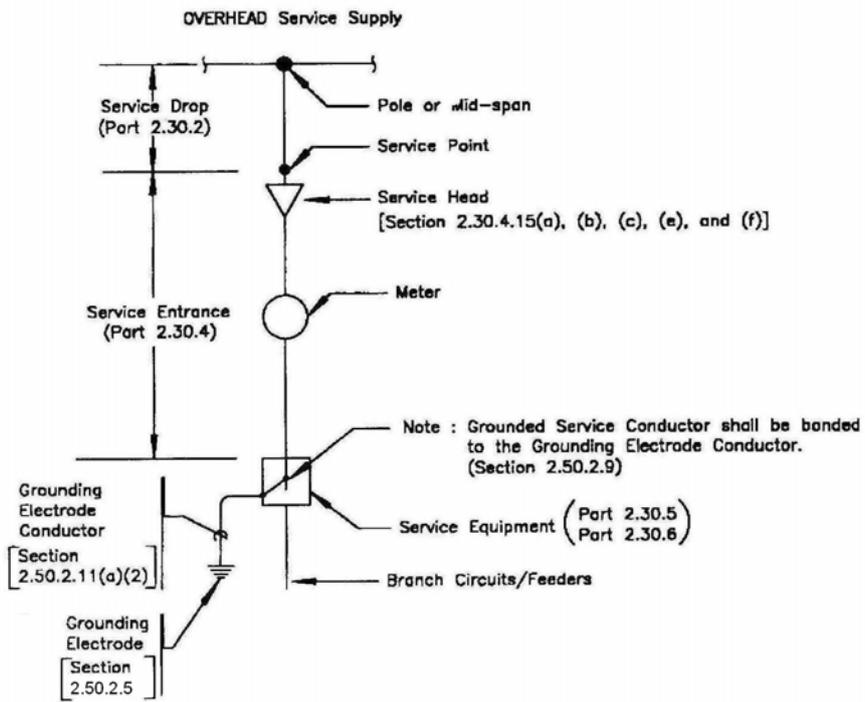

Figure 2.30.1.1(a) Overhead Service Supply (not Exceeding 600 Volts), Single Occupancy

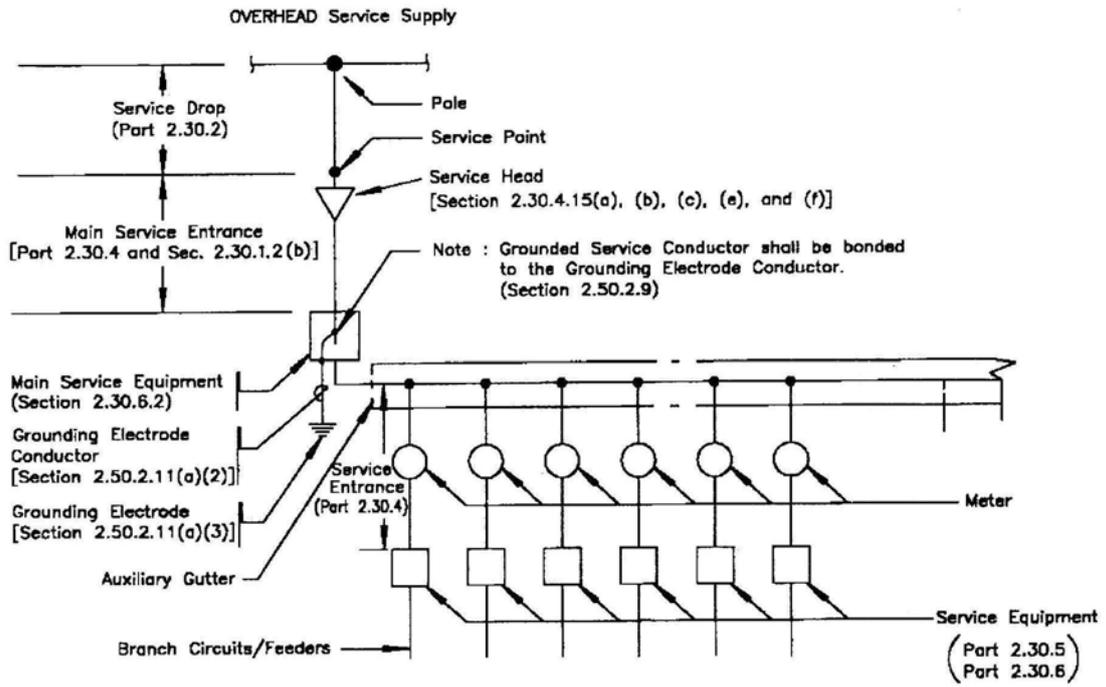

Figure 2.30 1.1(b) Overhead Service Supply (not Exceeding 600 Volts), Multiple Occupancy

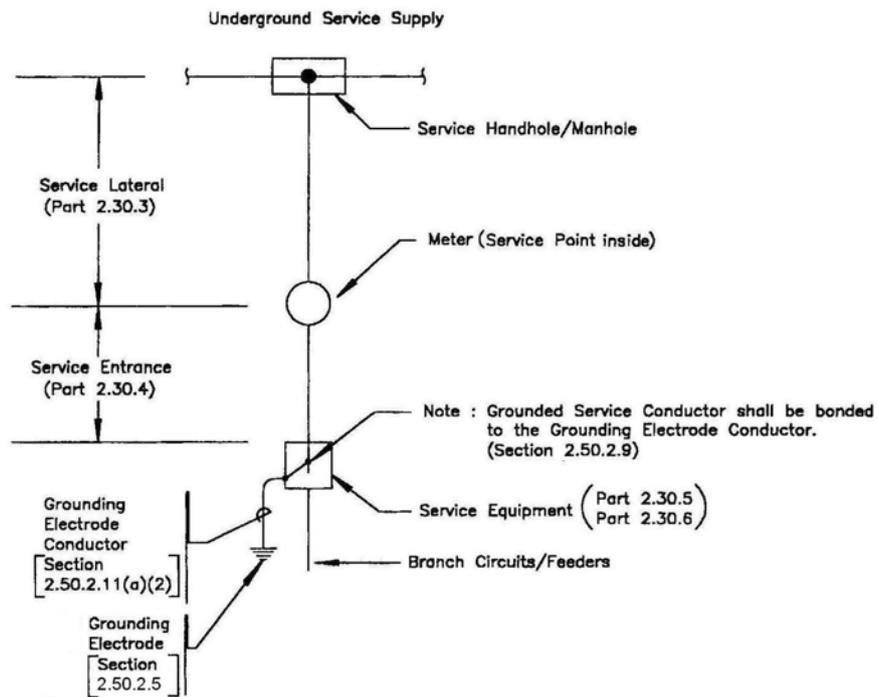

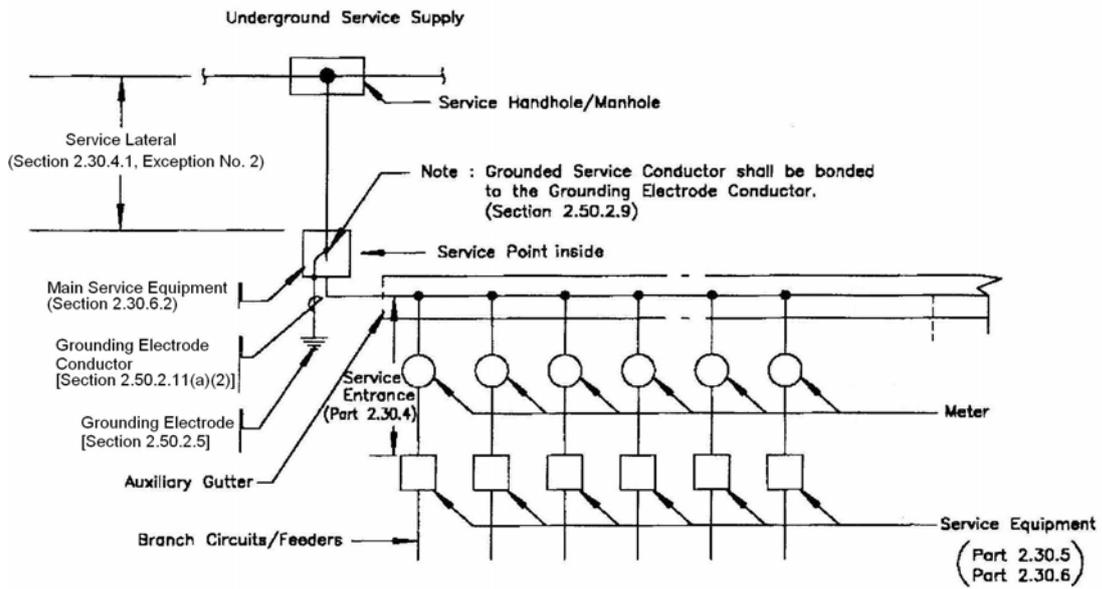

Figure 2.30.1.1 (c) Underground Service Supply (not Exceeding 600 Volts), Single Occupancy

**Figure 2.30.1.1(d) Underground Service Supply (not Exceeding 600 Volts),
Multiple Occupancy where electric service**

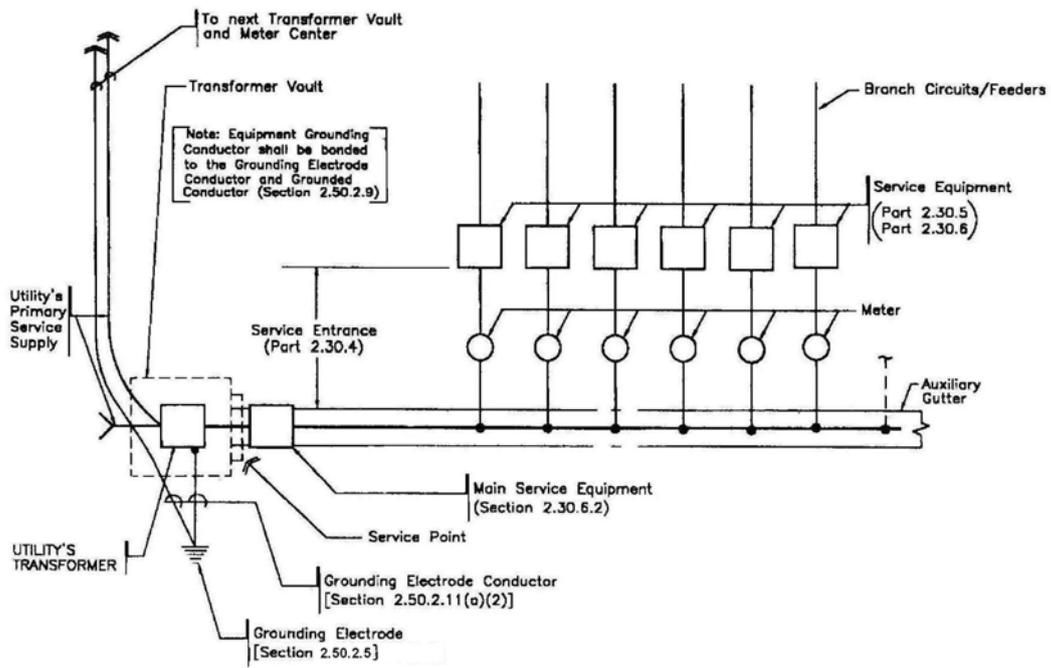

Figure 2.30.1.1(e) High Rise Building Services (not Exceeding 600 Volts), Multiple Occupancy

2.30.1.2 Number of Services. A building or other structure served shall be supplied by only one service unless permitted in 2.30.1.2(a) through (d). For the purpose of 2.30.4.1, Exception No. 2 only, underground sets of conductors, 50 mm² and larger, running to the same location and connected together at their supply end but not connected together at their load end shall be considered to be supplying one service.

(a) Special Conditions. Additional services shall be permitted to supply the following:

- (1) Fire pumps
- (2) Emergency systems
- (3) Legally required standby systems
- (4) Optional standby systems
- (5) Parallel power production systems
- (6) Systems designed for connection to multiple sources of supply for the purpose of enhanced reliability

(b) Special Occupancies. By special permission, additional services shall be permitted for either of the following:

- (1) Multiple-occupancy buildings where there is no available space for service equipment accessible to all occupants
- (2) A single building or other structure sufficiently large to make two or more services necessary

(c) Capacity Requirements. Additional services shall be permitted under any of the following:

- (1) Where the capacity requirements are in excess of 2000 amperes at a supply voltage of 600 volts or less
- (2) Where the load requirements of a single-phase installation are greater than the serving agency normally supplies through one service
- (3) By special permission

(d) Different Characteristics. Additional services shall be permitted for different voltages, frequencies, or phases, or for different uses, such as for different rate schedules.

(e) Identification. Where a building or structure is supplied by more than one service, or any combination of branch circuits, feeders, and services, a permanent plaque or directory shall be installed at each service disconnect location denoting all other services, feeders, and branch circuits supplying that building or structure and the area served by each. See Section 2.25.2.8.

2.30.1.3 One Building or Other Structure Not to Be Supplied Through Another. Service conductors supplying a building or other structure shall not pass through the interior of another building or other structure.

2.30.1.6 Conductors Considered Outside the Building. Conductors shall be considered outside of a building or other structure under any of the following conditions:

- (1) Where installed under not less than 50 mm of concrete beneath a building or other structure
- (2) Where installed within a building or other structure in a raceway that is encased in concrete or brick not less than 50 mm thick
- (3) Where installed in any vault that meets the construction requirements of Article 4.50.3.
- (4) Where installed in conduit and under not less than 450 mm of earth beneath a building or other structure

2.30.1.7 Other Conductors in Raceway or Cable. Conductors other than service conductors shall not be installed in the same service raceway or service cable.

Exception No. 1: Grounding conductors and bonding jumpers.

Exception No. 2: Load management control conductors having overcurrent protection.

2.30.1.8 Raceway Seal. Where a service raceway enters a building or structure from an underground distribution system, it shall be sealed in accordance with Section 3.0.1.5(g). Spare or unused raceways shall also be sealed. Sealants shall be identified for use with the cable insulation, shield, or other components.

2.30.1.9 Clearances on Buildings. Service conductors and final spans shall comply with 2.30.1.9(a), (b), and (c).

(a) Clearances. Service conductors installed as open conductors or multiconductor cable without an overall outer jacket shall have a clearance of not less than 900 mm from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.

Exception: Conductors run above the top level of a window shall be permitted to be less than the 900 mm requirement.

(b) Vertical Clearance. The vertical clearance of final spans above, or within 900 mm measured horizontally of, platforms, projections, or surfaces from which they might be reached shall be maintained in accordance with 2.30.2.3(b).

(c) Building Openings. Overhead service conductors shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they obstruct entrance to these building openings.

2.30.1.10 Vegetation as Support. Vegetation such as trees shall not be used for support of overhead service conductors.

2.30.2 Overhead Service-Drop Conductors

2.30.2.1 Insulation or Covering. Individual conductors shall be insulated or covered.

Exception: The grounded conductor of a multiconductor cable shall be permitted to be bare.

2.30.2.2 Size and Rating.

(a) General. Conductors shall have sufficient ampacity to carry the current for the load as calculated in accordance with Article 2.20 and shall have adequate mechanical strength.

(b) Minimum Size. The conductors shall not be smaller than 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum or copper-clad aluminum.

Exception: Conductors supplying only limited loads of a single branch circuit — such as small polyphase power, controlled water heaters, and similar loads — shall not be smaller than 12 AWG hard-drawn copper or equivalent.

(c) Grounded Conductors. The grounded conductor shall not be less than the minimum size as required by 2.50.2.5(c).

2.30.2.3 Clearances. Service-drop conductors shall not be readily accessible and shall comply with 2.30.2.3(a) through (d) for services not over 600 volts, nominal.

(a) Above Roofs. Conductors shall have a vertical clearance of not less than 2 400 mm above the roof surface. The vertical clearance above the roof level shall be maintained for a distance of not less than 900 mm in all directions from the edge of the roof.

Exception No. 1: The area above a roof surface subject to pedestrian or vehicular traffic shall have a vertical clearance from the roof surface in accordance with the clearance requirements of 2.30.2.3(b).

Exception No. 2: Where the voltage between conductors does not exceed 300 and the roof has a slope of 100 mm in 300 mm or greater, a reduction in clearance to 900 mm shall be permitted.

Exception No. 3: Where the voltage between conductors does not exceed 300, a reduction in clearance above only the overhanging portion of the roof to not less than 450 mm shall be permitted if (1) not more than 1 800 mm of service-drop conductors, 1 200 mm horizontally, pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or approved support.

FPN: See 2.30.2.7 for mast supports.

Exception: The requirement for maintaining the vertical clearance 900 mm from the edge of the roof shall not apply to the final conductor span where the service drop is attached to the side of a building.

(b) Vertical Clearance from Ground. Service-drop conductors, where not in excess of 600 volts, nominal, shall have the following minimum clearance from final grade:

(1) 3 000 mm — at the electric service entrance to buildings, also at the lowest point of the drip loop of the building electric entrance, and above areas or sidewalks accessible only to pedestrians, measured from final grade or other accessible surface only for service-drop cables supported on and cabled together with a grounded bare messenger where the voltage does not exceed 150 volts to ground

(2) 3 600 mm — over residential property and driveways, and those commercial areas not subject to truck traffic where the voltage does not exceed 300 volts to ground

(3) 4 500 mm — for those areas listed in the 3 600 mm classification where the voltage exceeds 300 volts to ground

(4) 5 500 mm — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land such as cultivated, grazing, forest, and orchard

(c) Clearance from Building Openings. See 2.30.1.9.

(d) Clearance from Swimming Pools. See 6.80.1.8.

2.30.2.5 Point of Attachment. The point of attachment of the service-drop conductors to a building or other structure shall provide the minimum clearances as specified in 2.30.1.9 and 2.30.2.3. In no case shall this point of attachment be less than 3 000 mm above finished grade.

2.30.2.6 Means of Attachment. Multiconductor cables used for service drops shall be attached to buildings or other structures by fittings identified for use with service conductors. Open conductors shall be attached to fittings identified for use with service conductors or to noncombustible, nonabsorbent insulators securely attached to the building or other structure.

2.30.2.7 Service Masts as Supports. Where a service mast is used for the support of service-drop conductors, it shall be of adequate strength or be supported by braces or guys to withstand safely the strain imposed by the service drop. Where raceway-type service masts are used, all raceway fittings shall be identified for use with service masts. Only power service-drop conductors shall be permitted to be attached to a service mast.

2.30.2.8 Supports over Buildings. Service-drop conductors passing over a roof shall be securely supported by substantial structures. Where practicable, such supports shall be independent of the building.

2.30.3 Underground Service-Lateral Conductors

2.30.3.1 Insulation. Service-lateral conductors shall be insulated for the applied voltage.

Exception: A grounded conductor shall be permitted to be uninsulated as follows:

(1) *Bare copper used in a raceway.*

(2) *Bare copper for direct burial where bare copper is judged to be suitable for the soil conditions.*

(3) *Bare copper for direct burial without regard to soil conditions where part of a cable assembly identified for underground use.*

(4) *Aluminum or copper-clad aluminum without individual insulation or covering where part of a cable assembly identified for underground use in a raceway or for direct burial.*

2.30.3.2 Size and Rating.

(a) General. Service-lateral conductors shall have sufficient ampacity to carry the current for the load as calculated in accordance with Article 2.20 and shall have adequate mechanical strength.

(b) Minimum Size. The conductors shall not be smaller than 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum or copper-clad aluminum.

Exception: Conductors supplying only limited loads of a single branch circuit — such as small polyphase power, controlled water heaters, and similar loads — shall not be smaller than 3.5 mm² (2.0 mm dia.) copper or 5.5 mm² (2.6 mm dia.) aluminum or copper-clad aluminum.

(c) Grounded Conductors. The grounded conductor shall not be less than the minimum size required by 2.50.2.5(c).

2.30.3.3 Protection Against Damage. Underground service-lateral conductors shall be protected against damage in accordance with

300.5. Service-lateral conductors entering a building shall be installed in accordance with 2.30.1.6 or protected by a raceway wiring method identified in 2.30.4.4.

2.30.3.4 Spliced Conductors. Service-lateral conductors shall be permitted to be spliced or tapped in accordance with 1.10.1.14, 3.0.1.5(e), 3.0.1.13, and 3.0.1.15.

2.30.4 Service-Entrance Conductors

2.30.4.1 Number of Service-Entrance Conductor Sets. Each service drop or lateral shall supply only one set of service-entrance conductors.

Exception No. 1: A building shall be permitted to have one set of service-entrance conductors for each service, as defined in 2.30.1.2, run to each occupancy or group of occupancies.

Exception No. 2: Where two to six service disconnecting means in separate enclosures are grouped at one location and supply separate loads from one service drop or lateral in multiple-occupancy building or group of single detached buildings owned/managed/operated by a person or entity, one set of service-entrance conductors shall be permitted to supply each or several such service equipment enclosures.

Exception No. 3: A single-family dwelling unit and a separate structure shall be permitted to have one set of service-entrance conductors run to each from a single service drop or lateral.

Exception No. 4: A two-family dwelling or a multifamily dwelling shall be permitted to have one set of service-entrance conductors installed to supply the circuits covered in 2.10.2.7.

Exception No. 5: One set of service-entrance conductors connected to the supply side of the normal service disconnecting means shall be permitted to supply each or several systems covered by 2.30.6.13(4) or 2.30.6.13(5).

2.30.4.2 Insulation of Service-Entrance Conductors. Service-entrance conductors entering or on the exterior of buildings or other structures shall be insulated.

Exception: A grounded conductor shall be permitted to be uninsulated as follows:

(1) Bare copper used in a raceway or part of a service cable assembly.

(2) Bare copper for direct burial where bare copper is judged to be suitable for the soil conditions.

(3) Bare copper for direct burial without regard to soil conditions where part of a cable assembly identified for underground use.

(4) Aluminum or copper-clad aluminum without individual insulation or covering where part of a cable assembly or identified for underground use in a raceway, or for direct burial.

(5) Bare conductors used in an auxiliary gutter.

2.30.4.3 Minimum Size and Rating.

(a) General. The ampacity of the service-entrance conductors before the application of any adjustment or correction factors shall not be less than either (a)(1) or (a)(2). Loads shall be determined in accordance with Article 2.20. Ampacity shall be determined from 3.10.1.15. The maximum allowable current of busways shall be that value for which the busway has been listed or labeled.

(1) The sum of the noncontinuous loads plus 125 percent of continuous loads

(2) The sum of the noncontinuous load plus the continuous load if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating

(b) Specific Installations. In addition to the requirements of 2.30.4.3(a), the minimum ampacity for ungrounded conductors for specific installations shall not be less than the rating of the service disconnecting means specified in 2.30.6.10(a) through (d).

(c) Grounded Conductors. The grounded conductor shall not be less than the minimum size as required by 2.50.2.5(c).

2.30.4.4 Wiring Methods for 600 Volts, Nominal, or Less. Service-entrance conductors shall be installed in accordance with the applicable requirements of this Code covering the type of wiring method used and shall be limited to the following methods:

(1) Open wiring on insulators

- (2) Type IGS cable
- (3) Rigid metal conduit
- (4) Intermediate metal conduit
- (5) Electrical metallic tubing
- (6) Electrical nonmetallic tubing (ENT)
- (7) Service-entrance cables
- (8) Wireways
- (9) Busways
- (10) Auxiliary gutters
- (11) Rigid nonmetallic conduit
- (12) Cablebus
- (13) Type MC cable
- (14) Mineral-insulated, metal-sheathed cable
- (15) Flexible metal conduit not over 1 800 mm long or liquidtight flexible metal conduit not over 1 800 mm long between raceways, or between raceway and service equipment, with equipment bonding jumper routed with the flexible metal conduit or the liquidtight flexible metal conduit according to the provisions of 2.50.5.13(a), (b), (c), and (e)
- (16) Liquidtight flexible nonmetallic conduit

2.30.4.5 Cable Trays. Cable tray systems shall be permitted to support service-entrance conductors. Cable trays used to support service-entrance conductors shall contain only service-entrance conductors.

Exception: Conductors other than service-entrance conductors shall be permitted to be installed in a cable tray with service-entrance conductors, provided a solid fixed barrier of a material compatible with the cable tray is installed to separate the service-entrance conductors from other conductors installed in the cable tray.

2.30.4.7 Spliced Conductors. Service-entrance conductors shall be permitted to be spliced or tapped in accordance with 1.10.1.14, 3.0.1.5(e), 3.0.1.13, and 3.0.1.15.

2.30.4.10 Protection Against Physical Damage — Underground. Underground service-entrance conductors shall be protected against physical damage in accordance with 3.0.1.5.

2.30.4.11 Protection of Open Conductors and Cables Against Damage — Above Ground. Service-entrance conductors installed above ground shall be protected against physical damage as specified in 2.30.4.11(a) or (b).

(a) Service Cables. Service cables, where subject to physical damage, shall be protected by any of the following:

- (1) Rigid metal conduit
- (2) Intermediate metal conduit
- (3) Schedule 80 rigid nonmetallic conduit
- (4) Electrical metallic tubing
- (5) Other approved means

(b) Other Than Service Cable. Individual open conductors and cables other than service cables shall not be installed within 3 000 mm of grade level or where exposed to physical damage.

Exception: Type MI and Type MC cable shall be permitted within 3 000 mm of grade level where not exposed to physical damage or where protected in accordance with 3.0.1.5(d).

2.30.4.12 Mounting Supports. Cables or individual open service conductors shall be supported as specified in 2.30.4.12(a), (b), or (c).

(a) Service Cables. Service cables shall be supported by straps or other approved means within 300 mm of every service head, gooseneck, or connection to a raceway or enclosure and at intervals not exceeding 750 mm.

(b) Other Cables. Cables that are not approved for mounting in contact with a building or other structure shall be mounted on insulating supports installed at intervals not exceeding 4 500 mm and in a manner that maintains a clearance of not less than 50 mm from the surface over which they pass.

(c) Individual Open Conductors. Individual open conductors shall be installed in accordance with Table 2.30.4.12(c). Where exposed to the weather, the conductors shall be mounted on insulators or on insulating supports attached to racks, brackets, or other approved means. Where not exposed to the weather, the conductors shall be mounted on glass or porcelain knobs.

Table 2.30.4.12(c) Supports

Maximum Volts	Maximum Distance Between Supports (m)	Minimum Clearance	
		Between Conductors (mm)	From Surface (mm)
600	2.7	150	50
600	4.5	300	50
300	1.4	75	50
600*	1.4*	65*	25*

*Where not exposed to weather.

2.30.4.13 Individual Conductors Entering Buildings or Other Structures. Where individual open conductors enter a building or other structure, they shall enter through roof bushings or through the wall in an upward slant through individual, noncombustible, nonabsorbent insulating tubes. Drip loops shall be formed on the conductors before they enter the tubes.

2.30.4.14 Raceways to Drain. Where exposed to the weather, raceways enclosing service-entrance conductors shall be raintight and arranged to drain. Where embedded in masonry, raceways shall be arranged to drain.

Exception: As permitted in 3.48.2.3(1).

2.30.4.15 Overhead Service Locations.

(a) Raintight Service Head. Service raceways shall be equipped with a raintight service head at the point of connection to service-drop conductors.

(b) Service Cable Equipped with Raintight Service Head or Gooseneck. Service cables shall be equipped with a raintight service head.

Exception: Type SE cable shall be permitted to be formed in a gooseneck and taped with a self-sealing weather-resistant thermoplastic.

(c) Service Heads and Goosenecks Above Service-Drop Attachment. Service heads and goosenecks in service-entrance cables shall be located above the point of attachment of the service-drop conductors to the building or other structure.

Exception: Where it is impracticable to locate the service head or gooseneck above the point of attachment, the service head or gooseneck location shall be permitted not farther than 600 mm from the point of attachment.

(d) Secured. Service cables shall be held securely in place.

(e) Separately Bushed Openings. Service heads shall have conductors of different potential brought out through separately bushed openings.

Exception: For jacketed multiconductor service cable without splice.

(f) Drip Loops. Drip loops shall be formed on individual conductors. To prevent the entrance of moisture, service-entrance conductors shall be connected to the service-drop conductors either (1) below the level of the service head or (2) below the level of the termination of the service-entrance cable sheath.

(g) Arranged That Water Will Not Enter Service Raceway or Equipment. Service-drop conductors and service-entrance conductors shall be arranged so that water will not enter service raceway or equipment.

2.30.4.17 Service Conductor with the Higher Voltage to Ground. On a 4-wire, delta-connected service where the midpoint of one phase winding is grounded, the service conductor having the higher phase voltage to ground shall be durably and permanently marked by an outer finish that is orange in color, or by other effective means, at each termination or junction point.

2.30.5 Service Equipment — General

2.30.5.1 Service Equipment — Enclosed or Guarded. Energized parts of service equipment shall be enclosed as specified in 2.30.5.1(a) or guarded as specified in 2.30.5.1(b).

(a) **Enclosed.** Energized parts shall be enclosed so that they will not be exposed to accidental contact or shall be guarded as in 2.30.5.1(b).

(b) **Guarded.** Energized parts that are not enclosed shall be installed on a switchboard, panelboard, or control board and guarded in accordance with 1.10.1.18 and 1.10.2.2. Where energized parts are guarded as provided in 1.10.2.2(a)(1) and (a)(2), a means for locking or sealing doors providing access to energized parts shall be provided.

2.30.5.5 Marking. Service equipment rated at 600 volts or less shall be marked to identify it as being suitable for use as service equipment. Individual meter socket enclosures shall not be considered service equipment.

2.30.6 Service Equipment — Disconnecting Means

2.30.6.1 General. Means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors.

(a) **Location.** The service disconnecting means shall be installed in accordance with 2.30.6.1(a)(1), (a)(2), and (a)(3).

(1) **Readily Accessible Location.** The service disconnecting means shall be installed at a readily accessible location of a building or a structure. For a building, the service disconnecting means shall be installed either at the outside wall or inside nearest the point of entrance of the service conductors to the building.

(2) **Bathrooms.** Service disconnecting means shall not be installed in bathrooms.

(3) **Remote Control.** Where a remote control device(s) is used to actuate the service disconnecting means, the service disconnecting means shall be located in accordance with 2.30.6.1(a)(1).

(b) **Marking.** Each service disconnect shall be permanently marked to identify it as a service disconnect.

(c) **Suitable for Use.** Each service disconnecting means shall be suitable for the prevailing conditions. Service equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 5.0 through 5.17.

2.30.6.2 Maximum Number of Disconnects.

(a) **General.** The service disconnecting means for each service permitted by 2.30.1.2, or for each set of service-entrance conductors permitted by 2.30.4.1, Exception Nos. 1, 3, 4, or 5, shall consist of not more than six switches or sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be not more than six sets of disconnects per service grouped in any one location. For the purpose of this section, disconnecting means used solely for power monitoring equipment, transient voltage surge suppressors, or the control circuit of the ground-fault protection system or power-operable service disconnecting means, installed as part of the listed equipment, shall not be considered a service disconnecting means.

(b) **Single-Pole Units.** Two or three single-pole switches or breakers, capable of individual operation, shall be permitted on multiwire circuits, one pole for each ungrounded conductor, as one multipole disconnect, provided they are equipped with handle ties or a master handle to disconnect all conductors of the service with no more than six operations of the hand.

FPN: See 4.8.3.7(a) for service equipment in panelboards, and see 4.30.8.4 for service equipment in motor control centers.

2.30.6.3 Grouping of Disconnects.

(a) **General.** The two to six disconnects as permitted in 2.30.6.2 shall be grouped. Each disconnect shall be marked to indicate the load served.

Exception: One of the two to six service disconnecting means permitted in 2.30.6.2, where used only for a water pump also intended to provide fire protection, shall be permitted to be located remote from the other disconnecting means.

(b) Additional Service Disconnecting Means. The one or more additional service disconnecting means for fire pumps, emergency systems, legally required standby, or optional standby services permitted by 2.30.1.2 shall be installed remote from the one to six service disconnecting means for normal service to minimize the possibility of simultaneous interruption of supply.

(c) Access to Occupants. In a multiple-occupancy building, each occupant shall have access to the occupant's service disconnecting means.

Exception: In a multiple-occupancy building where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service disconnecting means supplying more than one occupancy shall be permitted to be accessible to authorized management personnel only.

2.30.6.5 Simultaneous Opening of Poles. Each service disconnect shall simultaneously disconnect all ungrounded service conductors that it controls from the premises wiring system.

2.30.6.6 Disconnection of Grounded Conductor. Where the service disconnecting means does not disconnect the grounded conductor from the premises wiring, other means shall be provided for this purpose in the service equipment. A terminal or bus to which all grounded conductors can be attached by means of pressure connectors shall be permitted for this purpose. In a multisection switchboard, disconnects for the grounded conductor shall be permitted to be in any section of the switchboard, provided any such switchboard section is marked.

2.30.6.7 Manually or Power Operable. The service disconnecting means for ungrounded service conductors shall consist of one of the following:

(1) A manually operable switch or circuit breaker equipped with a handle or other suitable operating means

(2) A power-operated switch or circuit breaker, provided the switch or circuit breaker can be opened by hand in the event of a power supply failure

2.30.6.8 Indicating. The service disconnecting means shall plainly indicate whether it is in the open or closed position.

2.30.6.10 Rating of Service Disconnecting Means. The service disconnecting means shall have a rating not less than the load to be carried, determined in accordance with Article 2.20. In no case shall the rating be lower than specified in 2.30.6.10(a), (b), (c), or (d).

(a) One-Circuit Installation. For installations to supply only limited loads of a single branch circuit, the service disconnecting means shall have a rating of not less than 15 amperes.

(b) Two-Circuit Installations. For installations consisting of not more than two 2-wire branch circuits, the service disconnecting means shall have a rating of not less than 30 amperes.

(c) One-Family Dwelling. For a one-family dwelling, the service disconnecting means shall have a rating of not less than 100 amperes, 3-wire.

(d) All Others. For all other installations, the service disconnecting means shall have a rating of not less than 60 amperes.

2.30.6.11 Combined Rating of Disconnects. Where the service disconnecting means consists of more than one switch or circuit breaker, as permitted by 2.30.6.2, the combined ratings of all the switches or circuit breakers used shall not be less than the rating required by 2.30.6.10.

2.30.6.12 Connection to Terminals. The service conductors shall be connected to the service disconnecting means by pressure connectors, clamps, or other approved means. Connections that depend on solder shall not be used.

2.30.6.13 Equipment Connected to the Supply Side of Service Disconnect. Only the following equipment shall be permitted to be connected to the supply side of the service disconnecting means:

- (1) Cable limiters or other current-limiting devices
- (2) Meters and meter sockets nominally rated not in excess of 600 volts, provided all metal housings and service enclosures are grounded
- (3) Meter disconnect switches nominally rated not in excess of 600 volts that have a short-circuit current rating equal to or greater than the available short circuit current, provided all metal housings and service enclosures are grounded
- (4) Instrument transformers (current and voltage), impedance shunts, load management devices, and arresters
- (5) Taps used only to supply load management devices, circuits for standby power systems, fire pump equipment, and fire and sprinkler alarms, if provided with service equipment and installed in accordance with requirements for service-entrance conductors
- (6) Solar photovoltaic systems, fuel cell systems, or interconnected electric power production sources
- (7) Control circuits for power-operable service disconnecting means, if suitable overcurrent protection and disconnecting means are provided
- (8) Ground-fault protection systems or transient voltage surge suppressors, where installed as part of listed equipment, if suitable overcurrent protection and disconnecting means are provided
- (9) Fusible disconnect switch or circuit breaker as deemed necessary. This equipment is considered as additional protection, while the next disconnecting means mentioned in 2.30.6.1(a)(1) shall still be considered as the service equipment.

2.30.7 Service Equipment — Overcurrent Protection

2.30.7.1 Where Required. Each ungrounded service conductor shall have overload protection.

(a) Ungrounded Conductor. Such protection shall be provided by an overcurrent device in series with each ungrounded service conductor that has a rating or setting not higher than the allowable ampacity of the conductor. A set of fuses shall be considered all the fuses required to protect all the ungrounded conductors of a circuit.

Single-pole circuit breakers, grouped in accordance with 2.30.6.2(b), shall be considered as one protective device.

Exception No. 1: For motor-starting currents, ratings that conform with 4.30.4.2, 4.30.5.2, and 4.30.5.3 shall be permitted.

Exception No. 2: Fuses and circuit breakers with a rating or setting that conforms with 2.40.1.4(b) or (c) and 2.40.1.6 shall be permitted.

Exception No. 3: Two to six circuit breakers or sets of fuses shall be permitted as the overcurrent device to provide the overload protection. The sum of the ratings of the circuit breakers or fuses shall be permitted to exceed the ampacity of the service conductors, provided the calculated load does not exceed the ampacity of the service conductors.

Exception No. 4: Overload protection for fire pump supply conductors shall conform with 6.95.1.4(b)(1).

Exception No. 5: Overload protection for 120/240-volt, 3-wire, single-phase dwelling services shall be permitted in accordance with the requirements of 3.10.1.15(b)(6).

(b) Not in Grounded Conductor. No overcurrent device shall be inserted in a grounded service conductor except a circuit breaker that simultaneously opens all conductors of the circuit.

2.30.7.2 Location. The service overcurrent device shall be an integral part of the service disconnecting means or shall be located immediately adjacent thereto.

2.30.7.3 Locked Service Overcurrent Devices. Where the service overcurrent devices are locked or sealed or are not readily accessible to the occupant, branch-circuit overcurrent devices shall be installed on the load side, shall be mounted in a readily accessible location, and shall be of lower ampere rating than the service overcurrent device.

2.30.7.4 Protection of Specific Circuits. Where necessary to prevent tampering, an automatic overcurrent device that protects service conductors supplying only a specific load, such as a water heater, shall be permitted to be locked or sealed where located so as to be accessible.

2.30.7.5 Relative Location of Overcurrent Device and Other Service Equipment. The overcurrent device shall protect all circuits and devices.

Exception No. 1: The service switch shall be permitted on the supply side.

Exception No. 2: High-impedance shunt circuits, surge arresters, surge-protective capacitors, and instrument transformers (current and voltage) shall be permitted to be connected and installed on the supply side of the service disconnecting means as permitted in 2.30.6.13.

Exception No. 3: Circuits for load management devices shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection.

Exception No. 4: Circuits used only for the operation of fire alarm, other protective signaling systems, or the supply to fire pump equipment shall be permitted to be connected on the supply side of the service overcurrent device where separately provided with overcurrent protection.

Exception No. 5: Meters nominally rated not in excess of 600 volts shall be permitted, provided all metal housings and service enclosures are grounded.

Exception No. 6: Where service equipment is power operable, the control circuit shall be permitted to be connected ahead of the service equipment if suitable overcurrent protection and disconnecting means are provided.

2.30.7.6 Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided for solidly grounded wye electrical services of more than 150 volts to ground but not exceeding 600 volts phase-to-phase for each service disconnect rated 1000 amperes or more. The grounded conductor for the solidly grounded wye system shall be connected directly to ground without inserting any resistor or impedance device.

The rating of the service disconnect shall be considered to be the rating of the largest fuse that can be installed or the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted.

Exception No. 1: The ground-fault protection provisions of this section shall not apply to a service disconnect for a continuous

industrial process where a nonorderly shutdown will introduce additional or increased hazards.

Exception No. 2: The ground-fault protection provisions of this section shall not apply to fire pumps.

(a) Setting. The ground-fault protection system shall operate to cause the service disconnect to open all ungrounded conductors of the faulted circuit. The maximum setting of the ground-fault protection shall be 1200 amperes, and the maximum time delay shall be one second for ground-fault currents equal to or greater than 3000 amperes.

(b) Fuses. If a switch and fuse combination is used, the fuses employed shall be capable of interrupting any current higher than the interrupting capacity of the switch during a time that the ground-fault protective system will not cause the switch to open.

(c) Performance Testing. The ground-fault protection system shall be performance tested when first installed on site. The test shall be conducted in accordance with instructions that shall be provided with the equipment. A written record of this test shall be made and shall be available to the authority having jurisdiction.

FPN No. 1: Ground-fault protection that functions to open the service disconnect affords no protection from faults on the line side of the protective element. It serves only to limit damage to conductors and equipment on the load side in the event of an arcing ground fault on the load side of the protective element.

FPN No. 2: This added protective equipment at the service equipment may make it necessary to review the overall wiring system for proper selective overcurrent protection coordination. Additional installations of ground-fault protective equipment may be needed on feeders and branch circuits where maximum continuity of electrical service is necessary.

FPN No. 3: Where ground-fault protection is provided for the service disconnect and interconnection is made with another supply system by a transfer device, means or devices may be needed to ensure proper ground-fault sensing by the ground-fault protection equipment.

FPN No. 4: See 5.17.2.8(a) for information on where an additional step of ground fault protection is required for hospitals and other buildings with critical areas or life support equipment.

2.30.8 Services Exceeding 600 Volts, Nominal

2.30.8.1 General. Service conductors and equipment used on circuits exceeding 600 volts, nominal, shall comply with all the applicable provisions of the preceding sections of this article and with the

following sections that supplement or modify the preceding sections. In no case shall the provisions of Part 2.30.8 apply to equipment on the supply side of the service point.

FPN: For clearances of conductors of over 600 volts, nominal, see ANSI C2-2002, National Electrical Safety Code.

2.30.8.3 Service-Entrance Conductors. Service-entrance conductors to buildings or enclosures shall be installed to conform to 2.30.8.3(a) and (b).

(a) **Conductor Size.** Service-entrance conductors shall not be smaller than 14 mm² unless in multiconductor cable. Multiconductor cable shall not be smaller than 8.0 mm² (3.2 mm dia.).

(b) **Wiring Methods.** Service-entrance conductors shall be installed by one of the wiring methods covered in 3.0.2.7 and 3.0.2.20.

2.30.8.5 Isolating Switches.

(a) **Where Required.** Where oil switches or air, oil, vacuum, or sulfur hexafluoride circuit breakers constitute the service disconnecting means, an isolating switch with visible break contacts shall be installed on the supply side of the disconnecting means and all associated service equipment.

Exception: An isolating switch shall not be required where the circuit breaker or switch is mounted on removable truck panels or metal-enclosed switchgear units where both of the following conditions apply:

- (1) *Cannot be opened unless the circuit is disconnected.*
- (2) *Where all energized parts are automatically disconnected when the circuit breaker or switch is removed from the normal operating position.*

(b) **Fuses as Isolating Switch.** Where fuses are of the type that can be operated as a disconnecting switch, a set of such fuses shall be permitted as the isolating switch.

(c) **Accessible to Licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical**

practitioner Only. The isolating switch shall be accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner only.

(d) **Grounding Connection.** Isolating switches shall be provided with a means for readily connecting the load side conductors to ground when disconnected from the source of supply.

A means for grounding the load side conductors shall not be required for any duplicate isolating switch installed and maintained by the electric supply company.

2.30.8.6 Disconnecting Means.

(a) **Location.** The service disconnecting means shall be located in accordance with 2.30.6.1.

(b) **Type.** Each service disconnect shall simultaneously disconnect all ungrounded service conductors that it controls and shall have a fault-closing rating that is not less than the maximum short-circuit current available at its supply terminals.

Where fused switches or separately mounted fuses are installed, the fuse characteristics shall be permitted to contribute to the fault-closing rating of the disconnecting means.

(c) **Remote Control.** For multibuilding, industrial installations under single management, the service disconnecting means shall be permitted to be located at a separate building or structure. In such cases, the service disconnecting means shall be permitted to be electrically operated by a readily accessible, remote-control device.

2.30.8.7 Overcurrent Devices as Disconnecting Means. Where the circuit breaker or alternative for it, as specified in 2.30.8.9 for service overcurrent devices, meets the requirements specified in 2.30.8.6, they shall constitute the service disconnecting means.

2.30.8.9 Protection Requirements. A short-circuit protective device shall be provided on the load side of, or as an integral part of, the service disconnect, and shall protect all ungrounded conductors that it supplies. The protective device shall be capable of detecting and interrupting all values of current, in excess of its trip setting or melting point, that can occur at its location. A fuse rated in continuous amperes

not to exceed three times the ampacity of the conductor, or a circuit breaker with a trip setting of not more than six times the ampacity of the conductors, shall be considered as providing the required short-circuit protection.

FPN: See Table 3.10.1.67 through Table 3.10.1.86 for ampacities of conductors rated 2001 volts and above.

Overcurrent devices shall conform to 2.30.8.9(a) and (b).

(a) Equipment Type. Equipment used to protect service-entrance conductors shall meet the requirements of Part 4.90.2.

(b) Enclosed Overcurrent Devices. The restriction to 80 percent of the rating for an enclosed overcurrent device for continuous loads shall not apply to overcurrent devices installed in systems operating at over 600 volts.

2.30.8.10 Surge Arresters (Lightning Arresters). Surge arresters installed in accordance with the requirements of Article 2.80 shall be permitted on each ungrounded overhead service conductor.

2.30.8.11 Service Equipment — General Provisions. Service equipment, including instrument transformers, shall conform to Part 4.90.1.

2.30.8.12 Metal-Enclosed Switchgear. Metal-enclosed switchgear shall consist of a substantial metal structure and a sheet metal enclosure. Where installed over a combustible floor, suitable protection thereto shall be provided.

2.30.8.13 Over 35,000 Volts. Where the voltage exceeds 35,000 volts between conductors that enter a building, they shall terminate in a metal-enclosed switchgear compartment or a vault conforming to the requirements of 4.50.3.1 through 4.50.3.8.

ARTICLE 2.40 — OVERCURRENT PROTECTION

2.40.1 General

2.40.1.1 Scope. Parts 2.40.1 through 2.40.7 of this article provide the general requirements for overcurrent protection and overcurrent protective devices not more than 600 volts, nominal. Part 2.40.8 covers overcurrent protection for those portions of supervised industrial installations operating at voltages of not more than 600 volts, nominal. Part 2.40.9 covers overcurrent protection over 600 volts, nominal.

FPN: Overcurrent protection for conductors and equipment is provided to open the circuit if the current reaches a value that will cause an excessive or dangerous temperature in conductors or conductor insulation. See also 1.10.1.9 for requirements for interrupting ratings and 1.10.1.10 for requirements for protection against fault currents.

2.40.1.2 Definitions.

Current-Limiting Overcurrent Protective Device. A device that, when interrupting currents in its current-limiting range, reduces the current flowing in the faulted circuit to a magnitude substantially less than that obtainable in the same circuit if the device were replaced with a solid conductor having comparable impedance.

Supervised Industrial Installation. For the purposes of Part 2.40.8, the industrial portions of a facility where all of the following conditions are met:

(1) Conditions of maintenance and engineering supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner monitor and service the system.

(2) The premises wiring system has 2500 kVA or greater of load used in industrial process(es), manufacturing activities, or both, as calculated in accordance with Article 2.20.

(3) The premises has at least one service or feeder that is more than 150 volts to ground and more than 300 volts phase-to-phase.

This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and

recreational facilities that are not an integral part of the industrial plant, substation, or control center.

Tap Conductors. As used in this article, a tap conductor is defined as a conductor, other than a service conductor, that has overcurrent protection ahead of its point of supply that exceeds the value permitted for similar conductors that are protected as described elsewhere in 2.40.1.4.

2.40.1.3 Other Articles. Equipment shall be protected against overcurrent in accordance with the article in this Code that covers the type of equipment specified in Table 2.40.1.3.

2.40.1.4 Protection of Conductors. Conductors, other than flexible cords, flexible cables, and fixture wires, shall be protected against overcurrent in accordance with their ampacities specified in 3.10.1.15, unless otherwise permitted or required in 2.40.1.4(a) through (g).

(a) Power Loss Hazard. Conductor overload protection shall not be required where the interruption of the circuit would create a hazard, such as in a material-handling magnet circuit or fire pump circuit. Short-circuit protection shall be provided.

FPN: See NFPA 20-2003, Standard for the Installation of Stationary Pumps for Fire Protection.

(b) Devices Rated 800 Amperes or Less. The next higher standard overcurrent device rating (above the ampacity of the conductors being protected) shall be permitted to be used, provided all of the following conditions are met:

(1) The conductors being protected are not part of a multioutlet branch circuit supplying receptacles for cord-and-plug-connected portable loads.

(2) The ampacity of the conductors does not correspond with the standard ampere rating of a fuse or a circuit breaker without overload trip adjustments above its rating (but that shall be permitted to have other trip or rating adjustments).

(3) The next higher standard rating selected does not exceed 800 amperes.

Table 2.40.1.3 Other Articles

Equipment	Article
Air-conditioning and refrigerating equipment	4.40
Appliances	4.22
Assembly occupancies	5.18
Audio signal processing, amplification, and reproduction equipment	6.40
Branch circuits	2.10
Busways	3.68

(c) Devices Rated Over 800 Amperes. Where the overcurrent device is rated over 800 amperes, the ampacity of the conductors it protects shall be equal to or greater than the rating of the overcurrent device defined in 2.40.1.6.

(d) Small Conductors. Unless specifically permitted in 2.40.1.4(e) or 2.40.1.4(g), the overcurrent protection shall not exceed 15 amperes for 2.0 mm² (1.6 mm dia.), 20 amperes for 3.5 mm² (2.0 mm dia.), and 30 amperes for 5.5 mm² (2.6 mm dia.) copper; or 15 amperes for 3.5 mm² (2.0 mm dia.) and 25 amperes for 5.5 mm² (2.6 mm dia.) aluminum and copper-clad aluminum after any correction factors for ambient temperature and number of conductors have been applied.

(e) Tap Conductors. Tap conductors shall be permitted to be protected against overcurrent in accordance with the following:

- (1) 2.10.2.1(a)(3) and (a)(4) Household Ranges and Cooking Appliances and Other Loads
- (2) 2.40.1.5(b)(2) Fixture Wire
- (3) 2.40.2.2 Location in Circuit
- (4) 3.68.2.8(b) Reduction in Ampacity Size of Busway
- (5) 3.68.2.8(c) Feeder or Branch Circuits (busway taps)
- (6) 4.30.4.3(d) Single Motor Taps

(f) Transformer Secondary Conductors. Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors shall not be considered to be protected by the primary overcurrent protective device. Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, or a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 4.50.1.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary to primary transformer voltage ratio.

(g) Overcurrent Protection for Specific Conductor Applications. Overcurrent protection for the specific conductors shall be permitted to be provided as referenced in Table 2.40.1.4(g).

Table 2.40.1.4(g) Specific Conductor Applications

Conductor	Article	Section
Air-conditioning and refrigeration equipment circuit conductors	4.40.3, 4.40.6	
Capacitor circuit conductors	4.60	4.60.1.8(b) and 4.60.2.2(a)–(d)
Control and instrumentation circuit conductors (Type ITC)	7.27	7.27.1.9
Electric welder circuit conductors	6.30	6.30.2.2 and 6.30.3.2
Fire alarm system circuit conductors	7.60	7.60.2.3, 7.60.2.4, 7.60.3.1, and Chapter 9, Tables 12(a) and 12(b)
Motor-operated appliance circuit conductors	4.22.2	
Motor and motor-control circuit conductors	4.30.3, 4.30.4, 4.30.5, 4.30.6, 4.30.7	
Phase converter supply conductors	4.55	4.55.17
Remote-control, signaling, and power-limited circuit conductors	7.25	7.25.2.3, 7.25.2.4, 725.41, and Chapter 9, Tables 11(a) and 11(b)
Secondary tie conductors	4.50	4.50.1.6

2.40.1.5 Protection of Flexible Cords, Flexible Cables, and Fixture Wires. Flexible cord and flexible cable, including tinsel cord and extension cords, and fixture wires shall be protected against overcurrent by either 2.40.1.5(a) or (b).

(a) Ampacities. Flexible cord and flexible cable shall be protected by an overcurrent device in accordance with their ampacity as specified in Table 4.0.1.5(a) and Table 4.0.1.5(b). Fixture wire shall be protected against overcurrent in accordance with its ampacity as specified in Table 4.2.1.5. Supplementary overcurrent protection, as in 2.40.1.10, shall be permitted to be an acceptable means for providing this protection.

(b) Branch Circuit Overcurrent Device. Flexible cord shall be protected where supplied by a branch circuit in accordance with one of the methods described in 2.40.1.5(b)(1), (b)(2), (b)(3), or (b)(4).

(1) Supply Cord of Listed Appliance or Portable Lamps. Where flexible cord or tinsel cord is approved for and used with a specific listed appliance or portable lamp, it shall be considered to be protected when applied within the appliance or portable lamp listing requirements.

(2) Fixture Wire. Fixture wire shall be permitted to be tapped to the branch circuit conductor of a branch circuit in accordance with the following:

- a. 20-ampere circuits — 18 AWG, up to 15 m of run length
- b. 20-ampere circuits — 16 AWG, up to 30 m of run length
- c. 20-ampere circuits — 2.0 mm² (1.6 mm dia.) and larger
- d. 30-ampere circuits — 2.0 mm² (1.6 mm dia.) and larger
- e. 40-ampere circuits — 3.5 mm² (2.0 mm dia.) and larger
- f. 50-ampere circuits — 3.5 mm² (2.0 mm dia.) and larger

(3) Extension Cord Sets. Flexible cord used in listed extension cord sets shall be considered to be protected when applied within the extension cord listing requirements.

(4) Field Assembled Extension Cord Sets. Flexible cord used in extension cords made with separately listed and installed components shall be permitted to be supplied by a branch circuit in accordance with the following:

20-ampere circuits — 16 AWG and larger

2.40.1.6 Standard Ampere Ratings.

(a) Fuses and Fixed-Trip Circuit Breakers. The standard ampere ratings for fuses and inverse time circuit breakers shall be considered 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 110, 125, 150, 175, 200, 225, 250, 300, 350, 400, 450, 500, 600, 700, 800, 1000, 1200, 1600, 2000, 2500, 3000, 4000, 5000, and 6000 amperes. Additional standard ampere ratings for fuses shall be 1, 3, 6, 10, and 601. The use of fuses and inverse time circuit breakers with nonstandard ampere ratings shall be permitted.

(b) Adjustable-Trip Circuit Breakers. The rating of adjustable-trip circuit breakers having external means for adjusting the current setting (long-time pickup setting), not meeting the requirements of 2.40.1.6(c), shall be the maximum setting possible.

(c) Restricted Access Adjustable-Trip Circuit Breakers. A circuit breaker(s) that has restricted access to the adjusting means shall be permitted to have an ampere rating(s) that is equal to the adjusted current setting (long-time pickup setting). Restricted access shall be defined as located behind one of the following:

- (1) Removable and sealable covers over the adjusting means
- (2) Bolted equipment enclosure doors
- (3) Locked doors accessible only to qualified personnel

2.40.1.8 Fuses or Circuit Breakers in Parallel. Fuses and circuit breakers shall be permitted to be connected in parallel where they are factory assembled in parallel and listed as a unit. Individual fuses, circuit breakers, or combinations thereof shall not otherwise be connected in parallel.

2.40.1.9 Thermal Devices. Thermal relays and other devices not designed to open short circuits or ground faults shall not be used for the protection of conductors against overcurrent due to short circuits or ground faults, but the use of such devices shall be permitted to protect motor branch-circuit conductors from overload if protected in accordance with 4.30.3.10.

2.40.1.10 Supplementary Overcurrent Protection. Where supplementary overcurrent protection is used for luminaires (lighting

fixtures), appliances, and other equipment or for internal circuits and components of equipment, it shall not be used as a substitute for required branch-circuit overcurrent devices or in place of the required branch-circuit protection. Supplementary overcurrent devices shall not be required to be readily accessible.

2.40.1.12 Electrical System Coordination. Where an orderly shutdown is required to minimize the hazard(s) to personnel and equipment, a system of coordination based on the following two conditions shall be permitted:

- (1) Coordinated short-circuit protection
- (2) Overload indication based on monitoring systems or devices

FPN: The monitoring system may cause the condition to go to alarm, allowing corrective action or an orderly shutdown, thereby minimizing personnel hazard and equipment damage.

2.40.1.13 Ground-Fault Protection of Equipment. Ground-fault protection of equipment shall be provided in accordance with the provisions of 2.30.7.6 for solidly grounded wye electrical systems of more than 150 volts to ground but not exceeding 600 volts phase-to-phase for each individual device used as a building or structure main disconnecting means rated 1000 amperes or more.

The provisions of this section shall not apply to the disconnecting means for the following:

- (1) Continuous industrial processes where a nonorderly shutdown will introduce additional or increased hazards
- (2) Installations where ground-fault protection is provided by other requirements for services or feeders
- (3) Fire pumps

2.40.2 Location

2.40.2.1 Ungrounded Conductors.

(a) Overcurrent Device Required. A fuse or an overcurrent trip unit of a circuit breaker shall be connected in series with each ungrounded conductor. A combination of a current transformer and overcurrent relay shall be considered equivalent to an overcurrent trip unit.

FPN: For motor circuits, see Parts 4.30.3, 4.30.4, 4.30.5, and 4.30.9.

(b) Circuit Breaker as Overcurrent Device. Circuit breakers shall open all ungrounded conductors of the circuit both manually and automatically unless otherwise permitted in 2.40.2.1(b)(1), (b)(2), and (b)(3).

(1) Multiwire Branch Circuit. Except where limited by 2.10.1.4(b), individual single-pole circuit breakers, with or without identified handle ties, shall be permitted as the protection for each ungrounded conductor of multiwire branch circuits that serve only single-phase line-to-neutral loads.

(2) Grounded Single-Phase and 3-Wire dc Circuits. In grounded systems, individual single-pole circuit breakers with identified handle ties shall be permitted as the protection for each ungrounded conductor for line-to-line connected loads for single-phase circuits or 3-wire, direct-current circuits.

(3) 3-Phase and 2-Phase Systems. For line-to-line loads in 4-wire, 3-phase systems or 5-wire, 2-phase systems having a grounded neutral and no conductor operating at a voltage greater than permitted in 2.10.1.6, individual single-pole circuit breakers with identified handle ties shall be permitted as the protection for each ungrounded conductor.

(c) Closed-Loop Power Distribution Systems. Listed devices that provide equivalent overcurrent protection in closed-loop power distribution systems shall be permitted as a substitute for fuses or circuit breakers.

2.40.2.2 Location in Circuit. Overcurrent protection shall be provided in each ungrounded circuit conductor and shall be located at the point where the conductors receive their supply except as specified in 2.40.2.2(a) through (g). No conductor supplied under the provisions of 2.40.2.2(a) through (g) shall supply another conductor under those provisions, except through an overcurrent protective device meeting the requirements of 2.40.1.4.

(a) Branch-Circuit Conductors. Branch-circuit tap conductors meeting the requirements specified in 2.10.2.1 shall be permitted to have overcurrent protection located as specified in that section.

(b) Feeder Taps. Conductors shall be permitted to be tapped, without overcurrent protection at the tap, to a feeder as specified in 2.40.2.2(b)(1) through (b)(5). The provisions of 2.40.1.4(b) shall not be permitted for tap conductors.

(1) Taps Not Over 3 000 mm Long. Where the length of the tap conductors does not exceed 3 000 mm and the tap conductors comply with all of the following:

a. The ampacity of the tap conductors is

1. Not less than the combined calculated loads on the circuits supplied by the tap conductors, and

2. Not less than the rating of the device supplied by the tap conductors or not less than the rating of the overcurrent-protective device at the termination of the tap conductors.

b. The tap conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.

c. Except at the point of connection to the feeder, the tap conductors are enclosed in a raceway, which shall extend from the tap to the enclosure of an enclosed switchboard, panelboard, or control devices, or to the back of an open switchboard.

d. For field installations where the tap conductors leave the enclosure or vault in which the tap is made, the rating of the overcurrent device on the line side of the tap conductors shall not exceed 10 times the ampacity of the tap conductor.

FPN: For overcurrent protection requirements for lighting and appliance branch-circuit panelboards and certain power panelboards, see 4.8.3.7(a), (b), and (e).

(2) Taps Not Over 7 600 mm Long. Where the length of the tap conductors does not exceed 7 600 mm and the tap conductors comply with all the following:

a. The ampacity of the tap conductors is not less than one-third of the rating of the overcurrent device protecting the feeder conductors.

b. The tap conductors terminate in a single circuit breaker or a single set of fuses that will limit the load to the ampacity of the tap

conductors. This device shall be permitted to supply any number of additional overcurrent devices on its load side.

c. The tap conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(3) Taps Supplying a Transformer [Primary Plus Secondary Not Over 7 600 mm Long]. Where the tap conductors supply a transformer and comply with all the following conditions:

a. The conductors supplying the primary of a transformer have an ampacity at least one-third the rating of the overcurrent device protecting the feeder conductors.

b. The conductors supplied by the secondary of the transformer shall have an ampacity that is not less than the value of the primary-to-secondary voltage ratio multiplied by one-third of the rating of the overcurrent device protecting the feeder conductors.

c. The total length of one primary plus one secondary conductor, excluding any portion of the primary conductor that is protected at its ampacity, is not over 7 600 mm.

d. The primary and secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

e. The secondary conductors terminate in a single circuit breaker or set of fuses that limit the load current to not more than the conductor ampacity that is permitted by 3.10.1.15.

(4) Taps Over 7 600 mm Long. Where the feeder is in a high bay manufacturing building over 11 m high at walls and the installation complies with all the following conditions:

a. Conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the systems.

b. The tap conductors are not over 7 600 mm long horizontally and not over 30 m total length.

c. The ampacity of the tap conductors is not less than one-third the rating of the overcurrent device protecting the feeder conductors.

d. The tap conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the tap

conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.

e. The tap conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

f. The tap conductors are continuous from end-to-end and contain no splices.

g. The tap conductors are sized 14 mm² copper or 22 mm² aluminum or larger.

h. The tap conductors do not penetrate walls, floors, or ceilings.

i. The tap is made no less than 9 000 mm from the floor.

(5) Outside Taps of Unlimited Length. Where the conductors are located outdoors of a building or structure, except at the point of load termination, and comply with all of the following conditions:

a. The conductors are protected from physical damage in an approved manner.

b. The conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.

c. The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.

d. The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:

1. Outside of a building or structure
2. Inside, nearest the point of entrance of the conductors
3. Where installed in accordance with 2.30.1.6, nearest the point of entrance of the conductors

(c) Transformer Secondary Conductors. Each set of conductors feeding separate loads shall be permitted to be connected to a transformer secondary, without overcurrent protection at the secondary, as specified in 2.40.2.2(c)(1) through (c)(6). The provisions of 2.40.1.4(b) shall not be permitted for transformer secondary conductors.

FPN: For overcurrent protection requirements for transformers, see 4.50.1.3.

(1) Protection by Primary Overcurrent Device. Conductors supplied by the secondary side of a single-phase transformer having a 2-wire (single-voltage) secondary, or a three-phase, delta-delta connected transformer having a 3-wire (single-voltage) secondary, shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection is in accordance with 4.50.1.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary to primary transformer voltage ratio.

Single-phase (other than 2-wire) and multiphase (other than delta-delta, 3-wire) transformer secondary conductors are not considered to be protected by the primary overcurrent protective device.

(2) Transformer Secondary Conductors Not Over 3 000 mm Long. Where the length of secondary conductor does not exceed 3 000 mm and complies with all of the following:

a. The ampacity of the secondary conductors is

1. Not less than the combined calculated loads on the circuits supplied by the secondary conductors, and

2. Not less than the rating of the device supplied by the secondary conductors or not less than the rating of the overcurrent-protective device at the termination of the secondary conductors, and

3. Not less than one-tenth of the rating of the overcurrent device protecting the primary of the transformer, multiplied by the primary to secondary transformer voltage ratio

b. The secondary conductors do not extend beyond the switchboard, panelboard, disconnecting means, or control devices they supply.

c. The secondary conductors are enclosed in a raceway, which shall extend from the transformer to the enclosure of an enclosed switchboard, panelboard, or control devices or to the back of an open switchboard.

FPN: For overcurrent protection requirements for lighting and appliance branch-circuit panelboards and certain power panelboards, see 4.8.3.7(a), (b), and (e).

(3) Industrial Installation Secondary Conductors Not Over 7 600 mm Long. For industrial installations only, where the length of the

secondary conductors does not exceed 7 600 mm and complies with all of the following:

a. The ampacity of the secondary conductors is not less than the secondary current rating of the transformer, and the sum of the ratings of the overcurrent devices does not exceed the ampacity of the secondary conductors.

b. All overcurrent devices are grouped.

c. The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(4) Outside Secondary Conductors. Where the conductors are located outdoors of a building or structure, except at the point of load termination, and comply with all of the following conditions:

a. The conductors are protected from physical damage in an approved manner.

b. The conductors terminate at a single circuit breaker or a single set of fuses that limit the load to the ampacity of the conductors. This single overcurrent device shall be permitted to supply any number of additional overcurrent devices on its load side.

c. The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.

d. The disconnecting means for the conductors is installed at a readily accessible location complying with one of the following:

1. Outside of a building or structure
2. Inside, nearest the point of entrance of the conductors
3. Where installed in accordance with 2.30.1.6, nearest the point of entrance of the conductors

(5) Secondary Conductors from a Feeder Tapped Transformer. Transformer secondary conductors installed in accordance with 2.40.2.2(b)(3) shall be permitted to have overcurrent protection as specified in that section.

(6) Secondary Conductors Not Over 7 600 mm Long. Where the length of secondary conductor does not exceed 7 600 mm and complies with all of the following:

a. The secondary conductors shall have an ampacity that is not less than the value of the primary-to-secondary voltage ratio multiplied by one-third of the rating of the overcurrent device protecting the primary of the transformer.

b. The secondary conductors terminate in a single circuit breaker or set of fuses that limit the load current to not more than the conductor ampacity that is permitted by 3.10.1.15.

c. The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(d) Service Conductors. Service-entrance conductors shall be permitted to be protected by overcurrent devices in accordance with 2.30.7.2.

(e) Busway Taps. Busways and busway taps shall be permitted to be protected against overcurrent in accordance with 3.68.2.8.

(f) Motor Circuit Taps. Motor-feeder and branch-circuit conductors shall be permitted to be protected against overcurrent in accordance with 4.30.2.8 and 4.30.4.3, respectively.

(g) Conductors from Generator Terminals. Conductors from generator terminals that meet the size requirement in 4.45.1.13 shall be permitted to be protected against overload by the generator overload protective device(s) required by 4.45.1.12.

2.40.2.3 Grounded Conductor. No overcurrent device shall be connected in series with any conductor that is intentionally grounded, unless one of the following two conditions is met:

(1) The overcurrent device opens all conductors of the circuit, including the grounded conductor, and is designed so that no pole can operate independently.

(2) Where required by 4.30.3.6 or 4.30.3.7 for motor overload protection.

2.40.2.4 Change in Size of Grounded Conductor. Where a change occurs in the size of the ungrounded conductor, a similar change shall be permitted to be made in the size of the grounded conductor.

2.40.2.5 Location in or on Premises.

(a) **Accessibility.** Overcurrent devices shall be readily accessible and shall be installed so that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 2.0 m (6 ft 7 in.) above the floor or working platform unless one of the following applies:

- (1) For busways, as provided in 3.68.2.3.
- (2) For supplementary overcurrent protection, as described in 2.40.1.10.
- (3) For overcurrent devices, as described in 2.25.2.11 and 2.30.7.3.
- (4) For overcurrent devices adjacent to utilization equipment that they supply, access shall be permitted to be by portable means.

(b) **Occupancy.** Each occupant shall have ready access to all overcurrent devices protecting the conductors supplying that occupancy.

Exception No. 1: Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the service overcurrent devices and feeder overcurrent devices supplying more than one occupancy shall be permitted to be accessible to only authorized management personnel in the following:

- (1) *Multiple-occupancy buildings*
- (2) *Guest rooms or guest suites of hotels and motels that are intended for transient occupancy*

Exception No. 2: Where electric service and electrical maintenance are provided by the building management and where these are under continuous building management supervision, the branch circuit overcurrent devices supplying any guest rooms or guest suites shall be permitted to be accessible to only authorized management personnel for guest rooms of hotels and motels that are intended for transient occupancy.

(c) **Not Exposed to Physical Damage.** Overcurrent devices shall be located where they will not be exposed to physical damage.

FPN: See 1.10.1.11, Deteriorating Agents.

(d) **Not in Vicinity of Easily Ignitable Material.** Overcurrent devices shall not be located in the vicinity of easily ignitable material, such as in clothes closets.

(e) **Not Located in Bathrooms.** In dwelling units and guest rooms or guest suites of hotels and motels, overcurrent devices, other than supplementary overcurrent protection, shall not be located in bathrooms.

2.40.3 Enclosures

2.40.3.1 General.

(a) **Protection from Physical Damage.** Overcurrent devices shall be protected from physical damage by one of the following:

- (1) Installation in enclosures, cabinets, cutout boxes, or equipment assemblies
- (2) Mounting on open-type switchboards, panelboards, or control boards that are in rooms or enclosures free from dampness and easily ignitable material and are accessible only to qualified personnel

(b) **Operating Handle.** The operating handle of a circuit breaker shall be permitted to be accessible without opening a door or cover.

2.40.3.3 Damp or Wet Locations. Enclosures for overcurrent devices in damp or wet locations shall comply with 3.12.1.2(a).

2.40.3.4 Vertical Position. Enclosures for overcurrent devices shall be mounted in a vertical position unless that is shown to be impracticable. Circuit breaker enclosures shall be permitted to be installed horizontally where the circuit breaker is installed in accordance with 2.40.7.2. Listed busway plug-in units shall be permitted to be mounted in orientations corresponding to the busway mounting position.

2.40.4 Disconnecting and Guarding

2.40.4.1 Disconnecting Means for Fuses. A disconnecting means shall be provided on the supply side of all fuses in circuits over 150 volts to ground and cartridge fuses in circuits of any voltage where

accessible to other than licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner, so that each circuit containing fuses can be independently disconnected from the source of power. A current-limiting device without a disconnecting means shall be permitted on the supply side of the service disconnecting means as permitted by 2.30.6.13. A single disconnecting means shall be permitted on the supply side of more than one set of fuses as permitted by 4.30.9.2, Exception, for group operation of motors and 4.24.3.4(c) for fixed electric space-heating equipment.

2.40.4.2 Arcing or Suddenly Moving Parts. Arcing or suddenly moving parts shall comply with 2.40.4.2(a) and (b).

(a) Location. Fuses and circuit breakers shall be located or shielded so that persons will not be burned or otherwise injured by their operation.

(b) Suddenly Moving Parts. Handles or levers of circuit breakers, and similar parts that may move suddenly in such a way that persons in the vicinity are likely to be injured by being struck by them, shall be guarded or isolated.

2.40.5 Plug Fuses, Fuseholders, and Adapters

2.40.5.1 General.

(a) Maximum Voltage. Plug fuses shall be permitted to be used in the following circuits:

- (1) Circuits not exceeding 125 volts between conductors
- (2) Circuits supplied by a system having a grounded neutral where the line-to-neutral voltage does not exceed 150 volts

(b) Marking. Each fuse, fuseholder, and adapter shall be marked with its ampere rating.

(c) Hexagonal Configuration. Plug fuses of 15-ampere and lower rating shall be identified by a hexagonal configuration of the window, cap, or other prominent part to distinguish them from fuses of higher ampere ratings.

(d) No Energized Parts. Plug fuses, fuseholders, and adapters shall have no exposed energized parts after fuses or fuses and adapters have been installed.

(e) Screw Shell. The screw shell of a plug-type fuseholder shall be connected to the load side of the circuit.

2.40.5.2 Edison-Base Fuses.

(a) Classification. Plug fuses of the Edison-base type shall be classified at not over 125 volts and 30 amperes and below.

(b) Replacement Only. Plug fuses of the Edison-base type shall be used only for replacements in existing installations where there is no evidence of overfusing or tampering.

2.40.5.3 Edison-Base Fuseholders. Fuseholders of the Edison-base type shall be installed only where they are made to accept Type S fuses by the use of adapters.

2.40.5.4 Type S Fuses. Type S fuses shall be of the plug type and shall comply with 2.40.5.4(a) and (b).

(a) Classification. Type S fuses shall be classified at not over 125 volts and 0 to 15 amperes, 16 to 20 amperes, and 21 to 30 amperes.

(b) Noninterchangeable. Type S fuses of an ampere classification as specified in 2.40.5.4(a) shall not be interchangeable with a lower ampere classification. They shall be designed so that they cannot be used in any fuseholder other than a Type S fuseholder or a fuseholder with a Type S adapter inserted.

2.40.5.5 Type S Fuses, Adapters, and Fuseholders.

(a) To Fit Edison-Base Fuseholders. Type S adapters shall fit Edison-base fuseholders.

(b) To Fit Type S Fuses Only. Type S fuseholders and adapters shall be designed so that either the fuseholder itself or the fuseholder

with a Type S adapter inserted cannot be used for any fuse other than a Type S fuse.

(c) **Nonremovable.** Type S adapters shall be designed so that once inserted in a fuseholder, they cannot be removed.

(d) **Nontamperable.** Type S fuses, fuseholders, and adapters shall be designed so that tampering or shunting (bridging) would be difficult.

(e) **Interchangeability.** Dimensions of Type S fuses, fuseholders, and adapters shall be standardized to permit interchangeability regardless of the manufacturer.

2.40.6 Cartridge Fuses and Fuseholders

2.40.6.1 General.

(a) **Maximum Voltage — 300-Volt Type.** Cartridge fuses and fuseholders of the 300-volt type shall be permitted to be used in the following circuits:

- (1) Circuits not exceeding 300 volts between conductors
- (2) Single-phase line-to-neutral circuits supplied from a 3-phase, 4-wire, solidly grounded neutral source where the line-to-neutral voltage does not exceed 300 volts

(b) **Noninterchangeable — 0–6000-Ampere Cartridge Fuseholders.** Fuseholders shall be designed so that it will be difficult to put a fuse of any given class into a fuseholder that is designed for a current lower, or voltage higher, than that of the class to which the fuse belongs. Fuseholders for current-limiting fuses shall not permit insertion of fuses that are not current-limiting.

(c) **Marking.** Fuses shall be plainly marked, either by printing on the fuse barrel or by a label attached to the barrel showing the following:

- (1) Ampere rating
- (2) Voltage rating
- (3) Interrupting rating where other than 10,000 amperes

- (4) Current limiting where applicable
- (5) The name or trademark of the manufacturer

The interrupting rating shall not be required to be marked on fuses used for supplementary protection.

(d) **Renewable Fuses.** Class H cartridge fuses of the renewable type shall only be permitted to be used for replacement in existing installations where there is no evidence of overfusing or tampering.

2.40.6.2 Classification. Cartridge fuses and fuseholders shall be classified according to voltage and amperage ranges. Fuses rated 600 volts, nominal, or less shall be permitted to be used for voltages at or below their ratings.

2.40.7 Circuit Breakers

2.40.7.1 Method of Operation. Circuit breakers shall be trip free and capable of being closed and opened by manual operation. Their normal method of operation by other than manual means, such as electrical or pneumatic, shall be permitted if means for manual operation are also provided.

2.40.7.2 Indicating. Circuit breakers shall clearly indicate whether they are in the open “off” or closed “on” position. Where circuit breaker handles are operated vertically rather than rotationally or horizontally, the “up” position of the handle shall be the “on” position.

2.40.7.3 Nontamperable. A circuit breaker shall be of such design that any alteration of its trip point (calibration) or the time required for its operation requires dismantling of the device or breaking of a seal for other than intended adjustments.

2.40.7.4 Marking.

(a) **Durable and Visible.** Circuit breakers shall be marked with their ampere rating in a manner that will be durable and visible after installation. Such marking shall be permitted to be made visible by removal of a trim or cover.

(b) Location. Circuit breakers rated at 100 amperes or less and 600 volts or less shall have the ampere rating molded, stamped, etched, or similarly marked into their handles or escutcheon areas.

(c) Interrupting Rating. Every circuit breaker having an interrupting rating other than 5000 amperes shall have its interrupting rating shown on the circuit breaker. The interrupting rating shall not be required to be marked on circuit breakers used for supplementary protection.

(d) Used as Switches. Circuit breakers used as switches in 120-volt and 277-volt fluorescent lighting circuits shall be listed and shall be marked SWD or HID. Circuit breakers used as switches in high-intensity discharge lighting circuits shall be listed and shall be marked as HID.

(e) Voltage Marking. Circuit breakers shall be marked with a voltage rating not less than the nominal system voltage that is indicative of their capability to interrupt fault currents between phases or phase to ground.

2.40.7.6 Applications. A circuit breaker with a straight voltage rating, such as 240V or 480V, shall be permitted to be applied in a circuit in which the nominal voltage between any two conductors does not exceed the circuit breaker's voltage rating. A two-pole circuit breaker shall not be used for protecting a 3-phase, corner-grounded delta circuit unless the circuit breaker is marked 1-3 to indicate such suitability.

A circuit breaker with a slash rating, such as 120/240V or 480Y/277V, shall be permitted to be applied in a solidly grounded circuit where the nominal voltage of any conductor to ground does not exceed the lower of the two values of the circuit breaker's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the circuit breaker's voltage rating.

FPN: Proper application of molded case circuit breakers on 3-phase systems, other than solidly grounded wye, particularly on corner grounded delta systems, considers the circuit breakers' individual pole-interrupting capability.

2.40.7.7 Series Ratings. Where a circuit breaker is used on a circuit having an available fault current higher than the marked interrupting rating by being connected on the load side of an acceptable

overcurrent protective device having a higher rating, the circuit breaker shall meet the requirements specified in (a) or (b), and (c).

(a) Selected Under Engineering Supervision in Existing Installations. The series rated combination devices shall be selected by a licensed professional engineer engaged primarily in the design or maintenance of electrical installations. The selection shall be documented and stamped by the professional engineer. This documentation shall be available to those authorized to design, install, inspect, maintain, and operate the system. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.

(b) Tested Combinations. The combination of line-side overcurrent device and load-side circuit breaker(s) is tested and marked on the end use equipment, such as switchboards and panelboards.

(c) Motor Contribution. Series ratings shall not be used where

(1) Motors are connected on the load side of the higher-rated overcurrent device and on the line side of the lower-rated overcurrent device, and

(2) The sum of the motor full-load currents exceeds 1 percent of the interrupting rating of the lower-rated circuit breaker.

2.40.8 Supervised Industrial Installations

2.40.8.1 General. Overcurrent protection in areas of supervised industrial installations shall comply with all of the other applicable provisions of this article, except as provided in Part 2.40.8. The provisions of Part 2.40.8 shall be permitted only to apply to those portions of the electrical system in the supervised industrial installation used exclusively for manufacturing or process control activities.

2.40.8.3 Location in Circuit. An overcurrent device shall be connected in each ungrounded circuit conductor as required in 2.40.8.3(a) through (d).

(a) Feeder and Branch-Circuit Conductors. Feeder and branch-circuit conductors shall be protected at the point the conductors

receive their supply as permitted in 2.40.2.2 or as otherwise permitted in 2.40.8.3(b), (c), or (d).

(b) Transformer Secondary Conductors of Separately Derived Systems. Conductors shall be permitted to be connected to a transformer secondary of a separately derived system, without overcurrent protection at the connection, where the conditions of 2.40.8.3(b)(1), (b)(2), and (b)(3) are met.

(1) Short-Circuit and Ground-Fault Protection. The conductors shall be protected from short-circuit and ground-fault conditions by complying with one of the following conditions:

a. The length of the secondary conductors does not exceed 30 m and the transformer primary overcurrent device has a rating or setting that does not exceed 150 percent of the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio.

b. The conductors are protected by a differential relay with a trip setting equal to or less than the conductor ampacity.

FPN: A differential relay is connected to be sensitive only to short-circuit or fault currents within the protected zone and is normally set much lower than the conductor ampacity. The differential relay is connected to trip protective devices that will de-energize the protected conductors if a short-circuit condition occurs.

c. The conductors shall be considered to be protected if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors within recognized time vs. current limits for all short-circuit and ground-fault conditions.

(2) Overload Protection. The conductors shall be protected against overload conditions by complying with one of the following:

a. The conductors terminate in a single overcurrent device that will limit the load to the conductor ampacity.

b. The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses, mounted in a single enclosure, in a group of separate enclosures,

or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location.

c. Overcurrent relaying is connected [with a current transformer(s), if needed] to sense all of the secondary conductor current and limit the load to the conductor ampacity by opening upstream or downstream devices.

d. Conductors shall be considered to be protected if calculations, made under engineering supervision, determine that the system overcurrent devices will protect the conductors from overload conditions.

(3) Physical Protection. The secondary conductors are protected from physical damage by being enclosed in an approved raceway or by other approved means.

(c) Outside Feeder Taps. Outside conductors shall be permitted to be tapped to a feeder or to be connected at a transformer secondary, without overcurrent protection at the tap or connection, where all the following conditions are met:

(1) The conductors are protected from physical damage in an approved manner.

(2) The sum of the overcurrent devices at the conductor termination limits the load to the conductor ampacity. The overcurrent devices shall consist of not more than six circuit breakers or sets of fuses mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard. There shall be no more than six overcurrent devices grouped in any one location.

(3) The tap conductors are installed outdoors of a building or structure except at the point of load termination.

(4) The overcurrent device for the conductors is an integral part of a disconnecting means or shall be located immediately adjacent thereto.

(5) The disconnecting means for the conductors are installed at a readily accessible location complying with one of the following:

a. Outside of a building or structure

b. Inside, nearest the point of entrance of the conductors

c. Where installed in accordance with 2.30.1.6, nearest the point of entrance of the conductors

(d) Protection by Primary Overcurrent Device. Conductors supplied by the secondary side of a transformer shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided the primary device time-current protection characteristic, multiplied by the maximum effective primary-to-secondary transformer voltage ratio, effectively protects the secondary conductors.

2.40.8.4 Series Ratings. Where a circuit breaker is used on a circuit having an available fault current higher than its marked interrupting rating by being connected on the load side of an acceptable overcurrent protective device having the higher rating, the circuit breaker shall meet the requirements specified in 2.40.8.4(a) or (b) and (c).

(a) Tested Combinations. The combination of line-side overcurrent device and load-side circuit breaker(s) is tested and marked on the end use equipment, such as switchboards and panelboards.

(b) Selected Under Engineering Supervision. The line-side device is selected under engineering supervision. This series combination rating, including identification of the upstream device, shall be field marked on the end use equipment.

(c) Motor Contribution. Series ratings shall not be used where

(1) Motors are connected on the load side of the higher-rated overcurrent device and on the line side of the lower-rated overcurrent device, and

(2) The sum of the motor full-load currents exceeds 1 percent of the interrupting rating of the lower-rated circuit breaker.

2.40.9 Overcurrent Protection Over 600 Volts, Nominal

2.40.9.1 Feeders and Branch Circuits.

(a) Location and Type of Protection. Feeder and branch-circuit conductors shall have overcurrent protection in each ungrounded conductor located at the point where the conductor receives its supply or at an alternative location in the circuit when designed under engineering supervision that includes but is not limited to considering

the appropriate fault studies and time-current coordination analysis of the protective devices and the conductor damage curves. The overcurrent protection shall be permitted to be provided by either 2.40.9.1(a)(1) or (a)(2).

(1) **Overcurrent Relays and Current Transformers.** Circuit breakers used for overcurrent protection of 3-phase circuits shall have a minimum of three overcurrent relay elements operated from three current transformers. The separate overcurrent relay elements (or protective functions) shall be permitted to be part of a single electronic protective relay unit.

On 3-phase, 3-wire circuits, an overcurrent relay element in the residual circuit of the current transformers shall be permitted to replace one of the phase relay elements.

An overcurrent relay element, operated from a current transformer that links all phases of a 3-phase, 3-wire circuit, shall be permitted to replace the residual relay element and one of the phase-conductor current transformers. Where the neutral is not regrounded on the load side of the circuit as permitted in 2.50.10.5(b), the current transformer shall be permitted to link all 3-phase conductors and the grounded circuit conductor (neutral).

(2) **Fuses.** A fuse shall be connected in series with each ungrounded conductor.

(b) Protective Devices. The protective device(s) shall be capable of detecting and interrupting all values of current that can occur at their location in excess of their trip-setting or melting point.

(c) Conductor Protection. The operating time of the protective device, the available short-circuit current, and the conductor used shall be coordinated to prevent damaging or dangerous temperatures in conductors or conductor insulation under short-circuit conditions.

2.40.9.2 Additional Requirements for Feeders.

(a) Rating or Setting of Overcurrent Protective Devices. The continuous ampere rating of a fuse shall not exceed three times the ampacity of the conductors. The long-time trip element setting of a breaker or the minimum trip setting of an electronically actuated fuse shall not exceed six times the ampacity of the conductor. For fire

pumps, conductors shall be permitted to be protected for overcurrent in accordance with 6.95.1.4(b).

(b) Feeder Taps. Conductors tapped to a feeder shall be permitted to be protected by the feeder overcurrent device where that overcurrent device also protects the tap conductor.

ARTICLE 2.50 — GROUNDING AND BONDING

2.50.1 General

2.50.1.1 Scope. This article covers general requirements for grounding and bonding of electrical installations, and specific requirements in (1) through (6).

- (1) Systems, circuits, and equipment required, permitted, or not permitted to be grounded
- (2) Circuit conductor to be grounded on grounded systems
- (3) Location of grounding connections
- (4) Types and sizes of grounding and bonding conductors and electrodes
- (5) Methods of grounding and bonding
- (6) Conditions under which guards, isolation, or insulation may be substituted for grounding

2.50.1.2 Definitions.

Effective Ground-Fault Current Path. An intentionally constructed, permanent, low-impedance electrically conductive path designed and intended to carry current under ground-fault conditions from the point of a ground fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground fault detectors on high-impedance grounded systems.

Ground Fault. An unintentional, electrically conducting connection between an ungrounded conductor of an electrical circuit and the normally non-current-carrying conductors, metallic enclosures, metallic raceways, metallic equipment, or earth.

Ground-Fault Current Path. An electrically conductive path from the point of a ground fault on a wiring system through normally non-current-carrying conductors, equipment, or the earth to the electrical supply source.

FPN: Examples of ground-fault current paths could consist of any combination of equipment grounding conductors, metallic raceways, metallic cable sheaths, electrical equipment, and any other electrically conductive material such as metal water and gas piping, steel framing members, stucco mesh, metal ducting, reinforcing steel, shields of communications cables, and the earth itself.

2.50.1.3 Application of Other Articles. In other articles applying to particular cases of installation of conductors and equipment, requirements are identified in Table 2.50.1.3 that are in addition to, or modifications of, those of this article.

2.50.1.4 General Requirements for Grounding and Bonding. The following general requirements identify what grounding and bonding of electrical systems are required to accomplish. The prescriptive methods contained in Article 2.50 shall be followed to comply with the performance requirements of this section.

(a) Grounded Systems.

(1) **Electrical System Grounding.** Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation.

(2) **Grounding of Electrical Equipment.** Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth so as to limit the voltage to ground on these materials.

(3) **Bonding of Electrical Equipment.** Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

Table 2.50.1.3 Additional Grounding Requirements

Conductor/Equipment	Article	Section
Agricultural buildings		5.47.1.9 and 5.47.1.10
Audio signal processing, amplification, and reproduction equipment		6.40.1.7
Branch circuits		2.10.1.5, 2.10.1.6, 4.6.1.3
Cablebus		3.70.1.9
Cable trays	3.92	3.92.1.3(c), 3.92.1.7
Capacitors		4.60.1.10, 4.60.2.4
Circuits and equipment operating at less than 50 volts	7.20	
Closed-loop and programmed power distribution		7.80.1.3
Communications circuits	8.0	
Community antenna television and radio distribution systems		8.20.3.1, 8.20.4.1, 8.20.4.4
Conductors for general wiring	3.10	
Cranes and hoists	6.10	
Electrically driven or controlled irrigation machines		6.75.1.11(c), 6.75.1.12, 6.75.1.13, 6.75.1.14, 6.75.1.15
Electric signs and outline lighting	6.0	
Electrolytic cells	6.68	

Table 2.50.1.3 (Continued)

Conductor/Equipment	Article	Section
Elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chair lifts	6.20	
Fire alarm systems		7.60.1.9
Fixed electric heating equipment for pipelines and vessels		4.27.4.5, 4.27.6.4
Fixed outdoor electric deicing and snow-melting equipment		4.26.3.8
Flexible cords and cables		4.0.2.3, 4.0.2.4
Floating buildings		5.53.3.1, 5.53.3.3, 5.53.3.4
Grounding-type receptacles, adapters, cord connectors, and attachment plugs		4.6.1.9
Hazardous (classified) locations	5.0–5.17	
Health care facilities	5.17	
Induction and dielectric heating equipment	6.65	
Industrial machinery	6.70	
Information technology equipment		6.45.1.15
Intrinsically safe systems		5.4.1.50
Luminaires (lighting fixtures) and lighting equipment		4.10.5.1, 4.10.5.2, 4.10.5.4, 4.10.5.5, 4.10.15.6(b)
Luminaires (fixtures), lampholders, and lamps	4.10

(4) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that are likely to become energized shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

(5) Effective Ground-Fault Current Path. Electrical equipment and wiring and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low-impedance circuit facilitating the operation of the overcurrent device or ground detector for high-impedance grounded systems. It shall be capable of safely carrying the maximum ground-fault current likely to be imposed on it from any point on the wiring system where a ground fault may occur to the electrical supply source. The earth shall not be considered as an effective ground-fault current path.

(b) Ungrounded Systems.

(1) Grounding Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected to earth in a manner that will limit the voltage imposed by lightning or unintentional contact with higher-voltage lines and limit the voltage to ground on these materials.

(2) Bonding of Electrical Equipment. Non-current-carrying conductive materials enclosing electrical conductors or equipment, or forming part of such equipment, shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low-impedance path for ground-fault current that is capable of carrying the maximum fault current likely to be imposed on it.

(3) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that are likely to become energized shall be connected together and to the supply system grounded equipment in a manner that creates a permanent, low-impedance path for ground-fault current that is capable of carrying the maximum fault current likely to be imposed on it.

(4) Path for Fault Current. Electrical equipment, wiring, and other electrically conductive material likely to become energized shall be installed in a manner that creates a permanent, low-impedance circuit from any point on the wiring system to the electrical supply source to facilitate the operation of overcurrent devices should a second fault

occur on the wiring system. The earth shall not be considered as an effective fault-current path.

FPN No. 1: A second fault that occurs through the equipment enclosures and bonding is considered a ground fault.

FPN No. 2: See Figure 2.50.1.4 for information on the organization of Article 2.50.

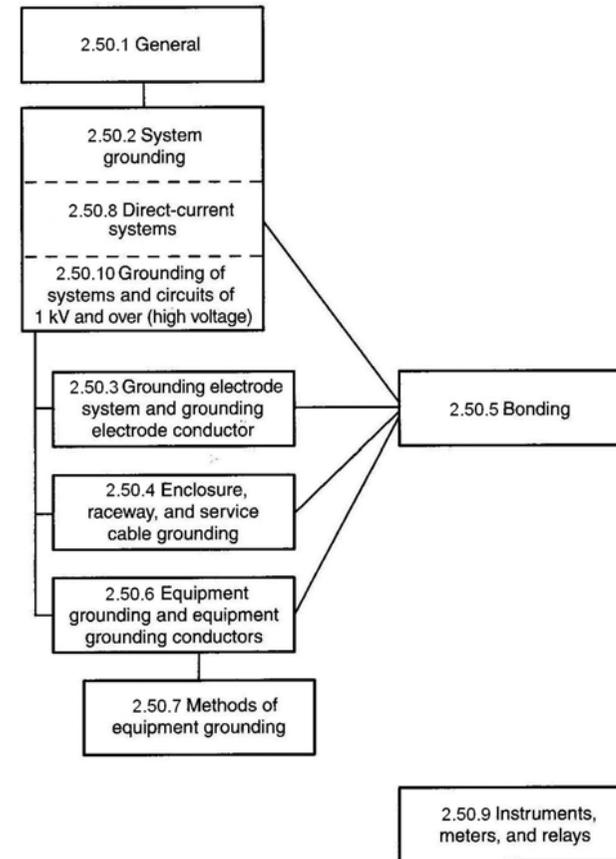

Figure 2.50.1.4 Grounding.

2.50.1.6 Objectionable Current over Grounding Conductors.

(a) Arrangement to Prevent Objectionable Current. The grounding of electrical systems, circuit conductors, surge arresters, and conductive non-current-carrying materials and equipment shall be installed and arranged in a manner that will prevent objectionable current over the grounding conductors or grounding paths.

(b) Alterations to Stop Objectionable Current. If the use of multiple grounding connections results in objectionable current, one or more of the following alterations shall be permitted to be made, provided that the requirements of 2.50.1.4(a)(5) or (b)(4) are met:

- (1) Discontinue one or more but not all of such grounding connections.
- (2) Change the locations of the grounding connections.
- (3) Interrupt the continuity of the conductor or conductive path interconnecting the grounding connections.
- (4) Take other suitable remedial and approved action.

(c) Temporary Currents Not Classified as Objectionable Currents. Temporary currents resulting from accidental conditions, such as ground-fault currents, that occur only while the grounding conductors are performing their intended protective functions shall not be classified as objectionable current for the purposes specified in 2.50.1.6(a) and (b).

(d) Limitations to Permissible Alterations. The provisions of this section shall not be considered as permitting electronic equipment from being operated on ac systems or branch circuits that are not grounded as required by this article. Currents that introduce noise or data errors in electronic equipment shall not be considered the objectionable currents addressed in this section.

(e) Isolation of Objectionable Direct-Current Ground Currents. Where isolation of objectionable dc ground currents from cathodic protection systems is required, a listed ac coupling/dc isolating device shall be permitted in the equipment grounding path to provide an effective return path for ac ground-fault current while blocking dc current.

2.50.1.8 Connection of Grounding and Bonding Equipment.

Grounding conductors and bonding jumpers shall be connected by exothermic welding, listed pressure connectors, listed clamps, or other listed means. Connection devices or fittings that depend solely on solder shall not be used. Sheet metal screws shall not be used to connect grounding conductors or connection devices to enclosures.

2.50.1.10 Protection of Ground Clamps and Fittings. Ground clamps or other fittings shall be approved for general use without protection or shall be protected from physical damage as indicated in (1) or (2) as follows:

- (1) In installations where they are not likely to be damaged
- (2) Where enclosed in metal, wood, or equivalent protective covering

2.50.1.12 Clean Surfaces. Nonconductive coatings (such as paint, lacquer, and enamel) on equipment to be grounded shall be removed from threads and other contact surfaces to ensure good electrical continuity or be connected by means of fittings designed so as to make such removal unnecessary.

2.50.2 System Grounding

2.50.2.1 Alternating-Current Systems to Be Grounded.

Alternating-current systems shall be grounded as provided for in 2.50.2.1(a), (b), (c), or (d). Other systems shall be permitted to be grounded. If such systems are grounded, they shall comply with the applicable provisions of this article.

FPN: An example of a system permitted to be grounded is a corner-grounded delta transformer connection. See 2.50.2.7(4) for conductor to be grounded.

(a) Alternating-Current Systems of Less Than 50 Volts. Alternating-current systems of less than 50 volts shall be grounded under any of the following conditions:

- (1) Where supplied by transformers, if the transformer supply system exceeds 150 volts to ground
- (2) Where supplied by transformers, if the transformer supply system is ungrounded

(3) Where installed as overhead conductors outside of buildings

(b) Alternating-Current Systems of 50 Volts to 1000 Volts. Alternating-current systems of 50 volts to 1000 volts that supply premises wiring and premises wiring systems shall be grounded under any of the following conditions:

(1) Where the system is 1-phase and can be grounded so that the maximum voltage to ground on the ungrounded conductors does not exceed 250 volts

(2) Where the system is 3-phase, 4-wire, wye connected in which the neutral is used as a circuit conductor

(3) Where the system is 3-phase, 4-wire, delta connected in which the midpoint of one phase winding is used as a circuit conductor

(c) Alternating-Current Systems of 1 kV and Over. Alternating-current systems supplying mobile or portable equipment shall be grounded as specified in 2.50.10.9. Where supplying other than mobile or portable equipment, such systems shall be permitted to be grounded.

(d) Separately Derived Systems. Separately derived systems, as covered in 2.50.2.1(a) or (b), shall be grounded as specified in 2.50.2.11.

FPN No. 1: An alternate ac power source such as an on-site generator is not a separately derived system if the neutral is solidly interconnected to a service-supplied system neutral.

FPN No. 2: For systems that are not separately derived and are not required to be grounded as specified in 2.50.2.11, see 4.45.1.13 for minimum size of conductors that must carry fault current.

(e) Impedance Grounded Neutral Systems. Impedance grounded neutral systems shall be grounded in accordance with 2.50.2.17 or 2.50.10.7.

2.50.2.2 Alternating-Current Systems of 50 Volts to 1000 Volts Not Required to Be Grounded. The following ac systems of 50 volts to 1000 volts shall be permitted to be grounded but shall not be required to be grounded:

(1) Electric systems used exclusively to supply industrial electric furnaces for melting, refining, tempering, and the like

(2) Separately derived systems used exclusively for rectifiers that supply only adjustable-speed industrial drives

(3) Separately derived systems supplied by transformers that have a primary voltage rating less than 1000 volts, provided that all the following conditions are met:

a. The system is used exclusively for control circuits.

b. The conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation.

c. Continuity of control power is required.

d. Ground detectors are installed on the control system.

(4) Other systems that are not required to be grounded in accordance with the requirements of 2.50.2.1(b).

Where an alternating-current system is not grounded as permitted in 2.50.2.2(1) through (4), ground detectors shall be installed on the system.

Exception: Systems of less than 120 volts to ground as permitted by this Code shall not be required to have ground detectors.

2.50.2.3 Circuits Not to Be Grounded. The following circuits shall not be grounded:

(1) Circuits for electric cranes operating over combustible fibers in Class III locations, as provided in 5.3.3.56.

(2) Circuits in health care facilities as provided in 5.17.4.2 and 5.17.7.1

(3) Circuits for equipment within electrolytic cell working zone as provided in Article 6.68

(4) Secondary circuits of lighting systems as provided in 4.11.1.5(a)

2.50.2.5 Grounding Service-Supplied Alternating-Current Systems.

(a) System Grounding Connections. A premises wiring system supplied by a grounded ac service shall have a grounding electrode conductor connected to the grounded service conductor, at each service, in accordance with 2.50.2.5(a)(1) through (a)(5).

(1) General. The connection shall be made at any accessible point from the load end of the service drop or service lateral to and including the terminal or bus to which the grounded service conductor is connected at the service disconnecting means.

FPN: See definitions of Service Drop and Service Lateral in Article 1.0.

(2) Outdoor Transformer. Where the transformer supplying the service is located outside the building, at least one additional grounding connection shall be made from the grounded service conductor to a grounding electrode, either at the transformer or elsewhere outside the building.

Exception: The additional grounding connection shall not be made on high-impedance grounded neutral systems. The system shall meet the requirements of 2.50.2.17.

(3) Dual Fed Services. For services that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single grounding electrode connection to the tie point of the grounded conductor(s) from each power source shall be permitted.

(4) Main Bonding Jumper as Wire or Busbar. Where the main bonding jumper specified in 2.50.2.9 is a wire or busbar and is installed from the grounded conductor terminal bar or bus to the equipment grounding terminal bar or bus in the service equipment, the grounding electrode conductor shall be permitted to be connected to the equipment grounding terminal, bar, or bus to which the main bonding jumper is connected.

(5) Load-Side Grounding Connections. A grounding connection shall not be made to any grounded conductor on the load side of the service disconnecting means except as otherwise permitted in this article.

FPN: See 2.50.2.11(a) for separately derived systems, 2.50.2.13 for connections at separate buildings or structures, and 2.50.7.13 for use of the grounded circuit conductor for grounding equipment.

(b) Main Bonding Jumper. For a grounded system, an unspliced main bonding jumper shall be used to connect the equipment grounding conductor(s) and the service-disconnect enclosure to the

grounded conductor within the enclosure for each service disconnect in accordance with 2.50.2.9.

Exception No. 1: Where more than one service disconnecting means is located in an assembly listed for use as service equipment, an unspliced main bonding jumper shall bond the grounded conductor(s) to the assembly enclosure.

Exception No. 2: Impedance grounded neutral systems shall be permitted to be connected as provided in 2.50.2.17 and 2.50.10.7.

(c) Grounded Conductor Brought to Service Equipment. Where an ac system operating at less than 1000 volts is grounded at any point, the grounded conductor(s) shall be run to each service disconnecting means and shall be bonded to each disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 2.50.2.5(c)(1) through (c)(3).

Exception: Where more than one service disconnecting means are located in an assembly listed for use as service equipment, it shall be permitted to run the grounded conductor(s) to the assembly, and the conductor(s) shall be bonded to the assembly enclosure.

(1) Routing and Sizing. This conductor shall be routed with the phase conductors and shall not be smaller than the required grounding electrode conductor specified in Table 2.50.3.17 but shall not be required to be larger than the largest ungrounded service-entrance phase conductor. In addition, for service-entrance phase conductors larger than 1100 kcmil copper or 850 mm² aluminum, the grounded conductor shall not be smaller than 12½ percent of the area of the largest service-entrance phase conductor. The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.

(2) Parallel Conductors. Where the service-entrance phase conductors are installed in parallel, the size of the grounded conductor shall be based on the total circular mil area of the parallel conductors as indicated in this section. Where installed in two or more raceways, the size of the grounded conductor in each raceway shall be based on the size of the ungrounded service-entrance conductor in the raceway but not smaller than 50 mm².

FPN: See 3.10.1.4 for grounded conductors connected in parallel.

(3) High Impedance. The grounded conductor on a high-impedance grounded neutral system shall be grounded in accordance with 2.50.2.17.

(d) Grounding Electrode Conductor. A grounding electrode conductor shall be used to connect the equipment grounding conductors, the service-equipment enclosures, and, where the system is grounded, the grounded service conductor to the grounding electrode(s) required by Part 2.50.3.

High-impedance grounded neutral system connections shall be made as covered in 2.50.2.17.

FPN: See 2.50.2.5(a) for ac system grounding connections.

(e) Ungrounded System Grounding Connections. A premises wiring system that is supplied by an ac service that is ungrounded shall have, at each service, a grounding electrode conductor connected to the grounding electrode(s) required by Part 2.50.3. The grounding electrode conductor shall be connected to a metal enclosure of the service conductors at any accessible point from the load end of the service drop or service lateral to the service disconnecting means.

2.50.2.7 Conductor to Be Grounded — Alternating-Current Systems. For ac premises wiring systems, the conductor to be grounded shall be as specified in the following:

- (1) Single-phase, 2-wire — one conductor
- (2) Single-phase, 3-wire — the neutral conductor
- (3) Multiphase systems having one wire common to all phases — the common conductor
- (4) Multiphase systems where one phase is grounded — one phase conductor
- (5) Multiphase systems in which one phase is used as in (2) — the neutral conductor

2.50.2.9 Main Bonding Jumper and System Bonding Jumper. For a grounded system, main bonding jumpers and system bonding jumpers shall be installed as follows:

(a) Material. Main bonding jumpers and system bonding jumpers shall be of copper or other corrosion-resistant material. A main bonding jumper and a system bonding jumper shall be a wire, bus, screw, or similar suitable conductor.

(b) Construction. Where a main bonding jumper or a system bonding jumper is a screw only, the screw shall be identified with a green finish that shall be visible with the screw installed.

(c) Attachment. Main bonding jumpers and system bonding jumpers shall be attached in the manner specified by the applicable provisions of 2.50.1.8.

(d) Size. Main bonding jumpers and system bonding jumpers shall not be smaller than the sizes shown in Table 2.50.3.17. Where the supply conductors are larger than 1100 kcmil copper or 850 mm² aluminum, the bonding jumper shall have an area that is not less than 12½ percent of the area of the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors.

2.50.2.11 Grounding Separately Derived Alternating-Current Systems.

(a) Grounded Systems. A separately derived ac system that is grounded shall comply with 2.50.2.11(a)(1) through (a)(8). A grounding connection shall not be made to any grounded circuit conductor on the load side of the point of grounding of the separately derived system except as otherwise permitted in this article.

FPN: See 2.50.2.13 for connections at separate buildings or structures, and 2.50.7.13 for use of the grounded circuit conductor for grounding equipment.

Exception: Impedance grounded neutral system grounding connections shall be made as specified in 2.50.2.17 or 2.50.10.7.

(1) System Bonding Jumper. An unspliced system bonding jumper in compliance with 2.50.2.9(a) through (d) that is sized based on the

derived phase conductors shall be used to connect the equipment grounding conductors of the separately derived system to the grounded conductor. This connection shall be made at any single point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices.

Exception No. 1: For separately derived systems that are dual fed (double ended) in a common enclosure or grouped together in separate enclosures and employing a secondary tie, a single system bonding jumper connection to the tie point of the grounded circuit conductors from each power source shall be permitted.

Exception No. 2: A system bonding jumper at both the source and the first disconnecting means shall be permitted where doing so does not establish a parallel path for the grounded conductor. Where a grounded conductor is used in this manner, it shall not be smaller than the size specified for the system bonding jumper but shall not be required to be larger than the ungrounded conductor(s). For the purposes of this exception, connection through the earth shall not be considered as providing a parallel path.

Exception No. 3: The size of the system bonding jumper for a system that supplies a Class 1, Class 2, or Class 3 circuit, and is derived from a transformer rated not more than 1000 volt-amperes, shall not be smaller than the derived phase conductors and shall not be smaller than 2.0 mm² (1.6 mm dia.) copper or 3.5 mm² (2.0 mm dia.) aluminum.

(2) Equipment Bonding Jumper Size. Where a bonding jumper of the wire type is run with the derived phase conductors from the source of a separately derived system to the first disconnecting means, it shall be sized in accordance with 2.50.5.13(c), based on the size of the derived phase conductors.

(3) Grounding Electrode Conductor, Single Separately Derived System. A grounding electrode conductor for a single separately derived system shall be sized in accordance with 2.50.3.17 for the derived phase conductors and shall be used to connect the grounded conductor of the derived system to the grounding electrode as specified in 2.50.2.11(a)(7). This connection shall be made at the same point on the separately derived system where the system bonding jumper is installed.

Exception No. 1: Where the system bonding jumper specified in 2.50.2.11(a)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: Where a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. Where the equipment ground bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

Exception No. 3: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000 volt-amperes, provided the grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 2.50.2.11(a)(1), Exception No. 3, and the transformer frame or enclosure is grounded by one of the means specified in 2.50.7.5.

(4) Grounding Electrode Conductor, Multiple Separately Derived Systems. Where more than one separately derived system is installed, it shall be permissible to connect a tap from each separately derived system to a common grounding electrode conductor. Each tap conductor shall connect the grounded conductor of the separately derived system to the common grounding electrode conductor. The grounding electrode conductors and taps shall comply with 2.50.2.11(a)(4)a through (a)(4)c.

Exception No. 1: Where the system bonding jumper specified in 2.50.2.11(a)(1) is a wire or busbar, it shall be permitted to connect the grounding electrode conductor to the equipment grounding terminal, bar, or bus, provided the equipment grounding terminal, bar, or bus is of sufficient size for the separately derived system.

Exception No. 2: A grounding electrode conductor shall not be required for a system that supplies a Class 1, Class 2, or Class 3 circuit and is derived from a transformer rated not more than 1000

volt-amperes, provided the system grounded conductor is bonded to the transformer frame or enclosure by a jumper sized in accordance with 2.50.2.11(a)(1), Exception No. 3 and the transformer frame or enclosure is grounded by one of the means specified in 2.50.7.5.

a. Common Grounding Electrode Conductor Size. The common grounding electrode conductor shall not be smaller than 80 mm² copper or 125 mm² aluminum.

b. Tap Conductor Size. Each tap conductor shall be sized in accordance with 2.50.3.17 based on the derived phase conductors of the separately derived system it serves.

Exception: Where a separately derived system originates in listed equipment suitable as service equipment, the grounding electrode conductor from the service or feeder equipment to the grounding electrode shall be permitted as the grounding electrode conductor for the separately derived system, provided the grounding electrode conductor is of sufficient size for the separately derived system. Where the equipment ground bus internal to the equipment is not smaller than the required grounding electrode conductor for the separately derived system, the grounding electrode connection for the separately derived system shall be permitted to be made to the bus.

c. Connections. All tap connections to the common grounding electrode conductor shall be made at an accessible location by one of the following methods:

1. A listed connector.
2. Listed connections to aluminum or copper busbars not less than 6 mm × 50 mm. Where aluminum busbars are used, the installation shall comply with 2.50.3.15(a).
3. By the exothermic welding process.

Tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.

(5) Installation. The installation of all grounding electrode conductors shall comply with 2.50.3.15(a), (b), (c), and (e).

(6) Bonding. Structural steel and metal piping shall be bonded in accordance with 2.50.5.15(d).

(7) Grounding Electrode. The grounding electrode shall be as near as practicable to and preferably in the same area as the grounding electrode conductor connection to the system. The grounding electrode shall be the nearest one of the following:

a. Metal water pipe grounding electrode as specified in 2.50.3.3(a)(1)

b. Structural metal grounding electrode as specified in 2.50.3.3(a)(2)

Exception No. 1: Any of the other electrodes identified in 2.50.3.3(a) shall be used where the electrodes specified by 2.50.2.11(a)(7) are not available.

Exception No. 2 to (1) and (2): Where a separately derived system originates in listed equipment suitable for use as service equipment, the grounding electrode used for the service or feeder equipment shall be permitted as the grounding electrode for the separately derived system.

FPN: See 2.50.5.15(d) for bonding requirements of interior metal water piping in the area served by separately derived systems.

(8) Grounded Conductor. Where a grounded conductor is installed and the system bonding jumper is not located at the source of the separately derived system, 2.50.2.11(a)(8)a, (a)(8)b, and (a)(8)c shall apply.

a. Routing and Sizing. This conductor shall be routed with the derived phase conductors and shall not be smaller than the required grounding electrode conductor specified in Table 2.50.3.17 but shall not be required to be larger than the largest ungrounded derived phase conductor. In addition, for phase conductors larger than 1100 kcmil copper or 850 mm² aluminum, the grounded conductor shall not be smaller than 12½ percent of the area of the largest derived phase conductor. The grounded conductor of a 3-phase, 3-wire delta system shall have an ampacity not less than that of the ungrounded conductors.

b. Parallel Conductors. Where the derived phase conductors are installed in parallel, the size of the grounded conductor shall be based on the total circular mil area of the parallel conductors, as indicated in this section. Where installed in two or more raceways, the size of the

grounded conductor in each raceway shall be based on the size of the ungrounded conductors in the raceway but not smaller than 50 mm².

FPN: See 3.10.1.4 for grounded conductors connected in parallel.

c. **Impedance Grounded System.** The grounded conductor of an impedance grounded neutral system shall be installed in accordance with 2.50.2.17 or 2.50.10.7.

(b) Ungrounded Systems. The equipment of an ungrounded separately derived system shall be grounded as specified in 2.50.2.11(b)(1) and (b)(2).

(1) **Grounding Electrode Conductor.** A grounding electrode conductor, sized in accordance with 2.50.3.17 for the derived phase conductors, shall be used to connect the metal enclosures of the derived system to the grounding electrode as specified in 2.50.2.11(b)(2). This connection shall be made at any point on the separately derived system from the source to the first system disconnecting means.

(2) **Grounding Electrode.** Except as permitted by 2.50.2.15 for portable and vehicle-mounted generators, the grounding electrode shall comply with 2.50.2.11(a)(7).

2.50.2.13 Buildings or Structures Supplied by Feeder(s) or Branch Circuit(s).

(a) Grounding Electrode. Building(s) or structure(s) supplied by feeder(s) or branch circuit(s) shall have a grounding electrode or grounding electrode system installed in accordance with 2.50.3.1. The grounding electrode conductor(s) shall be connected in accordance with 2.50.2.13(b) or (c). Where there is no existing grounding electrode, the grounding electrode(s) required in 2.50.3.1 shall be installed.

Exception: A grounding electrode shall not be required where only a single branch circuit supplies the building or structure and the branch circuit includes an equipment grounding conductor for grounding the conductive non-current-carrying parts of equipment. For the purpose of this section, a multiwire branch circuit shall be considered as a single branch circuit.

(b) Grounded Systems. For a grounded system at the separate building or structure, the connection to the grounding electrode and grounding or bonding of equipment, structures, or frames required to be grounded or bonded shall comply with either 2.50.2.13(b)(1) or (b)(2).

(1) **Equipment Grounding Conductor.** An equipment grounding conductor as described in 2.50.6.9 shall be run with the supply conductors and connected to the building or structure disconnecting means and to the grounding electrode(s). The equipment grounding conductor shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The equipment grounding conductor shall be sized in accordance with 2.50.6.13. Any installed grounded conductor shall not be connected to the equipment grounding conductor or to the grounding electrode(s).

(2) **Grounded Conductor.** Where (1) an equipment grounding conductor is not run with the supply to the building or structure, (2) there are no continuous metallic paths bonded to the grounding system in each building or structure involved, and (3) ground-fault protection of equipment has not been installed on the supply side of the feeder(s), the grounded conductor run with the supply to the building or structure shall be connected to the building or structure disconnecting means and to the grounding electrode(s) and shall be used for grounding or bonding of equipment, structures, or frames required to be grounded or bonded. The size of the grounded conductor shall not be smaller than the larger of either of the following:

- a. That required by 2.20.3.22
- b. That required by 2.50.6.13

(c) Ungrounded Systems. The grounding electrode(s) shall be connected to the building or structure disconnecting means.

(d) Disconnecting Means Located in Separate Building or Structure on the Same Premises. Where one or more disconnecting means supply one or more additional buildings or structures under single management, and where these disconnecting means are located remote from those buildings or structures in accordance with the provisions of 2.25.2.3, Exception Nos. 1 and 2, all of the following conditions shall be met:

(1) The connection of the grounded conductor to the grounding electrode at a separate building or structure shall not be made.

(2) An equipment grounding conductor for grounding any non-current-carrying equipment, interior metal piping systems, and building or structural metal frames is run with the circuit conductors to a separate building or structure and bonded to existing grounding electrode(s) required in Part 2.50.3, or, where there are no existing electrodes, the grounding electrode(s) required in Part 2.50.3 shall be installed where a separate building or structure is supplied by more than one branch circuit.

(3) Bonding the equipment grounding conductor to the grounding electrode at a separate building or structure shall be made in a junction box, panelboard, or similar enclosure located immediately inside or outside the separate building or structure.

(e) Grounding Electrode Conductor. The size of the grounding electrode conductor to the grounding electrode(s) shall not be smaller than given in 2.50.3.17, based on the largest ungrounded supply conductor. The installation shall comply with Part 2.50.3.

2.50.2.15 Portable and Vehicle-Mounted Generators.

(a) Portable Generators. The frame of a portable generator shall not be required to be connected to a grounding electrode as defined in 2.50.3.3 for a system supplied by the generator under the following conditions:

(1) The generator supplies only equipment mounted on the generator, cord-and-plug-connected equipment through receptacles mounted on the generator, or both, and

(2) The non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are bonded to the generator frame.

(b) Vehicle-Mounted Generators. The frame of a vehicle shall not be required to be connected to a grounding electrode as defined in 2.50.3.3 for a system supplied by a generator located on this vehicle under the following conditions:

(1) The frame of the generator is bonded to the vehicle frame, and

(2) The generator supplies only equipment located on the vehicle or cord-and-plug-connected equipment through receptacles mounted on the vehicle, or both equipment located on the vehicle and cord-and-plug-connected equipment through receptacles mounted on the vehicle or on the generator, and

(3) The non-current-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are bonded to the generator frame.

(c) Grounded Conductor Bonding. A system conductor that is required to be grounded by 2.50.2.7 shall be bonded to the generator frame where the generator is a component of a separately derived system.

FPN: For grounding portable generators supplying fixed wiring systems, see 2.50.2.1(d).

2.50.2.17 High-Impedance Grounded Neutral Systems. High-impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current to a low value shall be permitted for 3-phase ac systems of 250 volts to 1000 volts where all the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation.

(2) Continuity of power is required.

(3) Ground detectors are installed on the system.

(4) Line-to-neutral loads are not served.

High-impedance grounded neutral systems shall comply with the provisions of 2.50.2.17(a) through (g).

(a) Grounding Impedance Location. The grounding impedance shall be installed between the grounding electrode conductor and the system neutral. Where a neutral is not available, the grounding impedance shall be installed between the grounding electrode conductor and the neutral derived from a grounding transformer.

(b) Neutral Conductor. The neutral conductor from the neutral point of the transformer or generator to its connection point to the grounding impedance shall be fully insulated.

The neutral conductor shall have an ampacity of not less than the maximum current rating of the grounding impedance. In no case shall the neutral conductor be smaller than 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum or copper-clad aluminum.

(c) System Neutral Connection. The system neutral conductor shall not be connected to ground except through the grounding impedance.

FPN: The impedance is normally selected to limit the ground-fault current to a value slightly greater than or equal to the capacitive charging current of the system. This value of impedance will also limit transient overvoltages to safe values. For guidance, refer to criteria for limiting transient overvoltages in ANSI/IEEE 142-1991, Recommended Practice for Grounding of Industrial and Commercial Power Systems.

(d) Neutral Conductor Routing. The conductor connecting the neutral point of the transformer or generator to the grounding impedance shall be permitted to be installed in a separate raceway. It shall not be required to run this conductor with the phase conductors to the first system disconnecting means or overcurrent device.

(e) Equipment Bonding Jumper. The equipment bonding jumper (the connection between the equipment grounding conductors and the grounding impedance) shall be an unspliced conductor run from the first system disconnecting means or overcurrent device to the grounded side of the grounding impedance.

(f) Grounding Electrode Conductor Location. The grounding electrode conductor shall be attached at any point from the grounded side of the grounding impedance to the equipment grounding connection at the service equipment or first system disconnecting means.

(g) Equipment Bonding Jumper Size. The equipment bonding jumper shall be sized in accordance with (1) or (2) as follows:

(1) Where the grounding electrode conductor connection is made at the grounding impedance, the equipment bonding jumper shall be sized in accordance with 2.50.3.17, based on the size of the service

entrance conductors for a service or the derived phase conductors for a separately derived system.

(2) Where the grounding electrode conductor is connected at the first system disconnecting means or overcurrent device, the equipment bonding jumper shall be sized the same as the neutral conductor in 2.50.2.17(b).

2.50.3 Grounding Electrode System and Grounding Electrode Conductor

2.50.3.1 Grounding Electrode System. All grounding electrodes as described in 2.50.3.3(a)(1) through (a)(6) that are present at each building or structure served shall be bonded together to form the grounding electrode system. Where none of these grounding electrodes exist, one or more of the grounding electrodes specified in 2.50.3.3(a)(4) through (a)(7) shall be installed and used.

Exception: Concrete-encased electrodes of existing buildings or structures shall not be required to be part of the grounding electrode system where the steel reinforcing bars or rods are not accessible for use without disturbing the concrete.

2.50.3.3 Grounding Electrodes.

(a) Electrodes Permitted for Grounding.

(1) Metal Underground Water Pipe. A metal underground water pipe in direct contact with the earth for 3 000 mm or more (including any metal well casing effectively bonded to the pipe) and electrically continuous (or made electrically continuous by bonding around insulating joints or insulating pipe) to the points of connection of the grounding electrode conductor and the bonding conductors. Interior metal water piping located more than 1 500 mm from the point of entrance to the building shall not be used as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system.

Exception: In industrial and commercial buildings or structures where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the

installation, interior metal water piping located more than 1 500 mm from the point of entrance to the building shall be permitted as a part of the grounding electrode system or as a conductor to interconnect electrodes that are part of the grounding electrode system, provided that the entire length, other than short sections passing perpendicular through walls, floors, or ceilings, of the interior metal water pipe that is being used for the conductor is exposed.

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure, where any of the following methods are used to make an earth connection:

- a. 3 000 mm or more of a single structural metal member in direct contact with the earth or encased in concrete that is in direct contact with the earth
- b. The structural metal frame is bonded to one or more of the grounding electrodes as defined in 2.50.3.3(a)(1), (a)(3), or (a)(4)
- c. The structural metal frame is bonded to one or more of the grounding electrodes as defined in 2.50.3.3(a)(5) or (a)(6) that comply with 2.50.3.7, or
- d. Other approved means of establishing a connection to earth.

(3) Concrete-Encased Electrode. An electrode encased by at least 50 mm of concrete, located within and near the bottom of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6 000 mm of one or more bare or zinc galvanized or other electrically conductive coated steel reinforcing bars or rods of not less than 13 mm in diameter, or consisting of at least 6 000 mm of bare copper conductor not smaller than 22 mm². Reinforcing bars shall be permitted to be bonded together by the usual steel tie wires or other effective means.

(4) Ground Ring. A ground ring encircling the building or structure, in direct contact with the earth, consisting of at least 6 000 mm of bare copper conductor not smaller than 30 mm².

(5) Rod and Pipe Electrodes. Rod and pipe electrodes shall not be less than 2 400 mm in length and shall consist of the following materials.

- a. Electrodes of pipe or conduit shall not be smaller than metric designator 21 (trade size $\frac{3}{4}$) and, where of iron or steel, shall have the

outer surface galvanized or otherwise metal-coated for corrosion protection.

- b. Electrodes of rods of iron or steel shall be at least 16 mm in diameter. Stainless steel rods less than 16 mm in diameter, nonferrous rods, or their equivalent shall be listed and shall not be less than 13 mm in diameter.

(6) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m² (2 ft²) of surface to exterior soil. Electrodes of iron or steel plates shall be at least 6 mm in thickness. Electrodes of nonferrous metal shall be at least 1.5 mm in thickness.

(7) Other Local Metal Underground Systems or Structures. Other local metal underground systems or structures such as piping systems, underground tanks, and underground metal well casings that are not effectively bonded to a metal water pipe.

(b) Electrodes Not Permitted for Grounding. The following shall not be used as grounding electrodes:

- (1) Metal underground gas piping system
- (2) Aluminum electrodes

FPN: See 2.50.5.15(b) for bonding requirements of gas piping.

2.50.3.4 Grounding Electrode System Installation.

FPN: See 5.47.1.9 and 5.47.1.10 for special grounding and bonding requirements for agricultural buildings.

(a) Rod, Pipe, and Plate Electrodes. Where practicable, rod, pipe, and plate electrodes shall be embedded below permanent moisture level. Rod, pipe, and plate electrodes shall be free from nonconductive coatings such as paint or enamel.

(b) Electrode Spacing. Where more than one of the electrodes of the type specified in 2.50.3.3(a)(5) or (a)(6) are used, each electrode of one grounding system (including that used for air terminals) shall not be less than 1 800 mm from any other electrode of another grounding system. Two or more grounding electrodes that are effectively bonded together shall be considered a single grounding electrode system.

(c) Bonding Jumper. The bonding jumper(s) used to connect the grounding electrodes together to form the grounding electrode system shall be installed in accordance with 2.50.3.15(a), (b), and (e), shall be sized in accordance with 2.50.3.17, and shall be connected in the manner specified in 2.50.3.21.

(d) Metal Underground Water Pipe. Where used as a grounding electrode, metal underground water pipe shall meet the requirements of 2.50.3.4(d)(1) and (d)(2).

(1) Continuity. Continuity of the grounding path or the bonding connection to interior piping shall not rely on water meters or filtering devices and similar equipment.

(2) Supplemental Electrode Required. A metal underground water pipe shall be supplemented by an additional electrode of a type specified in 2.50.3.3(a)(2) through (a)(7). Where the supplemental electrode is a rod, pipe, or plate type, it shall comply with 2.50.3.7. The supplemental electrode shall be permitted to be bonded to the grounding electrode conductor, the grounded service-entrance conductor, the nonflexible grounded service raceway, or any grounded service enclosure.

Exception: The supplemental electrode shall be permitted to be bonded to the interior metal water piping at any convenient point as covered in 2.50.3.3(a)(1), Exception.

(e) Supplemental Electrode Bonding Connection Size. Where the supplemental electrode is a rod, pipe, or plate electrode, that portion of the bonding jumper that is the sole connection to the supplemental grounding electrode shall not be required to be larger than 14 mm² copper wire or 22 mm² aluminum wire.

(f) Ground Ring. The ground ring shall be buried at a depth below the earth's surface of not less than 750 mm.

(g) Rod and Pipe Electrodes. The electrode shall be installed such that at least 2 400 mm of length is in contact with the soil. It shall be driven to a depth of not less than 2 400 mm except that, where rock bottom is encountered, the electrode shall be driven at an oblique angle not to exceed 45 degrees from the vertical or, where rock bottom is encountered at an angle up to 45 degrees, the electrode shall be

permitted to be buried in a trench that is at least 750 mm deep. The upper end of the electrode shall be flush with or below ground level unless the aboveground end and the grounding electrode conductor attachment are protected against physical damage as specified in 2.50.1.10.

(h) Plate Electrode. Plate electrodes shall be installed not less than 750 mm below the surface of the earth.

2.50.3.5 Supplementary Grounding Electrodes. Supplementary grounding electrodes shall be permitted to be connected to the equipment grounding conductors specified in 2.50.6.9 and shall not be required to comply with the electrode bonding requirements of 2.50.3.1 or 2.50.3.4(c) or the resistance requirements of 2.50.3.7, but the earth shall not be used as an effective ground-fault current path as specified in 2.50.1.4(a)(5) and 2.50.1.4(b)(4).

2.50.3.7 Resistance of Rod, Pipe, and Plate Electrodes. A single electrode consisting of a rod, pipe, or plate that does not have a resistance to ground of 25 ohms or less shall be augmented by one additional electrode of any of the types specified by 2.50.3.3(a)(2) through (a)(7). Where multiple rod, pipe, or plate electrodes are installed to meet the requirements of this section, they shall not be less than 1 800 mm apart.

FPN: The paralleling efficiency of rods longer than 2 400 mm is improved by spacing greater than 1 800 mm.

2.50.3.9 Common Grounding Electrode. Where an ac system is connected to a grounding electrode in or at a building or structure, the same electrode shall be used to ground conductor enclosures and equipment in or on that building or structure. Where separate services, feeders, or branch circuits supply a building and are required to be connected to a grounding electrode(s), the same grounding electrode(s) shall be used.

Two or more grounding electrodes that are effectively bonded together shall be considered as a single grounding electrode system in this sense.

2.50.3.11 Use of Air Terminals. Air terminal conductors and driven pipes, rods, or plate electrodes used for grounding air terminals shall

not be used in lieu of the grounding electrodes required by 2.50.3.1 for grounding wiring systems and equipment. This provision shall not prohibit the required bonding together of grounding electrodes of different systems.

FPN No. 1: See 2.50.5.17 for spacing from air terminals. See 8.0.4.1(d), 8.10.2.11(j), and 8.20.4.1(d) for bonding of electrodes.

FPN No. 2: Bonding together of all separate grounding electrodes will limit potential differences between them and between their associated wiring systems.

2.50.3.13 Grounding Electrode Conductor Material. The grounding electrode conductor shall be of copper, aluminum, or copper-clad aluminum. The material selected shall be resistant to any corrosive condition existing at the installation or shall be suitably protected against corrosion. The conductor shall be solid or stranded, insulated, covered, or bare.

2.50.3.15 Grounding Electrode Conductor Installation. Grounding electrode conductors shall be installed as specified in 2.50.3.15(a) through (f).

(a) Aluminum or Copper-Clad Aluminum Conductors. Bare aluminum or copper-clad aluminum grounding conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding conductors shall not be terminated within 450 mm of the earth.

(b) Securing and Protection Against Physical Damage. Where exposed, a grounding electrode conductor or its enclosure shall be securely fastened to the surface on which it is carried. A 22 mm² or larger copper or aluminum grounding electrode conductor shall be protected where exposed to physical damage. A 14 mm² grounding electrode conductor that is free from exposure to physical damage shall be permitted to be run along the surface of the building construction without metal covering or protection where it is securely fastened to the construction; otherwise, it shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor. Grounding electrode conductors smaller than 14 mm² shall be in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or cable armor.

(c) Continuous. Grounding electrode conductor(s) shall be installed in one continuous length without a splice or joint except as permitted in (1) through (4):

(1) Splicing shall be permitted only by irreversible compression-type connectors listed as grounding and bonding equipment or by the exothermic welding process.

(2) Sections of busbars shall be permitted to be connected together to form a grounding electrode conductor.

(3) Bonding jumper(s) from grounding electrode(s) and grounding electrode conductor(s) shall be permitted to be connected to an aluminum or copper busbar not less than 6 mm × 50 mm. The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process.

(4) Where aluminum busbars are used, the installation shall comply with 2.50.3.15(a).

(d) Grounding Electrode Conductor Taps. Where a service consists of more than a single enclosure as permitted in 2.30.6.2(a), it shall be permitted to connect taps to the common grounding electrode conductor. Each such tap conductor shall extend to the inside of each such enclosure. The common grounding electrode conductor shall be sized in accordance with 2.50.3.17, based on the sum of the circular mil area of the largest ungrounded service entrance conductors. Where more than one set of service entrance conductors as permitted by 2.30.4.1, Exception No. 2 connect directly to a service drop or lateral, the common grounding electrode conductor shall be sized in accordance with Table 2.50.3.17 Note 1. The tap conductors shall be permitted to be sized in accordance with the grounding electrode conductors specified in 2.50.3.17 for the largest conductor serving the respective enclosures. The tap conductors shall be connected to the common grounding electrode conductor in such a manner that the common grounding electrode conductor remains without a splice or joint.

(e) Enclosures for Grounding Electrode Conductors. Ferrous metal enclosures for grounding electrode conductors shall be electrically continuous from the point of attachment to cabinets or equipment to the grounding electrode and shall be securely fastened to

the ground clamp or fitting. Nonferrous metal enclosures shall not be required to be electrically continuous. Ferrous metal enclosures that are not physically continuous from cabinets or equipment to the grounding electrode shall be made electrically continuous by bonding each end of the raceway or enclosure to the grounding electrode conductor. Bonding shall apply at each end and to all intervening ferrous raceways, boxes, and enclosures between the service equipment and the grounding electrode. The bonding jumper for a grounding electrode conductor raceway or cable armor shall be the same size as, or larger than, the required enclosed grounding electrode conductor. Where a raceway is used as protection for a grounding electrode conductor, the installation shall comply with the requirements of the appropriate raceway article.

(f) To Electrode(s). A grounding electrode conductor shall be permitted to be run to any convenient grounding electrode available in the grounding electrode system, or to one or more grounding electrode(s) individually, or to the aluminum or copper busbar as permitted in 2.50.3.15(c). The grounding electrode conductor shall be sized for the largest grounding electrode conductor required among all the electrodes connected to it.

2.50.3.17 Size of Alternating-Current Grounding Electrode Conductor. The size of the grounding electrode conductor of a grounded or ungrounded ac system shall not be less than given in Table 2.50.3.17, except as permitted in 2.50.3.17(a) through (c).

FPN: See 2.50.2.5(c) for size of ac system conductor brought to service equipment.

(a) Connections to Rod, Pipe, or Plate Electrodes. Where the grounding electrode conductor is connected to rod, pipe, or plate electrodes as permitted in 2.50.3.3(a)(5) or (a)(6), that portion of the conductor that is the sole connection to the grounding electrode shall not be required to be larger than 14 mm² copper wire or 22 mm² aluminum wire.

(b) Connections to Concrete-Encased Electrodes. Where the grounding electrode conductor is connected to a concrete-encased electrode as permitted in 2.50.3.3(a)(3), that portion of the conductor

that is the sole connection to the grounding electrode shall not be required to be larger than 22 mm² copper wire.

(c) Connections to Ground Rings. Where the grounding electrode conductor is connected to a ground ring as permitted in 2.50.3.3(a)(4), that portion of the conductor that is the sole connection to the grounding electrode shall not be required to be larger than the conductor used for the ground ring.

Table 2.50.3.17 Grounding Electrode Conductor for Alternating-Current Systems

Size of Largest Ungrounded Service-Entrance Conductor or Equivalent Area for Parallel Conductors ^a mm ²		Size of Grounding Electrode Conductor mm ² (mm dia)	
Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum ^b
30 or smaller	50 or smaller	8.0(3.2)	14
38 or 50	60 or 80	14	22
60 or 80	100 or 125	22	30
Over 80 through 175	Over 125 through 250	30	50
Over 175 through 600	Over 250 through 900	50	80
Over 600 through 1100	Over 900 through 1750	60	100
Over 1100	Over 1750	80	125

Notes:

1. Where multiple sets of service-entrance conductors are used as permitted in 2.30.4.1, Exception No. 2, the equivalent size of the largest service-entrance conductor shall be determined by the largest sum of the areas of the corresponding conductors of each set.

2. Where there are no service-entrance conductors, the grounding electrode conductor size shall be determined by the equivalent size of the largest service-entrance conductor required for the load to be served.

^aThis table also applies to the derived conductors of separately derived ac systems.

^bSee installation restrictions in 2.50.3.15(a).

2.50.3.19 Grounding Electrode Conductor and Bonding Jumper Connection to Grounding Electrodes.

(a) **Accessibility.** The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be accessible.

Exception No. 1: An encased or buried connection to a concrete-encased, driven, or buried grounding electrode shall not be required to be accessible.

Exception No. 2: An exothermic or irreversible compression connection to fire-proofed structural metal shall not be required to be accessible.

(b) **Effective Grounding Path.** The connection of a grounding electrode conductor or bonding jumper to a grounding electrode shall be made in a manner that will ensure a permanent and effective grounding path. Where necessary to ensure the grounding path for a metal piping system used as a grounding electrode, effective bonding shall be provided around insulated joints and around any equipment likely to be disconnected for repairs or replacement. Bonding conductors shall be of sufficient length to permit removal of such equipment while retaining the integrity of the bond.

2.50.3.21 Methods of Grounding and Bonding Conductor Connection to Electrodes. The grounding or bonding conductor shall be connected to the grounding electrode by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Connections depending on solder shall not be used. Ground clamps shall be listed for the materials of the grounding electrode and the grounding electrode conductor and, where used on pipe, rod, or other buried electrodes, shall also be listed for direct soil burial or concrete encasement. Not more than one conductor shall be connected to the grounding electrode by a single clamp or fitting unless the clamp or fitting is listed for multiple conductors. One of the following methods shall be used:

- (1) A pipe fitting, pipe plug, or other approved device screwed into a pipe or pipe fitting
- (2) A listed bolted clamp of cast bronze or brass, or plain or malleable iron

(3) For indoor telecommunications purposes only, a listed sheet metal strap-type ground clamp having a rigid metal base that seats on the electrode and having a strap of such material and dimensions that it is not likely to stretch during or after installation

(4) An equally substantial approved means

2.50.4 Enclosure, Raceway, and Service Cable Grounding

2.50.4.1 Service Raceways and Enclosures. Metal enclosures and raceways for service conductors and equipment shall be grounded.

Exception: A metal elbow that is installed in an underground installation of rigid nonmetallic conduit and is isolated from possible contact by a minimum cover of 450 mm to any part of the elbow shall not be required to be grounded.

2.50.4.5 Underground Service Cable or Raceway.

(a) **Underground Service Cable.** The sheath or armor of a continuous underground metal-sheathed or armored service cable system that is bonded to the grounded underground system shall not be required to be grounded at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway conduit or piping.

(b) **Underground Service Raceway Containing Cable.** An underground metal service raceway that contains a metal-sheathed or armored cable bonded to the grounded underground system shall not be required to be grounded at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway or piping.

2.50.4.7 Other Conductor Enclosures and Raceways. Except as permitted by 2.50.6.3(i), metal enclosures and raceways for other than service conductors shall be grounded.

Exception No. 1: Metal enclosures and raceways for conductors added to existing installations of open wire, knob and tube wiring, and nonmetallic-sheathed cable shall not be required to be grounded where these enclosures or wiring methods comply with (1) through (4) as follows:

- (1) Do not provide an equipment ground
- (2) Are in runs of less than 7 600 mm
- (3) Are free from probable contact with ground, grounded metal, metal lath, or other conductive material
- (4) Are guarded against contact by persons

Exception No. 2: Short sections of metal enclosures or raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be grounded.

Exception No. 3: A metal elbow shall not be required to be grounded where it is installed in a nonmetallic raceway and is isolated from possible contact by a minimum cover of 450 mm to any part of the elbow or is encased in not less than 50 mm of concrete.

2.50.5 Bonding

2.50.5.1 General. Bonding shall be provided where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed.

2.50.5.3 Services.

(a) Bonding of Services. The non-current-carrying metal parts of equipment indicated in 2.50.5.3(a)(1), (a)(2), and (a)(3) shall be effectively bonded together.

(1) The service raceways, cable trays, cablebus framework, auxiliary gutters, or service cable armor or sheath except as permitted in 2.50.4.5.

(2) All service enclosures containing service conductors, including meter fittings, boxes, or the like, interposed in the service raceway or armor.

(3) Any metallic raceway or armor enclosing a grounding electrode conductor as specified in 2.50.3.15(b). Bonding shall apply at each end and to all intervening raceways, boxes, and enclosures between the service equipment and the grounding electrode.

(b) Method of Bonding at the Service. Electrical continuity at service equipment, service raceways, and service conductor enclosures shall be ensured by one of the following methods:

(1) Bonding equipment to the grounded service conductor in a manner provided in 2.50.1.8

(2) Connections utilizing threaded couplings or threaded bosses on enclosures where made up wrenchtight

(3) Threadless couplings and connectors where made up tight for metal raceways and metal-clad cables

(4) Other listed devices, such as bonding-type locknuts, bushings, or bushings with bonding jumpers

Bonding jumpers meeting the other requirements of this article shall be used around concentric or eccentric knockouts that are punched or otherwise formed so as to impair the electrical connection to ground. Standard locknuts or bushings shall not be the sole means for the bonding required by this section.

2.50.5.5 Bonding for Other Systems. An accessible means external to enclosures for connecting intersystem bonding and grounding electrode conductors shall be provided at the service equipment and at the disconnecting means for any additional buildings or structures by at least one of the following means:

- (1) Exposed nonflexible metallic raceways
- (2) Exposed grounding electrode conductor
- (3) Approved means for the external connection of a copper or other corrosion-resistant bonding or grounding conductor to the grounded raceway or equipment

FPN No. 1: A 14 mm² copper conductor with one end bonded to the grounded nonflexible metallic raceway or equipment and with 150 mm or more of the other end made accessible on the outside wall is an example of the approved means covered in 2.50.5.5(3).

FPN No. 2: See 8.0.4.1, 8.10.2.11, and 8.20.4.1 for bonding and grounding requirements for communications circuits, radio and television equipment, and CATV circuits.

2.50.5.7 Bonding Other Enclosures.

(a) General. Metal raceways, cable trays, cable armor, cable sheath, enclosures, frames, fittings, and other metal non-current-carrying parts that are to serve as grounding conductors, with or without the use of supplementary equipment grounding conductors, shall be effectively bonded where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed on

them. Any nonconductive paint, enamel, or similar coating shall be removed at threads, contact points, and contact surfaces or be connected by means of fittings designed so as to make such removal unnecessary.

(b) Isolated Grounding Circuits. Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, an equipment enclosure supplied by a branch circuit shall be permitted to be isolated from a raceway containing circuits supplying only that equipment by one or more listed nonmetallic raceway fittings located at the point of attachment of the raceway to the equipment enclosure. The metal raceway shall comply with provisions of this article and shall be supplemented by an internal insulated equipment grounding conductor installed in accordance with 2.50.7.17(d) to ground the equipment enclosure.

FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system.

2.50.5.8 Bonding for Over 250 Volts. For circuits of over 250 volts to ground, the electrical continuity of metal raceways and cables with metal sheaths that contain any conductor other than service conductors shall be ensured by one or more of the methods specified for services in 2.50.5.3(b), except for (b)(1).

Exception: Where oversized, concentric, or eccentric knockouts are not encountered, or where a box or enclosure with concentric or eccentric knockouts listed to provide a permanent, reliable electrical bond, the following methods shall be permitted:

- (1) *Threadless couplings and connectors for cables with metal sheaths*
- (2) *Two locknuts, on rigid metal conduit or intermediate metal conduit, one inside and one outside of boxes and cabinets*
- (3) *Fittings with shoulders that seat firmly against the box or cabinet, such as electrical metallic tubing connectors, flexible metal conduit connectors, and cable connectors, with one locknut on the inside of boxes and cabinets*
- (4) *Listed fittings*

2.50.5.9 Bonding Loosely Jointed Metal Raceways. Expansion fittings and telescoping sections of metal raceways shall be made electrically continuous by equipment bonding jumpers or other means.

2.50.5.11 Bonding in Hazardous (Classified) Locations. Regardless of the voltage of the electrical system, the electrical continuity of non-current-carrying metal parts of equipment, raceways, and other enclosures in any hazardous (classified) location as defined in Article 500 shall be ensured by any of the methods specified in 2.50.5.3(b)(2) through (b)(4) that are approved for the wiring method used. One or more of these bonding methods shall be used whether or not supplementary equipment grounding conductors are installed.

2.50.5.13 Equipment Bonding Jumpers.

(a) Material. Equipment bonding jumpers shall be of copper or other corrosion-resistant material. A bonding jumper shall be a wire, bus, screw, or similar suitable conductor.

(b) Attachment. Equipment bonding jumpers shall be attached in the manner specified by the applicable provisions of 2.50.1.8 for circuits and equipment and by 2.50.3.21 for grounding electrodes.

(c) Size — Equipment Bonding Jumper on Supply Side of Service. The bonding jumper shall not be smaller than the sizes shown in Table 2.50.3.17 for grounding electrode conductors. Where the service-entrance phase conductors are larger than 1100 kcmil copper or 850 mm² aluminum, the bonding jumper shall have an area not less than 12½ percent of the area of the largest phase conductor except that, where the phase conductors and the bonding jumper are of different materials (copper or aluminum), the minimum size of the bonding jumper shall be based on the assumed use of phase conductors of the same material as the bonding jumper and with an ampacity equivalent to that of the installed phase conductors. Where the service-entrance conductors are paralleled in two or more raceways or cables, the equipment bonding jumper, where routed with the raceways or cables, shall be run in parallel. The size of the bonding jumper for each raceway or cable shall be based on the size of the service-entrance conductors in each raceway or cable.

(d) Size — Equipment Bonding Jumper on Load Side of Service.

The equipment bonding jumper on the load side of the service overcurrent devices shall be sized, as a minimum, in accordance with the sizes listed in Table 2.50.6.13, but shall not be required to be larger than the largest ungrounded circuit conductors supplying the equipment and shall not be smaller than 2.0 mm² (1.6 mm dia.).

A single common continuous equipment bonding jumper shall be permitted to bond two or more raceways or cables where the bonding jumper is sized in accordance with Table 2.50.6.13 for the largest overcurrent device supplying circuits therein.

(e) Installation. The equipment bonding jumper shall be permitted to be installed inside or outside of a raceway or enclosure. Where installed on the outside, the length of the equipment bonding jumper shall not exceed 1 800 mm and shall be routed with the raceway or enclosure. Where installed inside of a raceway, the equipment bonding jumper shall comply with the requirements of 2.50.6.10 and 2.50.7.19.

Exception: An equipment bonding jumper longer than 1 800 mm shall be permitted at outside pole locations for the purpose of bonding or grounding isolated sections of metal raceways or elbows installed in exposed risers of metal conduit or other metal raceway.

2.50.5.15 Bonding of Piping Systems and Exposed Structural Steel.

(a) Metal Water Piping. The metal water piping system shall be bonded as required in (a)(1), (a)(2), or (a)(3) of this section. The bonding jumper(s) shall be installed in accordance with 2.50.3.15(a), (b), and (e). The points of attachment of the bonding jumper(s) shall be accessible.

(1) General. Metal water piping system(s) installed in or attached to a building or structure shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 2.50.3.17 except as permitted in 2.50.5.15(a)(2) and (a)(3).

(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy where the metal water piping system(s) installed in or attached to a building or structure for the individual occupancies is

metallically isolated from all other occupancies by use of nonmetallic water piping, the metal water piping system(s) for each occupancy shall be permitted to be bonded to the equipment grounding terminal of the panelboard or switchboard enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with Table 2.50.6.13.

(3) Multiple Buildings or Structures Supplied by a Feeder(s) or Branch Circuit(s). The metal water piping system(s) installed in or attached to a building or structure shall be bonded to the building or structure disconnecting means enclosure where located at the building or structure, to the equipment grounding conductor run with the supply conductors, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 2.50.3.17, based on the size of the feeder or branch circuit conductors that supply the building. The bonding jumper shall not be required to be larger than the largest ungrounded feeder or branch circuit conductor supplying the building.

(b) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 2.50.6.13, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.

FPN: Bonding all piping and metal air ducts within the premises will provide additional safety.

(c) Structural Metal. Exposed structural metal that is interconnected to form a metal building frame and is not intentionally grounded and is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with Table 2.50.3.17 and installed in accordance

with 2.50.3.15(a), (b), and (e). The points of attachment of the bonding jumper(s) shall be accessible.

(d) Separately Derived Systems. Metal water piping systems and structural metal that is interconnected to form a building frame shall be bonded to separately derived systems in accordance with (d)(1) through (d)(3).

(1) Metal Water Piping System(s). The grounded conductor of each separately derived system shall be bonded to the nearest available point of the metal water piping system(s) in the area served by each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 2.50.3.17 based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper to the metal water piping system shall not be required where the metal water piping system is used as the grounding electrode for the separately derived system.

Exception No. 2: A separate water piping bonding jumper shall not be required where the metal frame of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the metal water piping in the area served by the separately derived system.

(2) Structural Metal. Where exposed structural metal that is interconnected to form the building frame exists in the area served by the separately derived system, it shall be bonded to the grounded conductor of each separately derived system. This connection shall be made at the same point on the separately derived system where the grounding electrode conductor is connected. Each bonding jumper shall be sized in accordance with Table 2.50.3.17 based on the largest ungrounded conductor of the separately derived system.

Exception No. 1: A separate bonding jumper to the building structural metal shall not be required where the metal frame of a building or structure is used as the grounding electrode for the separately derived system.

Exception No. 2: A separate bonding jumper to the building structural metal shall not be required where the water piping of a building or structure is used as the grounding electrode for a separately derived system and is bonded to the building structural metal in the area served by the separately derived system.

(3) Common Grounding Electrode Conductor. Where a common grounding electrode conductor is installed for multiple separately derived systems as permitted by 2.50.2.11(a)(4), and exposed structural metal that is interconnected to form the building frame or interior metal piping exists in the area served by the separately derived system, the metal piping and the structural metal member shall be bonded to the common grounding electrode conductor.

Exception: A separate bonding jumper from each derived system to metal water piping and to structural metal members shall not be required where the metal water piping and the structural metal members in the area served by the separately derived system are bonded to the common grounding electrode conductor.

2.50.5.17 Lightning Protection Systems. The lightning protection system ground terminals shall be bonded to the building or structure grounding electrode system.

FPN No. 1: See 2.50.3.11 for use of air terminals. For further information, see NFPA 780-2004, Standard for the Installation of Lightning Protection Systems, which contains detailed information on grounding, bonding, and spacing from lightning protection systems.

FPN No. 2: Metal raceways, enclosures, frames, and other non-current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. Separation from lightning protection conductors is typically 1 800 mm through air or 900 mm through dense materials such as concrete, brick, or wood.

2.50.6 Equipment Grounding and Equipment Grounding Conductors

2.50.6.1 Equipment Fastened in Place or Connected by Permanent Wiring Methods (Fixed). Exposed non-current-carrying metal parts of fixed equipment likely to become energized shall be grounded under any of the following conditions:

- (1) Where within 2 400 mm vertically or 1 500 mm horizontally of ground or grounded metal objects and subject to contact by persons
- (2) Where located in a wet or damp location and not isolated
- (3) Where in electrical contact with metal
- (4) Where in a hazardous (classified) location as covered by Articles 5.0 through 5.17
- (5) Where supplied by a metal-clad, metal-sheathed, metal-raceway, or other wiring method that provides an equipment ground, except as permitted by 2.50.4.7, Exception No. 2, for short sections of metal enclosures
- (6) Where equipment operates with any terminal at over 150 volts to ground

Exception No. 1: Metal frames of electrically heated appliances, exempted by special permission, in which case the frames shall be permanently and effectively insulated from ground.

Exception No. 2: Distribution apparatus, such as transformer and capacitor cases, mounted on wooden poles, at a height exceeding 2 400 mm above ground or grade level.

Exception No. 3: Listed equipment protected by a system of double insulation, or its equivalent, shall not be required to be grounded. Where such a system is employed, the equipment shall be distinctively marked.

2.50.6.3 Fastened in Place or Connected by Permanent Wiring Methods (Fixed) — Specific. Exposed, non-current-carrying metal parts of the kinds of equipment described in 2.50.6.3(a) through (k), and non-current-carrying metal parts of equipment and enclosures described in 2.50.6.3(l) and (m), shall be grounded regardless of voltage.

(a) Switchboard Frames and Structures. Switchboard frames and structures supporting switching equipment, except frames of 2-wire dc switchboards where effectively insulated from ground.

(b) Pipe Organs. Generator and motor frames in an electrically operated pipe organ, unless effectively insulated from ground and the motor driving it.

(c) Motor Frames. Motor frames, as provided by 4.30.13.2.

(d) Enclosures for Motor Controllers. Enclosures for motor controllers unless attached to ungrounded portable equipment.

(e) Elevators and Cranes. Electric equipment for elevators and cranes.

(f) Garages, Theaters, and Motion Picture Studios. Electric equipment in commercial garages, theaters, and motion picture studios, except pendant lampholders supplied by circuits not over 250 volts to ground.

(g) Electric Signs. Electric signs, outline lighting, and associated equipment as provided in Article 6.0.

(h) Motion Picture Projection Equipment. Motion picture projection equipment.

(i) Power-Limited Remote-Control, Signaling, and Fire Alarm Circuits. Equipment supplied by Class 1 power-limited circuits and Class 1, Class 2, and Class 3 remote-control and signaling circuits, and by fire alarm circuits, shall be grounded where system grounding is required by Part 2.50.2 or Part 2.50.8.

(j) Luminaires (Lighting Fixtures). Luminaires (lighting fixtures) as provided in Part 4.10.5.

(k) Skid Mounted Equipment. Permanently mounted electrical equipment and skids shall be grounded with an equipment bonding jumper sized as required by 2.50.6.13.

(l) Motor-Operated Water Pumps. Motor-operated water pumps, including the submersible type.

(m) Metal Well Casings. Where a submersible pump is used in a metal well casing, the well casing shall be bonded to the pump circuit equipment grounding conductor.

2.50.6.5 Equipment Connected by Cord and Plug. Under any of the conditions described in 2.50.6.5(1) through (4), exposed non-current-carrying metal parts of cord-and-plug-connected equipment likely to become energized shall be grounded.

Exception: Listed tools, listed appliances, and listed equipment covered in 2.50.6.5(2) through (4) shall not be required to be grounded where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked.

- (1) In hazardous (classified) locations (see Articles 5.0 through 5.17)
- (2) Where operated at over 150 volts to ground

Exception No. 1: Motors, where guarded, shall not be required to be grounded.

Exception No. 2: Metal frames of electrically heated appliances, exempted by special permission, shall not be required to be grounded, in which case the frames shall be permanently and effectively insulated from ground.

- (3) In residential occupancies:
 - a. Refrigerators, freezers, and air conditioners
 - b. Clothes-washing, clothes-drying, dish-washing machines; kitchen waste disposers; information technology equipment; sump pumps and electrical aquarium equipment
 - c. Hand-held motor-operated tools, stationary and fixed motor-operated tools, light industrial motor-operated tools
 - d. Motor-operated appliances of the following types: hedge clippers, lawn mowers, snow blowers, and wet scrubbers
 - e. Portable handlamps
- (4) In other than residential occupancies:
 - a. Refrigerators, freezers, and air conditioners
 - b. Clothes-washing, clothes-drying, dish-washing machines; information technology equipment; sump pumps and electrical aquarium equipment
 - c. Hand-held motor-operated tools, stationary and fixed motor-operated tools, light industrial motor-operated tools
 - d. Motor-operated appliances of the following types: hedge clippers, lawn mowers, snow blowers, and wet scrubbers
 - e. Portable handlamps

f. Cord-and-plug-connected appliances used in damp or wet locations or by persons standing on the ground or on metal floors or working inside of metal tanks or boilers

g. Tools likely to be used in wet or conductive locations

Exception: Tools and portable handlamps likely to be used in wet or conductive locations shall not be required to be grounded where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

2.50.6.7 Nonelectric Equipment. The metal parts of nonelectric equipment described in this section shall be grounded.

- (1) Frames and tracks of electrically operated cranes and hoists
- (2) Frames of nonelectrically driven elevator cars to which electric conductors are attached
- (3) Hand-operated metal shifting ropes or cables of electric elevators

FPN: Where extensive metal in or on buildings may become energized and is subject to personal contact, adequate bonding and grounding will provide additional safety.

2.50.6.9 Types of Equipment Grounding Conductors. The equipment grounding conductor run with or enclosing the circuit conductors shall be one or more or a combination of the following:

- (1) A copper, aluminum, or copper-clad aluminum conductor. This conductor shall be solid or stranded; insulated, covered, or bare; and in the form of a wire or a busbar of any shape.
- (2) Rigid metal conduit.
- (3) Intermediate metal conduit.
- (4) Electrical metallic tubing.
- (5) Listed flexible metal conduit meeting all the following conditions:
 - a. The conduit is terminated in fittings listed for grounding.
 - b. The circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.
 - c. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1 800 mm.

d. Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.

(6) Listed liquidtight flexible metal conduit meeting all the following conditions:

a. The conduit is terminated in fittings listed for grounding.

b. For metric designators 12 through 16 (trade sizes through ½), the circuit conductors contained in the conduit are protected by overcurrent devices rated at 20 amperes or less.

c. For metric designators 21 through 35 (trade sizes ¾ through 1¼), the circuit conductors contained in the conduit are protected by overcurrent devices rated not more than 60 amperes and there is no flexible metal conduit, flexible metallic tubing, or liquidtight flexible metal conduit in trade sizes metric designators 12 through 16 (trade sizes through ½) in the grounding path.

d. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1 800 mm.

e. Where used to connect equipment where flexibility is necessary after installation, an equipment grounding conductor shall be installed.

(7) Flexible metallic tubing where the tubing is terminated in fittings listed for grounding and meeting the following conditions:

a. The circuit conductors contained in the tubing are protected by overcurrent devices rated at 20 amperes or less.

b. The combined length of flexible metal conduit and flexible metallic tubing and liquidtight flexible metal conduit in the same ground return path does not exceed 1 800 mm.

(8) Armor of Type AC cable as provided in 3.20.3.9.

(9) The copper sheath of mineral-insulated, metal-sheathed cable.

(10) Type MC cable where listed and identified for grounding in accordance with the following:

a. The combined metallic sheath and grounding conductor of interlocked metal tape-type MC cable

b. The metallic sheath or the combined metallic sheath and grounding conductors of the smooth or corrugated tube type MC cable

(11) Cable trays as permitted in 3.92.1.3(c) and 3.92.1.7.

(12) Cablebus framework as permitted in 3.70.1.3.

(13) Other listed electrically continuous metal raceways and listed auxiliary gutters.

(14) Surface metal raceways listed for grounding.

2.50.6.10 Identification of Equipment Grounding Conductors.

Unless required elsewhere in this Code, equipment grounding conductors shall be permitted to be bare, covered, or insulated. Individually covered or insulated equipment grounding conductors shall have a continuous outer finish that is either green or green with one or more yellow stripes except as permitted in this section. Conductors with insulation or individual covering that is green, green with one or more yellow stripes, or otherwise identified as permitted by this section shall not be used for ungrounded or grounded circuit conductors.

(a) Conductors Larger Than 14 mm². Equipment grounding conductors larger than 14 mm² shall comply with 2.50.6.10(a)(1) and (a)(2).

(1) An insulated or covered conductor larger than 14 mm² shall be permitted, at the time of installation, to be permanently identified as an equipment grounding conductor at each end and at every point where the conductor is accessible.

Exception: Conductors larger than 14 mm² shall not be required to be marked in conduit bodies that contain no splices or unused hubs.

(2) Identification shall encircle the conductor and shall be accomplished by one of the following:

a. Stripping the insulation or covering from the entire exposed length

b. Coloring the exposed insulation or covering green

c. Marking the exposed insulation or covering with green tape or green adhesive labels

(b) Multiconductor Cable. Where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, one or more insulated conductors in a multiconductor cable, at the time of installation, shall be permitted to be permanently identified as equipment grounding conductors at each end and at every point where the conductors are accessible by one of the following means:

- (1) Stripping the insulation from the entire exposed length
- (2) Coloring the exposed insulation green
- (3) Marking the exposed insulation with green tape or green adhesive labels

(c) Flexible Cord. An uninsulated equipment grounding conductor shall be permitted, but, if individually covered, the covering shall have a continuous outer finish that is either green or green with one or more yellow stripes.

2.50.6.11 Equipment Grounding Conductor Installation. An equipment grounding conductor shall be installed in accordance with 2.50.6.11(a), (b), and (c).

(a) Raceway, Cable Trays, Cable Armor, Cablebus, or Cable Sheaths. Where it consists of a raceway, cable tray, cable armor, cablebus framework, or cable sheath or where it is a wire within a raceway or cable, it shall be installed in accordance with the applicable provisions in this Code using fittings for joints and terminations approved for use with the type raceway or cable used. All connections, joints, and fittings shall be made tight using suitable tools.

(b) Aluminum and Copper-Clad Aluminum Conductors. Equipment grounding conductors of bare or insulated aluminum or copper-clad aluminum shall be permitted. Bare conductors shall not come in direct contact with masonry or the earth or where subject to corrosive conditions. Aluminum or copper-clad aluminum conductors shall not be terminated within 450 mm of the earth.

(c) Equipment Grounding Conductors Smaller Than 14 mm². Equipment grounding conductors smaller than 14 mm² shall be protected from physical damage by a raceway or cable armor except

where run in hollow spaces of walls or partitions, where not subject to physical damage, or where protected from physical damage.

2.50.6.13 Size of Equipment Grounding Conductors.

(a) General. Copper, aluminum, or copper-clad aluminum equipment grounding conductors of the wire type shall not be smaller than shown in Table 2.50.6.13 but shall not be required to be larger than the circuit conductors supplying the equipment. Where a raceway or a cable armor or sheath is used as the equipment grounding conductor, as provided in 2.50.6.9 and 2.50.7.5(a), it shall comply with 2.50.1.4(a)(5) or (b)(4).

(b) Increased in Size. Where ungrounded conductors are increased in size, equipment grounding conductors, where installed, shall be increased in size proportionately according to circular mil area of the ungrounded conductors.

(c) Multiple Circuits. Where a single equipment grounding conductor is run with multiple circuits in the same raceway or cable, it shall be sized for the largest overcurrent device protecting conductors in the raceway or cable.

(d) Motor Circuits. Where the overcurrent device consists of an instantaneous trip circuit breaker or a motor short-circuit protector, as allowed in 4.30.4.2, the equipment grounding conductor size shall be permitted to be based on the rating of the motor overload protective device but shall not be less than the size shown in Table 2.50.6.13.

(e) Flexible Cord and Fixture Wire. The equipment grounding conductor in a flexible cord with the largest circuit conductor 5.5 mm² (2.6 mm dia.) or smaller, and the equipment grounding conductor used with fixture wires of any size in accordance with 2.40.1.5, shall not be smaller than 18 AWG copper and shall not be smaller than the circuit conductors. The equipment grounding conductor in a flexible cord with a circuit conductor larger than 5.5 mm² (2.6 mm dia.) shall be sized in accordance with Table 2.50.6.13.

(f) Conductors in Parallel. Where conductors are run in parallel in multiple raceways or cables as permitted in 3.10.1.4, the equipment grounding conductors, where used, shall be run in parallel in each

raceway or cable. One of the methods in 2.50.6.13(f)(1) or (f)(2) shall be used to ensure the equipment grounding conductors are protected.

(1) Based on Rating of Overcurrent Protective Device. Each parallel equipment grounding conductor shall be sized on the basis of the ampere rating of the overcurrent device protecting the circuit conductors in the raceway or cable in accordance with Table 2.50.6.13.

(2) Ground-Fault Protection of Equipment Installed. Where ground-fault protection of equipment is installed, each parallel equipment grounding conductor in a multiconductor cable shall be permitted to be sized in accordance with Table 2.50.6.13 on the basis of the trip rating of the ground-fault protection where the following conditions are met:

a. Conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner will service the installation.

b. The ground-fault protection equipment is set to trip at not more than the ampacity of a single ungrounded conductor of one of the cables in parallel.

c. The ground-fault protection is listed for the purpose of protecting the equipment grounding conductor.

(g) Feeder Taps. Equipment grounding conductors run with feeder taps shall not be smaller than shown in Table 2.50.6.13 based on the rating of the overcurrent device ahead of the feeder but shall not be required to be larger than the tap conductors.

2.50.6.15 Equipment Grounding Conductor Continuity.

(a) Separable Connections. Separable connections such as those provided in drawout equipment or attachment plugs and mating connectors and receptacles shall provide for first-make, last-break of the equipment grounding conductor. First-make, last-break shall not be required where interlocked equipment, plugs, receptacles, and connectors preclude energization without grounding continuity.

(b) Switches. No automatic cutout or switch shall be placed in the equipment grounding conductor of a premises wiring system unless the opening of the cutout or switch disconnects all sources of energy.

Table 2.50.6.13 Minimum Size Equipment Grounding Conductors for Grounding Raceway and Equipment

Rating or Setting of Automatic Overcurrent Device in Circuit Ahead of Equipment, Conduit, etc., Not Exceeding (Amperes)	Size mm ² (mm dia.)	
	Copper	Copper Aluminum or Copper-Clad Aluminum*
15	2.0(1.6)	3.5(2.0)
20	3.5(2.0)	5.5(2.6)
30	5.5(2.6)	8.0(3.2)
40	5.5(2.6)	8.0(3.2)
60	5.5(2.6)	8.0(3.2)
100	8.0(3.2)	14
200	14	22
300	22	30
400	30	38
500	30	50
600	38	60
800	50	80
1000	60	100
1200	80	125
1600	100	175
2000	125	200
2500	175	325
3000	200	325
4000	250	800
5000	700	1200
6000	800	1200

Note: Where necessary to comply with 2.50.1.4(a)(5) or (b)(4), the equipment grounding conductor shall be sized larger than given in this table.

*See installation restrictions in 2.50.6.11.

(b) Switches. No automatic cutout or switch shall be placed in the equipment grounding conductor of a premises wiring system unless the opening of the cutout or switch disconnects all sources of energy.

2.50.6.17 Identification of Wiring Device Terminals. The terminal for the connection of the equipment grounding conductor shall be identified by one of the following:

- (1) A green, not readily removable terminal screw with a hexagonal head.
- (2) A green, hexagonal, not readily removable terminal nut.
- (3) A green pressure wire connector. If the terminal for the grounding conductor is not visible, the conductor entrance hole shall be marked with the word green or ground, the letters G or GR, a grounding symbol, or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

FPN: See FPN Figure 2.50.6.17.

FPN Figure 2.50.6.17 One Example of a Symbol Used to Identify the Grounding Termination Point for an Equipment Grounding Conductor.

2.50.7 Methods of Equipment Grounding

2.50.7.1 Equipment Grounding Conductor Connections. Equipment grounding conductor connections at the source of separately derived systems shall be made in accordance with 2.50.2.11(a)(1). Equipment grounding conductor connections at service equipment shall be made as indicated in 2.50.7.1(a) or (b). For replacement of non-grounding-type receptacles with grounding-type receptacles and for branch-circuit extensions only in existing installations that do not have an equipment grounding conductor in the

branch circuit, connections shall be permitted as indicated in 2.50.7.1(c).

(a) For Grounded Systems. The connection shall be made by bonding the equipment grounding conductor to the grounded service conductor and the grounding electrode conductor.

(b) For Ungrounded Systems. The connection shall be made by bonding the equipment grounding conductor to the grounding electrode conductor.

(c) Nongrounding Receptacle Replacement or Branch Circuit Extensions. The equipment grounding conductor of a grounding-type receptacle or a branch-circuit extension shall be permitted to be connected to any of the following:

- (1) Any accessible point on the grounding electrode system as described in 2.50.3.1
- (2) Any accessible point on the grounding electrode conductor
- (3) The equipment grounding terminal bar within the enclosure where the branch circuit for the receptacle or branch circuit originates
- (4) For grounded systems, the grounded service conductor within the service equipment enclosure
- (5) For ungrounded systems, the grounding terminal bar within the service equipment enclosure

FPN: See 4.6.1.3(d) for the use of a ground-fault circuit-interrupting type of receptacle.

2.50.7.3 Short Sections of Raceway. Isolated sections of metal raceway or cable armor, where required to be grounded, shall be grounded in accordance with 2.50.7.5.

2.50.7.5 Equipment Fastened in Place or Connected by Permanent Wiring Methods (Fixed) — Grounding. Unless grounded by connection to the grounded circuit conductor as permitted by 2.50.2.13, 2.50.7.11, and 2.50.7.13, non-current-carrying metal parts of equipment, raceways, and other enclosures, if grounded, shall be grounded by one of the following methods.

(a) Equipment Grounding Conductor Types. By any of the equipment grounding conductors permitted by 2.50.6.9.

(b) With Circuit Conductors. By an equipment grounding conductor contained within the same raceway, cable, or otherwise run with the circuit conductors.

Exception No. 1: As provided in 2.50.7.1(c), the equipment grounding conductor shall be permitted to be run separately from the circuit conductors.

Exception No. 2: For dc circuits, the equipment grounding conductor shall be permitted to be run separately from the circuit conductors.

FPN No. 1: See 2.50.5.13 and 2.50.8.9 for equipment bonding jumper requirements.

FPN No. 2: See 4.0.1.7 for use of cords for fixed equipment.

2.50.7.7 Equipment Considered Effectively Grounded. Under the conditions specified in 2.50.7.7(a) and (b), the non-current-carrying metal parts of the equipment shall be considered effectively grounded.

(a) Equipment Secured to Grounded Metal Supports. Electrical equipment secured to and in electrical contact with a metal rack or structure provided for its support and grounded by one of the means indicated in 2.50.7.5. The structural metal frame of a building shall not be used as the required equipment grounding conductor for ac equipment.

(b) Metal Car Frames. Metal car frames supported by metal hoisting cables attached to or running over metal sheaves or drums of elevator machines that are grounded by one of the methods indicated in 2.50.7.5.

2.50.7.9 Cord-and-Plug-Connected Equipment. Non-current-carrying metal parts of cord-and-plug-connected equipment, if grounded, shall be grounded by one of the methods in 2.50.7.9(a) or (b).

(a) By Means of an Equipment Grounding Conductor. By means of an equipment grounding conductor run with the power supply conductors in a cable assembly or flexible cord properly terminated in a grounding-type attachment plug with one fixed grounding contact.

Exception: The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 250 volts between any two conductors or over 250 volts between any conductor and ground

(b) By Means of a Separate Flexible Wire or Strap. By means of a separate flexible wire or strap, insulated or bare, protected as well as practicable against physical damage, where part of equipment.

2.50.7.11 Frames of Ranges and Clothes Dryers. Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and outlet or junction boxes that are part of the circuit for these appliances shall be grounded in the manner specified by 2.50.7.5 or 2.50.7.9.

Exception: For existing branch circuit installations only where an equipment grounding conductor is not present in the outlet or junction box, the frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and outlet or junction boxes that are part of the circuit for these appliances shall be permitted to be grounded to the grounded circuit conductor if all the following conditions are met:

(1) *The supply circuit is 230-volt, single-phase, 2-wire; or 400Y/230-volt derived from a 3-phase, 4-wire, wye-connected system.*

(2) *The grounded conductor is not smaller than 5.5 mm² (2.6 mm dia.) copper or 8.0 mm² (3.2 mm dia.) aluminum.*

(3) *The grounded conductor is insulated, or the grounded conductor is uninsulated and part of a Type SE service-entrance cable and the branch circuit originates at the service equipment.*

(4) *Grounding contacts of receptacles furnished as part of the equipment are bonded to the equipment.*

2.50.7.13 Use of Grounded Circuit Conductor for Grounding Equipment.

(a) Supply-Side Equipment. A grounded circuit conductor shall be permitted to ground non-current-carrying metal parts of equipment, raceways, and other enclosures at any of the following locations:

(1) On the supply side or within the enclosure of the ac service-disconnecting means

(2) On the supply side or within the enclosure of the main disconnecting means for separate buildings as provided in 2.50.2.13(b)

(3) On the supply side or within the enclosure of the main disconnecting means or overcurrent devices of a separately derived system where permitted by 2.50.2.11(a)(1)

(b) Load-Side Equipment. Except as permitted in 2.50.2.11(a)(1) and 2.50.2.13(b), a grounded circuit conductor shall not be used for grounding non-current-carrying metal parts of equipment on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means or the overcurrent devices for a separately derived system not having a main disconnecting means.

Exception No. 1: The frames of ranges, wall-mounted ovens, counter-mounted cooking units, and clothes dryers under the conditions permitted for existing installations by 2.50.7.11 shall be permitted to be grounded by a grounded circuit conductor.

Exception No. 2: It shall be permissible to ground meter enclosures by connection to the grounded circuit conductor on the load side of the service disconnect where all of the following conditions apply:

(1) No service ground-fault protection is installed.

(2) All meter socket enclosures are located immediately adjacent to the service disconnecting means.

(3) The size of the grounded circuit conductor is not smaller than the size specified in Table 2.50.6.13 for equipment grounding conductors.

Exception No. 3: Direct-current systems shall be permitted to be grounded on the load side of the disconnecting means or overcurrent device in accordance with 2.50.8.5.

Exception No. 4: Electrode-type boilers operating at over 600 volts shall be grounded as required in 4.90.5.3(e)(1) and 4.90.5.5.

2.50.7.15 Multiple Circuit Connections. Where equipment is required to be grounded and is supplied by separate connection to more than one circuit or grounded premises wiring system, a means for grounding shall be provided for each such connection as specified in 2.50.7.5 and 2.50.7.9.

2.50.7.17 Connecting Receptacle Grounding Terminal to Box. An equipment bonding jumper shall be used to connect the grounding terminal of a grounding-type receptacle to a grounded box unless grounded as in 2.50.7.17(a) through (d).

(a) Surface Mounted Box. Where the box is mounted on the surface, direct metal-to-metal contact between the device yoke and the box or a contact yoke or device that complies with 2.50.7.17(b) shall be permitted to ground the receptacle to the box. At least one of the insulating washers shall be removed from receptacles that do not have a contact yoke or device that complies with 2.50.7.17(b) to ensure direct metal-to-metal contact. This provision shall not apply to cover-mounted receptacles unless the box and cover combination are listed as providing satisfactory ground continuity between the box and the receptacle.

(b) Contact Devices or Yokes. Contact devices or yokes designed and listed as self-grounding shall be permitted in conjunction with the supporting screws to establish the grounding circuit between the device yoke and flush-type boxes.

(c) Floor Boxes. Floor boxes designed for and listed as providing satisfactory ground continuity between the box and the device shall be permitted.

(d) Isolated Receptacles. Where required for the reduction of electrical noise (electromagnetic interference) on the grounding circuit, a receptacle in which the grounding terminal is purposely insulated from the receptacle mounting means shall be permitted. The receptacle grounding terminal shall be grounded by an insulated equipment grounding conductor run with the circuit conductors. This grounding conductor shall be permitted to pass through one or more panelboards without connection to the panelboard grounding terminal as permitted in 4.8.3.11, Exception, so as to terminate within the same building or structure directly at an equipment grounding conductor terminal of the applicable derived system or service.

FPN: Use of an isolated equipment grounding conductor does not relieve the requirement for grounding the raceway system and outlet box.

2.50.7.19 Continuity and Attachment of Equipment Grounding Conductors to Boxes. Where circuit conductors are spliced within a box, or terminated on equipment within or supported by a box, any equipment grounding conductor(s) associated with those circuit conductors shall be spliced or joined within the box or to the box with devices suitable for the use in accordance with 2.50.7.19(a) through (e).

Exception: The equipment grounding conductor permitted in 2.50.7.17(d) shall not be required to be connected to the other equipment grounding conductors or to the box.

(a) Connections. Connections and splices shall be made in accordance with 110.14(b) except that insulation shall not be required.

(b) Grounding Continuity. The arrangement of grounding connections shall be such that the disconnection or the removal of a receptacle, luminaire (fixture), or other device fed from the box does not interfere with or interrupt the grounding continuity.

(c) Metal Boxes. A connection shall be made between the one or more equipment grounding conductors and a metal box by means of a grounding screw that shall be used for no other purpose or a listed grounding device.

(d) Nonmetallic Boxes. One or more equipment grounding conductors brought into a nonmetallic outlet box shall be arranged such that a connection can be made to any fitting or device in that box requiring grounding.

(e) Solder. Connections depending solely on solder shall not be used.

2.50.8 Direct-Current Systems

2.50.8.1 General. Direct-current systems shall comply with Part 2.50.8 and other sections of Article 2.50 not specifically intended for ac systems.

2.50.8.3 Direct-Current Circuits and Systems to Be Grounded. Direct-current circuits and systems shall be grounded as provided for in 2.50.8.3(a) and (b).

(a) Two-Wire, Direct-Current Systems. A 2-wire, dc system supplying premises wiring and operating at greater than 50 volts but not greater than 300 volts shall be grounded.

Exception No. 1: A system equipped with a ground detector and supplying only industrial equipment in limited areas shall not be required to be grounded.

Exception No. 2: A rectifier-derived dc system supplied from an ac system complying with 2.50.2.1 shall not be required to be grounded.

Exception No. 3: Direct-current fire alarm circuits having a maximum current of 0.030 amperes as specified in Part 7.60.3 shall not be required to be grounded.

(b) Three-Wire, Direct-Current Systems. The neutral conductor of all 3-wire, dc systems supplying premises wiring shall be grounded.

2.50.8.5 Point of Connection for Direct-Current Systems.

(a) Off-Premises Source. Direct-current systems to be grounded and supplied from an off-premises source shall have the grounding connection made at one or more supply stations. A grounding connection shall not be made at individual services or at any point on the premises wiring.

(b) On-Premises Source. Where the dc system source is located on the premises, a grounding connection shall be made at one of the following:

- (1) The source
- (2) The first system disconnection means or overcurrent device
- (3) By other means that accomplish equivalent system protection and that utilize equipment listed and identified for the use

2.50.8.7 Size of Direct-Current Grounding Electrode Conductor. The size of the grounding electrode conductor for a dc system shall be as specified in 2.50.8.7(a) through (e).

(a) Not Smaller Than the Neutral Conductor. Where the dc system consists of a 3-wire balancer set or a balancer winding with overcurrent protection as provided in 445.12(d), the grounding electrode conductor shall not be smaller than the neutral conductor and not smaller than 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum.

(b) Not Smaller Than the Largest Conductor. Where the dc system is other than as in 2.50.8.7(a), the grounding electrode conductor shall not be smaller than the largest conductor supplied by the system, and not smaller than 8.0 mm² (3.2 mm dia.) copper or 14 mm² aluminum.

(c) Connected to Rod, Pipe, or Plate Electrodes. Where connected to rod, pipe, or plate electrodes as in 2.50.3.3(a)(5) or 2.50.3.3(a)(6), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than 14 mm² copper wire or 22 mm² aluminum wire.

(d) Connected to a Concrete-Encased Electrode. Where connected to a concrete-encased electrode as in 2.50.3.3(a)(3), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than 22 mm² copper wire.

(e) Connected to a Ground Ring. Where connected to a ground ring as in 2.50.3.3(a)(4), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than the conductor used for the ground ring.

2.50.8.9 Direct-Current Bonding Jumper. For dc systems, the size of the bonding jumper shall not be smaller than the system grounding electrode conductor specified in 2.50.8.7.

2.50.8.10 Ungrounded Direct-Current Separately Derived Systems. Except as otherwise permitted in 2.50.2.15 for portable and vehicle-mounted generators, an ungrounded dc separately derived system supplied from a stand-alone power source (such as an engine-generator set) shall have a grounding electrode conductor connected to an electrode that complies with Part 2.50.3 to provide for grounding of metal enclosures, raceways, cables, and exposed non-current-carrying

metal parts of equipment. The grounding electrode conductor connection shall be to the metal enclosure at any point on the separately derived system from the source to the first system disconnecting means or overcurrent device, or it shall be made at the source of a separately derived system that has no disconnecting means or overcurrent devices.

The size of the grounding electrode conductor shall be in accordance with 2.50.8.7.

2.50.9 Instruments, Meters, and Relays

2.50.9.1 Instrument Transformer Circuits. Secondary circuits of current and potential instrument transformers shall be grounded where the primary windings are connected to circuits of 300 volts or more to ground and, where on switchboards, shall be grounded irrespective of voltage.

Exception: Circuits where the primary windings are connected to circuits of less than 1000 volts with no live parts or wiring exposed or accessible to other than licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

2.50.9.3 Instrument Transformer Cases. Cases or frames of instrument transformers shall be grounded where accessible to other than licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

Exception: Cases or frames of current transformers, the primaries of which are not over 150 volts to ground and that are used exclusively to supply current to meters.

2.50.9.5 Cases of Instruments, Meters, and Relays Operating at Less Than 1000 Volts. Instruments, meters, and relays operating with windings or working parts at less than 1000 volts shall be grounded as specified in 2.50.9.5(a), (b), or (c).

(a) Not on Switchboards. Instruments, meters, and relays not located on switchboards, operating with windings or working parts at 300 volts or more to ground, and accessible to other than licensed electrical practitioner or non licensed electrical practitioner under the

supervision of a licensed electrical practitioner, shall have the cases and other exposed metal parts grounded.

(b) On Dead-Front Switchboards. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchboards having no live parts on the front of the panels shall have the cases grounded.

(c) On Live-Front Switchboards. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchboards having exposed live parts on the front of panels shall not have their cases grounded. Mats of insulating rubber or other suitable floor insulation shall be provided for the operator where the voltage to ground exceeds 150.

2.50.9.7 Cases of Instruments, Meters, and Relays — Operating Voltage 1 kV and Over. Where instruments, meters, and relays have current-carrying parts of 1 kV and over to ground, they shall be isolated by elevation or protected by suitable barriers, grounded metal, or insulating covers or guards. Their cases shall not be grounded.

Exception: Cases of electrostatic ground detectors where the internal ground segments of the instrument are connected to the instrument case and grounded and the ground detector is isolated by elevation.

2.50.9.9 Instrument Grounding Conductor. The grounding conductor for secondary circuits of instrument transformers and for instrument cases shall not be smaller than 3.5 mm² (2.0 mm dia.) copper or 5.5 mm² (2.6 mm dia.) aluminum. Cases of instrument transformers, instruments, meters, and relays that are mounted directly on grounded metal surfaces of enclosures or grounded metal switchboard panels shall be considered to be grounded, and no additional grounding conductor shall be required.

2.50.10 Grounding of Systems and Circuits of 1 kV and Over (High Voltage)

2.50.10.1 General. Where high-voltage systems are grounded, they shall comply with all applicable provisions of the preceding sections of this article and with 2.50.10.3 through 2.50.10.11, which supplement and modify the preceding sections.

2.50.10.3 Derived Neutral Systems. A system neutral derived from a grounding transformer shall be permitted to be used for grounding high-voltage systems.

2.50.10.5 Solidly Grounded Neutral Systems. Solidly grounded neutral systems shall be permitted to be either single point grounded or multigrounded neutral.

(a) Neutral Conductor.

(1) Insulation Level. The minimum insulation level for neutral conductors of solidly grounded systems shall be 600 volts.

Exception No. 1: Bare copper conductors shall be permitted to be used for the neutral of service entrances and the neutral of direct-buried portions of feeders.

Exception No. 2: Bare conductors shall be permitted for the neutral of overhead portions installed outdoors.

Exception No. 3: The neutral grounded conductor shall be permitted to be a bare conductor if isolated from phase conductors and protected from physical damage.

FPN: See 2.25.1.4 for conductor covering where within 3 000 mm of any building or other structure.

(2) Ampacity. The neutral conductor shall be of sufficient ampacity for the load imposed on the conductor but not less than 33 percent of the ampacity of the phase conductors.

Exception: In industrial and commercial premises under engineering supervision, it shall be permissible to size the ampacity of the neutral conductor to not less than 20 percent of the ampacity of the phase conductor.

(b) Single Point Grounded System. Where a single point grounded neutral system is used, the following shall apply:

(1) A single point grounded system shall be permitted to be supplied from (a) or (b):

- a. A separately derived system
- b. A multigrounded neutral system with an equipment grounding conductor connected to the multigrounded neutral at the source of the single point grounded system

(2) A grounding electrode shall be provided for the system.

(3) A grounding electrode conductor shall connect the grounding electrode to the system neutral.

(4) A bonding jumper shall connect the equipment grounding conductor to the grounding electrode conductor.

(5) An equipment bonding conductor shall be provided to each building, structure, and equipment enclosure.

(6) A neutral shall only be required where phase to neutral loads are supplied.

(7) The neutral, where provided, shall be insulated and isolated from earth except at one location.

(8) An equipment grounding conductor shall be run with the phase conductors and shall comply with (a), (b), and (c):

- a. Shall not carry continuous load
- b. May be bare or insulated
- c. Shall have sufficient ampacity for fault current duty

(c) Multigrounded Neutral Systems. Where a multigrounded neutral system is used, the following shall apply:

(1) The neutral of a solidly grounded neutral system shall be permitted to be grounded at more than one point. Grounding shall be permitted at one or more of the following locations:

- a. Transformers supplying conductors to a building or other structure
- b. Underground circuits where the neutral is exposed
- c. Overhead circuits installed outdoors

(2) The multigrounded neutral conductor shall be grounded at each transformer and at other additional locations by connection to a made or existing electrode.

(3) At least one grounding electrode shall be installed and connected to the multigrounded neutral circuit conductor every **400 m (1300 ft)**.

(4) The maximum distance between any two adjacent electrodes shall not be more than **400 m (1300 ft)**.

(5) In a multigrounded shielded cable system, the shielding shall be grounded at each cable joint that is exposed to personnel contact.

2.50.10.7 Impedance Grounded Neutral Systems. Impedance grounded neutral systems in which a grounding impedance, usually a resistor, limits the ground-fault current, shall be permitted where all of the following conditions are met:

(1) The conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner will service the installation.

(2) Ground detectors are installed on the system.

(3) Line-to-neutral loads are not served.

Impedance grounded neutral systems shall comply with the provisions of 2.50.10.7(a) through (d).

(a) Location. The grounding impedance shall be inserted in the grounding conductor between the grounding electrode of the supply system and the neutral point of the supply transformer or generator.

(b) Identified and Insulated. The neutral conductor of an impedance grounded neutral system shall be identified, as well as fully insulated with the same insulation as the phase conductors.

(c) System Neutral Connection. The system neutral shall not be connected to ground, except through the neutral grounding impedance.

(d) Equipment Grounding Conductors. Equipment grounding conductors shall be permitted to be bare and shall be electrically connected to the ground bus and grounding electrode conductor.

2.50.10.9 Grounding of Systems Supplying Portable or Mobile Equipment. Systems supplying portable or mobile high-voltage equipment, other than substations installed on a temporary basis, shall comply with 2.50.10.9(a) through (f).

(a) **Portable or Mobile Equipment.** Portable or mobile high-voltage equipment shall be supplied from a system having its neutral grounded through an impedance. Where a delta-connected high-voltage system is used to supply portable or mobile equipment, a system neutral shall be derived.

(b) **Exposed Non-Current-Carrying Metal Parts.** Exposed non-current-carrying metal parts of portable or mobile equipment shall be connected by an equipment grounding conductor to the point at which the system neutral impedance is grounded.

(c) **Ground-Fault Current.** The voltage developed between the portable or mobile equipment frame and ground by the flow of maximum ground-fault current shall not exceed 100 volts.

(d) **Ground-Fault Detection and Relaying.** Ground-fault detection and relaying shall be provided to automatically de-energize any high-voltage system component that has developed a ground fault. The continuity of the equipment grounding conductor shall be continuously monitored so as to de-energize automatically the high-voltage circuit to the portable or mobile equipment upon loss of continuity of the equipment grounding conductor.

(e) **Isolation.** The grounding electrode to which the portable or mobile equipment system neutral impedance is connected shall be isolated from and separated in the ground by at least 6 000 mm from any other system or equipment grounding electrode, and there shall be no direct connection between the grounding electrodes, such as buried pipe and fence, and so forth.

(f) **Trailing Cable and Couplers.** High-voltage trailing cable and couplers for interconnection of portable or mobile equipment shall meet the requirements of Part 4.0.3 for cables and 4.90.4.5 for couplers.

2.50.10.11 Grounding of Equipment. All non-current-carrying metal parts of fixed, portable, and mobile equipment and associated fences, housings, enclosures, and supporting structures shall be grounded.

Exception: Where isolated from ground and located so as to prevent any person who can make contact with ground from contacting such metal parts when the equipment is energized.

Grounding conductors not an integral part of a cable assembly shall not be smaller than 14 mm² copper or 22 mm² aluminum.

FPN: See 2.50.6.1, Exception No. 2, for pole-mounted distribution apparatus.

ARTICLE 2.80 — SURGE ARRESTERS

2.80.1 General

2.80.1.1 Scope. This article covers general requirements, installation requirements, and connection requirements for surge arresters installed on premises wiring systems.

2.80.1.2 Definition. Surge Arrester. A protective device for limiting surge voltages by discharging or bypassing surge current, and it also prevents continued flow of follow current while remaining capable of repeating these functions.

2.80.1.3 Number Required. Where used at a point on a circuit, a surge arrester shall be connected to each ungrounded conductor. A single installation of such surge arresters shall be permitted to protect a number of interconnected circuits, provided that no circuit is exposed to surges while disconnected from the surge arresters.

2.80.1.4 Surge Arrester Selection.

(a) **Circuits of Less Than 1 000 Volts.** Surge arresters installed on a circuit of less than 1 000 volts shall comply with all of the following:

(1) The rating of the surge arrester shall be equal to or greater than the maximum continuous phase-to-ground power frequency voltage available at the point of application.

(2) Surge arresters installed on circuits of less than 1 000 volts shall be listed.

(3) Surge arresters shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating.

(4) Surge arresters shall not be installed on ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.

(b) Circuits of 1 kV and Over — Silicon Carbide Types. The rating of a silicon carbide-type surge arrester shall be not less than 125 percent of the maximum continuous phase-to-ground voltage available at the point of application.

FPN No. 1: For further information on surge arresters, see ANSI/IEEE C62.1-1989, Standard for Gapped Silicon-Carbide Surge Arresters for AC Power Circuits; ANSI/IEEE C62.2-1987, Guide for the Application of Gapped Silicon-Carbide Surge Arresters for Alternating-Current Systems; ANSI/IEEE C62.11-1993, Standard for Metal-Oxide Surge Arresters for Alternating-Current Power Circuits; and ANSI/IEEE C62.22-1991, Guide for the Application of Metal-Oxide Surge Arresters for Alternating-Current Systems.

FPN No. 2: The selection of a properly rated metal oxide arrester is based on considerations of maximum continuous operating voltage and the magnitude and duration of overvoltages at the arrester location as affected by phase-to-ground faults, system grounding techniques, switching surges, and other causes. See the manufacturer's application rules for selection of the specific arrester to be used at a particular location.

2.80.2 Installation

2.80.2.1 Location. Surge arresters shall be permitted to be located indoors or outdoors. Surge arresters shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

2.80.2.2 Routing of Surge Arrester Connections. The conductor used to connect the surge arrester to line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

2.80.3 Connecting Surge Arresters

2.80.3.1 Installed at Services of Less Than 1 000 Volts. Line and ground connecting conductors shall not be smaller than 2.0 mm² (1.6 mm dia.) copper or 3.5 mm² (2.0 mm dia.) aluminum. The arrester grounding conductor shall be connected to one of the following:

- (1) Grounded service conductor
- (2) Grounding electrode conductor
- (3) Grounding electrode for the service
- (4) Equipment grounding terminal in the service equipment

2.80.3.2 Installed on the Load Side Services of Less Than 1000 Volts. Line and ground connecting conductors shall not be smaller than 2.0 mm² (1.6 mm dia.) copper or 3.5 mm² (2.0 mm dia.) aluminum. A surge arrester shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the surge arrester during a surge.

2.80.3.3 Circuits of 1 kV and Over — Surge-Arrester Conductors. The conductor between the surge arrester and the line and the surge arrester and the grounding connection shall not be smaller than 14 mm² copper or aluminum.

2.80.3.4 Circuits of 1 kV and Over — Interconnections. The grounding conductor of a surge arrester protecting a transformer that supplies a secondary distribution system shall be interconnected as specified in 2.80.3.4(a), (b), or (c).

(a) Metallic Interconnections. A metallic interconnection shall be made to the secondary grounded circuit conductor or the secondary circuit grounding conductor provided that, in addition to the direct grounding connection at the surge arrester, the following occurs:

(1) The grounded conductor of the secondary has elsewhere a grounding connection to a continuous metal underground water piping system. However, in urban water-pipe areas where there are at least four water-pipe connections on the neutral and not fewer than four such connections in each mile of neutral, the metallic interconnection shall be permitted to be made to the secondary neutral with omission of the direct grounding connection at the surge arrester.

(2) The grounded conductor of the secondary system is a part of a multiground neutral system or static wire of which the primary neutral or static wire has at least four ground connections in each mile of line in addition to a ground at each service.

(b) Through Spark Gap or Device. Where the surge arrester grounding conductor is not connected as in 2.80.3.4(a) or where the secondary is not grounded as in 2.80.3.4(a) but is otherwise grounded as in 2.50.3.3, an interconnection shall be made through a spark gap or listed device as follows:

(1) For ungrounded or ungrounded primary systems, the spark gap or listed device shall have a 60-Hz breakdown voltage of at least twice the primary circuit voltage but not necessarily more than 10 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6 000 mm distant from the surge arrester grounding electrode.

(2) For multigrounded neutral primary systems, the spark gap or listed device shall have a 60-Hz breakdown of not more than 3 kV, and there shall be at least one other ground on the grounded conductor of the secondary that is not less than 6 000 mm distant from the surge arrester grounding electrode.

(c) By Special Permission. An interconnection of the surge arrester ground and the secondary neutral, other than as provided in 2.80.3.4(a) or (b), shall be permitted to be made only by special permission.

2.80.3.5 Grounding. Except as indicated in this article, surge arrester grounding connections shall be made as specified in Article 2.50. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

ARTICLE 285 — TRANSIENT VOLTAGE SURGE SUPPRESSORS: TVSS

2.85.1 General

2.85.1.1 Scope. This article covers general requirements, installation requirements, and connection requirements for transient voltage surge suppressors (TVSSs) permanently installed on premises wiring systems.

2.85.1.2 Definition.

Transient Voltage Surge Suppressor (TVSS). A protective device for limiting transient voltages by diverting or limiting surge current; it also prevents continued flow of follow current while remaining capable of repeating these functions.

2.85.1.3 Uses Not Permitted. A TVSS device shall not be installed in the following:

- (1) Circuits exceeding 600 volts
- (2) On ungrounded systems, impedance grounded systems, or corner grounded delta systems unless listed specifically for use on these systems.
- (3) Where the rating of the TVSS is less than the maximum continuous phase-to-ground power frequency voltage available at the point of application

FPN: For further information on TVSSs, see NEMA LS 1-1992, Standard for Low Voltage Surge Suppression Devices. The selection of a properly rated TVSS is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.

2.85.1.4 Number Required. Where used at a point on a circuit, the TVSS shall be connected to each ungrounded conductor.

2.85.1.5 Listing. A TVSS shall be a listed device.

2.85.1.6 Short Circuit Current Rating. The TVSS shall be marked with a short circuit current rating and shall not be installed at a point on the system where the available fault current is in excess of that rating. This marking requirement shall not apply to receptacles.

2.85.2 Installation

2.85.2.1 Location. TVSSs shall be permitted to be located indoors or outdoors and shall be made inaccessible to unqualified persons, unless listed for installation in accessible locations.

2.85.2.2 Routing of Connections. The conductors used to connect the TVSS to the line or bus and to ground shall not be any longer than necessary and shall avoid unnecessary bends.

2.85.3 Connecting Transient Voltage Surge Suppressors

2.85.3.1 Connection. Where a TVSS is installed, it shall comply with 2.85.3.1(a) through (c).

(a) Location.

(1) Service Supplied Building or Structure. The transient voltage surge suppressor shall be connected on the load side of a service disconnect overcurrent device required in 2.30.7.2, unless installed in accordance with 2.30.6.13(8).

(2) Feeder Supplied Building or Structure. The transient voltage surge suppressor shall be connected on the load side of the first overcurrent device at the building or structure.

Exception to (1) and (2): Where the TVSS is also listed as a surge arrester, the connection shall be as permitted by Article 2.80.

(3) Separately Derived System. The TVSS shall be connected on the load side of the first overcurrent device in a separately derived system.

(b) Conductor Size. Line and ground connecting conductors shall not be smaller than 2.0 mm² (1.6 mm dia.) copper or 3.5 mm² (2.0 mm dia.) aluminum.

(c) Connection Between Conductors. A TVSS shall be permitted to be connected between any two conductors — ungrounded conductor(s), grounded conductor, grounding conductor. The grounded conductor and the grounding conductor shall be interconnected only by the normal operation of the TVSS during a surge.

2.85.3.5 Grounding. Grounding conductors shall not be run in metal enclosures unless bonded to both ends of such enclosure.

Chapter 3. Wiring Methods and Materials

ARTICLE 3.0 — WIRING METHODS

3.0.1 General Requirements

3.0.1.1 Scope.

(a) **All Wiring Installations.** This article covers wiring methods for all wiring installations unless modified by other articles.

(b) **Integral Parts of Equipment.** The provisions of this article are not intended to apply to the conductors that form an integral part of equipment, such as motors, controllers, motor control centers, or factory assembled control equipment or listed utilization equipment.

(c) **Metric Designators and Trade Sizes.** Metric designators and trade sizes for conduit, tubing, and associated fittings and accessories shall be as designated in Table 3.0.1.1(c).

3.0.1.2 Limitations.

(a) **Voltage.** Wiring methods specified in Chapter 3 shall be used for 600 volts, nominal, or less where not specifically limited in some section of Chapter 3. They shall be permitted for over 600 volts, nominal, where specifically permitted elsewhere in this Code.

(b) **Temperature.** Temperature limitation of conductors shall be in accordance with 3.10.1.10.

Table 3.0.1.1(c) Metric Designator and Trade Sizes

Metric Designator	Trade Size
12	$\frac{3}{8}$
16	$\frac{1}{2}$
21	$\frac{3}{4}$
27	1
35	1 $\frac{1}{4}$
41	1 $\frac{1}{2}$
53	2
63	2 $\frac{1}{2}$
78	3
91	3 $\frac{1}{2}$
103	4
129	5
155	6

Note: The metric designators and trade sizes are for identification purposes only and are not actual dimensions.

3.0.1.3 Conductors.

(a) **Single Conductors.** Single conductors specified in Table 3.10.1.13 shall only be installed where part of a recognized wiring method of Chapter 3.

Exception: Individual conductors shall be permitted where installed as separate overhead conductors in accordance with 2.25.1.6.

(b) **Conductors of the Same Circuit.** All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors and bonding conductors shall be contained within the same raceway, auxiliary gutter, cable tray, cablebus assembly, trench, cable, or cord, unless otherwise permitted in accordance with 3.0.1.3(b)(1) through (b)(4).

(1) **Paralleled Installations.** Conductors shall be permitted to be run in parallel in accordance with the provisions of 3.10.1.4. The requirement to run all circuit conductors within the same raceway, auxiliary gutter, cable tray, trench, cable, or cord shall apply separately to each portion of the paralleled installation, and the equipment grounding conductors shall comply with the provisions of 2.50.6.3.

Parallel runs in cable tray shall comply with the provisions of 3.92.1.8(d).

Exception: Conductors installed in nonmetallic raceways run underground shall be permitted to be arranged as isolated phase installations. The raceways shall be installed in close proximity, and the conductors shall comply with the provisions of 3.0.1.20(b).

(2) Grounding and Bonding Conductors. Equipment grounding conductors shall be permitted to be installed outside a raceway or cable assembly where in accordance with the provisions of 2.50.7.1(c) for certain existing installations or in accordance with 2.50.7.5(b), Exception No. 2, for dc circuits. Equipment bonding conductors shall be permitted to be installed on the outside of raceways in accordance with 2.50.5.3(e).

(3) Nonferrous Wiring Methods. Conductors in wiring methods with a nonmetallic or other nonmagnetic sheath, where run in different raceways, auxiliary gutters, cable trays, trenches, cables, or cords, shall comply with the provisions of 3.0.1.20(b). Conductors in single-conductor Type MI cable with a nonmagnetic sheath shall comply with the provisions of 3.32.2.22. Conductors of single-conductor Type MC cable with a nonmagnetic sheath shall comply with the provisions of 3.30.2.22, 3.30.3.13, and 3.0.1.20(b).

(4) Enclosures. Where an auxiliary gutter runs between a column-width panelboard and a pull box, and the pull box includes neutral terminations, the neutral conductors of circuits supplied from the panelboard shall be permitted to originate in the pull box.

(c) Conductors of Different Systems.

(1) 600 Volts, Nominal, or Less. Conductors of circuits rated 600 volts, nominal, or less, ac circuits, and dc circuits shall be permitted to occupy the same equipment wiring enclosure, cable, or raceway. All conductors shall have an insulation rating equal to at least the maximum circuit voltage applied to any conductor within the enclosure, cable, or raceway.

Exception: For solar photovoltaic systems in accordance with 6.90.1.4(b).

FPN: See 7.25.3.15(a) for Class 2 and Class 3 circuit conductors.

(2) Over 600 Volts, Nominal. Conductors of circuits rated over 600 volts, nominal, shall not occupy the same equipment wiring enclosure, cable, or raceway with conductors of circuits rated 600 volts, nominal, or less unless otherwise permitted in (c)(2)(a) through (c)(2)(e).

a. Secondary wiring to electric-discharge lamps of 1000 volts or less, if insulated for the secondary voltage involved, shall be permitted to occupy the same luminaire (fixture), sign, or outline lighting enclosure as the branch-circuit conductors.

b. Primary leads of electric-discharge lamp ballasts insulated for the primary voltage of the ballast, where contained within the individual wiring enclosure, shall be permitted to occupy the same luminaire (fixture), sign, or outline lighting enclosure as the branch-circuit conductors.

c. Excitation, control, relay, and ammeter conductors used in connection with any individual motor or starter shall be permitted to occupy the same enclosure as the motor-circuit conductors.

d. In motors, switchgear and control assemblies, and similar equipment, conductors of different voltage ratings shall be permitted.

e. In manholes, if the conductors of each system are permanently and effectively separated from the conductors of the other systems and securely fastened to racks, insulators, or other approved supports, conductors of different voltage ratings shall be permitted.

Conductors having nonshielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, or raceway.

3.0.1.4 Protection Against Physical Damage. Where subject to physical damage, conductors shall be protected.

(a) Cables and Raceways Through Wood Members.

(1) Bored Holes. In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through bored holes in joists, rafters, or wood members, holes shall be bored so that the edge of the hole is not less than 30 mm from the nearest edge of the wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a

steel plate or bushing, at least 1.60 mm thick, and of appropriate length and width installed to cover the area of the wiring.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.60 mm thick that provides equal or better protection against nail or screw penetration shall be permitted.

(2) Notches in Wood. Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in wood studs, joists, rafters, or other wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.60 mm thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.60 mm thick that provides equal or better protection against nail or screw penetration shall be permitted.

(b) Nonmetallic-Sheathed Cables and Electrical Nonmetallic Tubing Through Metal Framing Members.

(1) Nonmetallic-Sheathed Cable. In both exposed and concealed locations where nonmetallic-sheathed cables pass through either factory or field punched, cut, or drilled slots or holes in metal members, the cable shall be protected by listed bushings or listed grommets covering all metal edges that are securely fastened in the opening prior to installation of the cable.

(2) Nonmetallic-Sheathed Cable and Electrical Nonmetallic Tubing. Where nails or screws are likely to penetrate nonmetallic-sheathed cable or electrical nonmetallic tubing, a steel sleeve, steel plate, or steel clip not less than 1.60 mm in thickness shall be used to protect the cable or tubing.

Exception: A listed and marked steel plate less than 1.60 mm thick that provides equal or better protection against nail or screw penetration shall be permitted.

(c) **Cables Through Spaces Behind Panels Designed to Allow Access.** Cables or raceway-type wiring methods, installed behind panels designed to allow access, shall be supported according to their applicable articles.

(d) **Cables and Raceways Parallel to Framing Members and Furring Strips.** In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed parallel to framing members, such as joists, rafters, or studs, or is installed parallel to furring strips, the cable or raceway shall be installed and supported so that the nearest outside surface of the cable or raceway is not less than 30 mm from the nearest edge of the framing member or furring strips where nails or screws are likely to penetrate. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by nails or screws by a steel plate, sleeve, or equivalent at least 1.60 mm thick.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: For concealed work in finished buildings, or finished panels for prefabricated buildings where such supporting is impracticable, it shall be permissible to fish the cables between access points.

Exception No. 3: A listed and marked steel plate less than 1.60 mm thick that provides equal or better protection against nail or screw penetration shall be permitted.

(e) **Cables and Raceways Installed in Shallow Grooves.** Cable- or raceway-type wiring methods installed in a groove, to be covered by wallboard, siding, paneling, carpeting, or similar finish, shall be protected by 1.60 mm thick steel plate, sleeve, or equivalent or by not less than 30 mm free space for the full length of the groove in which the cable or raceway is installed.

Exception No. 1: Steel plates, sleeves, or the equivalent shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.60 mm thick that provides equal or better protection against nail or screw penetration shall be permitted.

(f) Insulated Fittings. Where raceways containing ungrounded conductors 22 mm² or larger enter a cabinet, box enclosure, or raceway, the conductors shall be protected by a substantial fitting providing a smoothly rounded insulating surface, unless the conductors are separated from the fitting or raceway by substantial insulating material that is securely fastened in place.

Exception: Where threaded hubs or bosses that are an integral part of a cabinet, box enclosure, or raceway provide a smoothly rounded or flared entry for conductors.

Conduit bushings constructed wholly of insulating material shall not be used to secure a fitting or raceway. The insulating fitting or insulating material shall have a temperature rating not less than the insulation temperature rating of the installed conductors.

3.0.1.5 Underground Installations.

(a) Minimum Cover Requirements. Direct-buried cable or conduit or other raceways shall be installed to meet the minimum cover requirements of Table 3.0.1.5.

(b) Listing. Cables and insulated conductors installed in enclosures or raceways in underground installations shall be listed for use in wet locations.

(c) Underground Cables Under Buildings. Underground cable installed under a building shall be in a raceway that is extended beyond the outside walls of the building.

(d) Protection from Damage. Direct-buried conductors and cables shall be protected from damage in accordance with 3.0.1.5(d)(1) through (d)(4).

(1) Emerging from Grade. Direct-buried conductors and enclosures emerging from grade shall be protected by enclosures or raceways extending from the minimum cover distance below grade required by 3.0.1.5(a) to a point at least 2 400 mm above finished grade. In no case shall the protection be required to exceed 450 mm below finished grade.

(2) Conductors Entering Buildings. Conductors entering a building shall be protected to the point of entrance.

(3) Service Conductors. Underground service conductors that are not encased in concrete and that are buried 450 mm or more below grade shall have their location identified by a warning ribbon that is placed in the trench at least 300 mm above the underground installation.

(4) Enclosure or Raceway Damage. Where the enclosure or raceway is subject to physical damage, the conductors shall be installed in rigid metal conduit, intermediate metal conduit, Schedule 80 rigid nonmetallic conduit, or equivalent.

(e) Splices and Taps. Direct-buried conductors or cables shall be permitted to be spliced or tapped without the use of splice boxes. The splices or taps shall be made in accordance with 1.10.1.14(b).

(f) Backfill. Backfill that contains large rocks, paving materials, cinders, large or sharply angular substances, or corrosive material shall not be placed in an excavation where materials may damage raceways, cables, or other substructures or prevent adequate compaction of fill or contribute to corrosion of raceways, cables, or other substructures.

Where necessary to prevent physical damage to the raceway or cable, protection shall be provided in the form of granular or selected material, suitable running boards, suitable sleeves, or other approved means.

(g) Raceway Seals. Conduits or raceways through which moisture may contact live parts shall be sealed or plugged at either or both ends.

FPN: Presence of hazardous gases or vapors may also necessitate sealing of underground conduits or raceways entering buildings.

Table 3.0.1.5 Minimum Cover Requirements, 0 to 600 Volts, Nominal, Burial in Millimeters

Location of Wiring Method or Circuit	Type of Wiring Method or Circuit				
	Column 1 Direct Burial Cables or Conductors (mm)	Column 2 Rigid Metal Conduit or Intermediate Metal Conduit (mm)	Column 3 Nonmetallic Raceways Listed for Direct Burial Without Concrete Encasement or Other Approved Raceways (mm)	Column 4 Residential Branch Circuits Rated 120 Volts or Less with GFCI Protection and Maximum Overcurrent Protection of 20 Amperes (mm)	Column 5 Circuits for Control of Irrigation and Landscape Lighting Limited to Not More Than 30 Volts and Installed with Type UF or in Other Identified Cable or Raceway (mm)
All locations not specified below	600	150	450	300	150
In trench below 50 mm thick concrete or equivalent	450	150	300	150	150
Under a building	0 (in raceway only)	0	0	0 (in raceway only)	0 (in raceway only)
Under minimum of 100 mm thick concrete exterior slab with no vehicular traffic and the slab extending not less than 150 mm beyond the underground installation	450	100	100	150 (direct burial) 100 (in raceway)	150
Under minimum of 100 mm thick concrete exterior slab with no vehicular traffic and the slab extending not less than 150 mm beyond the underground installation	450	100	100	150 (direct burial) 100 (in raceway)	150

Table 3.0.1.5 (Continued)

Type of Wiring Method or Circuit					
Location of Wiring Method or Circuit	Column 1 Direct Burial Cables or Conductors (mm)	Column 2 Rigid Metal Conduit or Intermediate Metal Conduit (mm)	Column 3 Nonmetallic Raceways Listed for Direct Burial Without Concrete Encasement or Other Approved Raceways (mm)	Column 4 Residential Branch Circuits Rated 120 Volts or Less with GFCI Protection and Maximum Overcurrent Protection of 20 Amperes (mm)	Column 5 Circuits for Control of Irrigation and Landscape Lighting Limited to Not More Than 30 Volts and Installed with Type UF or in Other Identified Cable or Raceway (mm)
Under streets, highways, roads, alleys, driveways, and parking lots	600	600	600	600	600
One- and two-family dwelling driveways and outdoor parking areas, and used only for dwelling-related purposes	450	450	450	450	450
In or under airport runways, including adjacent areas where trespassing prohibited	450	450	450	450	450

Notes:

1. Cover is defined as the shortest distance in millimeters (inches) measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.
2. Raceways approved for burial only where concrete encased shall require concrete envelope not less than 50 mm thick.
3. Lesser depths shall be permitted where cables and conductors rise for terminations or splices or where access is otherwise required.
4. Where one of the wiring method types listed in Columns 1–3 is used for one of the circuit types in Columns 4 and 5, the shallowest depth of burial shall be permitted.
5. Where solid rock prevents compliance with the cover depths specified in this table, the wiring shall be installed in metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm of concrete extending down to rock.

(h) Bushing. A bushing, or terminal fitting, with an integral bushed opening shall be used at the end of a conduit or other raceway that terminates underground where the conductors or cables emerge as a direct burial wiring method. A seal incorporating the physical protection characteristics of a bushing shall be permitted to be used in lieu of a bushing.

(i) Conductors of the Same Circuit. All conductors of the same circuit and, where used, the grounded conductor and all equipment grounding conductors shall be installed in the same raceway or cable or shall be installed in close proximity in the same trench.

Exception No. 1: Conductors in parallel in raceways or cables shall be permitted, but each raceway or cable shall contain all conductors of the same circuit including grounding conductors.

Exception No. 2: Isolated phase, polarity, grounded conductor, and equipment grounding and bonding conductor installations shall be permitted in nonmetallic raceways or cables with a nonmetallic covering or nonmagnetic sheath in close proximity where conductors are paralleled as permitted in 3.10.1.4, and where the conditions of 3.0.1.20(b) are met.

(j) Ground Movement. Where direct-buried conductors, raceways, or cables are subject to movement by settlement or frost, direct-buried conductors, raceways, or cables shall be arranged so as to prevent damage to the enclosed conductors or to equipment connected to the raceways.

FPN: This section recognizes "S" loops in underground direct burial to raceway transitions, expansion fittings in raceway risers to fixed equipment, and, generally, the provision of flexible connections to equipment subject to settlement or frost heaves.

(k) Directional Boring. Cables or raceways installed using directional boring equipment shall be approved for the purpose.

3.0.1.6 Protection Against Corrosion and Deterioration. Raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be of materials suitable for the environment in which they are to be installed.

(a) Ferrous Metal Equipment. Ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, nipples, fittings, supports, and support hardware shall be suitably protected against corrosion inside and outside (except threads at joints) by a coating of listed corrosion-resistant material. Where corrosion protection is necessary and the conduit is threaded in the field, the threads shall be coated with an approved electrically conductive, corrosion-resistant compound.

Exception: Stainless steel shall not be required to have protective coatings.

(1) Protected from Corrosion Solely by Enamel. Where protected from corrosion solely by enamel, ferrous metal raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, metal elbows, couplings, nipples, fittings, supports, and support hardware shall not be used outdoors or in wet locations as described in 3.0.1.6(d).

(2) Organic Coatings on Boxes or Cabinets. Where boxes or cabinets have an approved system of organic coatings and are marked "Raintight," "Rainproof," or "Outdoor Type," they shall be permitted outdoors.

(3) In Concrete or in Direct Contact with the Earth. Ferrous metal raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, nipples, fittings, supports, and support hardware shall be permitted to be installed in concrete or in direct contact with the earth, or in areas subject to severe corrosive influences where made of material approved for the condition, or where provided with corrosion protection approved for the condition.

(b) Non-Ferrous Metal Equipment. Non-ferrous raceways, cable trays, cablebus, auxiliary gutters, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, nipples, fittings, supports, and support hardware embedded or encased in concrete or in direct contact with the earth shall be provided with supplementary corrosion protection.

(c) Nonmetallic Equipment. Nonmetallic raceways, cable trays, cablebus, auxiliary gutters, boxes, cables with a nonmetallic outer jacket and internal metal armor or jacket, cable sheathing, cabinets, elbows, couplings, nipples, fittings, supports, and support hardware

shall be made of material approved for the condition and shall comply with (c)(1) and (c)(2) as applicable to the specific installation.

(1) Exposed to Sunlight. Where exposed to sunlight, the materials shall be listed as sunlight resistant or shall be identified as sunlight resistant.

(2) Chemical Exposure. Where subject to exposure to chemical solvents, vapors, splashing, or immersion, materials or coatings shall either be inherently resistant to chemicals based on its listing or be identified for the specific chemical reagent.

(d) Indoor Wet Locations. In portions of dairy processing facilities, laundries, canneries, and other indoor wet locations, and in locations where walls are frequently washed or where there are surfaces of absorbent materials, such as damp paper or wood, the entire wiring system, where installed exposed, including all boxes, fittings, raceways, and cable used therewith, shall be mounted so that there is at least a 6 mm airspace between it and the wall or supporting surface.

Exception: Nonmetallic raceways, boxes, and fittings shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.

FPN: In general, areas where acids and alkali chemicals are handled and stored may present such corrosive conditions, particularly when wet or damp. Severe corrosive conditions may also be present in portions of meatpacking plants, tanneries, glue houses, and some stables; in installations immediately adjacent to a seashore and swimming pool areas; in areas where chemical deicers are used; and in storage cellars or rooms for hides, casings, fertilizer, salt, and bulk chemicals.

3.0.1.7 Raceways Exposed to Different Temperatures.

(a) Sealing. Where portions of a cable raceway or sleeve are known to be subjected to different temperatures and where condensation is known to be a problem, as in cold storage areas of buildings or where passing from the interior to the exterior of a building, the raceway or sleeve shall be filled with an approved material to prevent the circulation of warm air to a colder section of the raceway or sleeve. An explosionproof seal shall not be required for this purpose.

(b) Expansion Fittings. Raceways shall be provided with expansion fittings where necessary to compensate for thermal expansion and

contraction.

FPN: Table 3.52.2.35(a) provides the expansion information for polyvinyl chloride (PVC). A nominal number for steel conduit can be determined by multiplying the expansion length in this table by 0.20. The coefficient of expansion for steel electrical metallic tubing, intermediate metal conduit, and rigid conduit is 11.70×10^{-6} (0.0000117 mm per mm of conduit for each °C in temperature change) [6.50×10^{-6} (0.0000065 in. per inch of conduit for each °F in temperature change)].

3.0.1.8 Installation of Conductors with Other Systems. Raceways or cable trays containing electric conductors shall not contain any pipe, tube, or equal for steam, water, air, gas, drainage, or any service other than electrical.

3.0.1.10 Electrical Continuity of Metal Raceways and Enclosures. Metal raceways, cable armor, and other metal enclosures for conductors shall be metallically joined together into a continuous electric conductor and shall be connected to all boxes, fittings, and cabinets so as to provide effective electrical continuity. Unless specifically permitted elsewhere in this Code, raceways and cable assemblies shall be mechanically secured to boxes, fittings, cabinets, and other enclosures.

Exception No. 1: Short sections of raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be made electrically continuous.

Exception No. 2: Equipment enclosures to be isolated, as permitted by 2.50.5.7(b), shall not be required to be metallically joined to the metal raceway.

3.0.1.11 Securing and Supporting.

(a) Secured in Place. Raceways, cable assemblies, boxes, cabinets, and fittings shall be securely fastened in place. Support wires that do not provide secure support shall not be permitted as the sole support. Support wires and associated fittings that provide secure support and that are installed in addition to the ceiling grid support wires shall be permitted as the sole support. Where independent support wires are used, they shall be secured at both ends. Cables and raceways shall not be supported by ceiling grids.

(1) Fire-Rated Assemblies. Wiring located within the cavity of a fire-rated floor-ceiling or roof-ceiling assembly shall not be secured

to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided and shall be permitted to be attached to the assembly. Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means from those that are part of the fire-rated design.

Exception: The ceiling support system shall be permitted to support wiring and equipment that have been tested as part of the fire-rated assembly.

FPN: One method of determining fire rating is testing in accordance with NFPA 251-1999, Standard Methods of Tests of Fire Endurance of Building Construction and Materials.

(2) Non-Fire-Rated Assemblies. Wiring located within the cavity of a non-fire-rated floor-ceiling or roof-ceiling assembly shall not be secured to, or supported by, the ceiling assembly, including the ceiling support wires. An independent means of secure support shall be provided.

Exception: The ceiling support system shall be permitted to support branch-circuit wiring and associated equipment where installed in accordance with the ceiling system manufacturer's instructions.

(b) Raceways Used as Means of Support. Raceways shall be used only as a means of support for other raceways, cables, or nonelectric equipment under any of the following conditions:

(1) Where the raceway or means of support is identified for the purpose

(2) Where the raceway contains power supply conductors for electrically controlled equipment and is used to support Class 2 circuit conductors or cables that are solely for the purpose of connection to the equipment control circuits

(3) Where the raceway is used to support boxes or conduit bodies in accordance with 3.14.2.9 or to support luminaires (fixtures) in accordance with 4.10.4.2(f)

(c) Cables Not Used as Means of Support. Cable wiring methods shall not be used as a means of support for other cables, raceways, or nonelectrical equipment.

3.0.1.12 Mechanical Continuity — Raceways and Cables. Metal or nonmetallic raceways, cable armors, and cable sheaths shall be continuous between cabinets, boxes, fittings, or other enclosures or outlets.

Exception: Short sections of raceways used to provide support or protection of cable assemblies from physical damage shall not be required to be mechanically continuous.

3.0.1.13 Mechanical and Electrical Continuity — Conductors.

(a) General. Conductors in raceways shall be continuous between outlets, boxes, devices, and so forth. There shall be no splice or tap within a raceway unless permitted by 3.0.1.15; 3.68.2.47(a); 3.76.2.47; 3.78.2.47; 3.84.2.47; 3.86.2.47; 3.88.2.47; or 3.90.1.6.

(b) Device Removal. In multiwire branch circuits, the continuity of a grounded conductor shall not depend on device connections such as lampholders, receptacles, and so forth, where the removal of such devices would interrupt the continuity.

3.0.1.14 Length of Free Conductors at Outlets, Junctions, and Switch Points. At least 150 mm of free conductor, measured from the point in the box where it emerges from its raceway or cable sheath, shall be left at each outlet, junction, and switch point for splices or the connection of luminaires (fixtures) or devices. Where the opening to an outlet, junction, or switch point is less than 200 mm in any dimension, each conductor shall be long enough to extend at least 75 mm outside the opening.

Exception: Conductors that are not spliced or terminated at the outlet, junction, or switch point shall not be required to comply with 3.0.1.14.

3.0.1.15 Boxes, Conduit Bodies, or Fittings — Where Required. A box shall be installed at each outlet and switch point for concealed knob-and-tube wiring.

Fittings and connectors shall be used only with the specific wiring methods for which they are designed and listed.

Where the wiring method is conduit, tubing, Type AC cable, Type MC cable, Type MI cable, nonmetallic-sheathed cable, or other cables, a box or conduit body shall be installed at each conductor splice point, outlet point, switch point, junction point, termination point, or pull point, unless otherwise permitted in 3.0.1.15(a) through (m).

(a) Wiring Methods with Interior Access. A box or conduit body shall not be required for each splice, junction, switch, pull, termination, or outlet points in wiring methods with removable covers, such as wireways, multioutlet assemblies, auxiliary gutters, and surface raceways. The covers shall be accessible after installation.

(b) Equipment. An integral junction box or wiring compartment as part of approved equipment shall be permitted in lieu of a box.

(c) Protection. A box or conduit body shall not be required where cables enter or exit from conduit or tubing that is used to provide cable support or protection against physical damage. A fitting shall be provided on the end(s) of the conduit or tubing to protect the cable from abrasion.

(d) Type MI Cable. A box or conduit body shall not be required where accessible fittings are used for straight-through splices in mineral-insulated metal-sheathed cable.

(e) Integral Enclosure. A wiring device with integral enclosure identified for the use, having brackets that securely fasten the device to walls or ceilings of conventional on-site frame construction, for use with nonmetallic-sheathed cable, shall be permitted in lieu of a box or conduit body.

FPN: See 3.34.2.21(c); 5.45.1.10; 5.50.2.6(i); 5.51.4.8(e), Exception No. 1; and 5.52.4.9(e), Exception No. 1.

(f) Fitting. A fitting identified for the use shall be permitted in lieu of a box or conduit body where conductors are not spliced or terminated within the fitting. The fitting shall be accessible after installation.

(g) Direct-Buried Conductors. As permitted in 3.0.1.5(e), a box or conduit body shall not be required for splices and taps in direct-buried

conductors and cables.

(h) Insulated Devices. As permitted in 3.34.2.31(b), a box or conduit body shall not be required for insulated devices supplied by nonmetallic-sheathed cable.

(i) Enclosures. A box or conduit body shall not be required where a splice, switch, terminal, or pull point is in a cabinet or cutout box, in an enclosure for a switch or overcurrent device as permitted in 3.12.1.8, in a motor controller as permitted in 4.30.1.10(a), or in a motor control center.

(j) Luminaires (Fixtures). A box or conduit body shall not be required where a luminaire (fixture) is used as a raceway as permitted in 4.10.6.10 and 4.10.6.11.

(k) Embedded. A box or conduit body shall not be required for splices where conductors are embedded as permitted in 4.24.5.7, 4.24.5.8(d), 4.26.3.3(b), 4.26.3.5(a), and 4.27.3.6(a).

(l) Manholes and Handhole Enclosures. Where accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner, a box or conduit body shall not be required for conductors in manholes or handhole enclosures, except where connecting to electrical equipment. The installation shall comply with the provisions of Part 1.10.5 for manholes, and 3.14.2.16 for handhole enclosures.

(m) Closed Loop. A box shall not be required with a closed-loop power distribution system where a device identified and listed as suitable for installation without a box is used.

3.0.1.16 Raceway or Cable to Open or Concealed Wiring.

(a) Box or Fitting. A box or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made from conduit, electrical metallic tubing, electrical nonmetallic tubing, nonmetallic-sheathed cable, Type AC cable, Type MC cable, or mineral-insulated, metal-sheathed cable and surface raceway wiring to open wiring or to concealed knob-and-tube wiring. A fitting used

for this purpose shall contain no taps or splices and shall not be used at luminaire (fixture) outlets.

(b) Bushing. A bushing shall be permitted in lieu of a box or terminal where the conductors emerge from a raceway and enter or terminate at equipment, such as open switchboards, unenclosed control equipment, or similar equipment. The bushing shall be of the insulating type for other than lead-sheathed conductors.

3.0.1.17 Number and Size of Conductors in Raceway. The number and size of conductors in any raceway shall not be more than will permit dissipation of the heat and ready installation or withdrawal of the conductors without damage to the conductors or to their insulation.

FPN: See the following sections of this Code: intermediate metal conduit, 3.42.2.13; rigid metal conduit, 3.44.2.13; flexible metal conduit, 3.48.2.13; liquidtight flexible metal conduit, 3.50.2.13; rigid nonmetallic conduit, 3.52.2.13; liquidtight nonmetallic flexible conduit, 3.56.2.13; electrical metallic tubing, 3.58.2.13; flexible metallic tubing, 3.60.2.13; electrical nonmetallic tubing, 3.62.2.13; cellular concrete floor raceways, 3.72.1.11; cellular metal floor raceways, 3.74.1.5; metal wireways, 3.76.2.13; nonmetallic wireways, 3.78.2.13; surface metal raceways, 3.86.2.13; surface nonmetallic raceways, 3.88.2.13; underfloor raceways, 3.90.1.5; fixture wire, 4.2.1.7; theaters, 5.20.1.6; signs, 6.0.2.2(c); elevators, 6.20.4.2; audio signal processing, amplification, and reproduction equipment, 6.40.2.3(a) and 6.40.2.4; Class 1, Class 2, and Class 3 circuits, Article 7.25; fire alarm circuits, Article 7.60; and optical fiber cables and raceways, Article 7.70.

3.0.1.18 Raceway Installations.

(a) Complete Runs. Raceways, other than busways or exposed raceways having hinged or removable covers, shall be installed complete between outlet, junction, or splicing points prior to the installation of conductors. Where required to facilitate the installation of utilization equipment, the raceway shall be permitted to be initially installed without a terminating connection at the equipment. Prewired raceway assemblies shall be permitted only where specifically permitted in this Code for the applicable wiring method.

Exception: Short sections of raceways used to contain conductors or cable assemblies for protection from physical damage shall not be required to be installed complete between outlet, junction, or splicing points.

(b) Welding. Metal raceways shall not be supported, terminated, or connected by welding to the raceway unless specifically designed to be or otherwise specifically permitted to be in this Code.

3.0.1.19 Supporting Conductors in Vertical Raceways.

(a) Spacing Intervals — Maximum. Conductors in vertical raceways shall be supported if the vertical rise exceeds the values in Table 3.0.1.19(a). One cable support shall be provided at the top of the vertical raceway or as close to the top as practical. Intermediate supports shall be provided as necessary to limit supported conductor lengths to not greater than those values specified in Table 3.0.1.19(a).

Exception: Steel wire armor cable shall be supported at the top of the riser with a cable support that clamps the steel wire armor. A safety device shall be permitted at the lower end of the riser to hold the cable in the event there is slippage of the cable in the wire-armored cable support. Additional wedge-type supports shall be permitted to relieve the strain on the equipment terminals caused by expansion of the cable under load.

(b) Support Methods. One of the following methods of support shall be used.

(1) By clamping devices constructed of or employing insulating wedges inserted in the ends of the raceways. Where clamping of insulation does not adequately support the cable, the conductor also shall be clamped.

(2) By inserting boxes at the required intervals in which insulating supports are installed and secured in a satisfactory manner to withstand the weight of the conductors attached thereto, the boxes being provided with covers.

(3) In junction boxes, by deflecting the cables not less than 90 degrees and carrying them horizontally to a distance not less than twice the diameter of the cable, the cables being carried on two or more insulating supports and additionally secured thereto by tie wires if desired. Where this method is used, cables shall be supported at intervals not greater than 20 percent of those mentioned in the preceding tabulation.

(4) By a method of equal effectiveness.

Table 3.0.1.19(a) Spacings for Conductor Supports

Size of Wire mm²(mm dia.)	Support of Conductors in Vertical Raceways	Conductors	
		Aluminum or Copper-Clad Aluminum (m)	Copper (m)
0.75(1.0) through 8.0(3.2)	Not greater than	30	30
14 through 38	Not greater than	60	30
60 through 100	Not greater than	55	25
Over 100 through 175	Not greater than	40	18
Over 175 through 250	Not greater than	35	15
Over 250 through 400	Not greater than	30	12
Over 400	Not greater than	25	11

3.0.1.20 Induced Currents in Metal Enclosures or Metal Raceways.

(a) Conductors Grouped Together. Where conductors carrying alternating current are installed in metal enclosures or metal raceways, they shall be arranged so as to avoid heating the surrounding metal by induction. To accomplish this, all phase conductors and, where used, the grounded conductor and all equipment grounding conductors shall be grouped together.

Exception No. 1: Equipment grounding conductors for certain existing installations shall be permitted to be installed separate from their associated circuit conductors where run in accordance with the provisions of 2.50.7.1(c).

Exception No. 2: A single conductor shall be permitted to be installed in a ferromagnetic enclosure and used for skin-effect heating in accordance with the provisions of 4.26.5.3 and 4.27.6.3.

(b) Individual Conductors. Where a single conductor carrying alternating current passes through metal with magnetic properties, the inductive effect shall be minimized by (1) cutting slots in the metal between the individual holes through which the individual conductors pass or (2) passing all the conductors in the circuit through an insulating wall sufficiently large for all of the conductors of the circuit.

Exception: In the case of circuits supplying vacuum or electric-discharge lighting systems or signs or X-ray apparatus, the currents carried by the conductors are so small that the inductive heating effect can be ignored where these conductors are placed in metal enclosures or pass through metal.

FPN: Because aluminum is not a magnetic metal, there will be no heating due to hysteresis; however, induced currents will be present. They will not be of sufficient magnitude to require grouping of conductors or special treatment in passing conductors through aluminum wall sections.

3.0.1.21 Spread of Fire or Products of Combustion. Electrical installations in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around electrical penetrations through fire-resistant-rated walls,

partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance-rated wall assembly. An example is the 600 mm minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 3.0.1.21 can be found in building codes, fire resistance directories, and product listings.

3.0.1.22 Wiring in Ducts, Plenums, and Other Air-Handling Spaces. The provisions of this section apply to the installation and uses of electric wiring and equipment in ducts, plenums, and other air-handling spaces.

FPN: See Part 4.24.6, for duct heaters.

(a) Ducts for Dust, Loose Stock, or Vapor Removal. No wiring systems of any type shall be installed in ducts used to transport dust, loose stock, or flammable vapors. No wiring system of any type shall be installed in any duct, or shaft containing only such ducts, used for vapor removal or for ventilation of commercial-type cooking equipment.

(b) Ducts or Plenums Used for Environmental Air. Only wiring methods consisting of Type MI cable, Type MC cable employing a smooth or corrugated impervious metal sheath without an overall nonmetallic covering, electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, or rigid metal conduit without an overall nonmetallic covering shall be installed in ducts or plenums specifically fabricated to transport environmental air. Flexible metal conduit shall be permitted, in lengths not to exceed 1 200 mm, to connect physically adjustable equipment and devices permitted to be in these ducts and plenum chambers. The connectors used with flexible metal conduit shall effectively close any openings in the connection. Equipment and devices shall be permitted within such ducts or plenum chambers only if necessary for their direct action upon, or sensing of, the contained air. Where equipment or devices are installed and illumination is necessary to facilitate maintenance and repair, enclosed gasketed-type luminaires (fixtures) shall be permitted.

(c) Other Space Used for Environmental Air. This section applies to space used for environmental air-handling purposes other than ducts and plenums as specified in 3.0.1.22(a) and (b). It does not include habitable rooms or areas of buildings, the prime purpose of which is not air handling.

FPN: The space over a hung ceiling used for environmental air-handling purposes is an example of the type of other space to which this section applies.

Exception: This section shall not apply to the joist or stud spaces of dwelling units where the wiring passes through such spaces perpendicular to the long dimension of such spaces.

(1) **Wiring Methods.** The wiring methods for such other space shall be limited to totally enclosed, nonventilated, insulated busway having no provisions for plug-in connections, Type MI cable, Type MC cable without an overall nonmetallic covering, Type AC cable, or other factory-assembled multiconductor control or power cable that is specifically listed for the use, or listed prefabricated cable assemblies of metallic manufactured wiring systems without nonmetallic sheath. Other types of cables and conductors shall be installed in electrical metallic tubing, flexible metallic tubing, intermediate metal conduit, rigid metal conduit without an overall nonmetallic covering, flexible metal conduit, or, where accessible, surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.

(2) **Equipment.** Electrical equipment with a metal enclosure, or with a nonmetallic enclosure listed for the use and having adequate fire-resistant and low-smoke-producing characteristics, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.

Exception: Integral fan systems shall be permitted where specifically identified for such use.

(d) Information Technology Equipment. Electric wiring in air-handling areas beneath raised floors for information technology equipment shall be permitted in accordance with Article 6.45.

3.0.1.23 Panels Designed to Allow Access. Cables, raceways, and equipment installed behind panels designed to allow access, including suspended ceiling panels, shall be arranged and secured so as to allow the removal of panels and access to the equipment.

3.0.2 Requirements for Over 600 Volts, Nominal

3.0.2.1 Covers Required. Suitable covers shall be installed on all boxes, fittings, and similar enclosures to prevent accidental contact with energized parts or physical damage to parts or insulation.

3.0.2.2 Conductors of Different Systems. See 3.0.1.3(c)(2).

3.0.2.4 Conductor Bending Radius. The conductor shall not be bent to a radius less than 8 times the overall diameter for nonshielded conductors or 12 times the overall diameter for shielded or lead-covered conductors during or after installation. For multiconductor or multiplexed single conductor cables having individually shielded conductors, the minimum bending radius is 12 times the diameter of the individually shielded conductors or 7 times the overall diameter, whichever is greater.

3.0.2.5 Protection Against Induction Heating. Metallic raceways and associated conductors shall be arranged so as to avoid heating of the raceway in accordance with the applicable provisions of 3.0.1.20.

3.0.2.7 Aboveground Wiring Methods. Aboveground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in electrical metallic tubing, in rigid nonmetallic conduit, in cable trays, as busways, as cablebus, in other identified raceways, or as exposed runs of metal-clad cable suitable for the use and purpose. In locations accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner only, exposed runs of Type MV cables, bare conductors, and bare busbars shall also be permitted. Busbars shall be permitted to be either copper or aluminum.

3.0.2.9 Braid-Covered Insulated Conductors — Exposed Installation. Exposed runs of braid-covered insulated conductors shall have a flame-retardant braid. If the conductors used do not have this protection, a flame-retardant saturant shall be applied to the braid

covering after installation. This treated braid covering shall be stripped back a safe distance at conductor terminals, according to the operating voltage. Where practicable, this distance shall not be less than 25 mm for each kilovolt of the conductor-to-ground voltage of the circuit.

3.0.2.10 Insulation Shielding. Metallic and semiconducting insulation shielding components of shielded cables shall be removed for a distance dependent on the circuit voltage and insulation. Stress reduction means shall be provided at all terminations of factory-applied shielding.

Metallic shielding components such as tapes, wires, or braids, or combinations thereof, and their associated conducting or semiconducting components shall be grounded.

3.0.2.12 Moisture or Mechanical Protection for Metal-Sheathed Cables. Where cable conductors emerge from a metal sheath and where protection against moisture or physical damage is necessary, the insulation of the conductors shall be protected by a cable sheath terminating device.

3.0.2.20 Underground Installations.

(a) **General.** Underground conductors shall be identified for the voltage and conditions under which they are installed. Direct burial cables shall comply with the provisions of 3.10.1.7. Underground cables shall be installed in accordance with 3.0.2.20(a)(1) or (a)(2), and the installation shall meet the depth requirements of Table 3.0.2.20.

(1) **Shielded Cables and Nonshielded Cables in Metal-Sheathed Cable Assemblies.** Underground cables, including nonshielded, Type MC and moisture-impervious metal sheath cables, shall have those sheaths grounded through an effective grounding path meeting the requirements of 2.50.1.4(a)(5) or (b)(4). They shall be direct buried or installed in raceways identified for the use.

(2) **Other Nonshielded Cables.** Other nonshielded cables not covered in 3.0.2.20(a)(1) shall be installed in rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit encased in not less than 75 mm of concrete.

Table 3.0.2.20 Minimum Cover¹ Requirements

Circuit Voltage	General Conditions (not otherwise specified)			Special Conditions (use if applicable)		
	(1) Direct-Buried Cables (mm)	(2) Rigid Nonmetallic Conduit ² (mm)	(3) Rigid Metal Conduit and Intermediate Metal Conduit (mm)	(4) Raceways under buildings or exterior concrete slabs, 100mm minimum thickness ³ (mm)	(5) Cables in airport runways or adjacent areas where trespass is prohibited (mm)	(6) Areas subject to vehicular traffic, such as thoroughfares and commercial parking areas (mm)
Over 600 V through 22 kV	760	460	150	100	450	600
Over 22 kV through 40 kV	900	600	150	100	450	600
Over 40 kV	1000	760	150	100	450	600

Notes:

1. Lesser depths shall be permitted where cables and conductors rise for terminations or splices or where access is otherwise required.
2. Where solid rock prevents compliance with the cover depths specified in this table, the wiring shall be installed in a metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm of concrete extending down to rock.

¹ Cover is defined as the shortest distance in millimeters measured between a point on the top surface of any direct-buried conductor, cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.

² Listed by a qualified testing agency as suitable for direct burial without encasement. All other nonmetallic systems shall require 50 mm of concrete or equivalent above conduit in addition to the table depth.

³ The slab shall extend a minimum of 150 mm beyond the underground installation, and a warning ribbon or other effective means suitable for the conditions shall be placed above the underground installation.

(b) Protection from Damage. Conductors emerging from the ground shall be enclosed in listed raceways. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, PVC Schedule 80, or equivalent, extending from the minimum cover depth specified in Table 3.0.2.20 to a point 2 400 mm above finished grade. Conductors entering a building shall be protected by an approved enclosure or raceway from the minimum cover depth to the point of entrance. Where direct-buried conductors, raceways, or cables are subject to movement by settlement or frost, they shall be installed to prevent damage to the enclosed conductors or to the equipment connected to the raceways. Metallic enclosures shall be grounded.

(c) Splices. Direct burial cables shall be permitted to be spliced or tapped without the use of splice boxes, provided they are installed using materials suitable for the application. The taps and splices shall be watertight and protected from mechanical damage. Where cables are shielded, the shielding shall be continuous across the splice or tap.

Exception: At splices of an engineered cabling system, metallic shields of direct-buried single-conductor cables with maintained spacing between phases shall be permitted to be interrupted and overlapped. Where shields are interrupted and overlapped, each shield section shall be grounded at one point.

(d) Backfill. Backfill containing large rocks, paving materials, cinders, large or sharply angular substances, or corrosive materials shall not be placed in an excavation where materials can damage or contribute to the corrosion of raceways, cables, or other substructures or where it may prevent adequate compaction of fill.

Protection in the form of granular or selected material or suitable sleeves shall be provided to prevent physical damage to the raceway or cable.

(e) Raceway Seal. Where a raceway enters from an underground system, the end within the building shall be sealed with an identified compound so as to prevent the entrance of moisture or gases, or it shall be so arranged to prevent moisture from contacting live parts.

ARTICLE 3.10 — CONDUCTORS FOR GENERAL WIRING

3.10.1.1 Scope. This article covers general requirements for conductors and their type designations, insulations, markings, mechanical strengths, ampacity ratings, and uses. These requirements do not apply to conductors that form an integral part of equipment, such as motors, motor controllers, and similar equipment, or to conductors specifically provided for elsewhere in this Code.

FPN: For flexible cords and cables, see Article 400. For fixture wires, see Article 4.2.

3.10.1.2 Conductors.

(a) Insulated. Conductors shall be insulated.

Exception: Where covered or bare conductors are specifically permitted elsewhere in this Code.

FPN: See 2.50.10.5 for insulation of neutral conductors of a solidly grounded high-voltage system.

(b) Conductor Material. Conductors in this article shall be of aluminum, copper-clad aluminum, or copper unless otherwise specified.

3.10.1.3 Stranded Conductors. Where installed in raceways, conductors of size 8.0 mm² (3.2 mm dia.) and larger shall be stranded.

Exception: As permitted or required elsewhere in this Code.

3.10.1.4 Conductors in Parallel. Aluminum, copper-clad aluminum, or copper conductors of size 50 mm² and larger, comprising each phase, polarity, neutral, or grounded circuit conductor, shall be permitted to be connected in parallel (electrically joined at both ends).

Exception No. 1: As permitted in 6.20.2.2(a)(1).

Exception No. 2: Conductors in sizes smaller than 50 mm² shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, provided all of the following apply:

(a) They are contained within the same raceway or cable.

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 3: Conductors in sizes smaller than 50 mm² shall be permitted to be run in parallel for frequencies of 360 Hz and higher where conditions (a), (b), and (c) of Exception No. 2 are met.

Exception No. 4: Under the supervision of a licensed electrical engineer, grounded neutral conductors in sizes 30 mm² and larger shall be permitted to be run in parallel for existing installations.

FPN: Exception No. 4 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

The paralleled conductors in each phase, polarity, neutral, or grounded circuit conductor shall comply with all of the following:

- (1) Be the same length
- (2) Have the same conductor material
- (3) Be the same cross sectional area of the conducting material
- (4) Have the same insulation type
- (5) Be terminated in the same manner

Where run in separate raceways or cables, the raceways or cables shall have the same physical characteristics. Where conductors are in separate raceways or cables, the same number of conductors shall be used in each raceway or cable. Conductors of one phase, polarity, neutral, or grounded circuit conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, or grounded circuit conductor to achieve balance.

FPN: Differences in inductive reactance and unequal division of current can be minimized by choice of materials, methods of construction, and orientation of conductors.

Where equipment grounding conductors are used with conductors in parallel, they shall comply with the requirements of this section except that they shall be sized in accordance with 2.50.6.13.

Conductors installed in parallel shall comply with the provisions of 3.10.1.15(b)(2)(a).

3.10.1.5 Minimum Size of Conductors. The minimum size of conductors shall be as shown in Table 3.10.1.5, except as permitted elsewhere in this Code.

Table 3.10.1.5 Minimum Size of Conductors

Conductor Voltage Rating (Volts)	Minimum Conductor Size mm ² (mm dia.)	
	Copper	Aluminum or Copper-Clad Aluminum
0–2000	2.0(1.6)	3.5(2.0)
2001–8000	8.0(3.2)	8.0(3.2)
8001–15,000	30	30
15,001–28,000	38	38
28,001–35,000	50	50

3.10.1.6 Shielding. Solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be grounded through an effective grounding path meeting the requirements of 2.50.1.4(a)(5) or 2.50.1.4(b)(4). Shielding shall be for the purpose of confining the voltage stresses to the insulation.

Exception: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2 400 volts under the following conditions:

(a) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(b) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(c) Insulation and jacket thicknesses shall be in accordance with Table 3.10.1.63.

3.10.1.7 Direct Burial Conductors. Conductors used for direct burial applications shall be of a type identified for such use. Cables rated above 2 000 volts shall be shielded.

Exception: Nonshielded multiconductor cables rated 2 001– 5000 volts shall be permitted if the cable has an overall metallic sheath or armor.

The metallic shield, sheath, or armor shall be grounded through an effective grounding path meeting the requirements of 2.50.1.4(a)(5) or (b)(4).

FPN No. 1: See 3.0.1.5 for installation requirements for conductors rated 600 volts or less.

FPN No. 2: See 3.0.2.20 for installation requirements for conductors rated over 600 volts.

3.10.1.8 Locations.

(a) Dry Locations. Insulated conductors and cables used in dry locations shall be any of the types identified in this Code.

(b) Dry and Damp Locations. Insulated conductors and cables used in dry and damp locations shall be Types FEP, FEPB, MTW, PFA, RHH, RHW, RHW-2, SA, THHN, THW, THW-2, THHW, THHW-2, THWN, THWN-2, TW, XHH, XHHW, XHHW-2, Z, or ZW.

(c) Wet Locations. Insulated conductors and cables used in wet locations shall be

- (1) Moisture-impervious metal-sheathed;
- (2) Types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THHW-2, THWN, THWN-2, XHHW, XHHW-2, ZW; or
- (3) Of a type listed for use in wet locations.

(d) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with one of the following:

- (1) Cables listed, or listed and marked, as being sunlight resistant
- (2) Conductors listed, or listed and marked, as being sunlight resistant
- (3) Covered with insulating material, such as tape or sleeving, that is listed, or listed and marked, as being sunlight resistant

3.10.1.9 Corrosive Conditions. Conductors exposed to oils, greases, vapors, gases, fumes, liquids, or other substances having a deleterious effect on the conductor or insulation shall be of a type suitable for the application.

3.10.1.10 Temperature Limitation of Conductors. No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

FPN No. 1: The temperature rating of a conductor (see Table 3.10.1.13 and Table 3.10.1.61) is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 3.10 and the ampacity tables of Annex B, the correction factors at the bottom of these tables, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors.

The principal determinants of operating temperature are as follows:

- (1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.
- (2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.
- (3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.
- (4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

FPN No. 2: Conductors installed in conduit exposed to direct sunlight in close proximity to rooftops have been shown, under certain conditions, to experience a temperature rise of 17°C (30°F) above ambient temperature on which the ampacity is based.

3.10.1.11 Marking.

(a) Required Information. All conductors and cables shall be marked to indicate the following information, using the applicable method described in 3.10.1.11(b):

- (1) The maximum rated voltage
- (2) The proper type letter or letters for the type of wire or cable as specified elsewhere in this Code

(3) The manufacturer's name, trademark, or other distinctive marking by which the organization responsible for the product can be readily identified

(4) The size in millimeter square or millimeter diameter

FPN: See Conductor Properties, Table 8 of Chapter 9, for conductor area expressed in SI units for conductor sizes specified in mm² or mm dia.

(5) Cable assemblies where the neutral conductor is smaller than the ungrounded conductors shall be so marked

(b) Method of Marking.

(1) Surface Marking. The following conductors and cables shall be durably marked on the surface. The size in mm² or mm diameter shall be repeated at intervals not exceeding 600 mm. All other markings shall be repeated at intervals not exceeding 1 000 mm.

- a. Single-conductor and multiconductor rubber- and thermoplastic-insulated wire and cable
- b. Nonmetallic-sheathed cable
- c. Service-entrance cable
- d. Underground feeder and branch-circuit cable
- e. Tray cable
- f. Irrigation cable
- g. Power-limited tray cable
- h. Instrumentation tray cable

(2) Marker Tape. Metal-covered multiconductor cables shall employ a marker tape located within the cable and running for its complete length.

Exception No. 1: Mineral-insulated, metal-sheathed cable.

Exception No. 2: Type AC cable.

Exception No. 3: The information required in 3.10.1.11(a) shall be permitted to be durably marked on the outer nonmetallic covering of Type MC, Type ITC, or Type PLTC cables at intervals not exceeding 1.0 m (40 in.).

Exception No. 4: The information required in 3.10.1.11(a) shall be permitted to be durably marked on a nonmetallic covering under the

metallic sheath of Type ITC or Type PLTC cable at intervals not exceeding 1 000 mm.

FPN: Included in the group of metal-covered cables are Type AC cable (Article 3.20), Type MC cable (Article 3.30), and lead-sheathed cable.

(3) Tag Marking. The following conductors and cables shall be marked by means of a printed tag attached to the coil, reel, or carton:

- a. Mineral-insulated, metal-sheathed cable
- b. Switchboard wires
- c. Metal-covered, single-conductor cables
- d. Type AC cable

(4) Optional Marking of Wire Size. The information required in 3.10.1.11(a)(4) shall be permitted to be marked on the surface of the individual insulated conductors for the following multiconductor cables:

- a. Type MC cable
- b. Tray cable
- c. Irrigation cable
- d. Power-limited tray cable
- e. Power-limited fire alarm cable
- f. Instrumentation tray cable

(c) Suffixes to Designate Number of Conductors. A type letter or letters used alone shall indicate a single insulated conductor. The letter suffixes shall be indicated as follows:

(1) D — For two insulated conductors laid parallel within an outer nonmetallic covering

(2) M — For an assembly of two or more insulated conductors twisted spirally within an outer nonmetallic covering

(d) Optional Markings. All conductors and cables contained in Chapter 3 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistant, and so forth.

3.10.1.12 Conductor Identification.

(a) **Grounded Conductors.** Insulated or covered grounded conductors shall be identified in accordance with 2.0.1.6.

(b) **Equipment Grounding Conductors.** Equipment grounding conductors shall be in accordance with 2.50.6.10.

(c) **Ungrounded Conductors.** Conductors that are intended for use as ungrounded conductors, whether used as a single conductor or in multiconductor cables, shall be finished to be clearly distinguishable from grounded and grounding conductors. Distinguishing markings shall not conflict in any manner with the surface markings required by 3.10.1.11(b)(1). Branch-circuit ungrounded conductors shall be identified in accordance with 2.10.1.5(c). Feeders shall be identified in accordance with 2.15.1.12.

Exception: Conductor identification shall be permitted in accordance with 2.0.1.7.

3.10.1.13 Conductor Constructions and Applications. Insulated conductors shall comply with the applicable provisions of one or more of the following: Table 3.10.1.13, Table 3.10.1.61, Table 3.10.1.62, Table 3.10.1.63, and Table 3.10.1.64.

These conductors shall be permitted for use in any of the wiring methods recognized in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this Code.

FPN: Thermoplastic insulation may stiffen at temperatures lower than -10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. Thermoplastic insulation, where used on dc circuits in wet locations, may result in electroendosmosis between conductor and insulation.

3.10.1.14 Aluminum Conductor Material. Solid aluminum conductors 8.0(3.2), 5.5(2.6), and 3.5(2.0) mm²(dia.) shall be made of an AA-8000 series electrical grade aluminum alloy conductor material. Stranded aluminum conductors 8.0 mm² (3.2 mm dia.) through 500 mm² marked as Type RHH, RHW, XHHW, THW, THHW, THWN, THHN, service-entrance Type SE Style U and SE Style R shall be made of an AA-8000 series electrical grade aluminum alloy conductor material.

Table 3.10.1.13 Conductor Application and Insulations

Trade Name	Type Letter	Maximum Operating Temperature	Application Provisions	Insulation	Thickness of Insulation (mm)		Outer Covering ¹

1 Some insulations do not require an outer covering.

2 Where design conditions require maximum conductor operating temperatures above 90°C (194°F).

3 For signaling circuits permitting 300-volt insulation.

4 Listed wire types designated with the suffix “2,” such as RHW-2, shall be permitted to be used at a continuous 90°C (194°F) operating temperature, wet or dry.

5 Some rubber insulations do not require an outer covering.

6 Includes integral jacket.

7 For ampacity limitation, see 3.40.2.71.

8 Insulation thickness shall be permitted to be **2.03 mm (80 mils)** for listed Type USE conductors that have been subjected to special investigations. The nonmetallic covering over individual rubber-covered conductors of aluminum-sheathed cable and of lead-sheathed or multiconductor cable shall not be required to be flame retardant. For Type MC cable, see 3.30.3.1. For nonmetallic-sheathed cable, see Article 3.34, Part III. For Type UF cable, see Part 3.40.3.

3.10.1.15 Ampacities for Conductors Rated 0–2000 Volts.

(a) General.

(1) Tables or Engineering Supervision. Ampacities for conductors shall be permitted to be determined by tables as provided in 3.10.1.15(b) or under engineering supervision, as provided in 3.10.1.15(c).

FPN No. 1: Ampacities provided by this section do not take voltage drop into consideration. See 2.10.2.1(a), FPN No. 4, for branch circuits and 2.15.1.2(a), FPN No. 2, for feeders.

FPN No. 2: For the allowable ampacities of Type MTW wire, see Table 13.5.1 in NFPA 79-2002, Electrical Standard for Industrial Machinery.

(2) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3 000 mm or 10 percent of the circuit length figured at the higher ampacity, whichever is less.

FPN: See 1.10.1.14(c) for conductor temperature limitations due to termination provisions.

(b) **Tables.** Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity Table 3.10.1.16 through Table 3.10.1.19, and Ampacity Table 3.10.1.20 and Table 3.10.1.21 as modified by (b)(1) through (b)(6).

FPN: Table 3.10.1.16 through Table 3.10.1.19 are application tables for use in determining conductor sizes on loads calculated in accordance with Article 220. Allowable ampacities result from consideration of one or more of the following:

- (1) Temperature compatibility with connected equipment, especially the connection points.
- (2) Coordination with circuit and system overcurrent protection.
- (3) Compliance with the requirements of product listings or certifications. See 110.3(b).
- (4) Preservation of the safety benefits of established industry practices and standardized procedures.

(1) General. For explanation of type letters used in tables and for recognized sizes of conductors for the various conductor insulations,

see 3.10.1.13. For installation requirements, see 3.10.1.1 through 3.10.1.10 and the various articles of this Code. For flexible cords, see Table 4.0.1.4, Table 4.0.1.5(a), and Table 4.0.1.5(b).

(2) Adjustment Factors.

a. More Than Three Current-Carrying Conductors in a Raceway or Cable. Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are stacked or bundled longer than 600 mm without maintaining spacing and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 3.10.1.15(b)(2)(a). Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

FPN No. 1: See Annex B, Table B.3.10.1.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

FPN No. 2: See 3.66.2.14(a) for correction factors for conductors in sheet metal auxiliary gutters and 3.76.2.13 for correction factors for conductors in metal wireways.

Exception No. 1: Where conductors of different systems, as provided in 3.0.1.3, are installed in a common raceway or cable, the derating factors shown in Table 3.10.1.15(b)(2)(a) shall apply only to the number of power and lighting conductors (Articles 2.10, 2.15, 2.20, and 2.30).

Exception No. 2: For conductors installed in cable trays, the provisions of 3.92.1.11 shall apply.

Exception No. 3: Derating factors shall not apply to conductors in nipples having a length not exceeding 600 mm.

Exception No. 4: Derating factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, or rigid nonmetallic conduit having a length not exceeding 3 000 mm and if the number of conductors does not exceed four.

Exception No. 5: Adjustment factors shall not apply to Type AC cable or to Type MC cable without an overall outer jacket under the following conditions:

(1) Each cable has not more than three current-carrying conductors.

- (2) The conductors are 3.5 mm² (2.0 mm dia.) copper.
- (3) Not more than 20 current-carrying conductors are bundled, stacked, or supported on “bridle rings.”

A 60 percent adjustment factor shall be applied where the current-carrying conductors in these cables that are stacked or bundled longer than 600 mm without maintaining spacing exceeds 20.

Table 3.10.1.15(b)(2)(a) Adjustment Factors for More Than Three Current-Carrying Conductors in a Raceway or Cable

Number of Current-Carrying Conductors	Percent of Values in Tables 3.10.1.16 through 3.10.1.19 as Adjusted for Ambient Temperature if Necessary
4–6	80
7–9	70
10–20	50
21–30	45
31–40	40
41 and above	35

b. More Than One Conduit, Tube, or Raceway. Spacing between conduits, tubing, or raceways shall be maintained.

(3) Bare or Covered Conductors. Where bare or covered conductors are used with insulated conductors, their allowable ampacities shall be limited to those permitted for the adjacent insulated conductors.

(4) Neutral Conductor.

a. A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to be counted when applying the provisions of 3.10.1.15(b)(2)(a).

b. In a 3-wire circuit consisting of two phase wires and the neutral of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of 3.10.1.15(b)(2)(a).

c. On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral shall therefore be considered a current-carrying conductor.

(5) Grounding or Bonding Conductor. A grounding or bonding conductor shall not be counted when applying the provisions of 3.10.1.15(b)(2)(a).

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one family, two-family, and multifamily dwellings, conductors, as listed in Table 3.10.1.15(b)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder(s) between the main disconnect and the lighting and appliance branch-circuit panelboards(s). The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 2.15.1.2, 2.20.3.22, and 2.30.4.3 are met.

Table 3.10.15(b)(6) Conductor Types and Sizes for 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. Conductor Types RHH, RHW, RHW-2, THHN, THHW, THW, THW-2, THWN, THWN-2, XHHW, XHHW-2, SE, USE, USE-2

Conductor mm ²		Service or Feeder Rating (Amperes)
Copper	Aluminum or Copper-Clad Aluminum	
22	30	100
30	30	110
30	50	125
38	60	150
50	80	175
60	100	200
80	125	225
100	150	250
125	175	300
175	250	350
200	325	400

(c) **Engineering Supervision.** Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general formula:

$$I = \sqrt{\frac{TC - (TA + \Delta TD)}{RDC(1 + YC)RCA}}$$

where:

TC= conductor temperature in degrees Celsius (°C)

TA= ambient temperature in degrees Celsius (°C)

TD= dielectric loss temperature rise

RDC= dc resistance of conductor at temperature TC

YC= component ac resistance resulting from skin effect and proximity effect

RCA= effective thermal resistance between conductor and surrounding ambient

FPN: See Appendix B for examples of formula applications.

Table 3.10.1.16 Allowable Ampacities of Insulated Conductors Rated 0 Through 2000 Volts, 60°C Through 90°C (140°F Through 194°F), Not More Than Three Current-Carrying Conductors in Raceway, Cable, or Earth (Directly Buried), Based on Ambient Temperature of 30°C (86°F)

3.10.1.60 Conductors Rated 2001 to 35,000 Volts.

(a) Definitions.

Electrical Ducts. As used in Article 3.10, electrical ducts shall include any of the electrical conduits recognized in Chapter 3 as suitable for use underground; other raceways round in cross section, listed for underground use, and embedded in earth or concrete.

Thermal Resistivity. As used in this Code, the heat transfer capability through a substance by conduction. It is the reciprocal of thermal conductivity and is designated Rho and expressed in the units °C-cm/watt.

(b) Ampacities of Conductors Rated 2001 to 35,000 Volts. Ampacities for solid dielectric-insulated conductors shall be permitted to be determined by tables or under engineering supervision, as provided in 3.10.1.60(c) and (d).

(1) Selection of Ampacity. Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3 000 mm or 10 percent of the circuit length figured at the higher ampacity, whichever is less.

FPN: See 1.10.3.11 for conductor temperature limitations due to termination provisions.

(c) Tables. Ampacities for conductors rated 2001 to 35,000 volts shall be as specified in the Ampacity Table 3.10.1.67 through Table 3.10.1.86. Ampacities at ambient temperatures other than those shown in the tables shall be determined by the formula in 3.10.1.60(c)(4).

FPN No. 1: For ampacities calculated in accordance with 3.10.1.60(b), reference IEEE 835-1994 (IPCEA Pub. No. P-46-426), Standard Power Cable Ampacity Tables, and the references therein for availability of all factors and constants.

FPN No. 2: Ampacities provided by this section do not take voltage drop into consideration. See 2.10.2.1(a), FPN No. 4, for branch circuits and 2.15.1.2(a), FPN No. 2, for feeders.

(1) Grounded Shields. Ampacities shown in Table 3.10.1.69, Table 3.10.1.70, Table 3.10.1.81, and Table 3.10.1.82 are for cable with shields grounded at one point only. Where shields are grounded at more than one point, ampacities shall be adjusted to take into consideration the heating due to shield currents.

(2) Burial Depth of Underground Circuits. Where the burial depth of direct burial or electrical duct bank circuits is modified from the values shown in a figure or table, ampacities shall be permitted to be modified as indicated in (c)(1) and (c)(2).

a. Where burial depths are increased in part(s) of an electrical duct run, no decrease in ampacity of the conductors is needed, provided the total length of parts of the duct run increased in depth is less than 25 percent of the total run length.

b. Where burial depths are deeper than shown in a specific underground ampacity table or figure, an ampacity derating factor of 6 percent per 300 mm increase in depth for all values of rho shall be permitted.

No rating change is needed where the burial depth is decreased.

(3) Electrical Ducts in Figure 3.10.1.60. At locations where electrical ducts enter equipment enclosures from under ground, spacing between such ducts, as shown in Figure 3.10.1.60, shall be permitted to be reduced without requiring the ampacity of conductors therein to be reduced.

(4) Ambients Not in Tables. Ampacities at ambient temperatures other than those shown in the tables shall be determined by means of the following formula:

$$I_2 = I_1 \sqrt{\frac{TC - TA_2 + \Delta TD}{TC - TA_1 + \Delta TD}}$$

where:

I_1 = ampacity from tables at ambient TA_1

I_2 = ampacity at desired ambient TA_2

TC = conductor temperature in degrees Celsius (°C)

TA_1 = surrounding ambient from tables in degrees Celsius (°C)

TA_2 = desired ambient in degrees Celsius (°C)

TD = dielectric loss temperature rise

(d) **Engineering Supervision.** Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general formula:

$$I = \sqrt{\frac{TC - (TA + \Delta TD)}{RDC(1 + YC)RCA}}$$

where:

TC = conductor temperature in °C

TA = ambient temperature in °C

TD = dielectric loss temperature rise

RDC = dc resistance of conductor at temperature TC

YC = component ac resistance resulting from skin effect and proximity effect

RCA = effective thermal resistance between conductor and surrounding ambient

FPN: See Appendix B for examples of formula applications.

501 – 1000	3.56	3.56

¹Column A insulations are limited to natural, SBR, and butyl rubbers.

²Column B insulations are materials such as cross-linked polyethylene, ethylene propylene rubber, and composites thereof.

Notes:

¹**100 Percent Insulation Level.** Cables in this category shall be permitted to be applied where the system is provided with relay protection such that ground faults will be cleared as rapidly as possible but, in any case, within 1 minute. While these cables are applicable to the great majority of cable installations that are on grounded systems, they shall be permitted to be used also on other systems for which the application of cables is acceptable, provided the above clearing requirements are met in completely de-energizing the faulted section.

²**133 Percent Insulation Level.** This insulation level corresponds to that formerly designated for ungrounded systems. Cables in this category shall be permitted to be applied in situations where the clearing time requirements of the 100 percent level category cannot be met and yet there

is adequate assurance that the faulted section will be de-energized in a time not exceeding 1 hour. Also, they shall be permitted to be used in 100 percent insulation level applications where additional insulation is desirable.

³**173 Percent Insulation Level.** Cables in this category shall be permitted to be applied under all of the following conditions:

(1) In industrial establishments where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation

(2) Where the fault clearing time requirements of the 133 percent level category cannot be met

(3) Where an orderly shutdown is essential to protect equipment and personnel

(4) There is adequate assurance that the faulted section will be de-energized in an orderly shutdown

Also, cables with this insulation thickness shall be permitted to be used in 100 or 133 percent insulation level applications where additional insulation strength is desirable.

**ARTICLE 3.12 — CABINETS, CUTOOT BOXES,
AND METER SOCKET ENCLOSURES**

3.12.1.1 Scope. This article covers the installation and construction specifications of cabinets, cutout boxes, and meter socket enclosures.

I. Installation

3.12.1.2 Damp, Wet, or Hazardous (Classified) Locations.

(a) Damp and Wet Locations. In damp or wet locations, surface-type enclosures within the scope of this article shall be placed or equipped so as to prevent moisture or water from entering and accumulating within the cabinet or cutout box, and shall be mounted so there is at least 6 mm airspace between the enclosure and the wall or other supporting surface. Enclosures installed in wet locations shall be weatherproof. For enclosures in wet locations, raceways or cables entering above the level of uninsulated live parts shall use fittings listed for wet locations.

Exception: Nonmetallic enclosures shall be permitted to be installed without the airspace on a concrete, masonry, tile, or similar surface.

FPN: For protection against corrosion, see 3.0.1.6.

(b) Hazardous (Classified) Locations. Installations in hazardous (classified) locations shall conform to Articles 5.0 through 5.17.

3.12.1.3 Position in Wall. In walls of concrete, tile, or other noncombustible material, cabinets shall be installed so that the front edge of the cabinet is not set back of the finished surface more than 6 mm. In walls constructed of wood or other combustible material, cabinets shall be flush with the finished surface or project therefrom.

3.12.1.4 Repairing Plaster and Drywall or Plasterboard. Plaster, drywall, or plasterboard surfaces that are broken or incomplete shall be repaired so there will be no gaps or open spaces greater than 3 mm at the edge of the cabinet or cutout box employing a flush-type cover.

3.12.1.5 Cabinets, Cutout Boxes, and Meter Socket Enclosures. Conductors entering enclosures within the scope of this article shall be

protected from abrasion and shall comply with 3.12.1.5(a) through (c).

(a) Openings to Be Closed. Openings through which conductors enter shall be adequately closed.

(b) Metal Cabinets, Cutout Boxes, and Meter Socket Enclosures. Where metal enclosures within the scope of this article are installed with messenger supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, conductors shall enter through insulating bushings or, in dry locations, through flexible tubing extending from the last insulating support and firmly secured to the enclosure.

(c) Cables. Where cable is used, each cable shall be secured to the cabinet, cutout box, or meter socket enclosure.

Exception: Cables with entirely nonmetallic sheaths shall be permitted to enter the top of a surface-mounted enclosure through one or more nonflexible raceways not less than 450 mm and not more than 3 000 mm in length, provided all of the following conditions are met:

(a) Each cable is fastened within 300 mm, measured along the sheath, of the outer end of the raceway.

(b) The raceway extends directly above the enclosure and does not penetrate a structural ceiling.

(c) A fitting is provided on each end of the raceway to protect the cable(s) from abrasion and the fittings remain accessible after installation.

(d) The raceway is sealed or plugged at the outer end using approved means so as to prevent access to the enclosure through the raceway.

(e) The cable sheath is continuous through the raceway and extends into the enclosure beyond the fitting not less than 6 mm (¼ in.).

(f) The raceway is fastened at its outer end and at other points in accordance with the applicable article.

(g) Where installed as conduit or tubing, the allowable cable fill does not exceed that permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code and all applicable notes thereto.

FPN: See Table 1 in Chapter 9, including Note 9, for allowable cable fill in circular raceways. See 3.10.1.15(b)(2)(a) for required ampacity reductions for multiple cables installed in a common raceway.

3.12.1.6 Deflection of Conductors. Conductors at terminals or conductors entering or leaving cabinets or cutout boxes and the like shall comply with 3.12.1.6(a) through (c).

Exception: Wire-bending space in enclosures for motor controllers with provisions for one or two wires per terminal shall comply with 4.30.1.10(b).

(a) Width of Wiring Gutters. Conductors shall not be deflected within a cabinet or cutout box unless a gutter having a width in accordance with Table 3.12.1.6(a) is provided. Conductors in parallel in accordance with 3.10.1.4 shall be judged on the basis of the number of conductors in parallel.

Table 3.12.1.6(a) Minimum Wire-Bending Space at Terminals and Minimum Width of Wiring Gutters

Wire Size mm ² (mm dia.)	Wires per Terminal				
	1 (mm)	2 (mm)	3 (mm)	4 (mm)	5 (mm)
2.0(1.6) – 5.5(2.6)	Not specified	—	—	—	—
8.0(3.2) – 14	38.1	—	—	—	—
22 – 30	50.8	—	—	—	—
30	63.5	—	—	—	—
38	76.2	—	—	—	—
50 – 60	88.9	127	178	—	—
80 – 100	102	152	203	—	—
125	114	152	203	254	—
150 – 175	127	203	254	305	—
200 – 250	152	203	254	305	356
325 – 700	203	254	305	356	406
400 – 900	203	305	356	406	457
500 – 600	254	—	—	—	—
725 – 1000	305	—	—	—	—

Note: Bending space at terminals shall be measured in a straight line from the end of the lug or wire connector (in the direction that the wire leaves the terminal) to the wall, barrier, or obstruction.

(b) Wire-Bending Space at Terminals. Wire-bending space at each terminal shall be provided in accordance with 3.12.1.6(b)(1) or (b)(2).

(1) Conductors Not Entering or Leaving Opposite Wall. Table 3.12.1.6(a) shall apply where the conductor does not enter or leave the enclosure through the wall opposite its terminal.

(2) Conductors Entering or Leaving Opposite Wall. Table 3.12.1.6(b) shall apply where the conductor does enter or leave the enclosure through the wall opposite its terminal.

Exception No. 1: Where the distance between the wall and its terminal is in accordance with Table 3.12.1.6(a), a conductor shall be permitted to enter or leave an enclosure through the wall opposite its terminal, provided the conductor enters or leaves the enclosure where the gutter joins an adjacent gutter that has a width that conforms to Table 3.12.1.6(b) for the conductor.

Exception No. 2: A conductor not larger than 175 mm² shall be permitted to enter or leave an enclosure containing only a meter socket(s) through the wall opposite its terminal, provided the distance between the terminal and the opposite wall is not less than that specified in Table 3.12.1.6(a) and the terminal is a lay-in type, where the terminal is either of the following:

(a) Directed toward the opening in the enclosure and within a 45 degree angle of directly facing the enclosure wall

(b) Directly facing the enclosure wall and offset not greater than 50 percent of the bending space specified in Table 3.12.1.6(a)

FPN: Offset is the distance measured along the enclosure wall from the axis of the centerline of the terminal to a line passing through the center of the opening in the enclosure.

(c) Conductors 4 AWG or Larger. Installation shall comply with 3.0.1.4(f).

3.12.1.7 Space in Enclosures. Cabinets and cutout boxes shall have sufficient space to accommodate all conductors installed in them without crowding.

Table 3.12.1.6(b) Minimum Wire-Bending Space at Terminals

Wire Size mm ² (mm dia.)		Wires per Terminal			
		1	2	3	4
All Other Conductors	Compact Stranded AA-8000 Aluminum Alloy Conductors (See Note 3.)	mm	mm	mm	mm

200	600	330 ^e	330 ^e	356 ^e	381 ^e
250	700-750	356 ^e	356 ^e	381 ^e	406 ^e
325	800-900	381 ^e	406 ^e	457 ^e	483 ^e
700	1000	406 ^e	457 ^e	508 ^e	559 ^e
400	—	432 ^e	483 ^e	559 ^e	610 ^e
800	—	457	508	559	610
900	—	483	559	610	610
500	—	508	—	—	—
600	—	559	—	—	—
725	—	610	—	—	—
850	—	610	—	—	—
1000	—	610	—	—	—

1. Bending space at terminals shall be measured in a straight line from the end of the lug or wire connector in a direction perpendicular to the enclosure wall.

2. For removable and lay-in wire terminals intended for only one wire, bending space shall be permitted to be reduced by the following number of millimeters:

- a 13 mm
- b 25 mm
- c 40 mm
- d 50 mm
- e 75 mm

3. This column shall be permitted to determine the required wire-bending space for compact stranded aluminum conductors in sizes up to 500 mm² and manufactured using AA-8000 series electrical grade aluminum alloy conductor material in accordance with 3.10.1.14.

3.12.1.8 Enclosures for Switches or Overcurrent Devices.

Enclosures for switches or overcurrent devices shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices, unless adequate space for this purpose is provided. The conductors shall not fill the wiring space at any cross section to more than 40 percent of the cross-sectional area of the space, and the conductors, splices, and taps shall not fill the wiring space at any cross section to more than 75 percent of the cross-sectional area of that space.

3.12.1.9 Side or Back Wiring Spaces or Gutters. Cabinets and cutout boxes shall be provided with back-wiring spaces, gutters, or wiring compartments as required by 3.12.2.2(c) and (d).

3.12.2 Construction Specifications

3.12.2.1 Material. Cabinets, cutout boxes, and meter socket enclosures shall comply with 3.12.2.1(a) through (c).

(a) Metal Cabinets and Cutout Boxes. Metal enclosures within the scope of this article shall be protected both inside and outside against corrosion.

FPN: For information on protection against corrosion, see 3.0.1.6.

(b) Strength. The design and construction of enclosures within the scope of this article shall be such as to secure ample strength and rigidity. If constructed of sheet steel, the metal thickness shall not be less than 1.35 mm (0.053 in.) uncoated.

(c) Nonmetallic Cabinets. Nonmetallic cabinets shall be listed, or they shall be submitted for approval prior to installation.

3.12.2.2 Spacing. The spacing within cabinets and cutout boxes shall comply with 3.12.2.2(a) through (d).

(a) General. Spacing within cabinets and cutout boxes shall be sufficient to provide ample room for the distribution of wires and cables placed in them and for a separation between metal parts of devices and apparatus mounted within them as follows.

(1) Base. Other than at points of support, there shall be an airspace of at least 1.60 mm between the base of the device and the wall of any metal cabinet or cutout box in which the device is mounted.

(2) Doors. There shall be an airspace of at least 25 mm between any live metal part, including live metal parts of enclosed fuses, and the door.

Exception: Where the door is lined with an approved insulating material or is of a thickness of metal not less than 2.35 mm uncoated, the airspace shall not be less than 13 mm.

(3) Live Parts. There shall be an airspace of at least 13 mm between the walls, back, gutter partition, if of metal, or door of any cabinet or cutout box and the nearest exposed current-carrying part of devices mounted within the cabinet where the voltage does not exceed 250. This spacing shall be increased to at least 25 mm for voltages of 251 to 600, nominal.

Exception: Where the conditions in 3.12.2.2(a)(2), Exception, are met, the airspace for nominal voltages from 251 to 600 shall be permitted to be not less than 13 mm.

(b) Switch Clearance. Cabinets and cutout boxes shall be deep enough to allow the closing of the doors when 30-ampere branch-circuit panelboard switches are in any position, when combination cutout switches are in any position, or when other single-throw switches are opened as far as their construction permits.

(c) Wiring Space. Cabinets and cutout boxes that contain devices or apparatus connected within the cabinet or box to more than eight conductors, including those of branch circuits, meter loops, feeder circuits, power circuits, and similar circuits, but not including the supply circuit or a continuation thereof, shall have back-wiring spaces or one or more side-wiring spaces, side gutters, or wiring compartments.

(d) Wiring Space — Enclosure. Side-wiring spaces, side gutters, or side-wiring compartments of cabinets and cutout boxes shall be made tight enclosures by means of covers, barriers, or partitions extending

from the bases of the devices contained in the cabinet, to the door, frame, or sides of the cabinet.

Exception: Side-wiring spaces, side gutters, and side-wiring compartments of cabinets shall not be required to be made tight enclosures where those side spaces contain only conductors that enter the cabinet directly opposite to the devices where they terminate.

Partially enclosed back-wiring spaces shall be provided with covers to complete the enclosure. Wiring spaces that are required by 3.12.2.2(c) and are exposed when doors are open shall be provided with covers to complete the enclosure. Where adequate space is provided for feed-through conductors and for splices as required in 3.12.1.8, additional barriers shall not be required.

ARTICLE 3.14 — OUTLET, DEVICE, PULL, AND JUNCTION BOXES; CONDUIT BODIES; FITTINGS; AND HANDHOLE ENCLOSURES

3.14.1 Scope and General

3.14.1.1 Scope. This article covers the installation and use of all boxes and conduit bodies used as outlet, device, junction, or pull boxes, depending on their use, and handhole enclosures. Cast, sheet metal, nonmetallic, and other boxes such as FS, FD, and larger boxes are not classified as conduit bodies. This article also includes installation requirements for fittings used to join raceways and to connect raceways and cables to boxes and conduit bodies.

3.14.1.2 Round Boxes. Round boxes shall not be used where conduits or connectors requiring the use of locknuts or bushings are to be connected to the side of the box.

3.14.1.3 Nonmetallic Boxes. Nonmetallic boxes shall be permitted only with open wiring on insulators, concealed knob-and-tube wiring, cabled wiring methods with entirely nonmetallic sheaths, flexible cords, and nonmetallic raceways.

Exception No. 1: Where internal bonding means are provided between all entries, nonmetallic boxes shall be permitted to be used

with metal raceways or metal-armored cables.

Exception No. 2: Where integral bonding means with a provision for attaching an equipment bonding jumper inside the box are provided between all threaded entries in nonmetallic boxes listed for the purpose, nonmetallic boxes shall be permitted to be used with metal raceways or metal-armored cables.

3.14.1.4 Metal Boxes. All metal boxes shall be grounded in accordance with the provisions of Article 2.50.

3.14.1.5 Short-Radius Conduit Bodies. Conduit bodies such as capped elbows and service-entrance elbows that enclose conductors 14 mm² or smaller, and are only intended to enable the installation of the raceway and the contained conductors, shall not contain splices, taps, or devices and shall be of sufficient size to provide free space for all conductors enclosed in the conduit body.

3.14.2 Installation

3.14.2.1 Damp, Wet, or Hazardous (Classified) Locations.

(a) Damp or Wet Locations. In damp or wet locations, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the box, conduit body, or fitting. Boxes, conduit bodies, and fittings installed in wet locations shall be listed for use in wet locations.

FPN No. 1: For boxes in floors, see 3.14.2.13(c).

FPN No. 2: For protection against corrosion, see 3.0.1.6.

(b) Hazardous (Classified) Locations. Installations in hazardous (classified) locations shall conform to Articles 5.0 through 5.17.

3.14.2.2 Number of Conductors in Outlet, Device, and Junction Boxes, and Conduit Bodies. Boxes and conduit bodies shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box, as calculated in 3.14.2.2(a), be less than the fill calculation as calculated in 3.14.2.2(b). The minimum volume for conduit bodies shall be as calculated in 3.14.2.2(c). The provisions of this section shall not apply to terminal housings supplied with motors.

FPN: For volume requirements of motor terminal housings, see 4.30.1.12.

Boxes and conduit bodies enclosing conductors 22 mm² or larger shall also comply with the provisions of 3.14.2.14.

(a) Box Volume Calculations. The volume of a wiring enclosure (box) shall be the total volume of the assembled sections and, where used, the space provided by plaster rings, domed covers, extension rings, and so forth, that are marked with their volume or are made from boxes the dimensions of which are listed in Table 3.14.2.2(a).

(1) Standard Boxes. The volumes of standard boxes that are not marked with their volume shall be as given in Table 3.14.2.2(a).

(2) Other Boxes. Boxes 1650 cm³ (100 in³) or less, other than those described in Table 3.14.2.2(a), and nonmetallic boxes shall be durably and legibly marked by the manufacturer with their volume. Boxes described in Table 3.14.2.2(a) that have a volume larger than is designated in the table shall be permitted to have their volume marked as required by this section.

Table 3.14.2.2(a) Metal Boxes

Box Trade Size mm	Minimum Volume cm ³	Maximum Number of Conductors*						
		18	16	2.0(1.6)	3.5(2.0)	5.5(2.6)	8.0(3.2)	14

100 × 54 × 48 device	213	8	7	6	5	5	4	2
100 × 54 × 54 device	238	9	8	7	6	5	4	2
95 × 50 × 65 masonry box/gang	230	9	8	7	6	5	4	2
95 × 50 × 90 masonry box/gang	344	14	12	10	9	8	7	4
min. 44.5 depth FS — single cover/gang	221	9	7	6	6	5	4	2
min. 60.3 depth FD — single cover/gang	295	12	10	9	8	7	6	3
min. 44.5 depth FS — multiple cover/gang	295	12	10	9	8	7	6	3
min. 60.3 depth FD — multiple cover/gang	395	16	13	12	10	9	8	4

*Where no volume allowances are required by 3.14.2.2(b)(2) through (b)(5).

(b) Box Fill Calculations. The volumes in paragraphs 3.14.2.2(b)(1) through (b)(5), as applicable, shall be added together. No allowance shall be required for small fittings such as locknuts and bushings.

(1) Conductor Fill. Each conductor that originates outside the box and terminates or is spliced within the box shall be counted once, and each conductor that passes through the box without splice or termination shall be counted once. A looped, unbroken conductor not less than twice the minimum length required for free conductors in 3.0.1.14 shall be counted twice. The conductor fill shall be calculated using Table 3.14.2.2(b). A conductor, no part of which leaves the box, shall not be counted.

Exception: An equipment grounding conductor or conductors or not over four fixture wires smaller than 2.0 mm²(1.6 mm dia.), or both, shall be permitted to be omitted from the calculations where they enter a box from a domed luminaire (fixture) or similar canopy and terminate within that box.

(2) Clamp Fill. Where one or more internal cable clamps, whether factory or field supplied, are present in the box, a single volume allowance in accordance with Table 3.14.2.2(b) shall be made based on the largest conductor present in the box. No allowance shall be required for a cable connector with its clamping mechanism outside the box.

(3) Support Fittings Fill. Where one or more luminaire (fixture) studs or hickey are present in the box, a single volume allowance in accordance with Table 3.14.2.2(b) shall be made for each type of fitting based on the largest conductor present in the box.

(4) Device or Equipment Fill. For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 3.14.2.2(b) shall be made for each yoke or strap based on the largest conductor connected to a device(s) or equipment supported by that yoke or strap.

Table 3.14.2.2(b) Volume Allowance Required per Conductor

Size of Conductor mm²(mm dia.)	Free Space Within Box for Each Conductor cm³
18	24.6
16	28.7
2.0(1.6)	32.8
3.5(2.0)	36.9
5.5(2.6)	41.0
8.0(3.2)	49.2
14	81.9

(5) Equipment Grounding Conductor Fill. Where one or more equipment grounding conductors or equipment bonding jumpers enter a box, a single volume allowance in accordance with Table 3.14.2.2(b) shall be made based on the largest equipment grounding conductor or equipment bonding jumper present in the box. Where an additional set of equipment grounding conductors, as permitted by 2.50.7.17(d), is present in the box, an additional volume allowance shall be made based on the largest equipment grounding conductor in the additional set.

(c) Conduit Bodies.

(1) General. Conduit bodies enclosing 14 mm² conductors or smaller, other than short-radius conduit bodies as described in 3.14.1.5, shall have a cross-sectional area not less than twice the cross-sectional area of the largest conduit or tubing to which it is attached. The maximum number of conductors permitted shall be the maximum number permitted by Table 1 of Chapter 9 for the conduit or tubing to which it is attached.

(2) With Splices, Taps, or Devices. Only those conduit bodies that are durably and legibly marked by the manufacturer with their volume shall be permitted to contain splices, taps, or devices. The maximum number of conductors shall be calculated in accordance with 3.14.2.2(b). Conduit bodies shall be supported in a rigid and secure manner.

3.14.2.3 Conductors Entering Boxes, Conduit Bodies, or Fittings.

Conductors entering boxes, conduit bodies, or fittings shall be protected from abrasion and shall comply with 3.14.2.3(a) through (d).

(a) **Openings to Be Closed.** Openings through which conductors enter shall be adequately closed.

(b) **Metal Boxes and Conduit Bodies.** Where metal boxes or conduit bodies are installed with messenger supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, conductors shall enter through insulating bushings or, in dry locations, through flexible tubing extending from the last insulating support to not less than 6 mm inside the box and beyond any cable clamps. Except as provided in 3.0.1.15(c), the wiring shall be firmly secured to the box or conduit body. Where raceway or cable is installed with metal boxes or conduit bodies, the raceway or cable shall be secured to such boxes and conduit bodies.

(c) **Nonmetallic Boxes and Conduit Bodies.** Nonmetallic boxes and conduit bodies shall be suitable for the lowest temperature-rated conductor entering the box. Where nonmetallic boxes and conduit bodies are used with messenger supported wiring, open wiring on insulators, or concealed knob-and-tube wiring, the conductors shall enter the box through individual holes. Where flexible tubing is used to enclose the conductors, the tubing shall extend from the last insulating support to not less than 6 mm inside the box and beyond any cable clamp. Where nonmetallic-sheathed cable or multiconductor Type UF cable is used, the sheath shall extend not less than 6 mm inside the box and beyond any cable clamp. In all instances, all permitted wiring methods shall be secured to the boxes.

Exception: Where nonmetallic-sheathed cable or multiconductor Type UF cable is used with single gang boxes not larger than a nominal size 57 mm × 100 mm mounted in walls or ceilings, and where the cable is fastened within 200 mm of the box measured along the sheath and where the sheath extends through a cable knockout not less than 6 mm, securing the cable to the box shall not be required. Multiple cable entries shall be permitted in a single cable knockout opening.

(d) **Conductors 22 mm² or Larger.** Installation shall comply with 3.0.1.4(f).

FPN: See 1.10.1.12(a) for requirements on closing unused cable and raceway knockout openings.

3.14.2.5 Boxes Enclosing Flush Devices. Boxes used to enclose flush devices shall be of such design that the devices will be completely enclosed on back and sides and substantial support for the devices will be provided. Screws for supporting the box shall not be used in attachment of the device contained therein.

3.14.2.6 In Wall or Ceiling. In walls or ceilings with a surface of concrete, tile, gypsum, plaster, or other noncombustible material, boxes employing a flush-type cover or faceplate shall be installed so that the front edge of the box, plaster ring, extension ring, or listed extender will not be set back of the finished surface more than 6 mm. In walls and ceilings constructed of wood or other combustible surface material, boxes, plaster rings, extension rings, or listed extenders shall be flush with the finished surface or project therefrom.

3.14.2.7 Repairing Plaster and Drywall or Plasterboard. Plaster, drywall, or plasterboard surfaces that are broken or incomplete around boxes employing a flush-type cover or faceplate shall be repaired so there will be no gaps or open spaces greater than 3 mm at the edge of the box.

3.14.2.8 Exposed Surface Extensions. Surface extensions from a flush-mounted box shall be made by mounting and mechanically securing an extension ring over the flush box. Equipment grounding and bonding shall be in accordance with Article 2.50.

Exception: A surface extension shall be permitted to be made from the cover of a flush-mounted box where the cover is designed so it is unlikely to fall off or be removed if its securing means becomes loose. The wiring method shall be flexible for a length sufficient to permit removal of the cover and provide access to the box interior, and arranged so that any bonding or grounding continuity is independent of the connection between the box and cover.

3.14.2.9 Supports. Enclosures within the scope of this article shall be supported in accordance with one or more of the provisions in 3.14.2.9(a) through (h).

(a) Surface Mounting. An enclosure mounted on a building or other surface shall be rigidly and securely fastened in place. If the surface does not provide rigid and secure support, additional support in accordance with other provisions of this section shall be provided.

(b) Structural Mounting. An enclosure supported from a structural member of a building or from grade shall be rigidly supported either directly or by using a metal, polymeric, or wood brace.

(1) Nails and Screws. Nails and screws, where used as a fastening means, shall be attached by using brackets on the outside of the enclosure, or they shall pass through the interior within 6 mm of the back or ends of the enclosure. Screws shall not be permitted to pass through the box unless exposed threads in the box are protected using approved means to avoid abrasion of conductor insulation.

(2) Braces. Metal braces shall be protected against corrosion and formed from metal that is not less than 0.50 mm thick uncoated. Wood braces shall have a cross section not less than nominal 25 mm × 50 mm. Wood braces in wet locations shall be treated for the conditions. Polymeric braces shall be identified as being suitable for the use.

(c) Mounting in Finished Surfaces. An enclosure mounted in a finished surface shall be rigidly secured thereto by clamps, anchors, or fittings identified for the application.

(d) Suspended Ceilings. An enclosure mounted to structural or supporting elements of a suspended ceiling shall be not more than 1650 cm^3 (100 in^3) in size and shall be securely fastened in place in accordance with either (d)(1) or (d)(2).

(1) Framing Members. An enclosure shall be fastened to the framing members by mechanical means such as bolts, screws, or rivets, or by the use of clips or other securing means identified for use with the type of ceiling framing member(s) and enclosure(s) employed. The framing members shall be adequately supported and securely fastened to each other and to the building structure.

(2) Support Wires. The installation shall comply with the provisions of 3.0.1.11(a). The enclosure shall be secured, using methods identified for the purpose, to ceiling support wire(s),

including any additional support wire(s) installed for that purpose. Support wire(s) used for enclosure support shall be fastened at each end so as to be taut within the ceiling cavity.

(e) Raceway Supported Enclosure, Without Devices, Luminaires (Fixtures), or Lampholders. An enclosure that does not contain a device(s) other than splicing devices or support a luminaire(s) [fixture(s)], lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm^3 (100 in^3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 900 mm of the enclosure, or within 450 mm of the enclosure if all conduit entries are on the same side.

Exception: Rigid metal, intermediate metal, or rigid nonmetallic conduit or electrical metallic tubing shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit or electrical metallic tubing.

(f) Raceway Supported Enclosures, with Devices, Luminaires (Fixtures), or Lampholders. An enclosure that contains a device(s), other than splicing devices, or supports a luminaire(s) [fixture(s)], lampholder, or other equipment and is supported by entering raceways shall not exceed 1650 cm^3 (100 in^3) in size. It shall have threaded entries or have hubs identified for the purpose. It shall be supported by two or more conduits threaded wrenchtight into the enclosure or hubs. Each conduit shall be secured within 450 mm of the enclosure.

Exception No. 1: Rigid metal or intermediate metal conduit shall be permitted to support a conduit body of any size, including a conduit body constructed with only one conduit entry, provided the trade size of the conduit body is not larger than the largest trade size of the conduit.

Exception No. 2: An unbroken length(s) of rigid or intermediate metal conduit shall be permitted to support a box used for luminaire (fixture) or lampholder support, or to support a wiring enclosure that is an integral part of a luminaire (fixture) and used in lieu of a box in

accordance with 3.0.1.15(b), where all of the following conditions are met:

(a) The conduit is securely fastened at a point so that the length of conduit beyond the last point of conduit support does not exceed 900 mm.

(b) The unbroken conduit length before the last point of conduit support is 300 mm or greater, and that portion of the conduit is securely fastened at some point not less than 300 mm from its last point of support.

(c) Where accessible to unqualified persons, the luminaire (fixture) or lampholder, measured to its lowest point, is at least 2 400 mm above grade or standing area and at least 900 mm measured horizontally to the 2 400 mm elevation from windows, doors, porches, fire escapes, or similar locations.

(d) A luminaire (fixture) supported by a single conduit does not exceed 300 mm in any direction from the point of conduit entry.

(e) The weight supported by any single conduit does not exceed 9 kg (20 lb).

(f) At the luminaire (fixture) or lampholder end, the conduit(s) is threaded wrenchtight into the box, conduit body, or integral wiring enclosure, or into hubs identified for the purpose. Where a box or conduit body is used for support, the luminaire (fixture) shall be secured directly to the box or conduit body, or through a threaded conduit nipple not over 75 mm long.

(g) Enclosures in Concrete or Masonry. An enclosure supported by embedment shall be identified as suitably protected from corrosion and securely embedded in concrete or masonry.

(h) Pendant Boxes. An enclosure supported by a pendant shall comply with 3.14.2.9(h)(1) or (h)(2).

(1) Flexible Cord. A box shall be supported from a multiconductor cord or cable in an approved manner that protects the conductors against strain, such as a strain-relief connector threaded into a box with a hub.

(2) Conduit. A box supporting lampholders or luminaires (lighting fixtures), or wiring enclosures within luminaires (fixtures) used in lieu of boxes in accordance with 3.0.1.15(b), shall be supported by rigid or intermediate metal conduit stems. For stems longer than 450 mm, the stems shall be connected to the wiring system with flexible fittings

suitable for the location. At the luminaire (fixture) end, the conduit(s) shall be threaded wrenchtight into the box or wiring enclosure, or into hubs identified for the purpose.

Where supported by only a single conduit, the threaded joints shall be prevented from loosening by the use of set-screws or other effective means, or the luminaire (fixture), at any point, shall be at least 2 400 mm above grade or standing area and at least 900 mm measured horizontally to the 2 400 mm elevation from windows, doors, porches, fire escapes, or similar locations. A luminaire (fixture) supported by a single conduit shall not exceed 300 mm in any horizontal direction from the point of conduit entry.

3.14.2.10 Depth of Outlet Boxes. No box shall have an internal depth of less than 13 mm. Boxes intended to enclose flush devices shall have an internal depth of not less than 24 mm.

3.14.2.11 Covers and Canopies. In completed installations, each box shall have a cover, faceplate, lampholder, or luminaire (fixture) canopy, except where the installation complies with 4.10.3.5(b).

(a) Nonmetallic or Metal Covers and Plates. Nonmetallic or metal covers and plates shall be permitted. Where metal covers or plates are used, they shall comply with the grounding requirements of 2.50.6.1.

FPN: For additional grounding requirements, see 4.10.5.2(a) for metal luminaire (fixture) canopies, and 4.4.1.12 and 4.6.1.5(b) for metal faceplates.

(b) Exposed Combustible Wall or Ceiling Finish. Where a luminaire (fixture) canopy or pan is used, any combustible wall or ceiling finish exposed between the edge of the canopy or pan and the outlet box shall be covered with noncombustible material.

(c) Flexible Cord Pendants. Covers of outlet boxes and conduit bodies having holes through which flexible cord pendants pass shall be provided with bushings designed for the purpose or shall have smooth, well-rounded surfaces on which the cords may bear. So-called hard rubber or composition bushings shall not be used.

3.14.2.13 Outlet Boxes.

(a) Boxes at Luminaire (Lighting Fixture) Outlets. Boxes used at luminaire (lighting fixture) or lampholder outlets shall be designed for the purpose. At every outlet used exclusively for lighting, the box shall be designed or installed so that a luminaire (lighting fixture) may be attached.

Exception: A wall-mounted luminaire (fixture) weighing not more than 3 kg (6 lb) shall be permitted to be supported on other boxes or plaster rings that are secured to other boxes, provided the luminaire (fixture) or its supporting yoke is secured to the box with no fewer than two No. 6 or larger screws.

(b) Maximum Luminaire (Fixture) Weight. Outlet boxes or fittings installed as required by 3.14.2.9 shall be permitted to support luminaires (lighting fixtures) weighing 23 kg (50 lb) or less. A luminaire (lighting fixture) that weighs more than 23 kg (50 lb) shall be supported independently of the outlet box unless the outlet box is listed for the weight to be supported.

(c) Floor Boxes. Boxes listed specifically for this application shall be used for receptacles located in the floor.

Exception: Where the authority having jurisdiction judges them free from likely exposure to physical damage, moisture, and dirt, boxes located in elevated floors of show windows and similar locations shall be permitted to be other than those listed for floor applications. Receptacles and covers shall be listed as an assembly for this type of location.

(d) Boxes at Ceiling-Suspended (Paddle) Fan Outlets. Outlet boxes or outlet box systems used as the sole support of a ceiling-suspended (paddle) fan shall be listed, shall be marked by their manufacturer as suitable for this purpose, and shall not support ceiling-suspended (paddle) fans that weigh more than 32 kg (70 lb). For outlet boxes or outlet box systems designed to support ceiling-suspended (paddle) fans that weigh more than 16 kg (35 lb), the required marking shall include the maximum weight to be supported.

3.14.2.14 Pull and Junction Boxes and Conduit Bodies. Boxes and conduit bodies used as pull or junction boxes shall comply with 3.14.2.14(a) through (d).

Exception: Terminal housings supplied with motors shall comply with the provisions of 4.30.1.12.

(a) Minimum Size. For raceways containing conductors of 22 mm² or larger, and for cables containing conductors of 22 mm² or larger, the minimum dimensions of pull or junction boxes installed in a raceway or cable run shall comply with (a)(1) through (a)(3). Where an enclosure dimension is to be calculated based on the diameter of entering raceways, the diameter shall be the metric designator (trade size) expressed in the units of measurement employed.

(1) Straight Pulls. In straight pulls, the length of the box shall not be less than eight times the metric designator (trade size) of the largest raceway.

(2) Angle or U Pulls. Where splices or where angle or U pulls are made, the distance between each raceway entry inside the box and the opposite wall of the box shall not be less than six times the metric designator (trade size) of the largest raceway in a row. This distance shall be increased for additional entries by the amount of the sum of the diameters of all other raceway entries in the same row on the same wall of the box. Each row shall be calculated individually, and the single row that provides the maximum distance shall be used.

Exception: Where a raceway or cable entry is in the wall of a box or conduit body opposite a removable cover, the distance from that wall to the cover shall be permitted to comply with the distance required for one wire per terminal in Table 3.12.1.6(a).

The distance between raceway entries enclosing the same conductor shall not be less than six times the metric designator (trade size) of the larger raceway.

When transposing cable size into raceway size in 3.14.2.14(a)(1) and (a)(2), the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

(3) Smaller Dimensions. Boxes or conduit bodies of dimensions less than those required in 3.14.2.14(a)(1) and (a)(2) shall be permitted

for installations of combinations of conductors that are less than the maximum conduit or tubing fill (of conduits or tubing being used) permitted by Table 1 of Chapter 9, provided the box or conduit body has been listed for, and is permanently marked with, the maximum number and maximum size of conductors permitted.

(b) Conductors in Pull or Junction Boxes. In pull boxes or junction boxes having any dimension over 1 800 mm, all conductors shall be cabled or racked up in an approved manner.

(c) Covers. All pull boxes, junction boxes, and conduit bodies shall be provided with covers compatible with the box or conduit body construction and suitable for the conditions of use. Where used, metal covers shall comply with the grounding requirements of 2.50.6.1. An extension from the cover of an exposed box shall comply with 3.14.2.8, Exception.

(d) Permanent Barriers. Where permanent barriers are installed in a box, each section shall be considered as a separate box.

3.14.2.15 Boxes, Conduit Bodies, and Handhole Enclosures to Be Accessible. Boxes, conduit bodies, and handhole enclosures shall be installed so that the wiring contained in them can be rendered accessible without removing any part of the building or, in underground circuits, without excavating sidewalks, paving, earth, or other substance that is to be used to establish the finished grade.

Exception: Listed boxes and handhole enclosures shall be permitted where covered by gravel, light aggregate, or noncohesive granulated soil if their location is effectively identified and accessible for excavation.

3.14.2.16 Handhole Enclosures. Handhole enclosures shall be designed and installed to withstand all loads likely to be imposed.

FPN: See ANSI/SCTE 77-2002, Specification for Underground Enclosure Integrity, for additional information on deliberate and nondeliberate traffic loading that can be expected to bear on underground enclosures.

(a) Size. Handhole enclosures shall be sized in accordance with 3.14.2.14(a) for conductors operating at 600 volts or below, and in accordance with 3.14.4.2 for conductors operating at over 600 volts.

For handhole enclosures without bottoms where the provisions of 3.14.2.14(a)(2), Exception, or 3.14.4.2(b)(1), Exception No. 1, apply, the measurement to the removable cover shall be taken from the end of the conduit or cable assembly.

(b) Wiring Entries. Underground raceways and cable assemblies entering a handhole enclosure shall extend into the enclosure, but they shall not be required to be mechanically connected to the enclosure.

(c) Handhole Enclosures Without Bottoms. Where handhole enclosures without bottoms are installed, all enclosed conductors and any splices or terminations, if present, shall be listed as suitable for wet locations.

(d) Covers. Handhole enclosure covers shall have an identifying mark or logo that prominently identifies the function of the enclosure, such as “electric.” Handhole enclosure covers shall require the use of tools to open, or they shall weigh over 45 kg (100 lb). Metal covers and other exposed conductive surfaces shall be bonded in accordance with 2.50.5.7(a).

3.14.3 Construction Specifications

3.14.3.1 Metal Boxes, Conduit Bodies, and Fittings.

(a) Corrosion Resistant. Metal boxes, conduit bodies, and fittings shall be corrosion resistant or shall be well-galvanized, enameled, or otherwise properly coated inside and out to prevent corrosion.

FPN: See 3.0.1.6 for limitation in the use of boxes and fittings protected from corrosion solely by enamel.

(b) Thickness of Metal. Sheet steel boxes not over 1650 cm³ (100 in.³) in size shall be made from steel not less than 1.60 mm thick. The wall of a malleable iron box or conduit body and a die-cast or permanent-mold cast aluminum, brass, bronze, or zinc box or conduit body shall not be less than 2.40 mm thick. Other cast metal boxes or conduit bodies shall have a wall thickness not less than 3 mm.

Exception No. 1: Listed boxes and conduit bodies shown to have equivalent strength and characteristics shall be permitted to be made of thinner or other metals.

Exception No. 2: The walls of listed short radius conduit bodies, as covered in 3.14.1.5, shall be permitted to be made of thinner metal.

(c) Metal Boxes Over 1650 cm³ (100 in.³). Metal boxes over 1650 cm³ (100 in.³) in size shall be constructed so as to be of ample strength and rigidity. If of sheet steel, the metal thickness shall not be less than 1.35 mm uncoated.

(d) Grounding Provisions. A means shall be provided in each metal box for the connection of an equipment grounding conductor. The means shall be permitted to be a tapped hole or equivalent.

3.14.3.2 Covers. Metal covers shall be of the same material as the box or conduit body with which they are used, or they shall be lined with firmly attached insulating material that is not less than 0.80 mm thick, or they shall be listed for the purpose. Metal covers shall be the same thickness as the boxes or conduit body for which they are used, or they shall be listed for the purpose. Covers of porcelain or other approved insulating materials shall be permitted if of such form and thickness as to afford the required protection and strength.

3.14.3.3 Bushings. Covers of outlet boxes and conduit bodies having holes through which flexible cord pendants may pass shall be provided with approved bushings or shall have smooth, well-rounded surfaces on which the cord may bear. Where individual conductors pass through a metal cover, a separate hole equipped with a bushing of suitable insulating material shall be provided for each conductor. Such separate holes shall be connected by a slot as required by 3.0.1.20.

3.14.3.4 Nonmetallic Boxes. Provisions for supports or other mounting means for nonmetallic boxes shall be outside of the box, or the box shall be constructed so as to prevent contact between the conductors in the box and the supporting screws.

3.14.3.5 Marking. All boxes and conduit bodies, covers, extension rings, plaster rings, and the like shall be durably and legibly marked with the manufacturer's name or trademark.

3.14.4. Pull and Junction Boxes for Use on Systems Over 600 Volts, Nominal

3.14.4.1 General. Where pull and junction boxes are used on systems over 600 volts, the installation shall comply with the provisions of Part IV and also with the following general provisions of this article:

- (1) Part 3.14.1, 3.14.1.2, 3.14.1.3, and 3.14.1.4
- (2) Part 3.14.2, 3.14.2.1; 3.14.2.3; 3.14.2.6; 3.14.2.9(a), (b), or (g); 3.14.2.14(b); and 3.14.2.15
- (3) Part 3.14.3, 3.14.3.1(a) and (c) and 3.14.3.2

3.14.4.2 Size of Pull and Junction Boxes. Pull and junction boxes shall provide adequate space and dimensions for the installation of conductors, and they shall comply with the specific requirements of this section.

Exception: Terminal housings supplied with motors shall comply with the provisions of 4.30.1.12.

(a) For Straight Pulls. The length of the box shall not be less than 48 times the outside diameter, over sheath, of the largest shielded or lead-covered conductor or cable entering the box. The length shall not be less than 32 times the outside diameter of the largest nonshielded conductor or cable.

(b) For Angle or U Pulls.

(1) Distance to Opposite Wall. The distance between each cable or conductor entry inside the box and the opposite wall of the box shall not be less than 36 times the outside diameter, over sheath, of the largest cable or conductor. This distance shall be increased for additional entries by the amount of the sum of the outside diameters, over sheath, of all other cables or conductor entries through the same wall of the box.

Exception No. 1: Where a conductor or cable entry is in the wall of a box opposite a removable cover, the distance from that wall to the cover shall be permitted to be not less than the bending radius for the conductors as provided in 3.0.2.4.

Exception No. 2: Where cables are nonshielded and not lead covered, the distance of 36 times the outside diameter shall be permitted to be reduced to 24 times the outside diameter.

(2) Distance Between Entry and Exit. The distance between a cable or conductor entry and its exit from the box shall not be less than 36 times the outside diameter, over sheath, of that cable or conductor.

Exception: Where cables are nonshielded and not lead covered, the distance of 36 times the outside diameter shall be permitted to be reduced to 24 times the outside diameter.

(c) **Removable Sides.** One or more sides of any pull box shall be removable.

3.14.4.3 Construction and Installation Requirements.

(a) **Corrosion Protection.** Boxes shall be made of material inherently resistant to corrosion or shall be suitably protected, both internally and externally, by enameling, galvanizing, plating, or other means.

(b) **Passing Through Partitions.** Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors or cables pass through partitions and at other locations where necessary.

(c) **Complete Enclosure.** Boxes shall provide a complete enclosure for the contained conductors or cables.

(d) **Wiring Is Accessible.** Boxes shall be installed so that the wiring is accessible without removing any part of the building. Working space shall be provided in accordance with 1.10.3.5.

(e) **Suitable Covers.** Boxes shall be closed by suitable covers securely fastened in place. Underground box covers that weigh over 45 kg (100 lb) shall be considered meeting this requirement. Covers for boxes shall be permanently marked “DANGER — HIGH VOLTAGE — KEEP OUT.” The marking shall be on the outside of the box cover and shall be readily visible. Letters shall be block type and at least 13 mm in height.

(f) **Suitable for Expected Handling.** Boxes and their covers shall be capable of withstanding the handling to which they are likely to be subjected.

ARTICLE 3.20 — ARMORED CABLE: TYPE AC

3.20.1 General

3.20.1.1 Scope. This article covers the use, installation, and construction specifications for armored cable, Type AC.

3.20.1.2 Definition.

Armored Cable, Type AC. A fabricated assembly of insulated conductors in a flexible metallic enclosure. See 3.20.3.1.

3.20.2 Installation

3.20.2.1 Uses Permitted. Type AC cable shall be permitted as follows:

- (1) In both exposed and concealed work
- (2) In cable trays
- (3) In dry locations
- (4) Embedded in plaster finish on brick or other masonry, except in damp or wet locations
- (5) To be run or fished in the air voids of masonry block or tile walls where such walls are not exposed or subject to excessive moisture or dampness

FPN: The “Uses Permitted” is not an all-inclusive list.

3.20.2.3 Uses Not Permitted. Type AC cable shall not be used as follows:

- (1) Where subject to physical damage
- (2) In damp or wet locations
- (3) In air voids of masonry block or tile walls where such walls are exposed or subject to excessive moisture or dampness

- (4) Where exposed to corrosive fumes or vapors
- (5) Embedded in plaster finish on brick or other masonry in damp or wet locations

3.20.2.6 Exposed Work. Exposed runs of cable, except as provided in 3.0.1.11(a), shall closely follow the surface of the building finish or of running boards. Exposed runs shall also be permitted to be installed on the underside of joists where supported at each joist and located so as not to be subject to physical damage.

3.20.2.8 Through or Parallel to Framing Members. Type AC cable shall be protected in accordance with 3.0.1.4(a), (c), and (d) where installed through or parallel to framing members.

3.20.2.14 In Accessible Attics. Type AC cables in accessible attics or roof spaces shall be installed as specified in 3.20.2.14(a) and (b).

(a) Where Run Across the Top of Floor Joists. Where run across the top of floor joists, or within 2 100 mm of floor or floor joists across the face of rafters or studding, in attics and roof spaces that are accessible, the cable shall be protected by substantial guard strips that are at least as high as the cable. Where this space is not accessible by permanent stairs or ladders, protection shall only be required within 1 800 mm of the nearest edge of the scuttle hole or attic entrance.

(b) Cable Installed Parallel to Framing Members. Where the cable is installed parallel to the sides of rafters, studs, or floor joists, neither guard strips nor running boards shall be required, and the installation shall also comply with 3.0.1.4(d).

3.20.2.15 Bending Radius. Bends in Type AC cable shall be made such that the cable is not damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the Type AC cable.

3.20.2.21 Securing and Supporting.

(a) General. Type AC cable shall be supported and secured by staples, cable ties, straps, hangers, or similar fittings, designed and installed so as not to damage the cable.

(b) Securing. Unless otherwise provided, Type AC cable shall be secured within 300 mm of every outlet box, junction box, cabinet, or fitting and at intervals not exceeding 1 400 mm where installed on or across framing members.

(c) Supporting. Unless otherwise provided, Type AC cable shall be supported at intervals not exceeding 1 400 mm.

Horizontal runs of Type AC cable installed in wooden or metal framing members or similar supporting means shall be considered supported where such support does not exceed 1 400 mm intervals.

(d) Unsupported Cables. Type AC cable shall be permitted to be unsupported where the cable complies with any of the following:

(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable

(2) Is not more than 600 mm in length at terminals where flexibility is necessary

(3) Is not more than 1 800 mm in length from the last point of cable support to the point of connection to a luminaire(s) [lighting fixture(s)] or other electrical equipment and the cable and point of connection are within an accessible ceiling. For the purposes of this section, Type AC cable fittings shall be permitted as a means of cable support.

3.20.2.31 Boxes and Fittings. At all points where the armor of AC cable terminates, a fitting shall be provided to protect wires from abrasion, unless the design of the outlet boxes or fittings is such as to afford equivalent protection, and, in addition, an insulating bushing or its equivalent protection shall be provided between the conductors and the armor. The connector or clamp by which the Type AC cable is fastened to boxes or cabinets shall be of such design that the insulating bushing or its equivalent will be visible for inspection. Where change is made from Type AC cable to other cable or raceway wiring methods, a box, fitting, or conduit body shall be installed at junction points as required in 3.0.1.15.

3.20.2.71 Ampacity. The ampacity shall be determined by 3.10.1.15.

(a) Thermal Insulation. Armored cable installed in thermal insulation shall have conductors rated at 90°C (194°F). The ampacity

of cable installed in these applications shall be that of 60°C (140°F) conductors. The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor.

(b) Cable Tray. The ampacity of Type AC cable installed in cable tray shall be determined in accordance with 3.92.1.11.

3.20.3 Construction Specifications

3.20.3.1 Construction. Type AC cable shall have an armor of flexible metal tape and shall have an internal bonding strip of copper or aluminum in intimate contact with the armor for its entire length.

3.20.3.5 Conductors. Insulated conductors shall be of a type listed in Table 3.10.1.13 or those identified for use in this cable. In addition, the conductors shall have an overall moisture-resistant and fire-retardant fibrous covering. For Type ACT, a moisture-resistant fibrous covering shall be required only on the individual conductors.

3.20.3.9 Equipment Grounding. Type AC cable shall provide an adequate path for equipment grounding as required by 2.50.1.4(a)(5) or 2.50.1.4(b)(4).

3.20.3.21 Marking. The cable shall be marked in accordance with 3.10.1.11, except that Type AC shall have ready identification of the manufacturer by distinctive external markings on the cable sheath throughout its entire length.

ARTICLE 3.22 — FLAT CABLE ASSEMBLIES: TYPE FC

3.22.1 General

3.22.1.1 Scope. This article covers the use, installation, and construction specifications for flat cable assemblies, Type FC.

3.22.1.2 Definition.

Flat Cable Assembly, Type FC. An assembly of parallel conductors formed integrally with an insulating material web

specifically designed for field installation in surface metal raceway.

3.22.2 Installation

3.22.2.1 Uses Permitted. Flat cable assemblies shall be permitted only as follows:

(1) As branch circuits to supply suitable tap devices for lighting, small appliances, or small power loads. The rating of the branch circuit shall not exceed 30 amperes.

(2) Where installed for exposed work.

(3) In locations where they will not be subjected to physical damage. Where a flat cable assembly is installed less than 2 400 mm above the floor or fixed working platform, it shall be protected by a cover identified for the use.

(4) In surface metal raceways identified for the use. The channel portion of the surface metal raceway systems shall be installed as complete systems before the flat cable assemblies are pulled into the raceways.

3.22.2.3 Uses Not Permitted. Flat cable assemblies shall not be used as follows:

(1) Where subject to corrosive vapors unless suitable for the application

(2) In hoistways or on elevators or escalators

(3) In any hazardous (classified) location

(4) Outdoors or in wet or damp locations unless identified for the use

3.22.2.21 Securing and Supporting. The flat cable assemblies shall be supported by means of their special design features, within the surface metal raceways.

The surface metal raceways shall be supported as required for the specific raceway to be installed.

3.22.2.31 Boxes and Fittings.

(a) Dead Ends. Each flat cable assembly dead end shall be terminated in an end-cap device identified for the use.

The dead-end fitting for the enclosing surface metal raceway shall be identified for the use.

(b) Luminaire (Fixture) Hangers. Luminaire (fixture) hangers installed with the flat cable assemblies shall be identified for the use.

(c) Fittings. Fittings to be installed with flat cable assemblies shall be designed and installed to prevent physical damage to the cable assemblies.

(d) Extensions. All extensions from flat cable assemblies shall be made by approved wiring methods, within the junction boxes, installed at either end of the flat cable assembly runs.

3.22.2.47 Splices and Taps.

(a) Splices. Splices shall be made in listed junction boxes.

(b) Taps. Taps shall be made between any phase conductor and the grounded conductor or any other phase conductor by means of devices and fittings identified for the use. Tap devices shall be rated at not less than 15 amperes, or more than 300 volts to ground, and shall be color-coded in accordance with the requirements of 3.22.3.21(c).

3.22.3 Construction

3.22.3.1 Construction. Flat cable assemblies shall consist of two, three, four, or five conductors.

3.22.3.5 Conductors. Flat cable assemblies shall have conductors of 5.5 mm² (2.6 mm dia.) special stranded copper wires.

3.22.3.13 Insulation. The entire flat cable assembly shall be formed to provide a suitable insulation covering all the conductors and using one of the materials recognized in Table 3.10.1.13 for general branch-circuit wiring.

3.22.3.21 Marking.

(a) Temperature Rating. In addition to the provisions of 3.10.1.11, Type FC cable shall have the temperature rating durably marked on

the surface at intervals not exceeding 600 mm.

(b) Identification of Grounded Conductor. The grounded conductor shall be identified throughout its length by means of a distinctive and durable white or gray marking.

FPN: The color gray may have been used in the past as an ungrounded conductor. Care should be taken when working on existing systems.

(c) Terminal Block Identification. Terminal blocks identified for the use shall have distinctive and durable markings for color or word coding. The grounded conductor section shall have a white marking or other suitable designation. The next adjacent section of the terminal block shall have a black marking or other suitable designation. The next section shall have a red marking or other suitable designation. The final or outer section, opposite the grounded conductor section of the terminal block, shall have a blue marking or other suitable designation.

ARTICLE 3.24 — FLAT CONDUCTOR CABLE: TYPE FCC

3.24.1 General

3.24.1.1 Scope. This article covers a field-installed wiring system for branch circuits incorporating Type FCC cable and associated accessories as defined by the article. The wiring system is designed for installation under carpet squares.

3.24.1.2 Definitions.

Bottom Shield. A protective layer that is installed between the floor and Type FCC flat conductor cable to protect the cable from physical damage and may or may not be incorporated as an integral part of the cable.

Cable Connector. A connector designed to join Type FCC cables without using a junction box.

FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares. The FCC system

includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.

Insulating End. An insulator designed to electrically insulate the end of a Type FCC cable.

Metal Shield Connections. Means of connection designed to electrically and mechanically connect a metal shield to another metal shield, to a receptacle housing or self-contained device, or to a transition assembly.

Top Shield. A grounded metal shield covering under-carpet components of the FCC system for the purposes of providing protection against physical damage.

Transition Assembly. An assembly to facilitate connection of the FCC system to other wiring systems, incorporating (1) a means of electrical interconnection and (2) a suitable box or covering for providing electrical safety and protection against physical damage.

Type FCC Cable. Three or more flat copper conductors placed edge-to-edge and separated and enclosed within an insulating assembly.

3.24.1.6 Listing Requirements. Type FCC cable and associated fittings shall be listed.

3.24.2 Installation

3.24.2.1 Uses Permitted.

(a) Branch Circuits. Use of FCC systems shall be permitted both for general-purpose and appliance branch circuits and for individual branch circuits.

(b) Branch-Circuit Ratings.

(1) Voltage. Voltage between ungrounded conductors shall not exceed 300 volts. Voltage between ungrounded conductors and the grounded conductor shall not exceed 150 volts.

(2) Current. General-purpose and appliance branch circuits shall have ratings not exceeding 20 amperes. Individual branch circuits shall have ratings not exceeding 30 amperes.

(c) Floors. Use of FCC systems shall be permitted on hard, sound, smooth, continuous floor surfaces made of concrete, ceramic, or composition flooring, wood, and similar materials.

(d) Walls. Use of FCC systems shall be permitted on wall surfaces in surface metal raceways.

(e) Damp Locations. Use of FCC systems in damp locations shall be permitted.

(f) Heated Floors. Materials used for floors heated in excess of 30°C (86°F) shall be identified as suitable for use at these temperatures.

(g) System Height. Any portion of an FCC system with a height above floor level exceeding 2.30 m shall be tapered or feathered at the edges to floor level.

(h) Coverings. Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 900 mm square. Carpet squares that are adhered to the floor shall be attached with release-type adhesives.

(i) Corrosion Resistance. Metal components of the system shall be either corrosion resistant, coated with corrosion-resistant materials, or insulated from contact with corrosive substances.

(j) Metal-Shield Connectors. Metal shields shall be connected to each other and to boxes, receptacle housings, self-contained devices, and transition assemblies using metal-shield connectors.

3.24.2.3 Uses Not Permitted. FCC systems shall not be used in the following locations:

- (1) Outdoors or in wet locations
- (2) Where subject to corrosive vapors
- (3) In any hazardous (classified) location

(4) In residential, school, and hospital buildings

3.24.2.9 Crossings. Crossings of more than two Type FCC cable runs shall not be permitted at any one point. Crossings of a Type FCC cable over or under a flat communications or signal cable shall be permitted. In each case, a grounded layer of metal shielding shall separate the two cables, and crossings of more than two flat cables shall not be permitted at any one point.

3.24.2.21 Securing and Supporting. All FCC system components shall be firmly anchored to the floor or wall using an adhesive or mechanical anchoring system identified for this use. Floors shall be prepared to ensure adherence of the FCC system to the floor until the carpet squares are placed.

3.24.2.31 Boxes and Fittings.

(a) **Cable Connections and Insulating Ends.** All Type FCC cable connections shall use connectors identified for their use, installed such that electrical continuity, insulation, and sealing against dampness and liquid spillage are provided. All bare cable ends shall be insulated and sealed against dampness and liquid spillage using listed insulating ends.

(b) **Polarization of Connections.** All receptacles and connections shall be constructed and installed so as to maintain proper polarization of the system.

(c) **Shields.**

(1) **Top Shield.** A metal top shield shall be installed over all floor-mounted Type FCC cable, connectors, and insulating ends. The top shield shall completely cover all cable runs, corners, connectors, and ends.

(2) **Bottom Shield.** A bottom shield shall be installed beneath all Type FCC cable, connectors, and insulating ends.

(d) **Connection to Other Systems.** Power feed, grounding connection, and shield system connection between the FCC system and other wiring systems shall be accomplished in a transition assembly identified for this use.

(e) **Metal-Shield Connectors.** Metal shields shall be connected to each other and to boxes, receptacle housings, self-contained devices, and transition assemblies using metal-shield connectors.

3.24.2.32 Floor Coverings. Floor-mounted Type FCC cable, cable connectors, and insulating ends shall be covered with carpet squares not larger than 900 mm square. Carpet squares that are adhered to the floor shall be attached with release-type adhesives.

3.24.2.33 Devices.

(a) **Receptacles.** All receptacles, receptacle housings, and self-contained devices used with the FCC system shall be identified for this use and shall be connected to the Type FCC cable and metal shields. Connection from any grounding conductor of the Type FCC cable shall be made to the shield system at each receptacle.

(b) **Receptacles and Housings.** Receptacle housings and self-contained devices designed either for floor mounting or for in-wall or on-wall mounting shall be permitted for use with the FCC system. Receptacle housings and self-contained devices shall incorporate means for facilitating entry and termination of Type FCC cable and for electrically connecting the housing or device with the metal shield. Receptacles and self-contained devices shall comply with 4.6.1.3. Power and communications outlets installed together in common housing shall be permitted in accordance with 8.0.5.24(a)(1)c, Exception No. 2.

3.24.2.47 Splices and Taps.

(a) **FCC Systems Alterations.** Alterations to FCC systems shall be permitted. New cable connectors shall be used at new connection points to make alterations. It shall be permitted to leave unused cable runs and associated cable connectors in place and energized. All cable ends shall be covered with insulating ends.

(b) **Transition Assemblies.** All transition assemblies shall be identified for their use. Each assembly shall incorporate means for facilitating entry of the Type FCC cable into the assembly, for connecting the Type FCC cable to grounded conductors, and for

electrically connecting the assembly to the metal cable shields and to equipment grounding conductors.

3.24.2.51 Grounding. All metal shields, boxes, receptacle housings, and self-contained devices shall be electrically continuous to the equipment grounding conductor of the supplying branch circuit. All such electrical connections shall be made with connectors identified for this use. The electrical resistivity of such shield system shall not be more than that of one conductor of the Type FCC cable used in the installation.

3.24.3 Construction

3.24.3.1 Construction.

(a) **Type FCC Cable.** Type FCC cable shall be listed for use with the FCC system and shall consist of three, four, or five flat copper conductors, one of which shall be an equipment grounding conductor.

(b) **Shields.**

(1) **Materials and Dimensions.** All top and bottom shields shall be of designs and materials identified for their use. Top shields shall be metal. Both metallic and nonmetallic materials shall be permitted for bottom shields.

(2) **Resistivity.** Metal shields shall have cross-sectional areas that provide for electrical resistivity of not more than that of one conductor of the Type FCC cable used in the installation.

3.24.3.2 Corrosion Resistance. Metal components of the system shall be either corrosion resistant, coated with corrosion-resistant materials, or insulated from contact with corrosive substances.

3.24.3.13 Insulation. The insulating material of the cable shall be moisture resistant and flame retardant. All insulating materials in the FCC systems shall be identified for their use.

3.24.3.21 Markings.

(a) **Cable Marking.** Type FCC cable shall be clearly and durably marked on both sides at intervals of not more than 600 mm with the

information required by 3.10.1.11(a) and with the following additional information:

- (1) Material of conductors
- (2) Maximum temperature rating
- (3) Ampacity

(b) **Conductor Identification.** Conductors shall be clearly and durably identified on both sides throughout their length as specified in 3.10.1.12.

ARTICLE 3.26 — INTEGRATED GAS SPACER CABLE: TYPE IGS

3.26.1 General

3.26.1.1 Scope. This article covers the use, installation, and construction specifications for integrated gas spacer cable, Type IGS.

3.26.1.2 Definition.

Integrated Gas Spacer Cable, Type IGS. A factory assembly of one or more conductors, each individually insulated and enclosed in a loose fit, nonmetallic flexible conduit as an integrated gas spacer cable rated 0 through 600 volts.

3.26.2 Installation

3.26.2.1 Uses Permitted. Type IGS cable shall be permitted for use under ground, including direct burial in the earth, as the following:

- (1) Service-entrance conductors
- (2) Feeder or branch-circuit conductors

3.26.2.3 Uses Not Permitted. Type IGS cable shall not be used as interior wiring or be exposed in contact with buildings.

3.26.2.15 Bending Radius. Where the coilable nonmetallic conduit and cable is bent for installation purposes or is flexed or bent during

shipment or installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 3.26.2.15.

Table 3.26.2.15 Minimum Radii of Bends

Conduit Size Metric Designator	Minimum Radii mm
53	600
78	900
103	1150

3.26.2.17 Bends. A run of Type IGS cable between pull boxes or terminations shall not contain more than the equivalent of four quarter bends (360 degrees total), including those bends located immediately at the pull box or terminations.

3.26.2.31 Fittings. Terminations and splices for Type IGS cable shall be identified as a type that is suitable for maintaining the gas pressure within the conduit. A valve and cap shall be provided for each length of the cable and conduit to check the gas pressure or to inject gas into the conduit.

3.26.2.71 Ampacity. The ampacity of Type IGS cable shall not exceed the values shown in Table 3.26.2.71.

Table 3.26.2.71 Ampacity of Type IGS Cable

Size (mm ²)	Amperes	Size (kcmil)	Amperes
125	119	2500	376
250	168	3000	412
400	206	3250	429
500	238	3500	445
600	266	3750	461
725	292	4000	476
850	344	4250	491
1000	336	4500	505
2250	357	4750	519

3.26.3 Construction Specifications

3.26.3.1 Conductors. The conductors shall be solid aluminum rods, laid parallel, consisting of one to nineteen 13 mm diameter rods. The minimum conductor size shall be 125 mm², and the maximum size shall be 4750 kcmil.

3.26.3.9 Insulation. The insulation shall be dry kraft paper tapes and a pressurized sulfur hexafluoride gas (SF6), both approved for electrical use. The nominal gas pressure shall be 138 kPa gauge (20 pounds per square inch gauge). The thickness of the paper spacer shall be as specified in Table 3.26.3.9.

Table 3.26.3.9 Paper Spacer Thickness

Size (mm ²)	Thickness mm
125 – 500	1.02
600 – 4750	1.52

3.26.3.13 Conduit. The conduit shall be a medium density polyethylene identified as suitable for use with natural gas rated pipe in metric designator 53, 78, or 103 (trade size 2, 3, or 4). The percent fill dimensions for the conduit are shown in Table 3.26.3.13.

The size of the conduit permitted for each conductor size shall be calculated for a percent fill not to exceed those found in Table 1, Chapter 9.

Table 3.26.3.13 Conduit Dimensions

Conduit Size Metric Designator	Actual Outside Diameter mm	Actual Inside Diameter mm
53	60	49.46
78	89	73.30
103	114	94.23

3.26.3.17 Marking. The cable shall be marked in accordance with 3.10.1.11(a), 3.10.1.11(b)(1), and 3.10.1.11(d).

ARTICLE 3.28 — MEDIUM VOLTAGE CABLE: TYPE MV

3.28.1 General

3.28.1.1 Scope. This article covers the use, installation, and construction specifications for medium voltage cable, Type MV.

3.28.1.2 Definition.

Medium Voltage Cable, Type MV. A single or multiconductor solid dielectric insulated cable rated 2 001 volts or higher.

3.28.2 Installation

3.28.2.1 Uses Permitted. Type MV cable shall be permitted for use on power systems rated up to 35 000 volts nominal as follows:

- (1) In wet or dry locations
- (2) In raceways
- (3) In cable trays as specified in 3.92.1.3(b)(2)
- (4) Direct buried in accordance with 3.0.2.20
- (5) In messenger-supported wiring

FPN: The "Uses Permitted" is not an all-inclusive list.

3.28.2.3 Uses Not Permitted. Unless identified for the use, Type MV cable shall not be used as follows:

- (1) Where exposed to direct sunlight
- (2) In cable trays, unless specified in 3.92.1.3(b)(2)
- (3) Direct buried, unless in accordance with 3.0.2.20

3.28.2.71 Ampacity. The ampacity of Type MV cable shall be determined in accordance with 3.10.1.60. The ampacity of Type MV cable installed in cable tray shall be determined in accordance with 3.92.1.13.

3.28.3 Construction Specifications

3.28.3.1 Construction. Type MV cables shall have copper, aluminum, or copper-clad aluminum conductors and shall comply with Table 3.10.1.61 and Table 3.10.1.63 or Table 3.10.1.64.

3.28.3.21 Marking. Medium voltage cable shall be marked as required by 3.10.1.11.

ARTICLE 3.30 — METAL-CLAD CABLE: TYPE MC

3.30.1 General

3.30.1.1 Scope. This article covers the use, installation, and construction specifications of metal-clad cable, Type MC.

3.30.1.2 Definition.

Metal Clad Cable, Type MC. A factory assembly of one or more insulated circuit conductors with or without optical fiber members enclosed in an armor of interlocking metal tape, or a smooth or corrugated metallic sheath.

3.30.2 Installation

3.30.2.1 Uses Permitted.

(a) General Uses. Type MC cable shall be permitted as follows:

- (1) For services, feeders, and branch circuits
- (2) For power, lighting, control, and signal circuits
- (3) Indoors or outdoors
- (4) Exposed or concealed
- (5) To be direct buried where identified for such use
- (6) In cable tray where identified for such use
- (7) In any raceway
- (8) As aerial cable on a messenger
- (9) In hazardous (classified) locations as permitted
- (10) In dry locations and embedded in plaster finish on brick or other masonry except in damp or wet locations

(11) In wet locations where any of the following conditions are met:

- a. The metallic covering is impervious to moisture.
- b. A lead sheath or moisture-impervious jacket is provided under the metal covering.
- c. The insulated conductors under the metallic covering are listed for use in wet locations.

(12) Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath.

(b) Specific Uses. Type MC cable shall be permitted to be installed in compliance with Parts 7.25.2 and 7.25.3 and 770.52 as applicable and in accordance with 3.30.2.1(b)(1) through (b)(4).

(1) Cable Tray. Type MC cable installed in cable tray shall comply with 3.92.1.3, 3.92.1.4, 3.92.1.6, and 3.92.1.8 through 3.92.1.13.

(2) Direct Buried. Direct-buried cable shall comply with 3.0.1.5 or 3.0.2.20, as appropriate.

(3) Installed as Service-Entrance Cable. Type MC cable installed as service-entrance cable shall be permitted in accordance with 230.43.

(4) Installed Outside of Buildings or as Aerial Cable. Type MC cable installed outside of buildings or as aerial cable shall comply with 225.10, 3.96.2.1, and 3.96.2.3.

FPN: The "Uses Permitted" is not an all-inclusive list.

3.30.2.3 Uses Not Permitted. Type MC cable shall not be used where exposed to the following destructive corrosive conditions, unless the metallic sheath is suitable for the conditions or is protected by material suitable for the conditions:

- (1) Where subject to physical damage
- (2) Direct burial in the earth
- (3) In concrete

FPN to (3): MC cable that is identified for direct burial applications is suitable for installation in concrete.

(4) Where subject to cinder fills, strong chlorides, caustic alkalis, or vapors of chlorine or of hydrochloric acids

3.30.2.8 Through or Parallel to Framing Members. Type MC cable shall be protected in accordance with 3.0.1.4(a), (c), and (d) where installed through or parallel to framing members.

3.30.2.14 In Accessible Attics. The installation of Type MC cable in accessible attics or roof spaces shall also comply with 3.20.2.14.

3.30.2.15 Bending Radius. Bends in Type MC cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend shall not be less than required in 3.30.2.15(a) through (c).

(a) Smooth Sheath.

(1) Ten times the external diameter of the metallic sheath for cable not more than 19 mm in external diameter

(2) Twelve times the external diameter of the metallic sheath for cable more than 19 mm but not more than 40 mm in external diameter

(3) Fifteen times the external diameter of the metallic sheath for cable more than 40 mm in external diameter

(b) Interlocked-Type Armor or Corrugated Sheath. Seven times the external diameter of the metallic sheath.

(c) Shielded Conductors. Twelve times the overall diameter of one of the individual conductors or seven times the overall diameter of the multiconductor cable, whichever is greater.

3.30.2.21 Securing and Supporting.

(a) General. Type MC cable shall be supported and secured by staples, cable ties, straps, hangers, or similar fittings or other approved means designed and installed so as not to damage the cable.

(b) Securing. Unless otherwise provided, cables shall be secured at intervals not exceeding 1 800 mm. Cables containing four or fewer conductors sized no larger than 5.5 mm² (2.6 mm dia.) shall be

secured within 300 mm of every box, cabinet, fitting, or other cable termination.

(c) Supporting. Unless otherwise provided, cables shall be supported at intervals not exceeding 1 800 mm.

Horizontal runs of Type MC cable installed in wooden or metal framing members or similar supporting means shall be considered supported and secured where such support does not exceed 1 800 mm intervals.

(d) Unsupported Cables. Type MC cable shall be permitted to be unsupported where the cable:

(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impractical; or

(2) Is not more than 1 800 mm in length from the last point of cable support to the point of connection to a luminaire (lighting fixture) or other piece of electrical equipment and the cable and point of connection are within an accessible ceiling. For the purpose of this section, Type MC cable fittings shall be permitted as a means of cable support.

3.30.2.22 Single Conductors. Where single-conductor cables with a nonferrous armor or sheath are used, the installation shall comply with 3.0.1.20.

3.30.2.31 Boxes and Fitting. Fittings used for connecting Type MC cable to boxes, cabinets, or other equipment shall be listed and identified for such use.

3.30.2.71 Ampacity. The ampacity of Type MC cable shall be determined in accordance with 3.10.1.15 or 3.10.1.60 for 2.0 mm² (1.6 mm dia.) and larger conductors and in accordance with Table 4.2.1.5 for 18 AWG and 16 AWG conductors. The installation shall not exceed the temperature ratings of terminations and equipment.

(a) Type MC Cable Installed in Cable Tray. The ampacities for Type MC cable installed in cable tray shall be determined in accordance with 3.92.1.11 and 3.92.1.13.

(b) Single Type MC Conductors Grouped Together. Where single Type MC conductors are grouped together in a triangular or square configuration and installed on a messenger or exposed with a maintained free airspace of not less than 2.15 times one conductor diameter (2.15 × O.D.) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities in the following tables:

(1) Table 3.10.1.20 for conductors rated 0 through 2 000 volts

(2) Table 3.10.1.67 and Table 3.10.1.68 for conductors rated over 2000 volts

3.30.3 Construction Specifications

3.30.3.1 Conductors. The conductors shall be of copper, aluminum, or copper-clad aluminum, solid or stranded. The minimum conductor size shall be 18 AWG copper and 3.5 mm² (2.0 mm dia.) aluminum or copper-clad aluminum.

3.30.3.5 Equipment Grounding. Where Type MC cable is used for equipment grounding, it shall comply with 2.50.6.9(10) and 2.50.6.13.

3.30.3.9 Insulation. Insulated conductors shall comply with 3.30.3.9(a) or (b).

(a) 600 Volts. Insulated conductors in sizes 18 AWG and 16 AWG shall be of a type listed in Table 402.3, with a maximum operating temperature not less than 90°C (194°F) and as permitted by 7.25.2.7. Conductors larger than 16 AWG shall be of a type listed in Table 3.10.1.13 or of a type identified for use in Type MC cable.

(b) Over 600 Volts. Insulated conductors shall be of a type listed in Table 3.10.1.61 through Table 3.10.1.64.

3.30.3.13 Sheath. Metallic covering shall be one of the following types: smooth metallic sheath, corrugated metallic sheath, interlocking metal tape armor. The metallic sheath shall be continuous and close fitting. A nonmagnetic sheath or armor shall be used on single conductor Type MC. Supplemental protection of an outer covering of corrosion-resistant material shall be permitted and shall be required

where such protection is needed. The sheath shall not be used as a current-carrying conductor.

FPN: See 3.0.1.6 for protection against corrosion.

ARTICLE 3.32 — MINERAL-INSULATED, METAL-SHEATHED CABLE: TYPE MI

3.32.1 General

3.32.1.1 Scope. This article covers the use, installation, and construction specifications for mineral-insulated, metal-sheathed cable, Type MI.

3.32.1.2 Definition.

Mineral-Insulated, Metal-Sheathed Cable, Type MI. A factory assembly of one or more conductors insulated with a highly compressed refractory mineral insulation and enclosed in a liquidtight and gastight continuous copper or alloy steel sheath.

3.32.2 Installation

3.32.2.1 Uses Permitted. Type MI cable shall be permitted as follows:

- (1) For services, feeders, and branch circuits
- (2) For power, lighting, control, and signal circuits
- (3) In dry, wet, or continuously moist locations
- (4) Indoors or outdoors
- (5) Where exposed or concealed
- (6) Where embedded in plaster, concrete, fill, or other masonry, whether above or below grade
- (7) In any hazardous (classified) location
- (8) Where exposed to oil and gasoline
- (9) Where exposed to corrosive conditions not deteriorating to its sheath
- (10) In underground runs where suitably protected against physical damage and corrosive conditions
- (11) In or attached to cable tray

FPN: The "Uses Permitted" is not an all-inclusive list.

3.32.2.3 Uses Not Permitted. Type MI cable shall not be used under the following conditions or in the following locations:

- (1) In underground runs unless protected from physical damage, where necessary
- (2) Where exposed to conditions that are destructive and corrosive to the metallic sheath, unless additional protection is provided

3.32.2.8 Through or Parallel to Framing Members. Type MI cable shall be protected in accordance with 3.0.1.4 where installed through or parallel to framing members.

3.32.2.15 Bending Radius. Bends in Type MI cable shall be so made that the cable will not be damaged. The radius of the inner edge of any bend shall not be less than required as follows:

- (1) Five times the external diameter of the metallic sheath for cable not more than 19 mm in external diameter
- (2) Ten times the external diameter of the metallic sheath for cable greater than 19 mm but not more than 25 mm in external diameter

3.32.2.21 Securing and Supporting. Type MI cable shall be supported and secured by staples, straps, hangers, or similar fittings, designed and installed so as not to damage the cable, at intervals not exceeding 1 800 mm.

(a) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with 3.0.1.4 shall be considered supported and secured where such support does not exceed 1 800 mm intervals.

(b) Unsupported Cable. Type MI cable shall be permitted to be unsupported where the cable is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable.

(c) Cable Trays. All MI cable installed in cable trays shall comply with 3.92.1.8(b).

3.32.2.22 Single Conductors. Where single-conductor cables are used, all phase conductors and, where used, the neutral conductor shall be grouped together to minimize induced voltage on the sheath.

3.32.2.31 Boxes and Fittings.

(a) **Fittings.** Fittings used for connecting Type MI cable to boxes, cabinets, or other equipment shall be identified for such use.

(b) **Terminal Seals.** Where Type MI cable terminates, an end seal fitting shall be installed immediately after stripping to prevent the entrance of moisture into the insulation. The conductors extending beyond the sheath shall be individually provided with an insulating material.

3.32.2.71 Ampacity. The ampacity of Type MI cable shall be determined in accordance with 3.10.1.15. The conductor temperature at the end seal fitting shall not exceed the temperature rating of the listed end seal fitting, and the installation shall not exceed the temperature ratings of terminations or equipment.

(a) **Type MI Cable Installed in Cable Tray.** The ampacities for Type MI cable installed in cable tray shall be determined in accordance with 3.92.1.11.

(b) **Single Type MI Conductors Grouped Together.** Where single Type MI conductors are grouped together in a triangular or square configuration, as required by 3.32.2.22, and installed on a messenger or exposed with a maintained free air space of not less than 2.15 times one conductor diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of the conductors shall not exceed the allowable ampacities of Table 3.10.1.17.

3.32.3 Construction Specifications

3.32.3.1 Conductors. Type MI cable conductors shall be of solid copper, nickel, or nickel-coated copper with a resistance corresponding to standard mm^2 and mm dia. sizes.

3.32.3.5 Equipment Grounding. Where the outer sheath is made of copper, it shall provide an adequate path for equipment grounding purposes. Where made of steel, an equipment grounding conductor shall be provided.

3.32.3.9 Insulation. The conductor insulation in Type MI cable shall be a highly compressed refractory mineral that provides proper spacing for all conductors.

3.32.3.13 Sheath. The outer sheath shall be of a continuous construction to provide mechanical protection and moisture seal.

ARTICLE 3.34 — NONMETALLIC-SHEATHED CABLE: TYPES NM, NMC, AND NMS

3.34.1 General

3.34.1.1 Scope. This article covers the use, installation, and construction specifications of nonmetallic-sheathed cable.

3.34.1.2 Definitions.

Nonmetallic-Sheathed Cable. A factory assembly of two or more insulated conductors enclosed within an overall nonmetallic jacket.

Type NM. Insulated conductors enclosed within an overall nonmetallic jacket.

Type NMC. Insulated conductors enclosed within an overall, corrosion resistant, nonmetallic jacket.

Type NMS. Insulated power or control conductors with signaling, data, and communications conductors within an overall nonmetallic jacket.

3.34.1.6 Listed. Type NM, Type NMC, and Type NMS cables shall be listed.

3.34.2 Installation

3.34.2.1 Uses Permitted. Type NM, Type NMC, and Type NMS cables shall be permitted to be used in the following:

- (1) One- and two-family dwellings.
- (2) Multifamily dwellings permitted to be of Types III, IV, and V construction except as prohibited in 3.34.2.3.
- (3) Other structures permitted to be of Types III, IV, and V construction except as prohibited in 3.34.2.3. Cables shall be concealed within walls, floors, or ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

FPN No. 1: Types of building construction and occupancy classifications are defined in NFPA 220-1999, Standard on Types of Building Construction, or the applicable building code, or both.

FPN No. 2: See Annex E for determination of building types [NFPA 220, Table 3-1].

- (4) Cable trays in structures permitted to be Types III, IV, or V where the cables are identified for the use.

FPN: See 3.10.1.10 for temperature limitation of conductors.

(a) Type NM. Type NM cable shall be permitted as follows:

- (1) For both exposed and concealed work in normally dry locations except as prohibited in 3.34.2.1(3)
- (2) To be installed or fished in air voids in masonry block or tile walls

(b) Type NMC. Type NMC cable shall be permitted as follows:

- (1) For both exposed and concealed work in dry, moist, damp, or corrosive locations, except as prohibited by 3.34.2.1(3)
- (2) In outside and inside walls of masonry block or tile
- (3) In a shallow chase in masonry, concrete, or adobe protected against nails or screws by a steel plate at least 1.60 mm thick and covered with plaster, adobe, or similar finish

(c) Type NMS. Type NMS cable shall be permitted as follows:

- (1) For both exposed and concealed work in normally dry locations except as prohibited by 3.34.2.1(3)

- (2) To be installed or fished in air voids in masonry block or tile walls

3.34.2.3 Uses Not Permitted.

(a) Types NM, NMC, and NMS. Types NM, NMC, and NMS cables shall not be permitted as follows:

- (1) In any dwelling or structure not specifically permitted in 3.34.2.1(1), (2), and (3)

- (2) Exposed in dropped or suspended ceilings in other than one- and two-family and multifamily dwellings

- (3) As service-entrance cable

- (4) In commercial garages having hazardous (classified) locations as defined in 5.11.1.3

- (5) In theaters and similar locations, except where permitted in 5.18.1.4(b)

- (6) In motion picture studios

- (7) In storage battery rooms

- (8) In hoistways or on elevators or escalators

- (9) Embedded in poured cement, concrete, or aggregate

- (10) In hazardous (classified) locations, except where permitted by the following:

- a. 5.1.2.1(b)(3)

- b. 5.2.2.1(b)(3)

- c. 5.4.1.20

(b) Types NM and NMS. Types NM and NMS cables shall not be used under the following conditions or in the following locations:

- (1) Where exposed to corrosive fumes or vapors

- (2) Where embedded in masonry, concrete, adobe, fill, or plaster

- (3) In a shallow chase in masonry, concrete, or adobe and covered with plaster, adobe, or similar finish

- (4) Where exposed or subject to excessive moisture or dampness

3.34.2.6 Exposed Work. In exposed work, except as provided in 3.0.1.11(a), cable shall be installed as specified in 3.34.2.6(a) through (c).

(a) To Follow Surface. Cable shall closely follow the surface of the building finish or of running boards.

(b) Protection from Physical Damage. Cable shall be protected from physical damage where necessary by rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, or other approved means. Where passing through a floor, the cable shall be enclosed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, Schedule 80 PVC rigid nonmetallic conduit, or other approved means extending at least 150 mm above the floor.

Where Type NMC cable is installed in shallow chases in masonry, concrete, or adobe, the cable shall be protected against nails or screws by a steel plate at least 1.60 mm thick and covered with plaster, adobe, or similar finish.

(c) In Unfinished Basements. Where cable is run at angles with joists in unfinished basements, it shall be permissible to secure cables not smaller than two 14 mm² or three 8.0 mm² (3.2 mm dia.) conductors directly to the lower edges of the joists. Smaller cables shall be run either through bored holes in joists or on running boards. NM cable used on a wall of an unfinished basement shall be permitted to be installed in a listed conduit or tubing. Conduit or tubing shall utilize a nonmetallic bushing or adapter at the point the cable enters the raceway. Metal conduit and tubings and metal outlet boxes shall be grounded.

3.34.2.8 Through or Parallel to Framing Members. Types NM, NMC, or NMS cable shall be protected in accordance with 3.0.1.4 where installed through or parallel to framing members. Grommets used as required in 3.0.1.4(b)(1) shall remain in place and be listed for the purpose of cable protection.

3.34.2.14 In Accessible Attics. The installation of cable in accessible attics or roof spaces shall also comply with 3.20.2.14.

3.34.2.15 Bending Radius. Bends in Types NM, NMC, and NMS cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend during or after installation shall not be less than five times the diameter of the cable.

3.34.2.21 Securing and Supporting. Nonmetallic-sheathed cable shall be supported and secured by staples, cable ties, straps, hangers, or similar fittings designed and installed so as not to damage the cable, at intervals not exceeding 1 400 mm and within 300 mm of every outlet box, junction box, cabinet, or fitting. Flat cables shall not be stapled on edge.

Sections of cable protected from physical damage by raceway shall not be required to be secured within the raceway.

(a) Horizontal Runs Through Holes and Notches. In other than vertical runs, cables installed in accordance with 3.0.1.4 shall be considered to be supported and secured where such support does not exceed 1 400 mm intervals and the nonmetallic-sheathed cable is securely fastened in place by an approved means within 300 mm of each box, cabinet, conduit body, or other nonmetallic-sheathed cable termination.

FPN: See 3.14.2.3(c) for support where nonmetallic boxes are used.

(b) Unsupported Cables. Nonmetallic-sheathed cable shall be permitted to be unsupported where the cable:

(1) Is fished between access points through concealed spaces in finished buildings or structures and supporting is impracticable.

(2) Is not more than 1 400 mm from the last point of cable support to the point of connection to a luminaire (lighting fixture) or other piece of electrical equipment and the cable and point of connection are within an accessible ceiling.

(c) Wiring Device Without a Separate Outlet Box. A wiring device identified for the use, without a separate outlet box, and incorporating an integral cable clamp shall be permitted where the cable is secured in place at intervals not exceeding 1 400 mm and within 300 mm from the wiring device wall opening, and there shall be at least a 300 mm loop of unbroken cable or 150 mm of a cable end

available on the interior side of the finished wall to permit replacement.

3.34.2.31 Boxes and Fittings.

(a) Boxes of Insulating Material. Nonmetallic outlet boxes shall be permitted as provided by 3.14.1.3.

(b) Devices of Insulating Material. Switch, outlet, and tap devices of insulating material shall be permitted to be used without boxes in exposed cable wiring and for rewiring in existing buildings where the cable is concealed and fished. Openings in such devices shall form a close fit around the outer covering of the cable, and the device shall fully enclose the part of the cable from which any part of the covering has been removed. Where connections to conductors are by binding-screw terminals, there shall be available as many terminals as conductors.

(c) Devices with Integral Enclosures. Wiring devices with integral enclosures identified for such use shall be permitted as provided by 3.0.1.15(e).

3.34.2.71 Ampacity. The ampacity of Types NM, NMC, and NMS cable shall be determined in accordance with 3.10.1.15. The ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating. The 90°C (194°F) rating shall be permitted to be used for ampacity derating purposes, provided the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor. The ampacity of Types NM, NMC, and NMS cable installed in cable tray shall be determined in accordance with 3.92.1.11.

Where more than two NM cables containing two or more current-carrying conductors are bundled together and pass through wood framing that is to be fire- or draft-stopped using thermal insulation or sealing foam, the allowable ampacity of each conductor shall be adjusted in accordance with Table 3.10.1.15(b)(2)a.

3.34.3 Construction Specifications

3.34.3.1 Construction. The outer cable sheath of nonmetallic-sheathed cable shall be a nonmetallic material.

3.34.3.5 Conductors. The 600 volt insulated conductors shall be sizes 2.0 mm² (1.6 mm dia.) through 30 mm² copper conductors or sizes 3.5 mm² (2.0 mm dia.) through 2.0 mm² aluminum or copper-clad aluminum conductors. The signaling conductors shall comply with 7.80.1.5. The communication conductors shall comply with Part 8.0.5.

3.34.3.9 Equipment Grounding. In addition to the insulated conductors, the cable shall have an insulated or bare conductor for equipment grounding purposes only.

3.34.3.13 Insulation. The insulated power conductors shall be one of the types listed in Table 3.10.1.13 that are suitable for branch circuit wiring or one that is identified for use in these cables. Conductor insulation shall be rated at 90°C (194°F).

FPN: Types NM, NMC, and NMS cable identified by the markings NM-B, NMC-B, and NMS-B meet this requirement.

3.34.3.17 Sheath. The outer sheath of nonmetallic-sheathed cable shall comply with 3.34.3.17(a), (b), and (c).

(a) Type NM. The overall covering shall be flame retardant and moisture resistant.

(b) Type NMC. The overall covering shall be flame retardant, moisture resistant, fungus resistant, and corrosion resistant.

(c) Type NMS. The overall covering shall be flame retardant and moisture resistant. The sheath shall be applied so as to separate the power conductors from the communications and signaling conductors. The signaling conductors shall be permitted to be shielded. An optional outer jacket shall be permitted.

FPN: For composite optical cable, see 770.9 and 770.133.

ARTICLE 3.36 — POWER AND CONTROL TRAY CABLE: TYPE TC

3.36.1 General

3.36.1.1 Scope. This article covers the use, installation, and construction specifications for power and control tray cable, Type TC.

3.36.1.2 Definition.

Power and Control Tray Cable, Type TC. A factory assembly of two or more insulated conductors, with or without associated bare or covered grounding conductors, under a nonmetallic jacket.

3.36.2 Installation

3.36.2.1 Uses Permitted. Type TC cable shall be permitted to be used as follows:

- (1) For power, lighting, control, and signal circuits.
- (2) In cable trays.
- (3) In raceways.
- (4) In outdoor locations supported by a messenger wire.
- (5) For Class 1 circuits as permitted in Parts 7.25.2 and 7.25.3.
- (6) For non-power-limited fire alarm circuits if conductors comply with the requirements of 7.60.2.7.
- (7) In industrial establishments where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, and where the cable is continuously supported and protected against physical damage using mechanical protection, such as struts, angles, or channels, Type TC tray cable that complies with the crush and impact requirements of Type MC cable and is identified for such use with the marking Type TC-ER shall be permitted between a cable tray and the utilization equipment or device. The cable shall be secured at intervals not exceeding 1 800 mm. Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable. In cables containing conductors sized 14 mm² or smaller, the equipment grounding conductor shall be provided within the cable or, at the time of installation, one or more insulated

conductors shall be permanently identified as an equipment grounding conductor in accordance with 2.50.6.10(b).

(8) Where installed in wet locations, Type TC cable shall also be resistant to moisture and corrosive agents.

FPN: See 3.10.1.10 for temperature limitation of conductors.

3.36.2.3 Uses Not Permitted. Type TC tray cable shall not be installed or used as follows:

- (1) Installed where it will be exposed to physical damage
- (2) Installed outside a raceway or cable tray system, except as permitted in 3.36.2.1(7)
- (3) Used where exposed to direct rays of the sun, unless identified as sunlight resistant
- (4) Direct buried, unless identified for such use

3.36.2.15 Bending Radius. Bends in Type TC cable shall be made so as not to damage the cable. For Type TC cable without metal shielding, the minimum bending radius shall be as follows:

- (1) Four times the overall diameter for cables 25 mm or less in diameter
- (2) Five times the overall diameter for cables larger than 25 mm (1 in.) but not more than 50 mm in diameter
- (3) Six times the overall diameter for cables larger than 50 mm in diameter

Type TC cables with metallic shielding shall have a minimum bending radius of not less than 12 times the cable overall diameter.

3.36.2.71 Ampacity. The ampacity of Type TC tray cable shall be determined in accordance with 3.92.1.11 for 2.0 mm² (1.6 mm dia.) and larger conductors, in accordance with 4.2.1.5 for 18 AWG through 16 AWG conductors where installed in cable tray, and in accordance with 3.10.1.15 where installed in a raceway or as messenger supported wiring.

3.36.3 Construction Specifications

3.36.3.1 Construction. A metallic sheath or armor as defined in

3.30.3.13 shall not be permitted either under or over the nonmetallic jacket. Metallic shield(s) shall be permitted over groups of conductors, under the outer jacket, or both.

3.36.3.5 Conductors. The insulated conductors of Type TC tray cable shall be in sizes **18 AWG** through 500 mm² copper and sizes 3.5 mm² (2.0 mm dia.) through 500 mm² aluminum or copper-clad aluminum. Insulated conductors of sizes 2.0 mm² (1.6 mm dia.) and larger copper and sizes 3.5 mm² (2.0 mm dia.) and larger aluminum or copper-clad aluminum shall be one of the types listed in Table 3.10.1.13 or Table 3.10.1.62 that is suitable for branch circuit and feeder circuits or one that is identified for such use.

(a) **Fire Alarm Systems.** Where used for fire alarm systems, conductors shall also be in accordance with 7.60.2.7.

(b) **Thermocouple Circuits.** Conductors in Type TC cable used for thermocouple circuits in accordance with Part 7.25.3 shall also be permitted to be any of the materials used for thermocouple extension wire.

(c) **Class I Circuit Conductors.** Insulated conductors of **18 AWG** and 16 AWG copper shall also be in accordance with 7.25.2.7.

3.36.3.17 Jacket. The outer jacket shall be a flame-retardant, nonmetallic material.

3.36.3.21 Marking. There shall be no voltage marking on a Type TC cable employing thermocouple extension wire.

ARTICLE 3.38 — SERVICE-ENTRANCE CABLE: TYPES SE AND USE

3.38.1 General

3.38.1.1 Scope. This article covers the use, installation, and construction specifications of service-entrance cable.

3.38.1.2 Definitions.

Service-Entrance Cable. A single conductor or multiconductor assembly provided with or without an overall covering, primarily used for services, and of the following types:

Type SE. Service-entrance cable having a flame-retardant, moisture-resistant covering.

Type USE. Service-entrance cable, identified for underground use, having a moisture-resistant covering, but not required to have a flame-retardant covering.

3.38.2 Installation

3.38.2.1 Uses Permitted.

(a) **Service-Entrance Conductors.** Service-entrance cable shall be permitted to be used as service-entrance conductors and shall be installed in accordance with 2.30.1.6, 2.30.1.7, and Parts 2.30.2, 2.30.3, and 2.30.4.

Type USE used for service laterals shall be permitted to emerge from the ground outside at terminations in meter bases or other enclosures where protected in accordance with 3.0.1.5(d).

(b) Branch Circuits or Feeders.

(1) **Grounded Conductor Insulated.** Type SE service-entrance cables shall be permitted in wiring systems where all of the circuit conductors of the cable are of the rubber-covered or thermoplastic type.

(2) **Grounded Conductor Not Insulated.** Type SE service-entrance cable shall be permitted for use where the insulated conductors are used for circuit wiring and the uninsulated conductor is used only for equipment grounding purposes.

Exception: Uninsulated conductors shall be permitted as a grounded conductor in accordance with 2.50.7.11, 2.50.2.13, and 2.25.2.1 through 2.25.2.11.

(3) **Temperature Limitations.** Type SE service-entrance cable used to supply appliances shall not be subject to conductor temperatures in excess of the temperature specified for the type of insulation involved.

(4) **Installation Methods for Branch Circuits and Feeders.**

a. Interior Installations. In addition to the provisions of this article, Type SE service-entrance cable used for interior wiring shall comply with the installation requirements of Parts 3.34.1 and 3.34.2, excluding 3.34.2.71.

FPN: See 3.10.1.10 for temperature limitation of conductors.

b. Exterior Installations. In addition to the provisions of this article, service-entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed in accordance with Part 2.25.1. The cable shall be supported in accordance with 3.34.2.21, unless used as messenger-supported wiring as permitted in Part 3.96.2. Type USE cable installed as underground feeder and branch circuit cable shall comply with Part 3.40.2. Where Type USE cable emerges from the ground at terminations, it shall be protected in accordance with 3.0.1.5(d). Multiconductor service-entrance cable shall be permitted to be installed as messenger-supported wiring in accordance with 2.25.1.10 and Part 3.96.2.

3.38.2.15 Bending Radius. Bends in Types USE and SE cable shall be so made that the cable will not be damaged. The radius of the curve of the inner edge of any bend, during or after installation, shall not be less than five times the diameter of the cable.

3.38.3 Construction

3.38.3.1 Construction. Cabled, single-conductor, Type USE constructions recognized for underground use shall be permitted to have a bare copper conductor cabled with the assembly. Type USE single, parallel, or cabled conductor assemblies recognized for underground use shall be permitted to have a bare copper concentric conductor applied. These constructions shall not require an outer overall covering.

FPN: See 2.30.4.2, Exception, item (2), for directly buried, uninsulated service-entrance conductors.

Type SE or USE cable containing two or more conductors shall be permitted to have one conductor uninsulated.

3.38.3.21 Marking. Service-entrance cable shall be marked as required in 3.10.1.11. Cable with the neutral conductor smaller than

the ungrounded conductors shall be so marked.

ARTICLE 3.40 — UNDERGROUND FEEDER AND BRANCH-CIRCUIT CABLE: TYPE UF

3.40.1 General

3.40.1.1 Scope. This article covers the use, installation, and construction specifications for underground feeder and branch-circuit cable, Type UF.

3.40.1.2 Definition.

Underground Feeder and Branch-Circuit Cable, Type UF. A factory assembly of one or more insulated conductors with an integral or an overall covering of nonmetallic material suitable for direct burial in the earth.

3.40.1.6 Listing Requirements. Type UF cable shall be listed.

3.40.2 Installation

3.40.2.1 Uses Permitted. Type UF cable shall be permitted as follows:

- (1) For use underground, including direct burial in the earth. For underground requirements, see 3.0.1.5.
- (2) As single-conductor cables. Where installed as single-conductor cables, all conductors of the feeder grounded conductor or branch circuit, including the grounded conductor and equipment grounding conductor, if any, shall be installed in accordance with 3.0.1.3.
- (3) For wiring in wet, dry, or corrosive locations under the recognized wiring methods of this Code.
- (4) Installed as nonmetallic-sheathed cable. Where so installed, the installation and conductor requirements shall comply with Parts 3.34.2 and 3.34.3 and shall be of the multiconductor type.
- (5) For solar photovoltaic systems in accordance with 6.90.4.1.
- (6) As single-conductor cables as the nonheating leads for heating cables as provided in 4.24.5.10.

(7) Supported by cable trays. Type UF cable supported by cable trays shall be of the multiconductor type.

FPN: See 3.10.1.10 for temperature limitation of conductors.

3.40.2.3 Uses Not Permitted. Type UF cable shall not be used as follows:

- (1) As service-entrance cable
- (2) In commercial garages
- (3) In theaters and similar locations
- (4) In motion picture studios
- (5) In storage battery rooms
- (6) In hoistways or on elevators or escalators
- (7) In hazardous (classified) locations
- (8) Embedded in poured cement, concrete, or aggregate, except where embedded in plaster as nonheating leads where permitted in 4.24.5.10
- (9) Where exposed to direct rays of the sun, unless identified as sunlight resistant
- (10) Where subject to physical damage
- (11) As overhead cable, except where installed as messenger-supported wiring in accordance with Part 3.96.2

3.40.2.15 Bending Radius. Bends in Type UF cable shall be so made that the cable is not damaged. The radius of the curve of the inner edge of any bend shall not be less than five times the diameter of the cable.

3.40.2.71 Ampacity. The ampacity of Type UF cable shall be that of 60°C (140°F) conductors in accordance with 3.10.1.15.

3.40.3 Construction Specifications

3.40.3.1 Conductors. The conductors shall be sizes 2.0 mm² (1.6 mm dia.) copper or 3.5 mm² (2.0 mm dia.) aluminum or copper-clad aluminum through 100 mm².

3.40.3.5 Equipment Grounding. In addition to the insulated conductors, the cable shall be permitted to have an insulated or bare conductor for equipment grounding purposes only.

3.40.3.9 Insulation. The conductors of Type UF shall be one of the moisture-resistant types listed in Table 3.10.1.13 that is suitable for branch-circuit wiring or one that is identified for such use. Where installed as a substitute wiring method for NM cable, the conductor insulation shall be rated 90°C (194°F).

3.40.3.13 Sheath. The overall covering shall be flame retardant; moisture, fungus, and corrosion resistant; and suitable for direct burial in the earth.

ARTICLE 3.42 — INTERMEDIATE METAL CONDUIT: TYPE IMC

3.42.1 General

3.42.1.1 Scope. This article covers the use, installation, and construction specifications for intermediate metal conduit (IMC) and associated fittings.

3.42.1.2 Definition.

Intermediate Metal Conduit (IMC). A steel threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings.

3.42.1.6 Listing Requirements. IMC, factory elbows and couplings, and associated fittings shall be listed.

3.42.2 Installation

3.42.2.1 Uses Permitted.

(a) **All Atmospheric Conditions and Occupancies.** Use of IMC shall be permitted under all atmospheric conditions and occupancies.

(b) **Corrosion Environments.** IMC, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where

protected by corrosion protection and judged suitable for the condition.

(c) Cinder Fill. IMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm thick; where the conduit is not less than 450 mm under the fill; or where protected by corrosion protection and judged suitable for the condition.

(d) Wet Locations. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: See 3.0.1.6 for protection against corrosion.

3.42.2.5 Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with IMC.

3.42.2.11 Size.

(a) Minimum. IMC smaller than metric designator 16 (trade size ½) shall not be used.

(b) Maximum. IMC larger than metric designator 103 (trade size 4) shall not be used.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.42.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.42.2.15 Bends — How Made. Bends of IMC shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in Table 2, Chapter 9.

3.42.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.42.2.19 Reaming and Threading. All cut ends shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a taper of **1 in 16 (¾ in. taper per foot)** shall be used.

FPN: See ANSI/ASME B.1.20.1-1983, Standard for Pipe Threads, General Purpose (Inch).

3.42.2.21 Securing and Supporting. IMC shall be installed as a complete system in accordance with 3.0.1.18 and shall be securely fastened in place and supported in accordance with 3.42.2.21(a) and (b).

(a) Securely Fastened. Each IMC shall be securely fastened within 900 mm of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination. Fastening shall be permitted to be increased to a distance of 1 500 mm where structural members do not readily permit fastening within 900 mm. Where approved, conduit shall not be required to be securely fastened within 900 mm of the service head for above-the-roof termination of a mast.

(b) Supports. IMC shall be supported in accordance with one of the following:

(1) Conduit shall be supported at intervals not exceeding 3 000 mm.

(2) The distance between supports for straight runs of conduit shall be permitted in accordance with Table 3.44.2.21(b)(2), provided the conduit is made up with threaded couplings and such supports prevent transmission of stresses to termination where conduit is deflected between supports.

(3) Exposed vertical risers from industrial machinery or fixed equipment shall be permitted to be supported at intervals not exceeding 6 000 mm if the conduit is made up with threaded couplings, the conduit is supported and securely fastened at the top and bottom of the riser, and no other means of intermediate support is readily available.

(4) Horizontal runs of IMC supported by openings through framing members at intervals not exceeding 3 000 mm and securely fastened within 900 mm of termination points shall be permitted.

3.42.2.33 Couplings and Connectors.

(a) **Threadless.** Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be the concretetight type. Where installed in wet locations, they shall comply with 3.14.2.1(a). Threadless couplings and connectors shall not be used on threaded conduit ends unless listed for the purpose.

(b) **Running Threads.** Running threads shall not be used on conduit for connection at couplings.

3.42.2.37 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wire from abrasion unless the design of the box, fitting, or enclosure is such as to afford equivalent protection.

FPN: See 3.0.1.4(f) for the protection of conductors 22 mm² and larger at bushings.

3.42.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.42.2.51 Grounding. IMC shall be permitted as an equipment grounding conductor.

3.42.3 Construction Specifications

3.42.3.1 Marking. Each length shall be clearly and durably marked at least every 1 500 mm with the letters IMC. Each length shall be marked as required in 1.10.1.21.

3.42.3.11 Standard Lengths. The standard length of IMC shall be 3 000 mm, including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

ARTICLE 3.44 — RIGID METAL CONDUIT: TYPE RMC

3.44.1 General

3.44.1.1 Scope. This article covers the use, installation, and construction specifications for rigid metal conduit (RMC) and associated fittings.

3.44.1.2 Definition.

Rigid Metal Conduit (RMC). A threadable raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed with its integral or associated coupling and appropriate fittings. RMC is generally made of steel (ferrous) with protective coatings or aluminum (nonferrous). Special use types are silicon bronze and stainless steel.

3.44.1.6 Listing Requirements. RMC, factory elbows and couplings, and associated fittings shall be listed.

3.44.2 Installation

3.44.2.1 Uses Permitted.

(a) **All Atmospheric Conditions and Occupancies.** Use of RMC shall be permitted under all atmospheric conditions and occupancies. Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.

(b) **Corrosion Environments.** RMC, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where

protected by corrosion protection and judged suitable for the condition.

(c) Cinder Fill. RMC shall be permitted to be installed in or under cinder fill where subject to permanent moisture where protected on all sides by a layer of noncinder concrete not less than 50 mm thick; where the conduit is not less than 450 mm under the fill; or where protected by corrosion protection and judged suitable for the condition.

(d) Wet Locations. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: See 3.0.1.6 for protection against corrosion.

3.44.2.5 Dissimilar Metals. Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. Aluminum fittings and enclosures shall be permitted to be used with steel RMC, and steel fittings and enclosures shall be permitted to be used with aluminum RMC where not subject to severe corrosive influences.

3.44.2.11 Size.

(a) Minimum. RMC smaller than metric designator 16 (trade size ½) shall not be used.

Exception: For enclosing the leads of motors as permitted in 4.30.13.5(b).

(b) Maximum. RMC larger than metric designator 155 (trade size 6) shall not be used.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.44.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall

not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.44.2.15 Bends — How Made. Bends of RMC shall be so made that the conduit will not be damaged and so that the internal diameter of the conduit will not be effectively reduced. The radius of the curve of any field bend to the centerline of the conduit shall not be less than indicated in Table 2, Chapter 9.

3.44.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.44.2.19 Reaming and Threading. All cut ends shall be reamed or otherwise finished to remove rough edges. Where conduit is threaded in the field, a standard cutting die with a **1 in 16 taper (¾-in. taper per foot)** shall be used.

FPN: See ANSI/ASME B.1.20.1-1983, Standard for Pipe Threads, General Purpose (Inch).

3.44.2.21 Securing and Supporting. RMC shall be installed as a complete system in accordance with 3.0.1.18 and shall be securely fastened in place and supported in accordance with 3.44.2.21(a) and (b).

(a) Securely Fastened. RMC shall be securely fastened within 900 mm of each outlet box, junction box, device box, cabinet, conduit body, or other conduit termination. Fastening shall be permitted to be increased to a distance of 1 500 mm where structural members do not readily permit fastening within 900 mm. Where approved, conduit shall not be required to be securely fastened within 900 mm of the service head for above-the-roof termination of a mast.

(b) Supports. RMC shall be supported in accordance with one of the following:

(1) Conduit shall be supported at intervals not exceeding 3 000 mm.

(2) The distance between supports for straight runs of conduit shall be permitted in accordance with Table 3.44.2.21(b)(2), provided

the conduit is made up with threaded couplings, and such supports prevent transmission of stresses to termination where conduit is deflected between supports.

(3) Exposed vertical risers from industrial machinery or fixed equipment shall be permitted to be supported at intervals not exceeding 6 000 mm if the conduit is made up with threaded couplings, the conduit is supported and securely fastened at the top and bottom of the riser, and no other means of intermediate support is readily available.

(4) Horizontal runs of RMC supported by openings through framing members at intervals not exceeding 3 000 mm and securely fastened within 900 mm of termination points shall be permitted.

Table 3.44.2.21(b)(2) Supports for Rigid Metal Conduit

Conduit Size (Metric Designator)	Maximum Distance Between Rigid Metal Conduit Supports (m)
16–21	3.0
27	3.7
35–41	4.3
53–63	4.9
78 and larger	6.1

3.44.2.33 Couplings and Connectors.

(a) **Threadless.** Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be the concretetight type. Where installed in wet locations, they shall comply with 3.14.2.1(a). Threadless couplings and connectors shall not be used on threaded conduit ends unless listed for the purpose.

(b) **Running Threads.** Running threads shall not be used on conduit for connection at couplings.

3.44.2.37 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing shall be provided to protect the wire from abrasion unless the design of the box, fitting, or enclosure is such as to afford equivalent protection.

FPN: See 3.0.1.4(f) for the protection of conductors sizes 4 AWG and larger at bushings.

3.44.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.44.2.51 Grounding. RMC shall be permitted as an equipment grounding conductor.

3.44.3 Construction Specifications

3.44.3.1 Marking. Each length shall be clearly and durably identified in every 3 000 mm as required in the first sentence of 1.10.1.21. Nonferrous conduit of corrosion-resistant material shall have suitable markings.

3.44.3.11 Standard Lengths. The standard length of RMC shall be 3 000 mm, including an attached coupling, and each end shall be threaded. Longer or shorter lengths with or without coupling and threaded or unthreaded shall be permitted.

**ARTICLE 3.48 — FLEXIBLE METAL
CONDUIT: TYPE FMC**

3.48.1 General

3.48.1.1 Scope. This article covers the use, installation, and construction specifications for flexible metal conduit (FMC) and associated fittings.

3.48.1.2 Definition.

Flexible Metal Conduit (FMC). A raceway of circular cross section made of helically wound, formed, interlocked metal strip.

3.48.1.6 Listing Requirements. FMC and associated fittings shall be listed.

3.48.2 Installation

3.48.2.1 Uses Permitted. FMC shall be permitted to be used in exposed and concealed locations.

3.48.2.3 Uses Not Permitted. FMC shall not be used in the following:

- (1) In wet locations unless the conductors are approved for the specific conditions and the installation is such that liquid is not likely to enter raceways or enclosures to which the conduit is connected
- (2) In hoistways, other than as permitted in 6.20.3.1(a)(1)
- (3) In storage battery rooms
- (4) In any hazardous (classified) location other than as permitted in 5.1.2.1(b) and 5.4.1.20
- (5) Where exposed to materials having a deteriorating effect on the installed conductors, such as oil or gasoline
- (6) Underground or embedded in poured concrete or aggregate
- (7) Where subject to physical damage

3.48.2.11 Size.

(a) Minimum. FMC less than metric designator 16 (trade size ½) shall not be used unless permitted in 3.48.2.11(a)(1) through (a)(5) for metric designator 12 (trade size).

- (1) For enclosing the leads of motors as permitted in 4.30.13.5(b)
- (2) In lengths not in excess of 1 800 mm for any of the following uses:
 - a. For utilization equipment
 - b. As part of a listed assembly
 - c. For tap connections to luminaires (lighting fixtures) as permitted in 4.10.11.4(c)

- (3) For manufactured wiring systems as permitted in 6.4.1.6(a)
- (4) In hoistways as permitted in 6.20.3.1(a)(1)
- (5) As part of a listed assembly to connect wired luminaire (fixture) sections as permitted in 4.10.13.5(c)

(b) Maximum. FMC larger than metric designator 103 (trade size 4) shall not be used.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.48.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9, or as permitted in Table 3.48.2.13, or for metric designator 12 (trade size).

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

Table 3.48.2.13 Maximum Number of Insulated Conductors in Metric Designator 12 (Trade Size) Flexible Metal Conduit*

Size mm ² (mm dia)	Types RFH-2, SF-2		Types TF, XHHW, TW		Types TFN, THHN, THWN		Types FEP, FEBP, PF, PGF	
	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit	Fittings Inside Conduit	Fittings Outside Conduit
18	2	3	3	5	5	8	5	8
16	1	2	3	4	4	6	4	6
2.0(1.6)	1	2	2	3	3	4	3	4
3.5(2.0)	—	—	1	2	2	3	2	3
5.5(2.6)	—	—	1	1	1	1	1	2

*In addition, one covered or bare equipment grounding conductor of the same size shall be permitted.

3.48.2.15 Bends — How Made. Bends in conduit shall be made so that the conduit is not damaged and the internal diameter of the conduit is not effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the centerline of any bend shall not be less than shown in Table 2, Chapter 9 using the column “Other Bends.”

3.48.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.48.2.19 Trimming. All cut ends shall be trimmed or otherwise finished to remove rough edges, except where fittings that thread into the convolutions are used.

3.48.2.21 Securing and Supporting. FMC shall be securely fastened in place and supported in accordance with 3.48.2.21(a) and (b).

(a) **Securely Fastened.** FMC shall be securely fastened in place by an approved means within 300 mm of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1 400 mm.

Exception No. 1: Where FMC is fished.

Exception No. 2: At terminals where flexibility is required, lengths shall not exceed the following:

(1) 900 mm for metric designators 16 through 35 (trade sizes ½ through 1¼)

(2) 1 200 mm for metric designators 41 through 53 (trade sizes 1½ through 2)

(3) 1 500 mm for metric designators 63 (trade size 2½) and larger

Exception No. 3: Lengths not exceeding 1 800 mm from a luminaire (fixture) terminal connection for tap connections to luminaires (light fixtures) as permitted in 4.10.11.4(c).

Exception No. 4: Lengths not exceeding 1 800 mm from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.

(b) **Supports.** Horizontal runs of FMC supported by openings through framing members at intervals not greater than 1 400 mm and securely fastened within 300 mm of termination points shall be permitted.

3.48.2.33 Couplings and Connectors. Angle connectors shall not be used for concealed raceway installations.

3.48.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.48.2.51 Grounding and Bonding. Where used to connect equipment where flexibility is required, an equipment grounding

conductor shall be installed.

Where flexibility is not required, FMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 2.50.6.9(5).

Where required or installed, equipment grounding conductors shall be installed in accordance with 2.50.7.5(b).

Where required or installed, equipment bonding jumpers shall be installed in accordance with 2.50.5.13.

ARTICLE 3.50 — LIQUIDTIGHT FLEXIBLE METAL CONDUIT: TYPE LFMC

3.50.1 General

3.50.1.1 Scope. This article covers the use, installation, and construction specifications for liquidtight flexible metal conduit (LFMC) and associated fittings.

3.50.1.2 Definition.

Liquidtight Flexible Metal Conduit (LFMC). A raceway of circular cross section having an outer liquidtight, nonmetallic, sunlight-resistant jacket over an inner flexible metal core with associated couplings, connectors, and fittings for the installation of electric conductors.

3.50.1.6 Listing Requirements. LFMC and associated fittings shall be listed.

3.50.2 Installation

3.50.2.1 Uses Permitted. LFMC shall be permitted to be used in exposed or concealed locations as follows:

(1) Where conditions of installation, operation, or maintenance require flexibility or protection from liquids, vapors, or solids

(2) As permitted by 5.1.2.1(b), 5.2.2.1, 5.3.2.1, and 5.4.1.20 and in other hazardous (classified) locations where specifically approved, and by 5.53.2.4(b)

(3) For direct burial where listed and marked for the purpose

3.50.2.3 Uses Not Permitted. LFMC shall not be used as follows:

- (1) Where subject to physical damage
- (2) Where any combination of ambient and conductor temperature produces an operating temperature in excess of that for which the material is approved

3.50.2.11 Size.

(a) Minimum. LFMC smaller than 15 mm electrical trade size shall not be used.

Exception: LFMC of 10 mm electrical trade size shall be permitted as covered in 3.48.2.11(a).

(b) Maximum. The maximum size of LFMC shall be 100 mm electrical trade size.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.50.2.13 Number of Conductors or Cables.

(a) 15 mm through 100 mm Sizes. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

(b) 10 mm Size. The number of conductors shall not exceed that permitted in Table 3.48.2.13, "Fittings Outside Conduit" columns.

3.50.2.15 Bends — How Made. Bends in conduit shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the centerline of any bend shall not be less than required in Table 2, Chapter 9 using the column "Other Bends."

3.50.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.50.2.21 Securing and Supporting. LFMC shall be securely fastened in place and supported in accordance with 3.50.2.21(a) and (b).

(a) Securely Fastened. LFMC shall be securely fastened in place by an approved means within 300 mm of each box, cabinet, conduit body, or other conduit termination and shall be supported and secured at intervals not to exceed 1 400 mm.

Exception No. 1: Where LFMC is fished.

Exception No. 2: Lengths not exceeding 900 mm at terminals where flexibility is necessary.

Exception No. 3: Lengths not exceeding 1 800 mm from a luminaire (fixture) terminal connection for tap conductors to luminaires (lighting fixtures), as permitted in 4.10.11.4(c).

Exception No. 4: Lengths not exceeding 1 800 mm from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.

(b) Supports. Horizontal runs of LFMC supported by openings through framing members at intervals not greater than 1 400 mm and securely fastened within 300 mm of termination points shall be permitted.

3.50.2.33 Couplings and Connectors. Angle connectors shall not be used for concealed raceway installations.

3.50.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.50.2.51 Grounding and Bonding. Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.

Where flexibility is not required, LFMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 2.50.6.9(6).

Where required or installed, equipment grounding conductors shall be installed in accordance with 2.50.7.5(b).

Where required or installed, equipment bonding jumpers shall be installed in accordance with 2.50.5.13.

FPN: See 5.1.2.21(b), 5.2.2.21(b), and 5.3.2.21(b) for types of equipment grounding conductors.

3.50.3 Construction Specifications

3.50.3.1 Marking. LFMC shall be marked according to 1.10.1.21. The trade size and other information required by the listing shall also be marked on the conduit. Conduit suitable for direct burial shall be so marked.

ARTICLE 3.52 — RIGID NONMETALLIC CONDUIT: TYPE RNC

3.52.1 General

3.52.1.1 Scope. This article covers the use, installation, and construction specifications for rigid nonmetallic conduit (RNC) and associated fittings.

3.52.1.2 Definition.

Rigid Nonmetallic Conduit (RNC). A nonmetallic raceway of circular cross section, with integral or associated couplings, connectors, and fittings for the installation of electrical conductors and cables.

3.52.1.6 Listing Requirements. RNC, factory elbows, and associated fittings shall be listed.

3.52.2 Installation

3.52.2.1 Uses Permitted. The use of RNC shall be permitted in accordance with 3.52.2.1(a) through (h).

FPN: Extreme cold may cause some nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.

(a) Concealed. RNC shall be permitted in walls, floors, and ceilings.

(b) Corrosive Influences. RNC shall be permitted in locations subject to severe corrosive influences as covered in 3.0.1.6 and where subject to chemicals for which the materials are specifically approved.

(c) Cinders. RNC shall be permitted in cinder fill.

(d) Wet Locations. RNC shall be permitted in portions of dairies, laundries, canneries, or other wet locations and in locations where walls are frequently washed, the entire conduit system including boxes and fittings used therewith shall be installed and equipped so as to prevent water from entering the conduit. All supports, bolts, straps, screws, and so forth, shall be of corrosion-resistant materials or be protected against corrosion by approved corrosion-resistant materials.

(e) Dry and Damp Locations. RNC shall be permitted for use in dry and damp locations not prohibited by 3.52.2.3.

(f) Exposed. RNC shall be permitted for exposed work where not subject to physical damage if identified for such use.

(g) Underground Installations. For underground installations, see 3.0.1.5 and 3.0.2.20.

FPN: Refer to Article 3.53 for High Density Polyethylene Conduit: Type HDPE.

(h) Support of Conduit Bodies. Rigid nonmetallic conduit shall be permitted to support nonmetallic conduit bodies not larger than the largest trade size of an entering raceway. These conduit bodies shall not support luminaires (fixtures) or other equipment and shall not contain devices other than splicing devices as permitted by 1.10.1.14(b) and 3.14.2.2(c)(2).

3.52.2.3 Uses Not Permitted. RNC shall not be used under the following conditions.

(a) Hazardous (Classified) Locations.

(1) In hazardous (classified) locations, except as permitted in 5.3.2.1(a), 5.4.1.20, 5.14.1.8 Exception No. 2, and 5.15.1.8

(2) In Class I, Division 2 locations, except as permitted in 5.1.2.1(b)(3)

(b) Support of Luminaires (Fixtures). For the support of luminaires (fixtures) or other equipment not described in 3.52.2.1(h).

(c) Physical Damage. Where subject to physical damage unless identified for such use.

(d) Ambient Temperatures. Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise.

(e) Insulation Temperature Limitations. For conductors or cables operating at a temperature higher than the RNC listed operating temperature rating.

Exception: Conductors or cables rated at a temperature higher than the RNC listed temperature rating shall be permitted to be installed in RNC, provided they are not operated at a temperature higher than the RNC listed temperature rating.

(f) Theaters and Similar Locations. In theaters and similar locations, except as provided in 5.18.1.4 and 5.20.1.5.

3.52.2.11 Size.

(a) Minimum. RNC smaller than metric designator 16 (trade size ½) shall not be used.

(b) Maximum. RNC larger than metric designator 155 (trade size 6) shall not be used.

FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 3.0.1.1(c).

3.52.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1,

Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.52.2.15 Bends — How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Field bends shall be made only with bending equipment identified for the purpose. The radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9.

3.52.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.52.2.19 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

3.52.2.21 Securing and Supporting. RNC shall be installed as a complete system as provided in 3.0.1.18 and shall be fastened so that movement from thermal expansion or contraction is permitted. RNC shall be securely fastened and supported in accordance with 3.52.2.21(a) and (b).

(a) Securely Fastened. RNC shall be securely fastened within 900 mm of each outlet box, junction box, device box, conduit body, or other conduit termination. Conduit listed for securing at other than 900 mm shall be permitted to be installed in accordance with the listing.

(b) Supports. RNC shall be supported as required in Table 3.52.2.21(b). Conduit listed for support at spacings other than as shown in Table 3.52.2.21(b) shall be permitted to be installed in accordance with the listing. Horizontal runs of RNC supported by openings through framing members at intervals not exceeding those in Table 3.52.2.21(b) and securely fastened within 900 mm of termination points shall be permitted.

Table 3.52.2.21(b) Support of Rigid Nonmetallic Conduit (RNC)

Conduit Size Metric Designator	Maximum Spacing Between Supports (mm)
16–27	900
35–53	1 500
63–78	1 800
91–129	2 100
155	2 400

3.52.2.35 Expansion Fittings. Expansion fittings for RNC shall be provided to compensate for thermal expansion and contraction where the length change, in accordance with Table 3.52.2.35(a) or Table 3.52.2.35(b), is expected to be 6 mm or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.

3.52.2.37 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 3.0.1.4(f) for the protection of conductors 22 mm² and larger at bushings.

3.52.2.39 Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

Table 3.52.2.35(a) Expansion Characteristics of PVC Rigid Nonmetallic Conduit Coefficient of Thermal Expansion = 6.084×10^{-5} mm/mm/°C (3.38×10^{-5} in./in./°F)

90	2.43	90	1.62	190	3.42
95	2.57	95	1.71	195	3.51
100	2.70	100	1.80	200	3.60

3.52.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.52.2.51 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: As permitted in 2.50.7.5(b), Exception No. 2, for dc circuits and 2.50.7.5(b), Exception No. 1, for separately run equipment grounding conductors.

Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 2.50.7.13.

3.52.3 Construction Specifications

3.52.3.1 Construction. RNC and fittings shall be composed of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. For use above ground, it shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low temperature and sunlight effects. For use underground, the material shall be acceptably resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

3.52.3.21 Marking. Each length of RNC shall be clearly and durably marked at least every 3 000 mm as required in the first sentence of 1.10.1.21. The type of material shall also be included in the marking unless it is visually identifiable. For conduit recognized for use above ground, these markings shall be permanent. For conduit limited to underground use only, these markings shall be sufficiently durable to remain legible until the material is installed. Conduit shall be permitted to be surface marked to indicate special characteristics of the material.

FPN: Examples of these markings include but are not limited to "limited smoke" and "sunlight resistant."

ARTICLE 3.53 — HIGH DENSITY POLYETHYLENE CONDUIT: TYPE HDPE CONDUIT

3.53.1 General

3.53.1.1 Scope. This article covers the use, installation, and construction specifications for high density polyethylene (HDPE) conduit and associated fittings.

3.53.1.2 Definition.

High Density Polyethylene (HDPE) Conduit. A nonmetallic raceway of circular cross section, with associated couplings, connectors, and fittings for the installation of electrical conductors.

3.53.1.6 Listing Requirements. HDPE conduit and associated fittings shall be listed.

3.53.2 Installation

3.53.2.1 Uses Permitted. The use of HDPE conduit shall be permitted under the following conditions:

- (1) In discrete lengths or in continuous lengths from a reel
- (2) In locations subject to severe corrosive influences as covered in 3.0.1.6 and where subject to chemicals for which the conduit is listed
- (3) In cinder fill
- (4) In direct burial installations in earth or concrete

FPN to (4): Refer to 3.0.1.5 and 3.0.2.20 for underground installations.

3.53.2.3 Uses Not Permitted. HDPE conduit shall not be used under the following conditions:

- (1) Where exposed
- (2) Within a building
- (3) In hazardous (classified) locations, except as permitted in 5.4.1.20

(4) Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise

(5) For conductors or cables operating at a temperature higher than the HDPE conduit listed operating temperature rating

Exception: Conductors or cables rated at a temperature higher than the HDPE conduit listed temperature rating shall be permitted to be installed in HDPE conduit, provided they are not operated at a temperature higher than the HDPE conduit listed temperature rating.

3.53.2.11 Size.

(a) **Minimum.** HDPE conduit smaller than metric designator 16 (trade size ½) shall not be used.

(b) **Maximum.** HDPE conduit larger than metric designator 103 (trade size 4) shall not be used.

FPN: The trade sizes and metric designators are for identification purposes only and do not relate to actual dimensions. See 3.0.1.1(c).

3.53.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.53.2.15 Bends — How Made. Bends shall be so made that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve to the centerline of such bends shall not be less than shown in Table 3.54.2.15.

3.53.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.53.2.19 Trimming. All cut ends shall be trimmed inside and outside

to remove rough edges.

3.53.2.37 Bushings. Where a conduit enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 3.0.1.4(f) for the protection of conductors 22 mm² and larger at bushings.

3.53.2.39 Joints. All joints between lengths of conduit, and between conduit and couplings, fittings, and boxes, shall be made by an approved method.

3.53.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.53.2.51 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.

Exception No. 1: The equipment grounding conductor shall be permitted to be run separately from the conduit where used for grounding dc circuits as permitted in 2.50.7.5, Exception No. 2.

Exception No. 2: The equipment grounding conductor shall not be required where the grounded conductor is used to ground equipment as permitted in 2.50.7.13.

3.53.3 Construction Specifications

3.53.3.1 Construction. HDPE conduit shall be composed of high density polyethylene that is resistant to moisture and chemical atmospheres. The material shall be resistant to moisture and corrosive agents and shall be of sufficient strength to withstand abuse, such as by impact and crushing, in handling and during installation. Where intended for direct burial, without encasement in concrete, the material shall also be capable of withstanding continued loading that is likely to be encountered after installation.

3.53.3.21 Marking. Each length of HDPE shall be clearly and durably marked at least every 3 000 mm as required in 1.10.1.21. The type of

| material shall also be included in the marking.

ARTICLE 3.54 — NONMETALLIC UNDERGROUND CONDUIT WITH CONDUCTORS: TYPE NUCC

3.54.1 General

3.54.1.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic underground conduit with conductors (NUCC).

3.54.1.2 Definition.

Nonmetallic Underground Conduit with Conductors (NUCC). A factory assembly of conductors or cables inside a nonmetallic, smooth wall conduit with a circular cross section.

3.54.1.6 Listing Requirements. NUCC and associated fittings shall be listed.

3.54.2 Installation

3.54.2.1 Uses Permitted. The use of NUCC and fittings shall be permitted in the following:

- (1) For direct burial underground installation (For minimum cover requirements, see Table 3.0.1.5 and Table 3.0.2.20 under Rigid Nonmetallic Conduit.)
- (2) Encased or embedded in concrete
- (3) In cinder fill
- (4) In underground locations subject to severe corrosive influences as covered in 3.0.1.6 and where subject to chemicals for which the assembly is specifically approved

3.54.2.3 Uses Not Permitted. NUCC shall not be used in the following:

- (1) In exposed locations
- (2) Inside buildings

Exception: The conductor or the cable portion of the assembly, where suitable, shall be permitted to extend within the building for termination purposes in accordance with 3.0.1.3.

(3) In hazardous (classified) locations except as permitted by 5.3.2.1(a), 5.4.1.20, 5.14.1.8, and 5.15.1.8, and in Class I, Division 2 locations as permitted in 5.1.2.1(b)(3)

3.54.2.11 Size.

(a) Minimum. NUCC smaller than metric designator 16 (trade size ½) shall not be used.

(b) Maximum. NUCC larger than metric designator 103 (trade size 4) shall not be used.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.54.2.13 Number of Conductors. The number of conductors or cables shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.

3.54.2.15 Bends — How Made. Bends shall be manually made so that the conduit will not be damaged and the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the centerline of such bends shall not be less than shown in Table 3.54.2.15.

3.54.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between termination points.

3.54.2.19 Trimming. For termination, the conduit shall be trimmed away from the conductors or cables using an approved method that will not damage the conductor or cable insulation or jacket. All conduit ends shall be trimmed inside and out to remove rough edges.

3.54.2.37 Bushings. Where the NUCC enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the

conductor or cable from abrasion unless the design of the box, fitting, or enclosure provides equivalent protection.

FPN: See 3.0.1.4(f) for the protection of conductors size 22 mm² or larger.

Table 3.54.2.15 Minimum Bending Radius for Nonmetallic Underground Conduit with Conductors (NUCC)

Conduit Size Metric Designator	Minimum Bending Radius (mm)
16	250
21	300
27	350
35	450
41	500
53	650
63	900
78	1200
103	1500

3.54.2.39 Joints. All joints between conduit, fittings, and boxes shall be made by an approved method.

3.54.2.41 Conductor Terminations. All terminations between the conductors or cables and equipment shall be made by an approved method for that type of conductor or cable.

3.54.2.47 Splices and Taps. Splices and taps shall be made in junction boxes or other enclosures.

3.54.2.51 Grounding. Where equipment grounding is required, an assembly containing a separate equipment grounding conductor shall be used.

3.54.3 Construction Specifications

3.54.3.1 Construction.

(a) **General.** NUCC is an assembly that is provided in continuous lengths shipped in a coil, reel, or carton.

(b) **Nonmetallic Underground Conduit.** The nonmetallic underground conduit shall be listed and composed of a material that is resistant to moisture and corrosive agents. It shall also be capable of being supplied on reels without damage or distortion and shall be of sufficient strength to withstand abuse, such as impact or crushing, in handling and during installation without damage to conduit or conductors.

(c) **Conductors and Cables.** Conductors and cables used in NUCC shall be listed and shall comply with 3.10.1.8(c). Conductors of different systems shall be installed in accordance with 3.0.1.3(c).

(d) **Conductor Fill.** The maximum number of conductors or cables in NUCC shall not exceed that permitted by the percentage fill in Table 1, Chapter 9.

3.54.3.21 Marking. NUCC shall be clearly and durably marked at least every 3 000 mm as required by 1.10.1.21. The type of conduit material shall also be included in the marking.

Identification of conductors or cables used in the assembly shall be provided on a tag attached to each end of the assembly or to the side of a reel. Enclosed conductors or cables shall be marked in accordance with 3.10.1.11.

ARTICLE 3.56 — LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT: TYPE LFNC

3.56 General

3.56.1.1 Scope. This article covers the use, installation, and construction specifications for liquidtight flexible nonmetallic conduit (LFNC) and associated fittings.

3.56.1.2 Definition.

Liquidtight Flexible Nonmetallic Conduit (LFNC). A raceway of circular cross section of various types as follows:

(1) A smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and covers, designated as Type LFNC-A

(2) A smooth inner surface with integral reinforcement within the conduit wall, designated as Type LFNC-B

(3) A corrugated internal and external surface without integral reinforcement within the conduit wall, designated as LFNC-C

LFNC is flame resistant and with fittings and is approved for the installation of electrical conductors.

FPN: FNMC is an alternative designation for LFNC.

3.56.1.6 Listing Requirements. LFNC and associated fittings shall be listed.

3.56.2 Installation

3.56.2.1 Uses Permitted. LFNC shall be permitted to be used in exposed or concealed locations for the following purposes:

FPN: Extreme cold may cause some types of nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.

(1) Where flexibility is required for installation, operation, or maintenance

(2) Where protection of the contained conductors is required from vapors, liquids, or solids

(3) For outdoor locations where listed and marked as suitable for the purpose

(4) For direct burial where listed and marked for the purpose

(5) Type LFNC-B shall be permitted to be installed in lengths longer than 1 800 mm where secured in accordance with 3.56.2.21

(6) Type LFNC-B as a listed manufactured prewired assembly, metric designator 16 through 27 (trade size ½ through 1) conduit

3.56.2.3 Uses Not Permitted. LFNC shall not be used as follows:

(1) Where subject to physical damage

(2) Where any combination of ambient and conductor temperatures is in excess of that for which the LFNC is approved

(3) In lengths longer than 1 800 mm, except as permitted by 3.56.2.1(5) or where a longer length is approved as essential for a required degree of flexibility

(4) Where the operating voltage of the contained conductors is in excess of 600 volts, nominal, except as permitted in 6.0.2.3(a)

(5) In any hazardous (classified) location other than as permitted in 5.1.2.1(b), 5.2.2.1(a) and (b), 5.3.2.1(a), and 5.4.1.20

3.56.2.11 Size.

(a) Minimum. LFNC smaller than metric designator 16 (trade size ½) shall not be used unless permitted in 3.56.2.11(a)(1) through (a)(3) for metric designator 12 (trade size).

(1) For enclosing the leads of motors as permitted in 4.30.13.5(b)

(2) In lengths not exceeding 1 800 mm as part of a listed assembly for tap connections to luminaires (lighting fixtures) as required in 4.10.11.4(c), or for utilization equipment

(3) For electric sign conductors in accordance with 6.0.2.3(a)

(b) Maximum. LFNC larger than metric designator 103 (trade size 4) shall not be used.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.56.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.56.2.15 Bends — How Made. Bends in conduit shall be so made that the conduit is not damaged and the internal diameter of the conduit is not effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment. The radius of the curve to the

centerline of any bend shall not be less than shown in Table 2, Chapter 9 using the column “Other Bends.”

3.56.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.56.2.19 Trimming. All cut ends of conduit shall be trimmed inside and outside to remove rough edges.

3.56.2.21 Securing and Supporting. Type LFNC-B shall be securely fastened and supported in accordance with one of the following:

(1) Where installed in lengths exceeding 1 800 mm, the conduit shall be securely fastened at intervals not exceeding 900 mm and within 300 mm on each side of every outlet box, junction box, cabinet, or fitting.

(2) Securing or supporting of the conduit shall not be required where it is fished, installed in lengths not exceeding 900 mm at terminals where flexibility is required, or installed in lengths not exceeding 1 800 mm from a luminaire (fixture) terminal connection for tap conductors to luminaires (lighting fixtures) permitted in 4.10.11.4(c).

(3) Horizontal runs of LFNC supported by openings through framing members at intervals not exceeding 900 mm and securely fastened within 300 mm of termination points shall be permitted.

(4) Securing or supporting of LFNC-B shall not be required where installed in lengths not exceeding 1 800 mm from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.

3.56.2.33 Couplings and Connectors. Only fittings listed for use with LFNC shall be used. Angle connectors shall not be used for concealed raceway installations. Straight LFNC fittings are permitted for direct burial or encasement in concrete.

3.56.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.56.2.51 Grounding and Bonding. Where used to connect equipment where flexibility is required, an equipment grounding conductor shall be installed.

Where required or installed, equipment grounding conductors shall be installed in accordance with 2.50.7.5(b).

Where required or installed, equipment bonding jumpers shall be installed in accordance with 2.50.5.13.

3.56.3 Construction Specifications

3.56.3.1 Construction. LFNC-B as a prewired manufactured assembly shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.

3.56.3.21 Marking. LFNC shall be marked at least every 600 mm in accordance with 1.10.1.21. The marking shall include a type designation in accordance with 3.56.1.2 and the trade size. Conduit that is intended for outdoor use or direct burial shall be marked.

The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with 3.10.1.11.

ARTICLE 3.58 — ELECTRICAL METALLIC TUBING: TYPE EMT

3.58 General

3.58.1.1 Scope. This article covers the use, installation, and construction specifications for electrical metallic tubing (EMT) and associated fittings.

3.58.1.2 Definition.

Electrical Metallic Tubing (EMT). An unthreaded thinwall raceway of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed utilizing appropriate fittings.

EMT is generally made of steel (ferrous) with protective coatings or aluminum (nonferrous).

3.58.1.6 Listing Requirements. EMT, factory elbows, and associated fittings shall be listed.

3.58.10 Installation

3.58.2.1 Uses Permitted.

(a) Exposed and Concealed. The use of EMT shall be permitted for both exposed and concealed work.

(b) Corrosion Protection. Ferrous or nonferrous EMT, elbows, couplings, and fittings shall be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.

(c) Wet Locations. All supports, bolts, straps, screws, and so forth shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

FPN: See 3.0.1.6 for protection against corrosion.

3.58.2.3 Uses Not Permitted. EMT shall not be used under the following conditions:

- (1) Where, during installation or afterward, it will be subject to severe physical damage
- (2) Where protected from corrosion solely by enamel
- (3) In cinder concrete or cinder fill where subject to permanent moisture unless protected on all sides by a layer of noncinder concrete at least 50 mm thick or unless the tubing is at least 450 mm under the fill
- (4) In any hazardous (classified) location except as permitted by 5.2.2.1, 5.3.2.1, and 5.4.1.20
- (5) For the support of luminaires (fixtures) or other equipment except conduit bodies no larger than the largest trade size of the tubing

(6) Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action

Exception: Aluminum fittings and enclosures shall be permitted to be used with steel EMT where not subject to severe corrosive influences.

3.58.2.11 Size.

(a) Minimum. EMT smaller than metric designator 16 (trade size ½) shall not be used.

Exception: For enclosing the leads of motors as permitted in 4.30.13.5(b).

(b) Maximum. The maximum size of EMT shall be metric designator 103 (trade size 4).

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.58.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.58.2.15 Bends — How Made. Bends shall be made so that the tubing is not damaged and the internal diameter of the tubing is not effectively reduced. The radius of the curve of any field bend to the centerline of the tubing shall not be less than shown in Table 2, Chapter 9 for one-shot and full shoe benders.

3.58.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.58.2.19 Reaming and Threading.

(a) **Reaming.** All cut ends of EMT shall be reamed or otherwise finished to remove rough edges.

(b) **Threading.** EMT shall not be threaded.

Exception: EMT with factory threaded integral couplings complying with 3.58.3.1.

3.58.2.21 Securing and Supporting. EMT shall be installed as a complete system in accordance with 3.0.1.18 and shall be securely fastened in place and supported in accordance with 3.58.2.21(a) and (b).

(a) **Securely Fastened.** EMT shall be securely fastened in place at least every 3 000 mm. In addition, each EMT run between termination points shall be securely fastened within 900 mm of each outlet box, junction box, device box, cabinet, conduit body, or other tubing termination.

Exception No. 1: Fastening of unbroken lengths shall be permitted to be increased to a distance of 1 500 mm where structural members do not readily permit fastening within 900 mm.

Exception No. 2: For concealed work in finished buildings or prefinished wall panels where such securing is impracticable, unbroken lengths (without coupling) of EMT shall be permitted to be fished.

(b) **Supports.** Horizontal runs of EMT supported by openings through framing members at intervals not greater than 3 000 mm and securely fastened within 900 mm of termination points shall be permitted.

3.58.2.33 Couplings and Connectors. Couplings and connectors used with EMT shall be made up tight. Where buried in masonry or concrete, they shall be concretetight type. Where installed in wet locations, they shall comply with 3.14.2.1(a).

3.58.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.58.2.51 Grounding. EMT shall be permitted as an equipment grounding conductor.

3.58.3 Construction Specifications

3.58.3.1 Construction. Factory-threaded integral couplings shall be permitted. Where EMT with a threaded integral coupling is used, threads for both the tubing and coupling shall be factory-made. The coupling and EMT threads shall be designed so as to prevent bending of the tubing at any part of the thread.

3.58.3.21 Marking. EMT shall be clearly and durably marked at least every 3 000 mm as required in the first sentence of 1.10.1.21.

ARTICLE 3.60 — FLEXIBLE METALLIC TUBING: TYPE FMT

3.60.1 General

3.60.1.1 Scope. This article covers the use, installation, and construction specifications for flexible metallic tubing (FMT) and associated fittings.

3.60.1.2 Definition.

Flexible Metallic Tubing (FMT). A raceway that is circular in cross section, flexible, metallic, and liquidtight without a nonmetallic jacket.

3.60.1.6 Listing Requirements. FMT and associated fittings shall be listed.

3.60.2 Installation

3.60.2.1 Uses Permitted. FMT shall be permitted to be used for branch circuits as follows:

- (1) In dry locations
- (2) Where concealed

- (3) In accessible locations
- (4) For system voltages of 1 000 volts maximum

3.60.2.3 Uses Not Permitted. FMT shall not be used as follows:

- (1) In hoistways
- (2) In storage battery rooms
- (3) In hazardous (classified) locations unless otherwise permitted under other articles in this Code
- (4) Under ground for direct earth burial, or embedded in poured concrete or aggregate
- (5) Where subject to physical damage
- (6) In lengths over 1 800 mm

3.60.2.11 Size.

(a) **Minimum.** FMT smaller than metric designator 16 (trade size ½) shall not be used.

Exception No. 1: FMT of metric designator 12 (trade size) shall be permitted to be installed in accordance with 3.0.1.22(b) and (c).

Exception No. 2: FMT of metric designator 12 (trade size) shall be permitted in lengths not in excess of 1 800 mm as part of an approved assembly or for luminaires (lighting fixtures). See 4.10.11.4(c).

(b) **Maximum.** The maximum size of FMT shall be metric designator 21 (trade size ¾).

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.60.2.13 Number of Conductors.

(a) **FMT — Metric Designators 16 and 21 (Trade Sizes ½ and ¾).** The number of conductors in metric designators 16 (trade size ½) and 21 (trade size ¾) shall not exceed that permitted by the percentage fill specified in Table 1, Chapter 9.

Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

(b) **FMT — Metric Designator 12 (Trade Size).** The number of conductors in metric designator 12 (trade size) shall not exceed that permitted in Table 3.48.2.13.

3.60.2.15 Bends.

(a) **Infrequent Flexing Use.** Where FMT may be infrequently flexed in service after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 3.60.2.15(a).

Table 3.60.2.15(a) Minimum Radii for Flexing Use

Metric Designator	Minimum Radii for Flexing Use (mm)
12	25.4
16	317.5
21	444.5

(b) **Fixed Bends.** Where FMT is bent for installation purposes and is not flexed or bent as required by use after installation, the radii of bends measured to the inside of the bend shall not be less than specified in Table 3.60.2.15(b).

Table 3.60.2.15(b) Minimum Radii for Fixed Bends

Metric Designator	Minimum Radii for Fixed Bends (mm)
12	88.9
16	101.6
21	127.0

3.60.2.31 Boxes and Fittings. Fittings shall effectively close any openings in the connection.

3.60.2.47 Splices and Taps. Splices and taps shall be made in accordance with 3.0.1.15.

3.60.2.51 Grounding. FMT shall be permitted as an equipment grounding conductor where installed in accordance with 2.50.6.9(7).

3.60.3 Construction Specifications

3.60.3.1 Marking. FMT shall be marked according to 1.10.1.21.

ARTICLE 3.62 — ELECTRICAL NONMETALLIC TUBING: TYPE ENT

3.62.1 General

3.62.1.1 Scope. This article covers the use, installation, and construction specifications for electrical nonmetallic tubing (ENT) and associated fittings.

3.62.1.2 Definition.

Electrical Nonmetallic Tubing (ENT). A nonmetallic pliable corrugated raceway of circular cross section with integral or associated couplings, connectors, and fittings for the installation of electric conductors. ENT is composed of a material that is resistant to moisture and chemical atmospheres and is flame retardant.

A pliable raceway is a raceway that can be bent by hand with a reasonable force but without other assistance.

3.62.1.6 Listing Requirements. ENT and associated fittings shall be listed.

3.62.2 Installation

3.62.2.1 Uses Permitted. For the purpose of this article, the first floor of a building shall be that floor that has 50 percent or more of the exterior wall surface area level with or above finished grade. One additional level that is the first level and not designed for human habitation and used only for vehicle parking, storage, or similar use

shall be permitted. The use of ENT and fittings shall be permitted in the following:

(1) In any building not exceeding three floors above grade as follows:

- a. For exposed work, where not prohibited by 3.62.2.3
- b. Concealed within walls, floors, and ceilings

(2) In any building exceeding three floors above grade, ENT shall be concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. The 15-minute-finish-rated thermal barrier shall be permitted to be used for combustible or noncombustible walls, floors, and ceilings.

Exception to (2): Where a fire sprinkler system(s) is installed in accordance with NFPA 13-2002, Standard for the Installation of Sprinkler Systems, on all floors, ENT shall be permitted to be used within walls, floors, and ceilings, exposed or concealed, in buildings exceeding three floors above grade.

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

(3) In locations subject to severe corrosive influences as covered in 3.0.1.6 and where subject to chemicals for which the materials are specifically approved.

(4) In concealed, dry, and damp locations not prohibited by 3.62.2.3.

(5) Above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies, except as permitted in 3.62.2.1(1)(a).

Exception to (5): ENT shall be permitted to be used above suspended ceilings in buildings exceeding three floors above grade where the building is protected throughout by a fire sprinkler system installed in accordance with NFPA 13-2002, Standard for the Installation of

| Sprinkler Systems.

(6) Encased in poured concrete, or embedded in a concrete slab on grade where ENT is placed on sand or approved screenings, provided fittings identified for this purpose are used for connections.

(7) For wet locations indoors as permitted in this section or in a concrete slab on or below grade, with fittings listed for the purpose.

(8) Metric designator 16 through 27 (trade size ½ through 1) as listed manufactured prewired assembly.

FPN: Extreme cold may cause some types of nonmetallic conduits to become brittle and therefore more susceptible to damage from physical contact.

3.62.2.3 Uses Not Permitted. ENT shall not be used in the following:

(1) In hazardous (classified) locations, except as permitted by 5.4.1.20 and 5.5.1.15(a)(1)

(2) For the support of luminaires (fixtures) and other equipment

(3) Where subject to ambient temperatures in excess of 50°C (122°F) unless listed otherwise

(4) For conductors or cables operating at a temperature higher than the ENT listed temperature rating

Exception to (4): Conductors or cables rated at a temperature higher than the ENT listed temperature rating shall be permitted to be installed in ENT, provided they are not operated at a temperature higher than the ENT listed temperature rating.

(5) For direct earth burial

(6) Where the voltage is over 600 volts

(7) In exposed locations, except as permitted by 3.62.2.1(1), 3.62.2.1(5), and 3.62.2.1(7)

(8) In theaters and similar locations, except as provided in 5.18.1.4 and 5.20.1.5

(9) Where exposed to the direct rays of the sun, unless identified as sunlight resistant

(10) Where subject to physical damage

3.62.2.11 Size.

(a) Minimum. ENT smaller than metric designator 16 (trade size ½) shall not be used.

(b) Maximum. ENT larger than metric designator 53 (trade size 2) shall not be used.

FPN: See 3.0.1.1(c) for the metric designators and trade sizes. These are for identification purposes only and do not relate to actual dimensions.

3.62.2.13 Number of Conductors. The number of conductors shall not exceed that permitted by the percentage fill in Table 1, Chapter 9. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles. The number of cables shall not exceed the allowable percentage fill specified in Table 1, Chapter 9.

3.62.2.15 Bends — How Made. Bends shall be so made that the tubing will not be damaged and the internal diameter of the tubing will not be effectively reduced. Bends shall be permitted to be made manually without auxiliary equipment, and the radius of the curve to the centerline of such bends shall not be less than shown in Table 2, Chapter 9 using the column “Other Bends.”

3.62.2.17 Bends — Number in One Run. There shall not be more than the equivalent of four quarter bends (360 degrees total) between pull points, for example, conduit bodies and boxes.

3.62.2.19 Trimming. All cut ends shall be trimmed inside and outside to remove rough edges.

3.62.2.21 Securing and Supporting. ENT shall be installed as a complete system in accordance with 3.0.1.18 and shall be securely fastened in place and supported in accordance with 3.62.2.21(a) and (b).

(a) Securely Fastened. ENT shall be securely fastened at intervals not exceeding 900 mm. In addition, ENT shall be securely fastened in place within 900 mm of each outlet box, device box, junction box, cabinet, or fitting where it terminates.

Exception No. 1: Lengths not exceeding a distance of 1 800 mm from a luminaire (fixture) terminal connection for tap connections to lighting luminaires (fixtures) shall be permitted without being secured.
Exception No. 2: Lengths not exceeding 1 800 mm from the last point where the raceway is securely fastened for connections within an accessible ceiling to luminaire(s) [lighting fixture(s)] or other equipment.

(b) Supports. Horizontal runs of ENT supported by openings in framing members at intervals not exceeding 900 mm and securely fastened within 900 mm of termination points shall be permitted.

3.62.2.37 Bushings. Where a tubing enters a box, fitting, or other enclosure, a bushing or adapter shall be provided to protect the wire from abrasion unless the box, fitting, or enclosure design provides equivalent protection.

FPN: See 3.0.1.4(f) for the protection of conductors size 22 mm² or larger.

3.62.2.39 Joints. All joints between lengths of tubing and between tubing and couplings, fittings, and boxes shall be by an approved method.

3.62.2.47 Splices and Taps. Splices and taps shall be made only in accordance with 3.0.1.15.

FPN: See Article 3.14 for rules on the installation and use of boxes and conduit bodies.

3.62.2.51 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the raceway.

3.62.3 Construction Specifications

3.62.3.1 Construction. ENT shall be made of material that does not exceed the ignitibility, flammability, smoke generation, and toxicity characteristics of rigid (nonplasticized) polyvinyl chloride. ENT, as a prewired manufactured assembly, shall be provided in continuous lengths capable of being shipped in a coil, reel, or carton without damage.

3.62.3.21 Marking. ENT shall be clearly and durably marked at least every 3 000 mm as required in the first sentence of 1.10.1.21. The type of material shall also be included in the marking. Marking for limited smoke shall be permitted on the tubing that has limited smoke-producing characteristics.

The type, size, and quantity of conductors used in prewired manufactured assemblies shall be identified by means of a printed tag or label attached to each end of the manufactured assembly and either the carton, coil, or reel. The enclosed conductors shall be marked in accordance with 3.10.1.11.

ARTICLE 3.66 — AUXILIARY GUTTERS

3.66 General

3.66.1.1 Scope. This article covers the use, installation, and construction requirements of metal auxiliary gutters and nonmetallic auxiliary gutters and associated fittings.

3.66.1.2 Definitions.

Metallic Auxiliary Gutters. Sheet metal enclosures with hinged or removable covers for housing and protecting electric wires, cable, and busbars in which conductors are laid in place after the wireway has been installed as a complete system.

Nonmetallic Auxiliary Gutters. Flame retardant, nonmetallic enclosures with removable covers for housing and protecting electric wires, cable, and busbars in which conductors are laid in place after the wireway has been installed as a complete system.

3.66.1.6 Listing Requirements.

(a) Outdoors. Nonmetallic auxiliary gutters installed outdoors shall comply with the following:

- (1) Be listed as suitable for exposure to sunlight
- (2) Be listed as suitable for use in wet locations
- (3) Be listed for maximum ambient temperature of the installation

(b) Indoors. Nonmetallic auxiliary gutters installed indoors shall be listed for the maximum ambient temperature of the installation.

3.66.2 Installation

3.66.2.1 Uses Permitted. Auxiliary gutters shall be permitted to supplement wiring spaces at meter centers, distribution centers, switchboards, and similar points of wiring systems and may enclose conductors or busbars.

(a) Sheet Metal Auxiliary Gutters.

(1) Indoor and Outdoor Use. Sheet metal auxiliary gutters shall be permitted for indoor and outdoor use.

(2) Wet Locations. Sheet metal auxiliary gutters installed in wet locations shall be suitable for such locations.

(b) Nonmetallic Auxiliary Gutters. Nonmetallic auxiliary gutters shall be listed for the maximum ambient temperature of the installation and marked for the installed conductor insulation temperature rating.

(1) Outdoors. Nonmetallic auxiliary gutters shall be permitted to be installed outdoors where listed and marked as suitable for the purpose.

FPN: Extreme cold may cause nonmetallic auxiliary gutter to become brittle and therefore more susceptible to damage from physical contact.

(2) Indoors. Nonmetallic auxiliary gutters shall be permitted to be installed indoors.

3.66.2.3 Uses Not Permitted. Auxiliary gutters shall not be used under the following conditions:

(1) To enclose switches, overcurrent devices, appliances, or other similar equipment.

FPN: Assembly of individual circuit breakers mounted in common enclosure without other feeder or circuit wiring passing through such enclosure is not considered as auxiliary gutter

(2) To extend a greater distance than 9 000 mm beyond the

equipment that it supplements.

Exception: As permitted in 6.20.4.4 for elevators, an auxiliary gutter shall be permitted to extend a distance greater than 9 000 mm beyond the equipment it supplements.

FPN: For wireways, see Articles 3.76 and 3.78. For busways, see Article 3.68.

3.66.2.13 Number of Conductors.

(a) Sheet Metal Auxiliary Gutters. The sum of the cross-sectional areas of all contained conductors at any cross section of a sheet metal auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the sheet metal auxiliary gutter. The derating factors in 3.10.1.15(b)(2)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 3.10.1.15(b)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

(b) Nonmetallic Auxiliary Gutters. The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic auxiliary gutter.

3.66.2.14 Ampacity of Conductors.

(a) Sheet Metal Auxiliary Gutters. Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the correction factors specified in 3.10.1.15(b)(2)a shall not apply. The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes/mm² (1000 amperes/in.²) of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/mm² (700 amperes/in.²) of cross section of the conductor.

(b) Nonmetallic Auxiliary Gutters. The derating factors specified in 3.10.1.15(b)(2)a shall be applicable to the current-carrying conductors in the nonmetallic auxiliary gutter.

3.66.2.21 Securing and Supporting.

(a) **Sheet Metal Auxiliary Gutters.** Sheet metal auxiliary gutters shall be supported throughout their entire length at intervals not exceeding 1 500 mm.

(b) **Nonmetallic Auxiliary Gutters.** Nonmetallic auxiliary gutters shall be supported at intervals not to exceed 900 mm and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 000 mm.

3.66.2.35 **Expansion Fittings.** Expansion fittings shall be installed where expected length change, due to expansion and contraction due to temperature change, is more than 6 mm.

3.66.2.47 **Splices and Taps.** Splices and taps shall comply with 3.66.2.47(a) through (d).

(a) **Within Gutters.** Splices or taps shall be permitted within gutters where they are accessible by means of removable covers or doors. The conductors, including splices and taps, shall not fill the gutter to more than 75 percent of its area.

(b) **Bare Conductors.** Taps from bare conductors shall leave the gutter opposite their terminal connections, and conductors shall not be brought in contact with uninsulated current-carrying parts of different potential.

(c) **Suitably Identified.** All taps shall be suitably identified at the gutter as to the circuit or equipment that they supply.

(d) **Overcurrent Protection.** Tap connections from conductors in auxiliary gutters shall be provided with overcurrent protection as required in 2.40.2.2.

3.66.2.49 Insulated Conductors.

(a) **Deflected Insulated Conductors.** Where insulated conductors are deflected within an auxiliary gutter, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the gutter, or where the direction of the gutter is deflected greater than 30

degrees, dimensions corresponding to one wire per terminal in Table 3.12.1.6(a) shall apply.

(b) **Auxiliary Gutters Used as Pullboxes.** Where insulated conductors 22 mm² or larger are pulled through an auxiliary gutter, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required in 3.14.2.14(a)(1) for straight pulls and 3.14.2.14(a)(2) for angle pulls.

3.66.2.51 **Grounding.** Metal auxiliary gutters shall be grounded.

3.66.3 Construction Specifications

3.66.3.1 Construction.

(a) **Electrical and Mechanical Continuity.** Gutters shall be constructed and installed so that adequate electrical and mechanical continuity of the complete system is secured.

(b) **Substantial Construction.** Gutters shall be of substantial construction and shall provide a complete enclosure for the contained conductors. All surfaces, both interior and exterior, shall be suitably protected from corrosion. Corner joints shall be made tight, and where the assembly is held together by rivets, bolts, or screws, such fasteners shall be spaced not more than 300 mm apart.

(c) **Smooth Rounded Edges.** Suitable bushings, shields, or fittings having smooth, rounded edges shall be provided where conductors pass between gutters, through partitions, around bends, between gutters and cabinets or junction boxes, and at other locations where necessary to prevent abrasion of the insulation of the conductors.

(d) **Covers.** Covers shall be securely fastened to the gutter.

(e) **Clearance of Bare Live Parts.** Bare conductors shall be securely and rigidly supported so that the minimum clearance between bare current-carrying metal parts of different potential mounted on the same surface will not be less than 50 mm, nor less than 25 mm for parts that are held free in the air. A clearance not less than 25 mm shall be secured between bare current-carrying metal parts and any metal

surface. Adequate provisions shall be made for the expansion and contraction of busbars.

3.66.3.21 Marking.

(a) **Outdoors.** Nonmetallic auxiliary gutters installed outdoors shall have the following markings:

- (1) Suitable for exposure to sunlight
- (2) Suitable for use in wet locations
- (3) Installed conductor insulation temperature rating

(b) **Indoors.** Nonmetallic auxiliary gutters installed indoors shall have the following markings:

- (1) Installed conductor insulation temperature rating

ARTICLE 3.68 — BUSWAYS

3.68.1 General Requirements

3.68.1.1 Scope. This article covers service-entrance, feeder, and branch-circuit busways and associated fittings.

3.68.1.2 Definition.

Busway. A grounded metal enclosure containing factory-mounted, bare or insulated conductors, which are usually copper or aluminum bars, rods, or tubes.

FPN: For cablebus, refer to Article 3.70.

3.68.2 Installation

3.68.2.1 Uses Permitted. Busways shall be permitted to be installed where they are located in accordance with 3.68.2.1(a) through (c).

(a) **Exposed.** Busways shall be permitted to be located in the open where visible, except as permitted in 3.68.2.1(c).

(b) **Concealed.** Busways shall be permitted to be installed behind access panels, provided the busways are totally enclosed, of nonventilating-type construction, and installed so that the joints between sections and at fittings are accessible for maintenance purposes. Where installed behind access panels, means of access shall be provided, and either of the following conditions shall be met:

(1) The space behind the access panels shall not be used for air-handling purposes.

(2) Where the space behind the access panels is used for environmental air, other than ducts and plenums, there shall be no provisions for plug-in connections, and the conductors shall be insulated.

(c) **Through Walls and Floors.** Busways shall be permitted to be installed through walls or floors in accordance with (c)(1) and (c)(2).

(1) Walls. Unbroken lengths of busway shall be permitted to be extended through dry walls.

(2) Floors. Floor penetrations shall comply with (a) and (b):

a. Busways shall be permitted to be extended vertically through dry floors if totally enclosed (unventilated) where passing through and for a minimum distance of 1 800 mm above the floor to provide adequate protection from physical damage.

b. In other than industrial establishments, where a vertical riser penetrates two or more dry floors, a minimum 100 mm high curb shall be installed around all floor openings for riser busways to prevent liquids from entering the opening. The curb shall be installed within 300 mm of the floor opening. Electrical equipment shall be located so that it will not be damaged by liquids that are retained by the curb.

FPN: See 3.0.1.21 for information concerning the spread of fire or products of combustion.

3.68.2.3 Uses Not Permitted.

(a) **Physical Damage.** Busways shall not be installed where subject to severe physical damage or corrosive vapors.

(b) **Hoistways.** Busways shall not be installed in hoistways.

(c) Hazardous Locations. Busways shall not be installed in any hazardous (classified) location, unless specifically approved for such use.

FPN: See 5.1.2.1(b).

(d) Wet Locations. Busways shall not be installed outdoors or in wet or damp locations unless identified for such use.

(e) Working Platform. Lighting busway and trolley busway shall not be installed less than 2 400 mm above the floor or working platform unless provided with a cover identified for the purpose.

3.68.2.8 Overcurrent Protection. Overcurrent protection shall be provided in accordance with 3.68.2.8(a) through (d).

(a) Rating of Overcurrent Protection — Feeders. A busway shall be protected against overcurrent in accordance with the allowable current rating of the busway.

Exception No. 1: The applicable provisions of 2.40.1.4 shall be permitted.

Exception No. 2: Where used as transformer secondary ties, the provisions of 4.50.1.6(a)(3) shall be permitted.

(b) Reduction in Ampacity Size of Busway. Overcurrent protection shall be required where busways are reduced in ampacity.

Exception: For industrial establishments only, omission of overcurrent protection shall be permitted at points where busways are reduced in ampacity, provided that the length of the busway having the smaller ampacity does not exceed 15 m and has an ampacity at least equal to one-third the rating or setting of the overcurrent device next back on the line, and provided that such busway is free from contact with combustible material.

(c) Feeder or Branch Circuits. Where a busway is used as a feeder, devices or plug-in connections for tapping off feeder or branch circuits from the busway shall contain the overcurrent devices required for the protection of the feeder or branch circuits. The plug-in device shall

consist of an externally operable circuit breaker or an externally operable fusible switch. Where such devices are mounted out of reach and contain disconnecting means, suitable means such as ropes, chains, or sticks shall be provided for operating the disconnecting means from the floor.

Exception No. 1: As permitted in 2.40.2.2.

Exception No. 2: For fixed or semifixed luminaires (lighting fixtures), where the branch-circuit overcurrent device is part of the luminaire (fixture) cord plug on cord-connected luminaires (fixtures).

Exception No. 3: Where luminaires (fixtures) without cords are plugged directly into the busway and the overcurrent device is mounted on the luminaire (fixture).

(d) Rating of Overcurrent Protection — Branch Circuits. A busway used as a branch circuit shall be protected against overcurrent in accordance with 2.10.2.2.

3.68.2.21 Support. Busways shall be securely supported at intervals not exceeding 1 500 mm unless otherwise designed and marked.

3.68.2.47 Branches from Busways. Branches from busways shall be permitted to be made in accordance with 3.68.2.47(a), (b), and (c).

(a) General. Branches from busways shall be permitted to use any of the following wiring methods:

- (1) Type AC armored cable
- (2) Type MC metal-clad cable
- (3) Type MI mineral-insulated, metal-sheathed cable
- (4) Type IMC intermediate metal conduit
- (5) Type RMC rigid metal conduit
- (6) Type FMC flexible metal conduit
- (7) Type LFMC liquidtight flexible metal conduit
- (8) Type RNC rigid nonmetallic conduit
- (9) Type LFNC liquidtight flexible nonmetal conduit
- (10) Type EMT electrical metallic tubing
- (11) Type ENT electrical nonmetallic tubing
- (12) Busways
- (13) Strut-type channel raceway
- (14) Surface metal raceways

(15) Surface nonmetallic raceways

Where a separate equipment grounding conductor is used, connection of the equipment grounding conductor to the busway shall comply with 2.50.1.8 and 2.50.1.12.

(b) Cord and Cable Assemblies. Suitable cord and cable assemblies approved for extra-hard usage or hard usage, and listed bus drop cable shall be permitted as branches from busways for the connection of portable equipment or the connection of stationary equipment to facilitate their interchange in accordance with 4.0.1.7 and 4.0.1.8 and the following conditions:

(1) The cord or cable shall be attached to the building by an approved means.

(2) The length of the cord or cable from a busway plug-in device to a suitable tension take-up support device shall not exceed 1 800 mm.

(3) The cord and cable shall be installed as a vertical riser from the tension take-up support device to the equipment served.

(4) Strain relief cable grips shall be provided for the cord or cable at the busway plug-in device and equipment terminations.

Exception to (b)(2): In industrial establishments only, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, lengths exceeding 1 800 mm shall be permitted between the busway plug-in device and the tension take-up support device where the cord or cable is supported at intervals not exceeding 2 400 mm.

(c) Branches from Trolley-Type Busways. Suitable cord and cable assemblies approved for extra-hard usage or hard usage and listed bus drop cable shall be permitted as branches from trolley-type busways for the connection of movable equipment in accordance with 4.0.1.7 and 4.0.1.8.

3.68.2.49 Dead Ends. A dead end of a busway shall be closed.

3.68.2.51 Grounding. Busway shall be grounded.

3.68.3 Construction

3.68.3.1 Marking. Busways shall be marked with the voltage and current rating for which they are designed, and with the manufacturer's name or trademark in such a manner as to be visible after installation.

3.68.4 Requirements for Over 600 Volts, Nominal

3.68.4.1 Adjacent and Supporting Structures. Metal-enclosed busways shall be installed so that temperature rise from induced circulating currents in any adjacent metallic parts will not be hazardous to personnel or constitute a fire hazard.

3.68.4.21 Barriers and Seals.

(a) Vapor Seals. Busway runs that have sections located both inside and outside of buildings shall have a vapor seal at the building wall to prevent interchange of air between indoor and outdoor sections.

Exception: Vapor seals shall not be required in forced-cooled bus.

(b) Fire Barriers. Fire barriers shall be provided where fire walls, floors, or ceilings are penetrated.

FPN: See 3.0.1.21 for information concerning the spread of fire or products of combustion.

3.68.4.23 Drain Facilities. Drain plugs, filter drains, or similar methods shall be provided to remove condensed moisture from low points in busway run.

3.68.4.24 Ventilated Bus Enclosures. Ventilated busway enclosures shall be installed in accordance with Part 1.10.3, and 4.90.2.4.

3.68.4.25 Terminations and Connections. Where bus enclosures terminate at machines cooled by flammable gas, seal-off bushings, baffles, or other means shall be provided to prevent accumulation of flammable gas in the busway enclosures. All conductor termination and connection hardware shall be accessible for installation, connection, and maintenance.

3.68.4.26 Switches. Switching devices or disconnecting links provided in the busway run shall have the same momentary rating as the busway. Disconnecting links shall be plainly marked to be removable only when bus is de-energized. Switching devices that are not load-break shall be interlocked to prevent operation under load, and disconnecting link enclosures shall be interlocked to prevent access to energized parts.

3.68.4.27 Wiring 600 Volts or Less, Nominal. Secondary control devices and wiring that are provided as part of the metal-enclosed bus run shall be insulated by fire-retardant barriers from all primary circuit elements with the exception of short lengths of wire, such as at instrument transformer terminals.

3.68.4.31 Expansion Fittings. Flexible or expansion connections shall be provided in long, straight runs of bus to allow for temperature expansion or contraction, or where the busway run crosses building vibration insulation joints.

3.68.4.45 Neutral. Neutral bus, where required, shall be sized to carry all neutral load current, including harmonic currents, and shall have adequate momentary and short-circuit rating consistent with system requirements.

3.68.4.47 Grounding. Metal-enclosed busway shall be grounded.

3.68.4.107 Marking. Each busway run shall be provided with a permanent nameplate on which the following information shall be provided:

- (1) Rated voltage.
- (2) Rated continuous current; if bus is forced-cooled, both the normal forced-cooled rating and the self-cooled (not forced-cooled) rating for the same temperature rise shall be given.
- (3) Rated frequency.
- (4) Rated impulse withstand voltage.
- (5) Rated 60-Hz withstand voltage (dry).
- (6) Rated momentary current.
- (7) Manufacturer's name or trademark.

FPN: See ANSI C37.23-1987 (R1991), Guide for Metal-Enclosed Bus and Calculating Losses in Isolated-Phase Bus, for construction and testing requirements for metal-enclosed buses.

ARTICLE 3.70 — CABLEBUS

3.70.1.1 Scope. This article covers the use and installation requirements of cablebus and associated fittings.

3.70.1.2 Definition.

Cablebus. An assembly of insulated conductors with fittings and conductor terminations in a completely enclosed, ventilated protective metal housing. Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer in accordance with instructions for the specific job. This assembly is designed to carry fault current and to withstand the magnetic forces of such current.

3.70.1.3 Use. Approved cablebus shall be permitted at any voltage or current for which spaced conductors are rated and shall be installed only for exposed work, except as permitted in 3.70.1.6. Cablebus installed outdoors or in corrosive, wet, or damp locations shall be identified for such use. Cablebus shall not be installed in hoistways or hazardous (classified) locations unless specifically approved for such use. Cablebus shall be permitted to be used for branch circuits, feeders, and services.

Cablebus framework, where bonded, shall be permitted to be used as the equipment grounding conductor for branch circuits and feeders.

3.70.1.4 Conductors.

(a) Types of Conductors. The current-carrying conductors in cablebus shall have an insulation rating of 75°C (167°F) or higher and be an approved type suitable for the application.

(b) Ampacity of Conductors. The ampacity of conductors in cablebus shall be in accordance with Table 3.10.1.17 and Table

3.10.1.19, or with Table 3.10.1.69 and Table 3.10.1.70 for installations over 600 volts.

(c) Size and Number of Conductors. The size and number of conductors shall be that for which the cablebus is designed, and in no case smaller than 50 mm².

(d) Conductor Supports. The insulated conductors shall be supported on blocks or other mounting means designed for the purpose.

The individual conductors in a cablebus shall be supported at intervals not greater than 900 mm for horizontal runs and 450 mm for vertical runs. Vertical and horizontal spacing between supported conductors shall not be less than one conductor diameter at the points of support.

3.70.1.5 Overcurrent Protection. Cablebus shall be protected against overcurrent in accordance with the allowable ampacity of the cablebus conductors in accordance with 2.40.1.4.

Exception: Overcurrent protection shall be permitted in accordance with 240.100 and 240.101 for over 600 volts, nominal.

3.70.1.6 Support and Extension Through Walls and Floors.

(a) Support. Cablebus shall be securely supported at intervals not exceeding 3 600 mm.

Exception: Where spans longer than 3 600 mm are required, the structure shall be specifically designed for the required span length.

(b) Transversely Routed. Cablebus shall be permitted to extend transversely through partitions or walls, other than fire walls, provided the section within the wall is continuous, protected against physical damage, and unventilated.

(c) Through Dry Floors and Platforms. Except where firestops are required, cablebus shall be permitted to extend vertically through dry floors and platforms, provided the cablebus is totally enclosed at the point where it passes through the floor or platform and for a distance of 1 800 mm above the floor or platform.

(d) Through Floors and Platforms in Wet Locations. Except where firestops are required, cablebus shall be permitted to extend vertically through floors and platforms in wet locations where (1) there are curbs or other suitable means to prevent waterflow through the floor or platform opening, and (2) where the cablebus is totally enclosed at the point where it passes through the floor or platform and for a distance of 1 800 mm above the floor or platform.

3.70.1.7 Fittings. A cablebus system shall include approved fittings for the following:

- (1) Changes in horizontal or vertical direction of the run
- (2) Dead ends
- (3) Terminations in or on connected apparatus or equipment or the enclosures for such equipment
- (4) Additional physical protection where required, such as guards where subject to severe physical damage

3.70.1.8 Conductor Terminations. Approved terminating means shall be used for connections to cablebus conductors.

3.70.1.9 Grounding. A cablebus installation shall be grounded and bonded in accordance with Article 2.50, excluding 2.50.4.7, Exception No. 2.

3.70.1.10 Marking. Each section of cablebus shall be marked with the manufacturer's name or trade designation and the maximum diameter, number, voltage rating, and ampacity of the conductors to be installed. Markings shall be located so as to be visible after installation.

ARTICLE 3.72 — CELLULAR CONCRETE FLOOR RACEWAYS

3.72.1.1 Scope. This article covers cellular concrete floor raceways, the hollow spaces in floors constructed of precast cellular concrete slabs, together with suitable metal fittings designed to provide access to the floor cells.

3.72.1.2 Definitions.

Cell. A single, enclosed tubular space in a floor made of precast cellular concrete slabs, the direction of the cell being parallel to the direction of the floor member.

Header. Transverse metal raceways for electric conductors, providing access to predetermined cells of a precast cellular concrete floor, thereby permitting the installation of electric conductors from a distribution center to the floor cells.

3.72.1.4 Uses Not Permitted. Conductors shall not be installed in precast cellular concrete floor raceways as follows:

- (1) Where subject to corrosive vapor
- (2) In any hazardous (classified) locations except as permitted by 5.4.1.20, and in Class I, Division 2 locations as permitted in 5.1.2.1(b)(3)
- (3) In commercial garages, other than for supplying ceiling outlets or extensions to the area below the floor but not above

FPN: See 3.0.1.8 for installation of conductors with other systems.

3.72.1.5 Header. The header shall be installed in a straight line at right angles to the cells. The header shall be mechanically secured to the top of the precast cellular concrete floor. The end joints shall be closed by a metal closure fitting and sealed against the entrance of concrete. The header shall be electrically continuous throughout its entire length and shall be electrically bonded to the enclosure of the distribution center.

3.72.1.6 Connection to Cabinets and Other Enclosures. Connections from headers to cabinets and other enclosures shall be made by means of listed metal raceways and listed fittings.

3.72.1.7 Junction Boxes. Junction boxes shall be leveled to the floor grade and sealed against the free entrance of water or concrete. Junction boxes shall be of metal and shall be mechanically and electrically continuous with the header.

3.72.1.8 Markers. A suitable number of markers shall be installed for the future location of cells.

3.72.1.9 Inserts. Inserts shall be leveled and sealed against the entrance of concrete. Inserts shall be of metal and shall be fitted with grounded-type receptacles. A grounding conductor shall connect the insert receptacles to a positive ground connection provided on the header. Where cutting through the cell wall for setting inserts or other purposes (such as providing access openings between header and cells), chips and other dirt shall not be allowed to remain in the raceway, and the tool used shall be designed so as to prevent the tool from entering the cell and damaging the conductors.

3.72.1.10 Size of Conductors. No conductor larger than 50 mm² shall be installed, except by special permission.

3.72.1.11 Maximum Number of Conductors. The combined cross-sectional area of all conductors or cables shall not exceed 40 percent of the cross-sectional area of the cell or header.

3.72.1.12 Splices and Taps. Splices and taps shall be made only in header access units or junction boxes. For the purposes of this section, so-called loop wiring (continuous unbroken conductor connecting the individual outlets) shall not be considered to be a splice or tap.

3.72.1.13 Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

3.72.1.17 Ampacity of Conductors. The ampacity adjustment factors, provided in 3.10.1.15(b)(2), shall apply to conductors installed in cellular concrete floor raceways.

ARTICLE 3.74 — CELLULAR METAL FLOOR RACEWAYS

3.74.1.1 Scope. This article covers the use and installation requirements for cellular metal floor raceways.

3.74.1.2 Definitions.

Cellular Metal Floor Raceway. The hollow spaces of cellular metal floors, together with suitable fittings, that may be approved as enclosures for electric conductors.

Cell. A single enclosed tubular space in a cellular metal floor member, the axis of the cell being parallel to the axis of the metal floor member.

Header. A transverse raceway for electric conductors, providing access to predetermined cells of a cellular metal floor, thereby permitting the installation of electric conductors from a distribution center to the cells.

3.74.1.3 Uses Not Permitted. Conductors shall not be installed in cellular metal floor raceways as follows:

- (1) Where subject to corrosive vapor
- (2) In any hazardous (classified) location except as permitted by 5.4.1.20, and in Class I, Division 2 locations as permitted by 5.1.2.1(b)(3)
- (3) In commercial garages, other than for supplying ceiling outlets or extensions to the area below the floor but not above

FPN: See 3.0.1.8 for installation of conductors with other systems.

3.74.1 Installation

3.74.1.4 Size of Conductors. No conductor larger than 50 mm² shall be installed, except by special permission.

3.74.1.5 Maximum Number of Conductors in Raceway. The combined cross-sectional area of all conductors or cables shall not exceed 40 percent of the interior cross-sectional area of the cell or header.

3.74.1.6 Splices and Taps. Splices and taps shall be made only in header access units or junction boxes.

For the purposes of this section, so-called loop wiring (continuous

unbroken conductor connecting the individual outlets) shall not be considered to be a splice or tap.

3.74.1.7 Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

3.74.1.8 Markers. A suitable number of markers shall be installed for locating cells in the future.

3.74.1.9 Junction Boxes. Junction boxes shall be leveled to the floor grade and sealed against the free entrance of water or concrete. Junction boxes used with these raceways shall be of metal and shall be electrically continuous with the raceway.

3.74.1.10 Inserts. Inserts shall be leveled to the floor grade and sealed against the entrance of concrete. Inserts shall be of metal and shall be electrically continuous with the raceway. In cutting through the cell wall and setting inserts, chips and other dirt shall not be allowed to remain in the raceway, and tools shall be used that are designed to prevent the tool from entering the cell and damaging the conductors.

3.74.1.11 Connection to Cabinets and Extensions from Cells. Connections between raceways and distribution centers and wall outlets shall be made by means of liquidtight flexible metal conduit, flexible metal conduit where not installed in concrete, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, or approved fittings. Where there are provisions for the termination of an equipment grounding conductor, nonmetallic conduit, electrical nonmetallic tubing, or liquidtight flexible nonmetallic conduit shall be permitted. Where installed in concrete, liquidtight flexible nonmetallic conduit shall be listed and marked for direct burial.

FPN: Liquidtight flexible metal conduit and liquidtight flexible nonmetallic conduit that is suitable for installation in concrete is listed and marked for direct burial.

3.74.1.17 Ampacity of Conductors. The ampacity adjustment factors in 3.10.1.15(b)(2) shall apply to conductors installed in cellular metal floor raceways.

3.74.2 Construction Specifications

3.74.2.1 General. Cellular metal floor raceways shall be constructed so that adequate electrical and mechanical continuity of the complete system will be secured. They shall provide a complete enclosure for the conductors. The interior surfaces shall be free from burrs and sharp edges, and surfaces over which conductors are drawn shall be smooth. Suitable bushings or fittings having smooth rounded edges shall be provided where conductors pass.

ARTICLE 3.76 — METAL WIREWAYS

3.76.1 General

3.76.1.1 Scope. This article covers the use, installation, and construction specifications for metal wireways and associated fittings.

3.76.1.2 Definition.

Metal Wireways. Sheet metal troughs with hinged or removable covers for housing and protecting electric wires and cable and in which conductors are laid in place after the wireway has been installed as a complete system.

3.76.2 Installation

3.76.2.1 Uses Permitted. The use of metal wireways shall be permitted in the following:

- (1) For exposed work
- (2) In concealed spaces as permitted in 3.76.2.1(4)
- (3) In hazardous (classified) locations as permitted by 5.1.2.1(b) for Class I, Division 2 locations; 5.2.2.1(b) for Class II, Division 2 locations; and 5.4.1.20 for intrinsically safe wiring. Where installed in wet locations, wireways shall be listed for the purpose.
- (4) As extensions to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.

3.76.2.3 Uses Not Permitted. Metal wireways shall not be used in the following:

- (1) Where subject to severe physical damage
- (2) Where subject to severe corrosive environments

3.76.2.12 Size of Conductors. No conductor larger than that for which the wireway is designed shall be installed in any wireway.

3.76.2.13 Number of Conductors. The sum of the cross-sectional areas of all contained conductors at any cross section of a wireway shall not exceed 20 percent of the interior cross-sectional area of the wireway. The derating factors in 3.10.1.15(b)(2)a shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 3.10.1.15(b)(4), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.

3.76.2.14 Insulated Conductors. Insulated conductors installed in a metallic wireway shall comply with 3.76.2.14(a) and (b).

(a) Deflected Insulated Conductors. Where insulated conductors are deflected within a metallic wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the metallic wireway, or where the direction of the metallic wireway is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 3.12.1.6(a) shall apply.

(b) Metallic Wireways Used as Pull Boxes. Where insulated conductors 22 mm² or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same conductor shall not be less than that required by 3.14.2.14(a)(1) for straight pulls and 3.14.2.14(a)(2) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

3.76.2.21 Securing and Supporting. Metal wireways shall be supported in accordance with 3.76.2.21(a) and (b).

(a) **Horizontal Support.** Wireways shall be supported where run horizontally at each end and at intervals not to exceed 1 500 mm or for individual lengths longer than 1 500 mm at each end or joint, unless listed for other support intervals. The distance between supports shall not exceed 3 000 mm.

(b) **Vertical Support.** Vertical runs of wireways shall be securely supported at intervals not exceeding 4 500 mm and shall not have more than one joint between supports. Adjoining wireway sections shall be securely fastened together to provide a rigid joint.

3.76.2.47 Splices, Taps, and Power Distribution Blocks.

(a) **Splices and Taps.** Splices and taps shall be permitted within a wireway, provided they are accessible. The conductors, including splices and taps, shall not fill the wireway to more than 75 percent of its area at that point.

(b) Power Distribution Blocks.

(1) **Installation.** Power distribution blocks installed in metal wireways shall be listed.

(2) **Size of Enclosure.** In addition to the wiring space requirement in 3.76.2.47(a), the power distribution block shall be installed in a wireway with dimensions not smaller than specified in the installation instructions of the power distribution block.

(3) **Wire Bending Space.** Wire bending space at the terminals of power distribution blocks shall comply with 3.12.1.6(b).

(4) **Live Parts.** Power distribution blocks shall not have exposed live parts in the wireway after installation.

3.76.2.49 Dead Ends. Dead ends of metal wireways shall be closed.

3.76.2.61 Extensions from Metal Wireways. Extensions from wireways shall be made with cord pendants installed in accordance with 400.10 or with any wiring method in Chapter 3 that includes a means for equipment grounding. Where a separate equipment grounding conductor is employed, connection of the equipment grounding conductors in the wiring method to the wireway shall comply with 2.50.1.8 and 2.50.1.12.

3.76.3 Construction Specifications

3.76.3.1 Marking. Metal wireways shall be so marked that their manufacturer's name or trademark will be visible after installation.

ARTICLE 3.78 — NONMETALLIC WIREWAYS

3.78.1 General

3.78.1.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic wireways and associated fittings.

3.78.1.2 Definition.

Nonmetallic Wireways. Flame retardant, nonmetallic troughs with removable covers for housing and protecting electric wires and cables in which conductors are laid in place after the wireway has been installed as a complete system.

3.78.1.6 Listing Requirements. Nonmetallic wireways and associated fittings shall be listed.

3.78.2 Installation

3.78.2.1 Uses Permitted. The use of nonmetallic wireways shall be permitted in the following:

- (1) Only for exposed work, except as permitted in 3.78.2.1(4).
- (2) Where subject to corrosive environments where identified for the use.
- (3) In wet locations where listed for the purpose.

FPN: Extreme cold may cause nonmetallic wireways to become brittle and therefore more susceptible to damage from physical contact.

(4) As extensions to pass transversely through walls if the length passing through the wall is unbroken. Access to the conductors shall be maintained on both sides of the wall.

3.78.2.3 Uses Not Permitted. Nonmetallic wireways shall not be used in the following:

- (1) Where subject to physical damage
- (2) In any hazardous (classified) location, except as permitted in 5.4.1.20
- (3) Where exposed to sunlight unless listed and marked as suitable for the purpose
- (4) Where subject to ambient temperatures other than those for which nonmetallic wireway is listed
- (5) For conductors whose insulation temperature limitations would exceed those for which the nonmetallic wireway is listed

3.78.2.12 Size of Conductors. No conductor larger than that for which the nonmetallic wireway is designed shall be installed in any nonmetallic wireway.

3.78.2.13 Number of Conductors. The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic wireway shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic wireway. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors. The derating factors specified in 3.10.1.15(b)(2)a shall be applicable to the current-carrying conductors up to and including the 20 percent fill specified above.

3.78.2.14 Insulated Conductors. Insulated conductors installed in a nonmetallic wireway shall comply with 3.78.2.14(a) and (b).

(a) Deflected Insulated Conductors. Where insulated conductors are deflected within a nonmetallic wireway, either at the ends or where conduits, fittings, or other raceways or cables enter or leave the nonmetallic wireway, or where the direction of the nonmetallic wireway is deflected greater than 30 degrees, dimensions corresponding to one wire per terminal in Table 3.12.1.6(a) shall apply.

(b) Nonmetallic Wireways Used as Pull Boxes. Where insulated conductors 22 mm² or larger are pulled through a wireway, the distance between raceway and cable entries enclosing the same

conductor shall not be less than that required in 3.14.2.14(a)(1) for straight pulls and in 3.14.2.14(a)(2) for angle pulls. When transposing cable size into raceway size, the minimum metric designator (trade size) raceway required for the number and size of conductors in the cable shall be used.

3.78.2.21 Securing and Supporting. Nonmetallic wireway shall be supported in accordance with 3.78.2.21(a) and (b).

(a) Horizontal Support. Nonmetallic wireways shall be supported where run horizontally at intervals not to exceed 900 mm, and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 000 mm.

(b) Vertical Support. Vertical runs of nonmetallic wireway shall be securely supported at intervals not exceeding 1 200 mm, unless listed for other support intervals, and shall not have more than one joint between supports. Adjoining nonmetallic wireway sections shall be securely fastened together to provide a rigid joint.

3.78.2.35 Expansion Fittings. Expansion fittings for nonmetallic wireway shall be provided to compensate for thermal expansion and contraction where the length change is expected to be 6 mm or greater in a straight run.

FPN: See Table 3.52.2.35(a) for expansion characteristics of PVC rigid nonmetallic conduit. The expansion characteristics of PVC nonmetallic wireway are identical.

3.78.2.47 Splices and Taps. Splices and taps shall be permitted within a nonmetallic wireway, provided they are accessible. The conductors, including splices and taps, shall not fill the nonmetallic wireway to more than 75 percent of its area at that point.

3.78.2.49 Dead Ends. Dead ends of nonmetallic wireway shall be closed using listed fittings.

3.78.2.51 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the nonmetallic wireway. A separate equipment grounding conductor shall not be required where the grounded conductor is used to ground equipment as permitted in 2.50.7.13.

3.78.2.61 Extensions from Nonmetallic Wireways. Extensions from nonmetallic wireway shall be made with cord pendants or any wiring method of Chapter 3. A separate equipment grounding conductor shall be installed in, or an equipment grounding connection shall be made to, any of the wiring methods used for the extension.

3.78.3 Construction Specifications

3.78.3.1 Marking. Nonmetallic wireways shall be marked so that the manufacturer's name or trademark and interior cross-sectional area in square inches shall be visible after installation. Marking for limited smoke shall be permitted on the nonmetallic wireways that have limited smoke-producing characteristics.

ARTICLE 3.80 — MULTIOUTLET ASSEMBLY

3.80.1.1 Scope. This article covers the use and installation requirements for multioutlet assemblies.

3.80.1.2 Use.

(a) Permitted. The use of a multioutlet assembly shall be permitted in dry locations.

(b) Not Permitted. A multioutlet assembly shall not be installed as follows:

(1) Where concealed, except that it shall be permissible to surround the back and sides of a metal multioutlet assembly by the building finish or recess a nonmetallic multioutlet assembly in a baseboard

(2) Where subject to severe physical damage

(3) Where the voltage is 300 volts or more between conductors unless the assembly is of metal having a thickness of not less than 1.02 mm (0.040 in.)

(4) Where subject to corrosive vapors

(5) In hoistways

(6) In any hazardous (classified) locations except Class I, Division 2 locations as permitted in 5.1.2.1(b)(3)

3.80.1.3 Metal Multioutlet Assembly Through Dry Partitions. It shall be permissible to extend a metal multioutlet assembly through (not run within) dry partitions if arrangements are made for removing the cap or cover on all exposed portions and no outlet is located within the partitions.

ARTICLE 3.82 — NONMETALLIC EXTENSIONS

3.82.1 General

3.82.1.1 Scope. This article covers the use, installation, and construction specifications for nonmetallic extensions.

3.82.1.2 Definition.

Nonmetallic Extension. An assembly of two insulated conductors within a nonmetallic jacket or an extruded thermoplastic covering. The classification includes surface extensions intended for mounting directly on the surface of walls or ceilings.

3.82.2 Installation

3.82.2.1 Uses Permitted. Nonmetallic extensions shall be permitted only in accordance with 3.82.2.1(a), (b), and (c).

(a) **From an Existing Outlet.** The extension shall be from an existing outlet on a 15- or 20-ampere branch circuit.

(b) **Exposed and in a Dry Location.** The extension shall be run exposed and in a dry location.

(c) **Residential or Offices.** For nonmetallic surface extensions mounted directly on the surface of walls or ceilings, the building shall be occupied for residential or office purposes and shall not exceed three floors above grade.

FPN No. 1: See 3.10.1.10 for temperature limitation of conductors.

FPN No. 2: See 3.62.2.1 for definition of first floor.

3.82.2.3 Uses Not Permitted. Nonmetallic extensions shall not be

used as follows:

- (1) In unfinished basements, attics, or roof spaces
- (2) Where the voltage between conductors exceeds 150 volts for nonmetallic surface extension and 300 volts for aerial cable
- (3) Where subject to corrosive vapors
- (4) Where run through a floor or partition, or outside the room in which it originates

3.82.2.6 Exposed. One or more extensions shall be permitted to be run in any direction from an existing outlet, but not on the floor or within 50 mm from the floor.

3.82.2.17 Bends. A bend that reduces the normal spacing between the conductors shall be covered with a cap to protect the assembly from physical damage.

3.82.2.21 Securing and Supporting. Nonmetallic surface extensions shall be secured in place by approved means at intervals not exceeding 200 mm, with an allowance for 300 mm to the first fastening where the connection to the supplying outlet is by means of an attachment plug. There shall be at least one fastening between each two adjacent outlets supplied. An extension shall be attached to only woodwork or plaster finish and shall not be in contact with any metal work or other conductive material other than with metal plates on receptacles.

3.82.2.31 Boxes and Fittings. Each run shall terminate in a fitting that covers the end of the assembly. All fittings and devices shall be of a type identified for the use.

3.82.2.47 Splices and Taps. Extensions shall consist of a continuous unbroken length of the assembly, without splices, and without exposed conductors between fittings. Taps shall be permitted where approved fittings completely covering the tap connections are used. Aerial cable and its tap connectors shall be provided with an approved means for polarization. Receptacle-type tap connectors shall be of the locking type.

ARTICLE 3.84 — STRUT-TYPE CHANNEL RACEWAY

3.84.1 General

3.84.1.1 Scope. This article covers the use, installation, and construction specifications of strut-type channel raceway.

3.84.1.2 Definition.

Strut-Type Channel Raceway. A metallic raceway that is intended to be mounted to the surface of or suspended from a structure, with associated accessories for the installation of electrical conductors and cables.

3.84.1.6 Listing Requirements. Strut-type channel raceways, closure strips, and accessories shall be listed and identified for such use.

3.84.2 Installation

3.84.2.1 Uses Permitted. The use of strut-type channel raceways shall be permitted in the following:

- (1) Where exposed.
- (2) In dry locations.
- (3) In locations subject to corrosive vapors where protected by finishes judged suitable for the condition.
- (4) Where the voltage is 600 volts or less.
- (5) As power poles.
- (6) In Class I, Division 2 hazardous (classified) locations as permitted in 5.1.2.1(b)(3).
- (7) As extensions of unbroken lengths through walls, partitions, and floors where closure strips are removable from either side and the portion within the wall, partition, or floor remains covered.
- (8) Ferrous channel raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors.

3.84.2.3 Uses Not Permitted. Strut type channel raceways shall not be used as follows:

- (1) Where concealed.

(2) Ferrous channel raceways and fittings protected from corrosion solely by enamel shall not be permitted where subject to severe corrosive influences.

3.84.2.12 Size of Conductors. No conductor larger than that for which the raceway is listed shall be installed in strut-type channel raceways.

3.84.2.13 Number of Conductors. The number of conductors permitted in strut-type channel raceways shall not exceed the percentage fill using Table 3.84.2.13 and applicable outside diameter (O.D.) dimensions of specific types and sizes of wire given in the tables in Chapter 9.

The derating factors of 3.10.1.15(b)(2)a shall not apply to conductors installed in strut-type channel raceways where all of the following conditions are met:

- (1) The cross-sectional area of the raceway exceeds 2500 mm² (4 in.²).
- (2) The current-carrying conductors do not exceed 30 in number.
- (3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the strut-type channel raceways, calculated in accordance with the following formula for wire fill:

$$n = \frac{ca}{wa}$$

where:

- n = number of wires
- ca = channel area in square inches
- wa = wire area

3.84.2.21 Securing and Supporting.

(a) Surface Mount. A surface mount strut-type channel raceway shall be secured to the mounting surface with retention straps external to the channel at intervals not exceeding 3 000 mm and within 900 mm of each outlet box, cabinet, junction box, or other channel raceway termination.

(b) Suspension Mount. Strut-type channel raceways shall be permitted to be suspension mounted in air with approved appropriate methods designed for the purpose at intervals not to exceed 3 000 mm and within 900 mm of channel raceway terminations and ends.

Table 3.84.2.13 Channel Size and Inside Diameter Area

Size Channel	Area mm ²	40% Area* mm ²	25% Area** mm ²
1 ⁵ / ₈ x 13/16	572	229	143
1 ⁵ / ₈ x 1	743	297	186
1 ⁵ / ₈ x 1 ³ / ₈	1076	433	270
1 ⁵ / ₈ x 1 ⁵ / ₈	1308	523	327
1 ⁵ / ₈ x 2 7/16	2045	817	511
1 ⁵ / ₈ x 3 1/4	2780	1112	695
1 1/2 x 3/4	548	219	137
1 1/2 x 1 1/2	1179	472	295
1 1/2 x 7/8	1485	594	371
1 1/2 x 3	2487	995	622

*Raceways with external joiners shall use a 40 percent wire fill calculation to determine the number of conductors permitted.

**Raceways with internal joiners shall use a 25 percent wire fill calculation to determine the number of conductors permitted.

3.84.2.47 Splices and Taps. Splices and taps shall be permitted in raceways that are accessible after installation by having a removable cover. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. All splices and taps shall be made by approved methods.

3.84.2.51 Grounding. Strut-type channel raceway enclosures providing a transition to or from other wiring methods shall have a means for connecting an equipment grounding conductor. Strut-type channel raceways shall be permitted as an equipment grounding conductor in accordance with 2.50.6.9(14). Where a snap-fit metal cover for strut-type channel raceways is used to achieve electrical continuity in accordance with the listing, this cover shall not be

permitted as the means for providing electrical continuity for a receptacle mounted in the cover.

3.84.3 Construction Specifications

3.84.3.1 Construction. Strut-type channel raceways and their accessories shall be of a construction that distinguishes them from other raceways. Raceways and their elbows, couplings, and other fittings shall be designed such that the sections can be electrically and mechanically coupled together and installed without subjecting the wires to abrasion. They shall comply with 3.84.3.1(a), (b), and (c).

(a) Material. Raceways and accessories shall be formed of steel, stainless steel, or aluminum.

(b) Corrosion Protection. Steel raceways and accessories shall be protected against corrosion by galvanizing or by an organic coating.

FPN: Enamel and PVC coatings are examples of organic coatings that provide corrosion protection.

(c) Cover. Covers of strut-type channel raceways shall be either metallic or nonmetallic.

3.84.3.21 Marking. Each length of strut-type channel raceways shall be clearly and durably identified as required in the first sentence of 1.10.1.21.

ARTICLE 3.86 — SURFACE METAL RACEWAYS

3.86.1 General

3.86.1.1 Scope. This article covers the use, installation, and construction specifications for surface metal raceways and associated fittings.

3.86.1.2 Definition.

Surface Metal Raceway. A metallic raceway that is intended to be mounted to the surface of a structure, with associated couplings,

connectors, boxes, and fittings for the installation of electrical conductors.

3.86.1.6 Listing Requirements. Surface metal raceway and associated fittings shall be listed.

3.86.2 Installation

3.86.2.1 Uses Permitted. The use of surface metal raceways shall be permitted in the following:

- (1) In dry locations.
- (2) In Class I, Division 2 hazardous (classified) locations as permitted in 5.1.2.1(b)(3).
- (3) Under raised floors, as permitted in 6.45.1.5(d)(2).
- (4) Extension through walls and floors. Surface metal raceway shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.

3.86.2.3 Uses Not Permitted. Surface metal raceways shall not be used in the following:

- (1) Where subject to severe physical damage, unless otherwise approved
- (2) Where the voltage is 300 volts or more between conductors, unless the metal has a thickness of not less than 1.0 mm nominal
- (3) Where subject to corrosive vapors
- (4) In hoistways
- (5) Where concealed, except as permitted in 3.86.2.1

3.86.2.12 Size of Conductors. No conductor larger than that for which the raceway is designed shall be installed in surface metal raceway.

3.86.2.13 Number of Conductors or Cables. The number of conductors or cables installed in surface metal raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles.

The derating factors of 3.10.1.15(b)(2)a shall not apply to conductors installed in surface metal raceways where all of the following conditions are met:

- (1) The cross-sectional area of the raceway exceeds 2500 mm² (4 in.²)
- (2) The current-carrying conductors do not exceed 30 in number
- (3) The sum of the cross-sectional areas of all contained conductors does not exceed 20 percent of the interior cross-sectional area of the surface metal raceway

3.86.2.21 Securing and Supporting. Surface metal raceways shall be supported at intervals in accordance with the manufacturer's installation instructions.

3.86.2.47 Splices and Taps. Splices and taps shall be permitted in surface metal raceways having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. Splices and taps in surface metal raceways without removable covers shall be made only in boxes. All splices and taps shall be made by approved methods.

Taps of Type FC cable installed in surface metal raceway shall be made in accordance with 3.22.2.47(b).

3.86.2.51 Grounding. Surface metal raceway enclosures providing a transition from other wiring methods shall have a means for connecting an equipment grounding conductor.

3.86.2.61 Combination Raceways. When combination surface metallic raceways are used for both signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by stamping, imprinting, or color coding of the interior finish.

3.86.3 Construction Specifications

3.86.3.1 Construction. Surface metal raceways shall be of such construction as will distinguish them from other raceways. Surface metal raceways and their elbows, couplings, and similar fittings shall be designed so that the sections can be electrically and mechanically

coupled together and installed without subjecting the wires to abrasion.

Where covers and accessories of nonmetallic materials are used on surface metal raceways, they shall be identified for such use.

ARTICLE 3.88 — SURFACE NONMETALLIC RACEWAYS

3.88.1 General

3.88.1.1 Scope. This article covers the use, installation, and construction specifications for surface nonmetallic raceways and associated fittings.

3.88.1.2 Definition.

Surface Nonmetallic Raceway. A nonmetallic raceway that is intended to be mounted to the surface of a structure, with associated couplings, connectors, boxes, and fittings for the installation of electrical conductors.

3.88.1.6 Listing Requirements. Surface nonmetallic raceway and associated fittings shall be listed.

3.88.2 Installation

3.88.2.1 Uses Permitted. Surface nonmetallic raceway shall be permitted as follows:

- (1) The use of surface nonmetallic raceways shall be permitted in dry locations.
- (2) Extension through walls and floors shall be permitted. Surface nonmetallic raceway shall be permitted to pass transversely through dry walls, dry partitions, and dry floors if the length passing through is unbroken. Access to the conductors shall be maintained on both sides of the wall, partition, or floor.

3.88.2.3 Uses Not Permitted. Surface nonmetallic raceways shall not be used in the following:

- (1) Where concealed, except as permitted in 3.88.2.1(2)

- (2) Where subject to severe physical damage
- (3) Where the voltage is 300 volts or more between conductors, unless listed for higher voltage
- (4) In hoistways
- (5) In any hazardous (classified) location except Class I, Division 2 locations as permitted in 5.1.2.1(b)(3)
- (6) Where subject to ambient temperatures exceeding those for which the nonmetallic raceway is listed
- (7) For conductors whose insulation temperature limitations would exceed those for which the nonmetallic raceway is listed

3.88.2.12 Size of Conductors. No conductor larger than that for which the raceway is designed shall be installed in surface nonmetallic raceway.

3.88.2.13 Number of Conductors or Cables. The number of conductors or cables installed in surface nonmetallic raceway shall not be greater than the number for which the raceway is designed. Cables shall be permitted to be installed where such use is not prohibited by the respective cable articles.

3.88.2.47 Splices and Taps. Splices and taps shall be permitted in surface nonmetallic raceways having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill the raceway to more than 75 percent of its area at that point. Splices and taps in surface nonmetallic raceways without removable covers shall be made only in boxes. All splices and taps shall be made by approved methods.

3.88.2.51 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the raceway.

3.88.2.61 Combination Raceways. When combination surface nonmetallic raceways are used both for signaling and for lighting and power circuits, the different systems shall be run in separate compartments identified by stamping, imprinting, or color coding of the interior finish.

3.88.3 Construction Specifications

3.88.3.1 Construction. Surface nonmetallic raceways shall be of such construction as will distinguish them from other raceways. Surface nonmetallic raceways and their elbows, couplings, and similar fittings shall be designed so that the sections can be mechanically coupled together and installed without subjecting the wires to abrasion. Surface nonmetallic raceways and fittings are made of suitable nonmetallic material that is resistant to moisture and chemical atmospheres. It shall also be flame retardant, resistant to impact and crushing, resistant to distortion from heat under conditions likely to be encountered in service, and resistant to low-temperature effects.

3.88.3.21 Marking. Surface nonmetallic raceways that have limited smoke-producing characteristics shall be permitted to be so identified.

ARTICLE 3.90 — UNDERFLOOR RACEWAYS

3.90.1.1 Scope. This article covers the use and installation requirements for underfloor raceways.

3.90.1.2 Use.

(a) Permitted. The installation of underfloor raceways shall be permitted beneath the surface of concrete or other flooring material or in office occupancies where laid flush with the concrete floor and covered with linoleum or equivalent floor covering.

(b) Not Permitted. Underfloor raceways shall not be installed (1) where subject to corrosive vapors or (2) in any hazardous (classified) locations, except as permitted by 5.4.1.20 and in Class I, Division 2 locations as permitted in 5.1.2.1(b)(3). Unless made of a material judged suitable for the condition or unless corrosion protection approved for the condition is provided, ferrous or nonferrous metal underfloor raceways, junction boxes, and fittings shall not be installed in concrete or in areas subject to severe corrosive influences.

3.90.1.3 Covering. Raceway coverings shall comply with 3.90.1.3(a) through (d).

(a) Raceways Not Over 100 mm (4 in.) Wide. Half-round and flat-top raceways not over 100 mm in width shall have not less than 19 mm of concrete or wood above the raceway.

Exception: As permitted in 3.90.1.3(c) and (d) for flat-top raceways.

(b) Raceways Over 100 mm Wide But Not Over 200 mm Wide. Flat-top raceways over 100 mm but not over 200 mm wide with a minimum of 25 mm spacing between raceways shall be covered with concrete to a depth of not less than 25 mm. Raceways spaced less than 25 mm apart shall be covered with concrete to a depth of 40 mm.

(c) Trench-Type Raceways Flush with Concrete. Trench-type flush raceways with removable covers shall be permitted to be laid flush with the floor surface. Such approved raceways shall be designed so that the cover plates provide adequate mechanical protection and rigidity equivalent to junction box covers.

(d) Other Raceways Flush with Concrete. In office occupancies, approved metal flat-top raceways, if not over 100 mm in width, shall be permitted to be laid flush with the concrete floor surface, provided they are covered with substantial linoleum that is not less than 1.60 mm thick or with equivalent floor covering. Where more than one and not more than three single raceways are each installed flush with the concrete, they shall be contiguous with each other and joined to form a rigid assembly.

3.90.1.4 Size of Conductors. No conductor larger than that for which the raceway is designed shall be installed in underfloor raceways.

3.90.1.5 Maximum Number of Conductors in Raceway. The combined cross-sectional area of all conductors or cables shall not exceed 40 percent of the interior cross-sectional area of the raceway.

3.90.1.6 Splices and Taps. Splices and taps shall be made only in junction boxes.

For the purposes of this section, so-called loop wiring (continuous, unbroken conductor connecting the individual outlets) shall not be considered to be a splice or tap.

Exception: Splices and taps shall be permitted in trench-type flush

raceway having a removable cover that is accessible after installation. The conductors, including splices and taps, shall not fill more than 75 percent of the raceway area at that point.

3.90.1.7 Discontinued Outlets. When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

3.90.1.8 Laid in Straight Lines. Underfloor raceways shall be laid so that a straight line from the center of one junction box to the center of the next junction box coincides with the centerline of the raceway system. Raceways shall be firmly held in place to prevent disturbing this alignment during construction.

3.90.1.9 Markers at Ends. A suitable marker shall be installed at or near each end of each straight run of raceways to locate the last insert.

3.90.1.10 Dead Ends. Dead ends of raceways shall be closed.

3.90.1.13 Junction Boxes. Junction boxes shall be leveled to the floor grade and sealed to prevent the free entrance of water or concrete. Junction boxes used with metal raceways shall be metal and shall be electrically continuous with the raceways.

3.90.1.14 Inserts. Inserts shall be leveled and sealed to prevent the entrance of concrete. Inserts used with metal raceways shall be metal and shall be electrically continuous with the raceway. Inserts set in or on fiber raceways before the floor is laid shall be mechanically secured to the raceway. Inserts set in fiber raceways after the floor is laid shall be screwed into the raceway. When cutting through the raceway wall and setting inserts, chips and other dirt shall not be allowed to remain in the raceway, and tools shall be used that are designed so as to prevent the tool from entering the raceway and damaging conductors that may be in place.

3.90.1.15 Connections to Cabinets and Wall Outlets. Connections from underfloor raceways to distribution centers and wall outlets shall be made by approved fittings or by any of the wiring methods in Chapter 3, where installed in accordance with the provisions of the

respective articles.

3.90.1.17 Ampacity of Conductors. The ampacity adjustment factors, in 3.10.1.15(b)(2), shall apply to conductors installed in underfloor raceways.

ARTICLE 3.92 — CABLE TRAYS

3.92.1.1 Scope. This article covers cable tray systems, including ladder, ventilated trough, ventilated channel, solid bottom, and other similar structures.

FPN: For further information on cable trays, see ANSI/NEMA–VE 1-1998, Metal Cable Tray Systems; NEMA–VE 2-1996, Metal Cable Tray Installation Guidelines; and NEMA–FG-1998, Nonmetallic Cable Tray Systems.

3.92.1.2 Definition.

Cable Tray System. A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

3.92.1.3 Uses Permitted. Cable tray shall be permitted to be used as a support system for service conductors, feeders, branch circuits, communications circuits, control circuits, and signaling circuits. Cable tray installations shall not be limited to industrial establishments. Where exposed to direct rays of the sun, insulated conductors and jacketed cables shall be identified as being sunlight resistant. Cable trays and their associated fittings shall be identified for the intended use.

(a) Wiring Methods. The wiring methods in Table 3.92.1.3(a) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections.

(b) In Industrial Establishments. The wiring methods in Table 3.92.1.3(a) shall be permitted to be used in any industrial establishment under the conditions described in their respective articles. In industrial establishments only, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the

supervision of a licensed electrical practitioner service the installed cable tray system, any of the cables in 3.92.1.3(b)(1) and (b)(2) shall be permitted to be installed in ladder, ventilated trough, solid bottom, or ventilated channel cable trays.

Table 3.92.1.3(a) Wiring Methods

Wiring Method	Article	Section
Armored cable	3.20	
Communication raceways	8.0	
Electrical metallic tubing	3.58	
Electrical nonmetallic tubing	3.62	
Fire alarm cables	7.60	
Flexible metal conduit	3.48	
Flexible metallic tubing	3.60	
Instrumentation tray cable	7.27	
Intermediate metal conduit	3.42	
Liquidtight flexible metal conduit	3.50	
Liquidtight flexible nonmetallic conduit	3.56	
Metal-clad cable	3.30	
Mineral-insulated, metal-sheathed cable	3.32	
Multiconductor service-entrance cable	3.38	
Multiconductor underground feeder and branch-circuit cable	3.40	
Multipurpose and communications cables	8.0	
Nonmetallic-sheathed cable	3.34	
Power and control tray cable	3.36	
Power-limited tray cable		7.25.3.21(c), 7.25.4.1(e)
Optical fiber cables	7.70	
Optical fiber raceways	7.70	
Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays		
Rigid metal conduit	3.44	
Rigid nonmetallic conduit	3.52	

(1) Single Conductors. Single-conductor cables shall be permitted to be installed in accordance with (b)(1)a through (b)(1)c.

a. Single-conductor cable shall be 50 mm² or larger and shall be of a type listed and marked on the surface for use in cable trays. Where 50 mm² through 100 mm² single-conductor cables are installed in ladder cable tray, the maximum allowable rung spacing for the ladder cable tray shall be 230 mm.

b. Welding cables shall comply with the provisions of Part 6.30.4.

c. Single conductors used as equipment grounding conductors shall be insulated, covered, or bare, and they shall be 22 mm² or larger.

(2) Medium Voltage. Single- and multiconductor medium voltage cables shall be Type MV cable. Single conductors shall be installed in accordance with 3.92.1.3(b)(1).

(c) Equipment Grounding Conductors. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installed cable tray system and the cable tray complies with provisions of 3.92.1.7.

(d) Hazardous (Classified) Locations. Cable trays in hazardous (classified) locations shall contain only the cable types permitted in 5.1.2.1, 5.2.2.1, 5.3.2.1, 5.4.1.20, and 5.5.1.15.

(e) Nonmetallic Cable Tray. In addition to the uses permitted elsewhere in 3.92.1.3, nonmetallic cable tray shall be permitted in corrosive areas and in areas requiring voltage isolation.

3.92.1.4 Uses Not Permitted. Cable tray systems shall not be used in hoistways or where subject to severe physical damage. Cable tray systems shall not be used in ducts, plenums, and other air-handling spaces, except as permitted in 3.0.1.22, to support wiring methods recognized for use in such spaces.

3.92.1.5 Construction Specifications.

(a) Strength and Rigidity. Cable trays shall have suitable strength and rigidity to provide adequate support for all contained wiring.

(b) Smooth Edges. Cable trays shall not have sharp edges, burrs, or projections that could damage the insulation or jackets of the wiring.

(c) Corrosion Protection. Cable tray systems shall be corrosion resistant. If made of ferrous material, the system shall be protected from corrosion as required by 3.0.1.6.

(d) Side Rails. Cable trays shall have side rails or equivalent structural members.

(e) Fittings. Cable trays shall include fittings or other suitable means for changes in direction and elevation of runs.

(f) Nonmetallic Cable Tray. Nonmetallic cable trays shall be made of flame-retardant material.

3.92.1.6 Installation.

(a) Complete System. Cable trays shall be installed as a complete system. Field bends or modifications shall be so made that the electrical continuity of the cable tray system and support for the cables is maintained. Cable tray systems shall be permitted to have mechanically discontinuous segments between cable tray runs or between cable tray runs and equipment. The system shall provide for the support of the cables in accordance with their corresponding articles.

Where cable trays support individual conductors and where the conductors pass from one cable tray to another, or from a cable tray to raceway(s) or from a cable tray to equipment where the conductors are terminated, the distance between cable trays or between the cable tray and the raceway(s) or the equipment shall not exceed 1 800 mm. The conductors shall be secured to the cable tray(s) at the transition, and they shall be protected, by guarding or by location, from physical damage.

A bonding jumper sized in accordance with 2.50.5.13 shall connect the two sections of cable tray, or the cable tray and the raceway or

equipment. Bonding shall be in accordance with 2.50.5.7.

(b) Completed Before Installation. Each run of cable tray shall be completed before the installation of cables.

(c) Supports. Supports shall be provided to prevent stress on cables where they enter raceways or other enclosures from cable tray systems.

Cable trays shall be supported at intervals in accordance with the installation instructions.

(d) Covers. In portions of runs where additional protection is required, covers or enclosures providing the required protection shall be of a material that is compatible with the cable tray.

(e) Multiconductor Cables Rated 600 Volts or Less. Multiconductor cables rated 600 volts or less shall be permitted to be installed in the same cable tray.

(f) Cables Rated Over 600 Volts. Cables rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:

(1) The cables rated over 600 volts are Type MC.

(2) The cables rated over 600 volts are separated from the cables rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.

(g) Through Partitions and Walls. Cable trays shall be permitted to extend transversely through partitions and walls or vertically through platforms and floors in wet or dry locations where the installations, complete with installed cables, are made in accordance with the requirements of 3.0.1.21.

(h) Exposed and Accessible. Cable trays shall be exposed and accessible except as permitted by 3.92.1.6(g).

(i) Adequate Access. Sufficient space shall be provided and maintained about cable trays to permit adequate access for installing and maintaining the cables.

(j) Raceways, Cables, Boxes, and Conduit Bodies Supported from Cable Tray Systems. In industrial facilities where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation and where the cable tray systems are designed and installed to support the load, such systems shall be permitted to support raceways and cables, and boxes and conduit bodies covered in 3.14.1.1. For raceways terminating at the tray, a listed cable tray clamp or adapter shall be used to securely fasten the raceway to the cable tray system. Additional supporting and securing of the raceway shall be in accordance with the requirements of the appropriate raceway article.

For raceways or cables running parallel to and attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of the appropriate raceway or cable article.

For boxes and conduit bodies attached to the bottom or side of a cable tray system, fastening and supporting shall be in accordance with the requirements of 3.14.2.9.

3.92.1.7 Grounding.

(a) Metallic Cable Trays. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 2.50.5.7.

(b) Steel or Aluminum Cable Tray Systems. Steel or aluminum cable tray systems shall be permitted to be used as equipment grounding conductors, provided that all the following requirements are met:

(1) The cable tray sections and fittings shall be identified for grounding purposes.

(2) The minimum cross-sectional area of cable trays shall conform to the requirements in Table 3.92.1.7(b).

(3) All cable tray sections and fittings shall be legibly and durably marked to show the cross-sectional area of metal in channel cable trays, or cable trays of one-piece construction, and the total cross-sectional area of both side rails for ladder or trough cable trays.

(4) Cable tray sections, fittings, and connected raceways shall be bonded in accordance with 2.50.5.7, using bolted mechanical

connectors or bonding jumpers sized and installed in accordance with 2.50.5.13.

Table 3.92.1.7(b) Metal Area Requirements for Cable Trays Used as Equipment Grounding Conductor

Maximum Fuse Ampere Rating, Circuit Breaker Ampere Trip Setting, or Circuit Breaker Protective Relay Ampere Trip Setting for Ground-Fault Protection of Any Cable Circuit in the Cable Tray System	Minimum Cross-Sectional Area of Metal ^a	
	Steel Cable Trays mm ²	Aluminum Cable Trays mm ²
60	129	129
100	258	129
200	451.5	129
400	645	258
600	967.5	258
1000	—	387
1200	—	645
1600	—	967.5
2000	—	1290

^aTotal cross-sectional area of both side rails for ladder or trough cable trays; or the minimum cross-sectional area of metal in channel cable trays or cable trays of one-piece construction.

3.92.1.8 Cable Installation.

(a) Cable Splices. Cable splices made and insulated by approved methods shall be permitted to be located within a cable tray, provided they are accessible and do not project above the side rails.

(b) Fastened Securely. In other than horizontal runs, the cables shall be fastened securely to transverse members of the cable trays.

(c) Bushed Conduit and Tubing. A box shall not be required where cables or conductors are installed in bushed conduit and tubing used for support or for protection against physical damage.

(d) Connected in Parallel. Where single conductor cables comprising each phase, neutral; or grounded conductor of an alternating-current circuit are connected in parallel as permitted in 3.10.1.4, the conductors shall be installed in groups consisting of not more than one conductor per phase, neutral, or grounded conductor to prevent current imbalance in the paralleled conductors due to inductive reactance.

Single conductors shall be securely bound in circuit groups to prevent excessive movement due to fault-current magnetic forces unless single conductors are cabled together, such as triplexed assemblies.

(e) Single Conductors. Where any of the single conductors installed in ladder or ventilated trough cable trays are 50 mm² through 100 mm², all single conductors shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

3.92.1.9 Number of Multiconductor Cables, Rated 2000 Volts or Less, in Cable Trays. The number of multiconductor cables, rated 2 000 volts or less, permitted in a single cable tray shall not exceed the requirements of this section. The conductor sizes herein apply to both aluminum and copper conductors.

(a) Any Mixture of Cables. Where ladder or ventilated trough cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(1) Where all of the cables are 100 mm² or larger, the sum of the diameters of all cables shall not exceed the cable tray width, and the cables shall be installed in a single layer.

(2) Where all of the cables are smaller than 100 mm², the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 3.92.1.9 for the appropriate cable tray width.

(3) Where 100 mm² or larger cables are installed in the same cable tray with cables smaller than 100 mm², the sum of the cross-sectional areas of all cables smaller than 100 mm² shall not exceed the maximum allowable fill area resulting from the calculation in Column 2 of Table 3.92.1.9 for the appropriate cable tray width. The 100 mm²

and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(b) Multiconductor Control and/or Signal Cables Only. Where a ladder or ventilated trough cable tray having a usable inside depth of 150 mm or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 50 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm.

(c) Solid Bottom Cable Trays Containing Any Mixture. Where solid bottom cable trays contain multiconductor power or lighting cables, or any mixture of multiconductor power, lighting, control, and signal cables, the maximum number of cables shall conform to the following:

(1) Where all of the cables are 100 mm² or larger, the sum of the diameters of all cables shall not exceed 90 percent of the cable tray width, and the cables shall be installed in a single layer.

(2) Where all of the cables are smaller than 100 mm², the sum of the cross-sectional areas of all cables shall not exceed the maximum allowable cable fill area in Column 3 of Table 3.92.1.9 for the appropriate cable tray width.

(3) Where 100 mm² or larger cables are installed in the same cable tray with cables smaller than 100 mm², the sum of the cross-sectional areas of all cables smaller than 100 mm² shall not exceed the maximum allowable fill area resulting from the computation in Column 4 of Table 3.92.1.9 for the appropriate cable tray width. The 100 mm² and larger cables shall be installed in a single layer, and no other cables shall be placed on them.

(d) Solid Bottom Cable Tray — Multiconductor Control and/or Signal Cables Only. Where a solid bottom cable tray having a usable inside depth of 150 mm or less contains multiconductor control and/or signal cables only, the sum of the cross-sectional areas of all cables at any cross section shall not exceed 40 percent of the interior cross-sectional area of the cable tray. A depth of 150 mm shall be used to calculate the allowable interior cross-sectional area of any cable tray that has a usable inside depth of more than 150 mm.

Table 3.92.1.9 Allowable Cable Fill Area for Multiconductor Cables in Ladder, Ventilated Trough, or Solid Bottom Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray mm	Maximum Allowable Fill Area for Multiconductor Cables			
	Ladder or Ventilated Trough Cable Trays, 3.92.1.9(a)		Solid Bottom Cable Trays, 3.92.1.9(c)	
	Column 1 Applicable for 3.92.1.9(a)(2) Only mm ²	Column 2 ^a Applicable for 3.92.1.9(a)(3) Only mm ²	Column 3 Applicable for 3.92.1.9(c)(2) Only mm ²	Column 4 ^a Applicable for 3.92.1.9(c)(3) Only mm ²
150	4 500	4 500 – (30 Sd) ^b	3 500	3 500–(25 Sd) ^b
225	6 800	6 800 – (30 Sd)	5 100	5 100–(25 Sd)
300	9 000	9 000 – (30 Sd)	7 100	7 100–(25 Sd)
450	13 500	13 500 – (30 Sd)	10 600	10 600–(25 Sd)
600	18 000	18 000 – (30 Sd)	14 200	14 200–(25 Sd)
750	22 500	22 500 – (30 Sd)	17 700	17,700–(25 Sd)
900	27 000	27 000 – (30 Sd)	21 300	21 300–(25 Sd)

^aThe maximum allowable fill areas in Columns 2 and 4 shall be calculated. For example, the maximum allowable fill in mm² for a 150 mm wide cable tray in Column 2 shall be 4 500 minus (30 multiplied by Sd) [the maximum allowable fill, in square inches, for a 150 mm wide cable tray in Column 2 shall be 7 minus (1.2 multiplied by Sd)].

^bThe term Sd in Columns 2 and 4 is equal to the sum of the diameters, in mm, of all cables 107.2 mm (in inches, of all 4/0 AWG) and larger multiconductor cables in the same cable tray with smaller cables.

(e) **Ventilated Channel Cable Trays.** Where ventilated channel cable trays contain multiconductor cables of any type, the following shall apply:

(1) Where only one multiconductor cable is installed, the cross-sectional area shall not exceed the value specified in Column 1 of Table 3.92.1.9(e).

(2) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cables shall not exceed the value specified in Column 2 of Table 3.92.1.9(e).

Table 3.92.1.9(e) Allowable Cable Fill Area for Multiconductor Cables in Ventilated Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray mm	Maximum Allowable Fill Area for Multiconductor Cables	
	Column 1 One Cable mm ²	Column 2 More Than One Cable mm ²
75	1 500	850
100	2 900	1 600
150	4 500	2 450

(f) **Solid Channel Cable Trays.** Where solid channel cable trays contain multiconductor cables of any type, the following shall apply:

(1) Where only one multiconductor cable is installed, the cross-sectional area of the cable shall not exceed the value specified in Column 1 of Table 3.92.1.9(f).

(2) Where more than one multiconductor cable is installed, the sum of the cross-sectional area of all cable shall not exceed the value specified in Column 2 of Table 3.92.1.9(f).

Table 3.92.1.9(f) Allowable Cable Fill Area for Multiconductor Cables in Solid Channel Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray mm	Column 1 One Cable mm ²	Column 2 More Than One Cable mm ²
50	850	500
75	1 300	700
100	2 400	1 400
150	3 600	2 100

3.92.1.10 Number of Single-Conductor Cables, Rated 2000 Volts or Less, in Cable Trays. The number of single-conductor cables, rated 2000 volts or less, permitted in a single cable tray section shall not exceed the requirements of this section. The single conductors, or conductor assemblies, shall be evenly distributed across the cable tray. The conductor sizes herein apply to both aluminum and copper conductors.

(a) **Ladder or Ventilated Trough Cable Trays.** Where ladder or ventilated trough cable trays contain single-conductor cables, the maximum number of single conductors shall conform to the following:

(1) Where all of the cables are 500 mm² or larger, the sum of the diameters of all single conductor cables shall not exceed cable tray width, and the cables shall be installed in a single layer. Conductors that are bound together to comprise each circuit group shall be permitted to be installed in other than a single layer.

(2) Where all of the cables are from 125 mm² up to 500 mm², the sum of the cross-sectional areas of all single-conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 3.92.1.10(a) for the appropriate cable tray width.

(3) Where 500 mm² or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 500 mm², the sum of the cross-sectional areas of all cables smaller than 500 mm² shall not exceed the maximum allowable fill area

resulting from the computation in Column 2 of Table 3.92.1.10(a) for the appropriate cable tray width.

(4) Where any of the single conductor cables are 50 mm² through 100 mm², the sum of the diameters of all single conductor cables shall not exceed the cable tray width.

(b) Ventilated Channel Cable Trays. Where 50 mm, 75 mm, 100 mm, or 150 mm wide ventilated channel cable trays contain single-conductor cables, the sum of the diameters of all single conductors shall not exceed the inside width of the channel.

3.92.1.11 Ampacity of Cables, Rated 2000 Volts or Less, in Cable Trays.

(a) Multiconductor Cables. The allowable ampacity of multiconductor cables, nominally rated 2 000 volts or less, installed according to the requirements of 3.92.1.9 shall be as given in Table 3.10.1.16 and Table 3.10.1.18, subject to the provisions of (1), (2), (3), and 3.10.1.15(a)(2).

(1) The derating factors of 3.10.1.15(b)(2)a shall apply only to multiconductor cables with more than three current-carrying conductors. Derating shall be limited to the number of current-carrying conductors in the cable and not to the number of conductors in the cable tray.

(2) Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, not over 95 percent of the allowable ampacities of Table 3.10.1.16 and Table 3.10.1.18 shall be permitted for multiconductor cables.

(3) Where multiconductor cables are installed in a single layer in uncovered trays, with a maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ambient temperature-corrected ampacities of multiconductor cables, with not more than three insulated conductors rated 0 through 2000 volts in free air, in accordance with 3.10.1.15(c).

FPN: See Table B.3.10.1.3.

Table 3.92.1.10(a) Allowable Cable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays for Cables Rated 2000 Volts or Less

Inside Width of Cable Tray mm	Maximum Allowable Fill Area for Single-Conductor Cables in Ladder or Ventilated Trough Cable Trays	
	Column 1 Applicable for 3.92.1.10(a)(2) Only mm ²	Column 2 ^a Applicable for 3.92.1.10(a)(3) Only mm ²
150	4 200	4 200 – (28 Sd) ^b
225	6 100	6 100 – (28 Sd)
300	8 400	8 400 – (28 Sd)
450	12 600	12 600 – (28 Sd)
600	16 800	16 800 – (28 Sd)
750	21 000	21 000 – (28 Sd)
900	25 200	25 200 – (28 Sd)

^aThe maximum allowable fill areas in Column 2 shall be calculated. For example, the maximum allowable fill, in mm², for a 150 mm wide cable tray in Column 2 shall be 4 200 minus (28 multiplied by Sd) [the maximum allowable fill, in square inches, for a 6-in. wide cable tray in Column 2 shall be 6.5 minus (1.1 multiplied by Sd)].

^bThe term Sd in Column 2 is equal to the sum of the diameters, in mm, of all cables 507 mm² (in inches, of all 500 mm²) and larger single-conductor cables in the same ladder or ventilated trough cable tray with small cables.

(b) Single-Conductor Cables. The allowable ampacity of single-conductor cables shall be as permitted by 3.10.1.15(a)(2). The derating factors of 3.10.1.15(b)(2)(a) shall not apply to the ampacity of cables in cable trays. The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), nominally rated 2000 volts or less, shall comply with the following:

(1) Where installed according to the requirements of 3.92.1.10, the ampacities for 600 kcmil and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 3.10.1.17 and Table 3.10.1.19. Where cable trays are continuously covered for more than 1 800 mm with solid unventilated covers, the ampacities for 325 mm² and larger cables

shall not exceed 70 percent of the allowable ampacities in Table 3.10.1.17 and Table 3.10.1.19.

(2) Where installed according to the requirements of 3.92.1.10, the ampacities for 50 mm² through 125 mm² single-conductor cables in uncovered cable trays shall not exceed 65 percent of the allowable ampacities in Table 3.10.1.17 and Table 3.10.1.19. Where cable trays are continuously covered for more than 1.8 m (6 ft) with solid unventilated covers, the ampacities for 50 mm² through 250 mm² cables shall not exceed 60 percent of the allowable ampacities in Table 3.10.1.17 and Table 3.10.1.19.

(3) Where single conductors are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 50 mm² and larger cables shall not exceed the allowable ampacities in Table 3.10.1.17 and Table 3.10.1.19.

Exception to (b)(3): For solid bottom cable trays the ampacity of single conductor cables shall be determined by 3.10.1.15(c).

(4) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free airspace of not less than 2.15 times one conductor diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 50 mm² and larger cables shall not exceed the allowable ampacities of two or three single insulated conductors rated 0 through 2 000 volts supported on a messenger in accordance with 3.10.1.15(b).

FPN: See Table 3.10.1.20.

3.92.1.12 Number of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The number of cables rated 2001 volts or over permitted in a single cable tray shall not exceed the requirements of this section.

The sum of the diameters of single-conductor and multiconductor cables shall not exceed the cable tray width, and the cables shall be installed in a single layer. Where single conductor cables are triplexed, quadruplexed, or bound together in circuit groups, the sum of the diameters of the single conductors shall not exceed the cable tray width, and these groups shall be installed in single layer arrangement.

3.92.1.13 Ampacity of Type MV and Type MC Cables (2001 Volts or Over) in Cable Trays. The ampacity of cables, rated 2001 volts, nominal, or over, installed according to 3.92.1.12 shall not exceed the requirements of this section.

(a) Multiconductor Cables (2001 Volts or Over). The allowable ampacity of multiconductor cables shall be as given in Table 3.10.1.75 and Table 3.10.1.76, subject to the following provisions:

(1) Where cable trays are continuously covered for more than 1 800 mm with solid unventilated covers, not more than 95 percent of the allowable ampacities of Table 3.10.1.75 and Table 3.10.1.76 shall be permitted for multiconductor cables.

(2) Where multiconductor cables are installed in a single layer in uncovered cable trays, with maintained spacing of not less than one cable diameter between cables, the ampacity shall not exceed the allowable ampacities of Table 3.10.1.71 and Table 3.10.1.72.

(b) Single-Conductor Cables (2001 Volts or Over). The ampacity of single-conductor cables, or single conductors cabled together (triplexed, quadruplexed, etc.), shall comply with the following:

(1) The ampacities for 50 mm² and larger single-conductor cables in uncovered cable trays shall not exceed 75 percent of the allowable ampacities in Table 3.10.1.69 and Table 3.10.1.70. Where the cable trays are covered for more than 1 800 mm with solid unventilated covers, the ampacities for 50 mm² and larger single-conductor cables shall not exceed 70 percent of the allowable ampacities in Table 3.10.1.69 and Table 3.10.1.70.

(2) Where single-conductor cables are installed in a single layer in uncovered cable trays, with a maintained space of not less than one cable diameter between individual conductors, the ampacity of 50 mm² and larger cables shall not exceed the allowable ampacities in Table 3.10.1.69 and Table 3.10.1.70.

(3) Where single conductors are installed in a triangular or square configuration in uncovered cable trays, with a maintained free air space of not less than 2.15 times the diameter ($2.15 \times \text{O.D.}$) of the largest conductor contained within the configuration and adjacent conductor configurations or cables, the ampacity of 50 mm² and larger cables shall not exceed the allowable ampacities in Table 3.10.1.67 and Table 3.10.1.68.

ARTICLE 3.94 — CONCEALED KNOB-AND-TUBE WIRING

3.94.1 General

3.94.1.1 Scope. This article covers the use, installation, and construction specifications of concealed knob-and-tube wiring.

3.94.1.2. Definition.

Concealed Knob-and-Tube Wiring. A wiring method using knobs, tubes, and flexible nonmetallic tubing for the protection and support of single insulated conductors.

3.94.2 Installation

3.94.2.1 Uses Permitted. Concealed knob-and-tube wiring shall be permitted to be installed in the hollow spaces of walls and ceilings or in unfinished attics and roof spaces as provided by 3.94.2.14 only as follows:

- (1) For extensions of existing installations
- (2) Elsewhere by special permission

3.94.2.3 Uses Not Permitted. Concealed knob-and-tube wiring shall not be used in the following:

- (1) Commercial garages
- (2) Theaters and similar locations
- (3) Motion picture studios
- (4) Hazardous (classified) locations
- (5) Hollow spaces of walls, ceilings, and attics where such spaces are insulated by loose, rolled, or foamed-in-place insulating material that envelops the conductors

3.94.2.8 Through or Parallel to Framing Members. Conductors shall comply with 3.98.2.8 where passing through holes in structural members. Where passing through wood cross members in plastered partitions, conductors shall be protected by noncombustible, nonabsorbent, insulating tubes extending not less than 75 mm beyond the wood member.

3.94.2.10 Clearances.

(a) General. A clearance of not less than 75 mm shall be maintained between conductors and a clearance of not less than 25 mm between the conductor and the surface over which it passes.

(b) Limited Conductor Space. Where space is too limited to provide these minimum clearances, such as at meters, panelboards, outlets, and switch points, the individual conductors shall be enclosed in flexible nonmetallic tubing, which shall be continuous in length between the last support and the enclosure or terminal point.

(c) Clearance from Piping, Exposed Conductors, and So Forth. Conductors shall comply with 3.98.2.10 for clearances from other exposed conductors, piping, and so forth.

3.94.2.14 In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with 3.94.2.14(a) or (b).

FPN: See 3.10.1.10 for temperature limitation of conductors.

(a) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2 100 mm above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required where conductors are installed along the sides of joists, studs, or rafters.

(b) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 900 mm, the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

3.94.2.21 Securing and Supporting.

(a) **Supporting.** Conductors shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed as follows:

- (1) Within 150 mm of each side of each tap or splice, and
- (2) At intervals not exceeding 1 400 mm.

Where it is impracticable to provide supports, conductors shall be permitted to be fished through hollow spaces in dry locations, provided each conductor is individually enclosed in flexible nonmetallic tubing that is in continuous lengths between supports, between boxes, or between a support and a box.

(b) **Securing.** Where solid knobs are used, conductors shall be securely tied thereto by tie wires having insulation equivalent to that of the conductor.

3.94.2.33 Devices. Switches shall comply with 4.4.1.4 and 4.4.1.10(b).

3.94.2.47 Splices and Taps. Splices shall be soldered unless approved splicing devices are used. In-line or strain splices shall not be used.

3.94.3 Construction Specifications

3.94.3.1 Conductors. Conductors shall be of a type specified by Article 3.10.

ARTICLE 3.96 — MESSENGER SUPPORTED WIRING

3.96.1 General

3.96.1.1 Scope. This article covers the use, installation, and construction specifications for messenger supported wiring.

3.96.1.2 Definition.

Messenger Supported Wiring. An exposed wiring support system

using a messenger wire to support insulated conductors by any one of the following:

- (1) A messenger with rings and saddles for conductor support
- (2) A messenger with a field-installed lashing material for conductor support
- (3) Factory-assembled aerial cable
- (4) Multiplex cables utilizing a bare conductor, factory assembled and twisted with one or more insulated conductors, such as duplex, triplex, or quadruplex type of construction

3.96.2 Installation

3.96.2.1 Uses Permitted.

(a) **Cable Types.** The cable types in Table 3.96.2.1(a) shall be permitted to be installed in messenger supported wiring under the conditions described in the article or section referenced for each.

(b) **In Industrial Establishments.** In industrial establishments only, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installed messenger supported wiring, the following shall be permitted:

- (1) Any of the conductor types shown in Table 3.10.1.13 or Table 3.10.1.62
- (2) MV cable

Where exposed to weather, conductors shall be listed for use in wet locations. Where exposed to direct rays of the sun, conductors or cables shall be sunlight resistant.

(c) **Hazardous (Classified) Locations.** Messenger supported wiring shall be permitted to be used in hazardous (classified) locations where the contained cables are permitted for such use in 5.1.2.1, 5.2.2.1, 5.3.2.1, and 5.4.1.20.

3.96.2.3 Uses Not Permitted. Messenger supported wiring shall not be used in hoistways or where subject to physical damage.

ARTICLE 398 — OPEN WIRING ON INSULATORS

Table 3.96.2.1(a) Cable Types

Cable Type	Section	Article
Metal-clad cable		3.30
Mineral-insulated, metal-sheathed cable		3.32
Multiconductor service-entrance cable		3.38
Multiconductor underground feeder and branch-circuit cable		3.40
Other factory-assembled, multiconductor control, signal, or power cables that are identified for the use		
Power and control tray cable		3.36
Power-limited tray cable	7.25.3.21(c) and 7.25.4.1(e)	

3.96.2.21 Messenger Support. The messenger shall be supported at dead ends and at intermediate locations so as to eliminate tension on the conductors. The conductors shall not be permitted to come into contact with the messenger supports or any structural members, walls, or pipes.

3.96.2.47 Conductor Splices and Taps. Conductor splices and taps made and insulated by approved methods shall be permitted in messenger supported wiring.

3.96.2.51 Grounding. The messenger shall be grounded as required by 2.50.4.1 and 2.50.4.7 for enclosure grounding.

3.98 General

3.98.1.1 Scope. This article covers the use, installation, and construction specifications of open wiring on insulators.

3.98.1.2 Definition.

Open Wiring on Insulators. An exposed wiring method using cleats, knobs, tubes, and flexible tubing for the protection and support of single insulated conductors run in or on buildings.

3.98.2 Installation

3.98.2.1 Uses Permitted. Open wiring on insulators shall be permitted only for industrial or agricultural establishments on systems of 600 volts, nominal, or less, as follows:

- (1) Indoors or outdoors
- (2) In wet or dry locations
- (3) Where subject to corrosive vapors
- (4) For services

3.98.2.3 Uses Not Permitted. Open wiring on insulators shall not be installed where concealed by the building structure.

3.98.2.6 Exposed Work.

(a) Dry Locations. In dry locations, where not exposed to physical damage, conductors shall be permitted to be separately enclosed in flexible nonmetallic tubing. The tubing shall be in continuous lengths not exceeding 4 500 mm and secured to the surface by straps at intervals not exceeding 1 400 mm.

(b) Entering Spaces Subject to Dampness, Wetness, or Corrosive Vapors. Conductors entering or leaving locations subject to dampness, wetness, or corrosive vapors shall have drip loops formed on them and shall then pass upward and inward from the outside of the buildings, or from the damp, wet, or corrosive location, through noncombustible, nonabsorbent insulating tubes.

FPN: See 2.30.4.13 for individual conductors entering buildings or other structures.

(c) Exposed to Physical Damage. Conductors within 2 100 mm from the floor shall be considered exposed to physical damage. Where open conductors cross ceiling joists and wall studs and are exposed to physical damage, they shall be protected by one of the following methods:

(1) Guard strips not less than 25 mm nominal in thickness and at least as high as the insulating supports, placed on each side of and close to the wiring.

(2) A substantial running board at least 13 mm thick in back of the conductors with side protections. Running boards shall extend at least 25 mm outside the conductors, but not more than 50 mm, and the protecting sides shall be at least 50 mm high and at least 25 mm nominal in thickness.

(3) Boxing made in accordance with 3.98.2.6(c)(1) or (c)(2) and furnished with a cover kept at least 25 mm away from the conductors within. Where protecting vertical conductors on side walls, the boxing shall be closed at the top and the holes through which the conductors pass shall be bushed.

(4) Rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing. When installed in metal piping, the conductors shall be encased in continuous lengths of approved flexible tubing.

3.98.2.8 Through or Parallel to Framing Members. Open conductors shall be separated from contact with walls, floors, wood cross members, or partitions through which they pass by tubes or bushings of noncombustible, nonabsorbent insulating material. Where the bushing is shorter than the hole, a waterproof sleeve of noninductive material shall be inserted in the hole and an insulating bushing slipped into the sleeve at each end in such a manner as to keep the conductors absolutely out of contact with the sleeve. Each conductor shall be carried through a separate tube or sleeve.

FPN: See 3.10.1.10 for temperature limitation of conductors.

3.98.2.10 Clearances. Open conductors shall be separated at least 50 mm (2 in.) from metal raceways, piping, or other conducting material,

and from any exposed lighting, power, or signaling conductor, or shall be separated therefrom by a continuous and firmly fixed nonconductor in addition to the insulation of the conductor. Where any insulating tube is used, it shall be secured at the ends. Where practicable, conductors shall pass over rather than under any piping subject to leakage or accumulations of moisture.

3.98.2.14 In Accessible Attics. Conductors in unfinished attics and roof spaces shall comply with 3.98.2.14(a) or (b).

(a) Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the side of or through bored holes in floor joists, studs, or rafters. Where run through bored holes, conductors in the joists and in studs or rafters to a height of not less than 2 100 mm above the floor or floor joists shall be protected by substantial running boards extending not less than 25 mm on each side of the conductors. Running boards shall be securely fastened in place. Running boards and guard strips shall not be required for conductors installed along the sides of joists, studs, or rafters.

(b) Not Accessible by Stairway or Permanent Ladder. Conductors shall be installed along the sides of or through bored holes in floor joists, studs, or rafters.

Exception: In buildings completed before the wiring is installed, attic and roof spaces that are not accessible by stairway or permanent ladder and have headroom at all points less than 900 mm, the wiring shall be permitted to be installed on the edges of rafters or joists facing the attic or roof space.

3.98.2.21 Securing and Supporting.

(a) Conductor Sizes Smaller Than 8.0 mm²(3.2 mm dia.). Conductors smaller than 8.0 mm²(3.2 mm dia.) shall be rigidly supported on noncombustible, nonabsorbent insulating materials and shall not contact any other objects. Supports shall be installed as follows:

- (1) Within 150 mm from a tap or splice
- (2) Within 300 mm of a dead-end connection to a lampholder or receptacle

(3) At intervals not exceeding 1 400 mm and at closer intervals sufficient to provide adequate support where likely to be disturbed

(b) Conductor Sizes 8.0 mm²(3.2 mm dia.) and Larger. Supports for conductors 8.0 mm²(3.2 mm dia.) or larger installed across open spaces shall be permitted up to 4 500 mm apart if noncombustible, nonabsorbent insulating spacers are used at least every 1 400 mm to maintain at least 65 mm between conductors.

Where not likely to be disturbed in buildings of mill construction, 8.0 mm²(3.2 mm dia.) and larger conductors shall be permitted to be run across open spaces if supported from each wood cross member on approved insulators maintaining 150 mm between conductors.

(c) Industrial Establishments. In industrial establishments only, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the system, conductors of sizes 125 mm² and larger shall be permitted to be run across open spaces where supported at intervals up to 9 000 mm.

(d) Mounting of Conductor Supports. Where nails are used to mount knobs, they shall not be smaller than tenpenny. Where screws are used to mount knobs, or where nails or screws are used to mount cleats, they shall be of a length sufficient to penetrate the wood to a depth equal to at least one-half the height of the knob and the full thickness of the cleat. Cushion washers shall be used with nails.

(e) Tie Wires. 8.0 mm²(3.2 mm dia.) or larger conductors supported on solid knobs shall be securely tied thereto by tie wires having an insulation equivalent to that of the conductor.

3.98.2.33 Devices. Surface-type snap switches shall be mounted in accordance with 4.4.1.10(a), and boxes shall not be required. Other type switches shall be installed in accordance with 4.4.1.4.

3.98.3.1 Conductors. Conductors shall be of a type specified by Article 3.10.

3.98.3 Construction Specifications

Chapter 4. Equipment for General Use

ARTICLE 4.0 — FLEXIBLE CORDS AND CABLES

4.0.1 General

4.0.1.1 Scope. This article covers general requirements, applications, and construction specifications for flexible cords and flexible cables.

4.0.1.2 Other Articles. Flexible cords and flexible cables shall comply with this article and with the applicable provisions of other articles of this Code.

4.0.1.3 Suitability. Flexible cords and cables and their associated fittings shall be suitable for the conditions of use and location.

4.0.1.4 Types. Flexible cords and flexible cables shall conform to the description in Table 4.0.1.4. Types of flexible cords and flexible cables other than those listed in the table shall be the subject of special investigation.

4.0.1.5 Ampacities for Flexible Cords and Cables.

(a) **Ampacity Tables.** Table 4.0.1.5(a) provides the allowable ampacities, and Table 4.0.1.5(b) provides the ampacities for flexible cords and cables with not more than three current-carrying conductors. These tables shall be used in conjunction with applicable end-use product standards to ensure selection of the proper size and type. Where cords are used in ambient temperatures exceeding 30°C (86°F), the temperature correction factors from Table 3.10.1.16 that correspond to the temperature rating of the cord shall be applied to the ampacity from Table 4.0.1.5(b). Where the number of current-carrying conductors exceeds three, the allowable ampacity or the ampacity of each conductor shall be reduced from the 3-conductor rating as shown in Table 4.0.1.5.

Table 4.0.1.4 Flexible Cords and Cables (See 4.0.1.4.)

**The required outer covering on some single conductor cables may be integral with the insulation.

Notes:

1. All types listed in Table 4.0.1.4 shall have individual conductors twisted together except for Types HPN, SP-1, SP-2, SP-3, SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, TPT, NISP-1, NISP-2, NISPT-1, NISPT-2, NISPE-1, NISPE-2, and three-conductor parallel versions of SRD, SRDE, and SRDT.

2. Types TPT and TST shall be permitted in lengths not exceeding 2 400 mm where attached directly, or by means of a special type of plug, to a portable appliance rated at 50 watts or less and of such nature that extreme flexibility of the cord is essential.

3. Rubber-filled or varnished cambric tapes shall be permitted as a substitute for the inner braids.

4. Types G, G-GC, S, SC, SCE, SCT, SE, SEO, SEOO, SO, SOO, ST, STO, STOO, PPE, and W shall be permitted for use on theater stages, in garages, and elsewhere where flexible cords are permitted by this Code.

5. Elevator traveling cables for operating control and signal circuits shall contain nonmetallic fillers as necessary to maintain concentricity. Cables shall have steel supporting members as required for suspension by 6.20.5.1. In locations subject to excessive moisture or corrosive vapors or gases, supporting members of other materials shall be permitted. Where steel supporting members are used, they shall run straight through the center of the cable assembly and shall not be cabled with the copper strands of any conductor.

In addition to conductors used for control and signaling circuits, Types E, EO, ETP, and ETT elevator cables shall be permitted to incorporate in the construction one or more **20 AWG** telephone conductor pairs, one or more coaxial cables, or one or more optical fibers. The **20 AWG** conductor pairs shall be permitted to be covered with suitable shielding for telephone, audio, or higher frequency communications circuits; the coaxial cables consist of a center conductor, insulation, and shield for use in video or other radio frequency communications circuits. The optical fiber shall be suitably covered with flame-retardant thermoplastic. The insulation of the conductors shall be rubber or thermoplastic of thickness not less than specified for the other conductors of the particular type of cable. Metallic shields shall have their own protective covering. Where used, these components shall be permitted to be incorporated in any layer of the cable assembly but shall not run straight through the center.

6. The third conductor in these cables shall be used for equipment grounding purpose only. The insulation of the grounding conductor for Types SPE-1, SPE-2, SPE-3, SPT-1, SPT-2, SPT-3, NISPT-1, NISPT-2, NISPE-1, and NISPE-2 shall be permitted to be thermoset polymer.

7. The individual conductors of all cords, except those of heat-resistant cords, shall have a thermoset or thermoplastic insulation, except that the equipment grounding conductor where used shall be in accordance with 4.0.2.4(b).

8. Where the voltage between any two conductors exceeds 300, but does not exceed 600, flexible cord of 5.5 mm² (2.6 mm dia.) and smaller shall have thermoset or thermoplastic insulation on the individual conductors at least 1.14 mm (45 mils) in thickness, unless Type S, SE, SEO, SEOO, SO, SOO, ST, STO, or STOO cord is used.

9. Insulations and outer coverings that meet the requirements as flame retardant, limited smoke, and are so listed, shall be permitted to be marked for limited smoke after the code type designation.

10. Elevator cables in sizes 20 AWG through 2.0 mm² (1.6 mm dia.) are rated 300 volts, and sizes 5.5 mm² (2.6 mm dia.) through 30 mm² are rated 600 volts. 3.5 mm² (2.0 mm dia.) is rated 300 volts with a 0.76-mm (30-mil) insulation thickness and 600 volts with a 1.14-mm (45-mil) insulation thickness.

11. Conductor size for Types EV, EVJ, EVE, EVJE, EVT, and EVJT cables apply to nonpower-limited circuits only. Conductors of power-limited (data, signal, or communications) circuits may extend beyond the stated AWG size range. All conductors shall be insulated for the same cable voltage rating.

12. Insulation thickness for Types EV, EVJ, EVEJE, EVT, and EVJT cables of nylon construction is indicated in parentheses.

13. Cords that comply with the requirements for outdoor cords and are so listed shall be permitted to be designated as weather and water resistant with the suffix "W" after the code type designation. Cords with the "W" suffix are suitable for use in wet locations.

250	515	448	392	620	537	470	700	613	536

¹The ampacities under subheading D shall be permitted for single-conductor Types SC, SCE, SCT, PPE, and W cable only where the individual conductors are not installed in raceways and are not in physical contact with each other except in lengths not to exceed 600 mm where passing through the wall of an enclosure.

²The ampacities under subheading E apply to two-conductor cables and other multiconductor cables connected to utilization equipment so that only two conductors are current carrying.

³The ampacities under subheading F apply to three-conductor cables and other multiconductor cables connected to utilization equipment so that only three conductors are current carrying.

(b) Ultimate Insulation Temperature. In no case shall conductors be associated together in such a way with respect to the kind of circuit, the wiring method used, or the number of conductors such that the limiting temperature of the conductors is exceeded.

A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to meet the requirements of a current-carrying conductor.

In a 3-wire circuit consisting of two phase wires and the neutral of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.

On a 4-wire, 3-phase, wye circuit where the major portion of the load consists of nonlinear loads, there are harmonic currents present in the neutral conductor and the neutral shall be considered to be a current-carrying conductor.

An equipment grounding conductor shall not be considered a current-carrying conductor.

Where a single conductor is used for both equipment grounding and to carry unbalanced current from other conductors, as provided for in 250.140 for electric ranges and electric clothes dryers, it shall not be considered as a current-carrying conductor.

Exception: For other loading conditions, adjustment factors shall be permitted to be calculated under 3.10.1.15(c).

FPN: See Annex B, Table B 3.10.1.11, for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

4.0.1.6 Markings.

(a) Standard Markings. Flexible cords and cables shall be marked by means of a printed tag attached to the coil reel or carton. The tag shall contain the information required in 3.10.1.11(a). Types S, SC, SCE, SCT, SE, SEO, SEOO, SJ, SJE, SJE0, SJE00, SJO, SJT, SJTO, SJTOO, SO, SOO, ST, STO, STOO, SEW, SEOW, SEOWW, SJEW, SJEOW, SJEOWW, SJOW, SJTW, SJTOW, SJTOOW, SOW, SOOW, STW, STOW, and STOWW flexible cords and G, G-GC, PPE, and W flexible cables shall be durably marked on the surface at intervals not exceeding 600 mm with the type designation, size, and number of conductors.

(b) Optional Markings. Flexible cords and cable types listed in Table 4.0.1.4 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistance, and so forth.

4.0.1.7 Uses Permitted.

(a) Uses. Flexible cords and cables shall be used only for the following:

- (1) Pendants
- (2) Wiring of luminaires (fixtures)
- (3) Connection of portable lamps, portable and mobile signs, or appliances
- (4) Elevator cables
- (5) Wiring of cranes and hoists
- (6) Connection of utilization equipment to facilitate frequent interchange
- (7) Prevention of the transmission of noise or vibration
- (8) Appliances where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance and repair, and the appliance is intended or identified for flexible cord connection
- (9) Connection of moving parts
- (10) Where specifically permitted elsewhere in this Code

(b) Attachment Plugs. Where used as permitted in 4.0.1.7(a)(3), (a)(6), and (a)(8), each flexible cord shall be equipped with an attachment plug and shall be energized from a receptacle outlet.

Exception: As permitted in 3.68.2.47.

4.0.1.8 Uses Not Permitted. Unless specifically permitted in 4.0.1.7, flexible cords and cables shall not be used for the following:

- (1) As a substitute for the fixed wiring of a structure
- (2) Where run through holes in walls, structural ceilings, suspended ceilings, dropped ceilings, or floors
- (3) Where run through doorways, windows, or similar openings

- (4) Where attached to building surfaces

Exception to (4): Flexible cord and cable shall be permitted to be attached to building surfaces in accordance with the provisions of 3.68.2.47(b)

- (5) Where concealed by walls, floors, or ceilings or located above suspended or dropped ceilings

- (6) Where installed in raceways, except as otherwise permitted in this Code

- (7) Where subject to physical damage

4.0.1.9 Splices. Flexible cord shall be used only in continuous lengths without splice or tap where initially installed in applications permitted by 4.0.1.7(a). The repair of hard-service cord and junior hard-service cord (see Trade Name column in Table 4.0.1.4) 2.0 mm² (1.6 mm dia.) and larger shall be permitted if conductors are spliced in accordance with 1.10.1.14(b) and the completed splice retains the insulation, outer sheath properties, and usage characteristics of the cord being spliced.

4.0.1.10 Pull at Joints and Terminals. Flexible cords and cables shall be connected to devices and to fittings so that tension is not transmitted to joints or terminals.

Exception: Listed portable single-pole devices that are intended to accommodate such tension at their terminals shall be permitted to be used with single-conductor flexible cable.

FPN: Some methods of preventing pull on a cord from being transmitted to joints or terminals are knotting the cord, winding with tape, and fittings designed for the purpose.

4.0.1.11 In Show Windows and Show Cases. Flexible cords used in show windows and show cases shall be Type S, SE, SEO, SEOO, SJ, SJE, SJEJ, SJEEO, SJO, SJOJ, SJT, SJTO, SJTOO, SO, SOO, ST, STO, STOO, SEW, SEOW, SEOOW, SJEW, SJEOW, SJEOWW, SJOW, SJOOW, SJTW, SJTOW, SJTOOW, SOW, SOOW, STW, STOW, or STOWW.

Exception No. 1: For the wiring of chain-supported luminaires (lighting fixtures).

Exception No. 2: As supply cords for portable lamps and other merchandise being displayed or exhibited.

4.0.1.12 Minimum Size. The individual conductors of a flexible cord or cable shall not be smaller than the sizes in Table 4.0.1.4.

Exception: The size of the insulated ground-check conductor of Type G-GC cables shall be not smaller than 5.5 mm² (2.6 mm dia.).

4.0.1.13 Overcurrent Protection. Flexible cords not smaller than **18 AWG**, and tinsel cords or cords having equivalent characteristics of smaller size approved for use with specific appliances, shall be considered as protected against overcurrent by the overcurrent devices described in 2.40.1.5.

4.0.1.14 Protection from Damage. Flexible cords and cables shall be protected by bushings or fittings where passing through holes in covers, outlet boxes, or similar enclosures.

In industrial establishments where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, flexible cords and cables shall be permitted to be installed in aboveground raceways that are no longer than 15 m to protect the flexible cord or cable from physical damage. Where more than three current-carrying conductors are installed within the raceway, the allowable ampacity shall be reduced in accordance with Table 4.0.1.5.

4.0.2 Construction Specifications

4.0.2.1 Labels. Flexible cords shall be examined and tested at the factory and labeled before shipment.

4.0.2.2 Nominal Insulation Thickness. The nominal thickness of insulation for conductors of flexible cords and cables shall not be less than specified in Table 4.0.1.4.

*Exception: The nominal insulation thickness for the ground-check conductors of Type G-GC cables shall not be less than **1.14 mm (45 mils)** for 8.0 mm² (3.2 mm dia.) and not less than **0.76 mm (30 mils)** for 5.5 mm² (2.6 mm dia.).*

4.0.2.3 Grounded-Conductor Identification. One conductor of flexible cords that is intended to be used as a grounded circuit conductor shall have a continuous marker that readily distinguishes it from the other conductor or conductors. The identification shall consist of one of the methods indicated in 4.0.2.3(a) through 4.0.2.3(f).

(a) **Colored Braid.** A braid finished to show a white or gray color and the braid on the other conductor or conductors finished to show a readily distinguishable solid color or colors.

(b) **Tracer in Braid.** A tracer in a braid of any color contrasting with that of the braid and no tracer in the braid of the other conductor or conductors. No tracer shall be used in the braid of any conductor of a flexible cord that contains a conductor having a braid finished to show white or gray.

Exception: In the case of Types C and PD and cords having the braids on the individual conductors finished to show white or gray. In such cords, the identifying marker shall be permitted to consist of the solid white or gray finish on one conductor, provided there is a colored tracer in the braid of each other conductor.

(c) **Colored Insulation.** A white or gray insulation on one conductor and insulation of a readily distinguishable color or colors on the other conductor or conductors for cords having no braids on the individual conductors.

For jacketed cords furnished with appliances, one conductor having its insulation colored light blue, with the other conductors having their insulation of a readily distinguishable color other than white or gray.

Exception: Cords that have insulation on the individual conductors integral with the jacket.

The insulation shall be permitted to be covered with an outer finish to provide the desired color.

(d) **Colored Separator.** A white or gray separator on one conductor and a separator of a readily distinguishable solid color on the other conductor or conductors of cords having insulation on the individual conductors integral with the jacket.

(e) **Tinned Conductors.** One conductor having the individual strands tinned and the other conductor or conductors having the individual strands untinned for cords having insulation on the individual conductors integral with the jacket.

(f) **Surface Marking.** One or more ridges, grooves, or white stripes located on the exterior of the cord so as to identify one conductor for cords having insulation on the individual conductors integral with the jacket.

4.0.2.4 Equipment Grounding Conductor Identification. A conductor intended to be used as an equipment grounding conductor shall have a continuous identifying marker readily distinguishing it from the other conductor or conductors. Conductors having a continuous green color or a continuous green color with one or more yellow stripes shall not be used for other than equipment grounding purposes. The identifying marker shall consist of one of the methods in 4.0.2.4(a) or 4.0.2.4(b).

(a) **Colored Braid.** A braid finished to show a continuous green color or a continuous green color with one or more yellow stripes.

(b) **Colored Insulation or Covering.** For cords having no braids on the individual conductors, an insulation of a continuous green color or a continuous green color with one or more yellow stripes.

4.0.2.5 Attachment Plugs. Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 2.50.7.9(a) and 2.50.7.9(b).

4.0.3 Portable Cables Over 600 Volts, Nominal

4.0.3.1 Scope. This part applies to multiconductor portable cables used to connect mobile equipment and machinery.

4.0.3.2 Construction.

(a) **Conductors.** The conductors shall be 8.0 mm² (3.2 mm dia.) copper or larger and shall employ flexible stranding.

Exception: The size of the insulated ground-check conductor of Type G-GC cables shall be not smaller than 5.5 mm² (2.6 mm dia.).

(b) Shields. Cables operated at over 2 000 volts shall be shielded. Shielding shall be for the purpose of confining the voltage stresses to the insulation.

(c) Equipment Grounding Conductor(s). An equipment grounding conductor(s) shall be provided. The total area shall not be less than that of the size of the equipment grounding conductor required in 2.50.6.13.

4.0.3.3 Shielding. All shields shall be grounded.

4.0.3.4 Grounding. Grounding conductors shall be connected in accordance with Part 2.50.5.

4.0.3.5 Minimum Bending Radii. The minimum bending radii for portable cables during installation and handling in service shall be adequate to prevent damage to the cable.

4.0.3.6 Fittings. Connectors used to connect lengths of cable in a run shall be of a type that lock firmly together. Provisions shall be made to prevent opening or closing these connectors while energized. Suitable means shall be used to eliminate tension at connectors and terminations.

4.0.3.7 Splices and Terminations. Portable cables shall not contain splices unless the splices are of the permanent molded, vulcanized types in accordance with 1.10.1.14(b). Terminations on portable cables rated over 600 volts, nominal, shall be accessible only to authorized and licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

ARTICLE 402 — FIXTURE (Luminaires) WIRES

4.2.1.1 Scope. This article covers general requirements and construction specifications for fixture (luminaire) wires.

4.2.1.2 Other Articles. Fixture wires shall comply with this article and also with the applicable provisions of other articles of this Code.

FPN: For application in luminaires (lighting fixtures), see Article 4.10.

4.2.1.3 Types. Fixture (luminaire) wires shall be of a type listed in Table 4.2.1.3, and they shall comply with all requirements of that table. The fixture (luminaire) wires listed in Table 4.2.1.3 are all suitable for service at 600 volts, nominal, unless otherwise specified.

FPN: Thermoplastic insulation may stiffen at temperatures colder than -10°C (+14°F), requiring that care be exercised during installation at such temperatures. Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, requiring that care be exercised during installation and at points of support.

4.2.1.5 Allowable Ampacities for Fixture (luminaire) Wires. The allowable ampacity of fixture wire shall be as specified in Table 4.2.1.5.

No conductor shall be used under such conditions that its operating temperature exceeds the temperature specified in Table 4.2.1.3 for the type of insulation involved.

FPN: See 3.10.1.10 for temperature limitation of conductors.

4.2.1.6 Minimum Size. Fixture (luminaire) wires shall not be smaller than 18 AWG.

4.2.1.7 Number of Conductors in Conduit or Tubing. The number of fixture wires permitted in a single conduit or tubing shall not exceed the percentage fill specified in Table 1, Chapter 9.

4.2.1.8 Grounded Conductor Identification. Fixture wires that are intended to be used as grounded conductors shall be identified by one or more continuous white stripes on other than green insulation or by the means described in 4.0.2.3(a) through 4.0.2.3(e).

4.2.1.9 Marking.

(a) Method of Marking. Thermoplastic insulated fixture (luminaire) wire shall be durably marked on the surface at intervals not exceeding 600 mm. All other fixture wire shall be marked by means of a printed tag attached to the coil, reel, or carton.

Table 4.2.1.3 Fixture Wires

Name	Type Letter	Insulation	Thickness of Insulation		Outer Covering	Maximum Operating Temperature	Application Provisions
			mm	mils			
Heat-resistant rubber-covered fixture wire — flexible stranding	FFH-2	Heat-resistant rubber Cross-linked synthetic polymer	0.76	30	Nonmetallic covering	75°C 167°F	Fixture wiring

*Insulations and outer coverings that meet the requirements of flame retardant, limited smoke, and are so listed shall be permitted to be marked for limited smoke after the Code type designation.

Table 4.2.1.5 Allowable Ampacity for Fixture (luminaire) Wires

Size mm ² (mm dia.)	Allowable Ampacity
18	6
16	8
2.0(1.6)	17
3.5(2.6)	23
5.5(2.6)	28

(b) Optional Marking. Fixture (luminaire) wire types listed in Table 4.2.1.3 shall be permitted to be surface marked to indicate special characteristics of the cable materials. These markings include, but are not limited to, markings for limited smoke, sunlight resistance, and so forth.

4.2.1.10 Uses Permitted. Fixture (luminaire) wires shall be permitted (1) for installation in luminaires (lighting fixtures) and in similar equipment where enclosed or protected and not subject to bending or twisting in use, or (2) for connecting luminaires (lighting fixtures) to the branch-circuit conductors supplying the luminaires (fixtures).

4.2.1.11 Uses Not Permitted. Fixture wires shall not be used as branch-circuit conductors.

4.2.1.12 Overcurrent Protection. Overcurrent protection for fixture wires shall be as specified in 2.40.1.5.

ARTICLE 4.4 — SWITCHES

4.4.1 Installation

4.4.1.1 Scope. The provisions of this article shall apply to all switches, switching devices, and circuit breakers where used as switches.

4.4.1.2 Switch Connections.

(a) Three-Way and Four-Way Switches. Three-way and four-way switches shall be wired so that all switching is done only in the ungrounded circuit conductor. Where in metal raceways or metal-armored cables, wiring between switches and outlets shall be in accordance with 3.0.1.20(a).

Exception: Switch loops shall not require a grounded conductor.

(b) Grounded Conductors. Switches or circuit breakers shall not disconnect the grounded conductor of a circuit.

Exception: A switch or circuit breaker shall be permitted to disconnect a grounded circuit conductor where all circuit conductors are disconnected simultaneously, or where the device is arranged so that the grounded conductor cannot be disconnected until all the ungrounded conductors of the circuit have been disconnected.

4.4.1.3 Enclosure.

(a) General. Switches and circuit breakers shall be of the externally operable type mounted in an enclosure listed for the intended use. The minimum wire-bending space at terminals and minimum gutter space provided in switch enclosures shall be as required in 3.12.1.6.

Exception No. 1: Pendant- and surface-type snap switches and knife switches mounted on an open-face switchboard or panelboard shall be permitted without enclosures.

Exception No. 2: Switches and circuit breakers installed in accordance with 1.10.2.2(a)(1), (a)(2), (a)(3), or (a)(4) shall be permitted without enclosures.

(b) Used as a Raceway. Enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices, unless the enclosure complies with 3.12.1.8.

4.4.1.4 Wet Locations. A switch or circuit breaker in a wet location or outside of a building shall be enclosed in a weatherproof enclosure or cabinet that shall comply with 3.12.1.2(a). Switches shall not be

installed within wet locations in tub or shower spaces unless installed as part of a listed tub or shower assembly.

4.4.1.5 Time Switches, Flashers, and Similar Devices. Time switches, flashers, and similar devices shall be of the enclosed type or shall be mounted in cabinets or boxes or equipment enclosures. Energized parts shall be barriered to prevent operator exposure when making manual adjustments or switching.

Exception: Devices mounted so they are accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner shall be permitted without barriers, provided they are located within an enclosure such that any energized parts within 150 mm of the manual adjustment or switch are covered by suitable barriers.

4.4.1.6 Position and Connection of Switches.

(a) Single-Throw Knife Switches. Single-throw knife switches shall be placed so that gravity will not tend to close them. Single-throw knife switches, approved for use in the inverted position, shall be provided with an integral mechanical means that ensures that the blades remain in the open position when so set.

(b) Double-Throw Knife Switches. Double-throw knife switches shall be permitted to be mounted so that the throw is either vertical or horizontal. Where the throw is vertical, integral mechanical means shall be provided to hold the blades in the open position when so set.

(c) Connection of Switches. Single-throw knife switches and switches with butt contacts shall be connected such that their blades are de-energized when the switch is in the open position. Bolted pressure contact switches shall have barriers that prevent inadvertent contact with energized blades. Single-throw knife switches, bolted pressure contact switches, molded case switches, switches with butt contacts, and circuit breakers used as switches shall be connected so that the terminals supplying the load are de-energized when the switch is in the open position.

Exception: The blades and terminals supplying the load of a switch shall be permitted to be energized when the switch is in the open

position where the switch is connected to circuits or equipment inherently capable of providing a backfeed source of power. For such installations, a permanent sign shall be installed on the switch enclosure or immediately adjacent to open switches with the following words or equivalent:

WARNING — LOAD SIDE TERMINALS MAY BE ENERGIZED BY BACKFEED.

4.4.1.7 Indicating. General-use and motor-circuit switches, circuit breakers, and molded case switches, where mounted in an enclosure as described in 4.4.1.3, shall clearly indicate whether they are in the open (off) or closed (on) position.

Where these switch or circuit breaker handles are operated vertically rather than rotationally or horizontally, the up position of the handle shall be the (on) position.

Exception No. 1: Vertically operated double-throw switches shall be permitted to be in the closed (on) position with the handle in either the up or down position.

Exception No. 2: On busway installations, tap switches employing a center-pivoting handle shall be permitted to be open or closed with either end of the handle in the up or down position. The switch position shall be clearly indicating and shall be visible from the floor or from the usual point of operation.

4.4.1.8 Accessibility and Grouping.

(a) Location. All switches and circuit breakers used as switches shall be located so that they may be operated from a readily accessible place. They shall be installed such that the center of the grip of the operating handle of the switch or circuit breaker, when in its highest position, is not more than 1 980 mm above the floor or working platform.

Exception No. 1: On busway installations, fused switches and circuit breakers shall be permitted to be located at the same level as the busway. Suitable means shall be provided to operate the handle of the device from the floor.

Exception No. 2: Switches and circuit breakers installed adjacent to motors, appliances, or other equipment that they supply shall be

permitted to be located higher than 1 980 mm and to be accessible by portable means.

Exception No. 3: Hookstick operable isolating switches shall be permitted at greater heights.

(b) Voltage Between Adjacent Devices. A snap switch shall not be grouped or ganged in enclosures with other snap switches, receptacles, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices.

4.4.1.9 Provisions for General-Use Snap Switches.

(a) Faceplates. Faceplates provided for snap switches mounted in boxes and other enclosures shall be installed so as to completely cover the opening and, where the switch is flush mounted, seat against the finished surface.

(b) Grounding. Snap switches, including dimmer and similar control switches, shall be effectively grounded and shall provide a means to ground metal faceplates, whether or not a metal faceplate is installed. Snap switches shall be considered effectively grounded if either of the following conditions is met:

(1) The switch is mounted with metal screws to a metal box or to a nonmetallic box with integral means for grounding devices.

(2) An equipment grounding conductor or equipment bonding jumper is connected to an equipment grounding termination of the snap switch.

Exception to (b): Where no grounding means exists within the snap-switch enclosure or where the wiring method does not include or provide an equipment ground, a snap switch without a grounding connection shall be permitted for replacement purposes only. A snap switch wired under the provisions of this exception and located within reach of earth, grade, conducting floors, or other conducting surfaces shall be provided with a faceplate of nonconducting, noncombustible material or shall be protected by a ground-fault circuit interrupter.

(c) Construction. Metal faceplates shall be of ferrous metal not less

than 0.75 mm in thickness or of nonferrous metal not less than 1.00 mm in thickness. Faceplates of insulating material shall be noncombustible and not less than 0.25 mm in thickness, but they shall be permitted to be less than 0.25 mm in thickness if formed or reinforced to provide adequate mechanical strength.

4.4.1.10 Mounting of Snap Switches.

(a) Surface-Type. Snap switches used with open wiring on insulators shall be mounted on insulating material that separates the conductors at least 13 mm from the surface wired over.

(b) Box Mounted. Flush-type snap switches mounted in boxes that are set back of the finished surface as permitted in 3.14.2.6 shall be installed so that the extension plaster ears are seated against the surface. Flush-type snap switches mounted in boxes that are flush with the finished surface or project from it shall be installed so that the mounting yoke or strap of the switch is seated against the box.

4.4.1.11 Circuit Breakers as Switches. A hand-operable circuit breaker equipped with a lever or handle, or a power-operated circuit breaker capable of being opened by hand in the event of a power failure, shall be permitted to serve as a switch if it has the required number of poles.

FPN: See the provisions contained in 2.40.7.2 and 2.40.7.4.

4.4.1.12 Grounding of Enclosures. Metal enclosures for switches or circuit breakers shall be grounded as specified in Article 2.50. Where nonmetallic enclosures are used with metal raceways or metal-armored cables, provision shall be made for grounding continuity.

Except as covered in 4.4.1.9(b), Exception, nonmetallic boxes for switches shall be installed with a wiring method that provides or includes an equipment ground.

4.4.1.13 Knife Switches.

(a) Isolating Switches. Knife switches rated at over 1 200 amperes at 250 volts or less, and at over 600 amperes at 251 to 600 volts, shall be used only as isolating switches and shall not be opened under load.

(b) To Interrupt Currents. To interrupt currents over 1 200 amperes at 250 volts, nominal, or less, or over 600 amperes at 251 to 600 volts, nominal, a circuit breaker or a switch of special design listed for such purpose shall be used.

(c) General-Use Switches. Knife switches of ratings less than specified in 4.4.1.13(a) and 4.4.1.13(b) shall be considered general-use switches.

FPN: See the definition of General-Use Switch in Article 100.

(d) Motor-Circuit Switches. Motor-circuit switches shall be permitted to be of the knife-switch type.

FPN: See the definition of a Motor-Circuit Switch in Article 1.1.

4.4.1.14 Rating and Use of Snap Switches. Snap switches shall be used within their ratings and as indicated in 4.4.1.14(a) through 4.4.1.14(d).

FPN No. 1: For switches on signs and outline lighting, see 6.0.1.6.

FPN No. 2: For switches controlling motors, see 4.30.7.3, 4.30.9.9, and 4.30.9.10.

(a) Alternating Current General-Use Snap Switch. A form of general-use snap switch suitable only for use on ac circuits for controlling the following:

(1) Resistive and inductive loads, including electric-discharge lamps, not exceeding the ampere rating of the switch at the voltage involved

(2) Tungsten-filament lamp loads not exceeding the ampere rating of the switch at 120 volts

(3) Motor loads not exceeding 80 percent of the ampere rating of the switch at its rated voltage

(b) Alternating-Current or Direct-Current General-Use Snap Switch. A form of general-use snap switch suitable for use on either ac or dc circuits for controlling the following:

(1) Resistive loads not exceeding the ampere rating of the switch at the voltage applied.

(2) Inductive loads not exceeding 50 percent of the ampere rating

of the switch at the applied voltage. Switches rated in horsepower are suitable for controlling motor loads within their rating at the voltage applied.

(3) Tungsten-filament lamp loads not exceeding the ampere rating of the switch at the applied voltage if T-rated.

(c) CO/ALR Snap Switches. Snap switches rated 20 amperes or less directly connected to aluminum conductors shall be listed and marked CO/ALR.

(d) Alternating-Current Specific-Use Snap Switches Rated for 347 Volts. Snap switches rated 347 volts ac shall be listed and shall be used only for controlling the loads permitted by (d)(1) and (d)(2).

(1) Noninductive Loads. Noninductive loads other than tungsten-filament lamps not exceeding the ampere and voltage ratings of the switch.

(2) Inductive Loads. Inductive loads not exceeding the ampere and voltage ratings of the switch. Where particular load characteristics or limitations are specified as a condition of the listing, those restrictions shall be observed regardless of the ampere rating of the load.

The ampere rating of the switch shall not be less than 15 amperes at a voltage rating of 347 volts ac. Flush-type snap switches rated 347 volts ac shall not be readily interchangeable in box mounting with switches identified in 4.4.1.14(a) and 4.4.1.14(b).

(e) Dimmer Switches. General-use dimmer switches shall be used only to control permanently installed incandescent luminaires (lighting fixtures) unless listed for the control of other loads and installed accordingly.

4.4.2 Construction Specifications

4.4.2.1 Marking.

(a) Ratings. Switches shall be marked with the current voltage, and, if horsepower rated, the maximum rating for which they are designed.

(b) Off Indication. Where in the off position, a switching device with a marked OFF position shall completely disconnect all

ungrounded conductors to the load it controls.

4.4.2.2 600-Volt Knife Switches. Auxiliary contacts of a renewable or quick-break type or the equivalent shall be provided on all knife switches rated 600 volts and designed for use in breaking current over 200 amperes.

4.4.2.3 Fused Switches. A fused switch shall not have fuses in parallel except as permitted in 2.40.1.8.

4.4.2.4 Wire-Bending Space. The wire-bending space required by 4.4.1.3 shall meet Table 3.12.1.6(b) spacings to the enclosure wall opposite the line and load terminals.

ARTICLE 4.6 — RECEPTACLES, CORD CONNECTORS, AND ATTACHMENT PLUGS (CAPS)

4.6.1.1 Scope. This article covers the rating, type, and installation of receptacles, cord connectors, and attachment plugs (cord caps).

4.6.1.2 Receptacle Rating and Type.

(a) Receptacles. Receptacles shall be listed and marked with the manufacturer's name or identification and voltage and ampere ratings.

(b) Rating. Receptacles and cord connectors shall be rated not less than 15 amperes, 125 volts, or 15 amperes, 250 volts, and shall be of a type not suitable for use as lampholders.

FPN: See 2.10.2.3(b) for receptacle ratings where installed on branch circuits.

(c) Receptacles for Aluminum Conductors. Receptacles rated 20 amperes or less and designed for the direct connection of aluminum conductors shall be marked CO/ALR.

(d) Isolated Ground Receptacles. Receptacles incorporating an isolated grounding connection intended for the reduction of electrical noise (electromagnetic interference) as permitted in 2.50.7.17(d) shall be identified by an orange triangle located on the face of the receptacle.

(1) **Isolated Equipment Grounding Conductor Required.** Receptacles so identified shall be used only with grounding conductors that are isolated in accordance with 2.50.7.17(d).

(2) **Installation in Nonmetallic Boxes.** Isolated ground receptacles installed in nonmetallic boxes shall be covered with a nonmetallic faceplate.

Exception: Where an isolated ground receptacle is installed in a nonmetallic box, a metal faceplate shall be permitted if the box contains a feature or accessory that permits the effective grounding of the faceplate.

4.6.1.3 General Installation Requirements. Receptacle outlets shall be located in branch circuits in accordance with Part 2.10.3. General installation requirements shall be in accordance with 4.6.1.3(a) through 4.6.1.3(f).

(a) Grounding Type. Receptacles installed on 15- and 20-ampere branch circuits shall be of the grounding type. Grounding-type receptacles shall be installed only on circuits of the voltage class and current for which they are rated, except as provided in Table 2.10.2.3(b)(2) and Table 2.10.2.3(b)(3).

Exception: Nongrounding-type receptacles installed in accordance with 4.6.1.3(d).

(b) To Be Grounded. Receptacles and cord connectors that have grounding contacts shall have those contacts effectively grounded.

Exception No. 1: Receptacles mounted on portable and vehicle-mounted generators in accordance with 2.50.2.15.

Exception No. 2: Replacement receptacles as permitted by 4.6.1.3(d).

(c) Methods of Grounding. The grounding contacts of receptacles and cord connectors shall be grounded by connection to the equipment grounding conductor of the circuit supplying the receptacle or cord connector.

FPN: For installation requirements for the reduction of electrical noise, see 2.50.7.17(d).

The branch-circuit wiring method shall include or provide an equipment-grounding conductor to which the grounding contacts of the receptacle or cord connector are connected.

FPN No. 1: See 2.50.6.9 for acceptable grounding means.

FPN No. 2: For extensions of existing branch circuits, see 2.50.7.1.

(d) Replacements. Replacement of receptacles shall comply with 4.6.1.3(d)(1), (d)(2), and (d)(3) as applicable.

(1) **Grounding-Type Receptacles.** Where a grounding means exists in the receptacle enclosure or a grounding conductor is installed in accordance with 2.50.7.1(c), grounding-type receptacles shall be used and shall be connected to the grounding conductor in accordance with 4.6.1.3(c) or 2.50.7.1(c).

(2) **Ground-Fault Circuit Interrupters.** Ground-fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this Code.

(3) **Non-grounding-Type Receptacles.** Where grounding means does not exist in the receptacle enclosure, the installation shall comply with (d)(3)a, (d)(3)b, or (d)(3)c.

a. A non-grounding-type receptacle(s) shall be permitted to be replaced with another non-grounding-type receptacle(s).

b. A non-grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles shall be marked "No Equipment Ground." An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.

c. A non-grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Grounding-type receptacles supplied through the ground-fault circuit interrupter shall be marked "GFCI Protected" and "No Equipment Ground." An equipment grounding conductor shall not be connected between the grounding-type receptacles.

(e) Cord-and-Plug-Connected Equipment. The installation of grounding-type receptacles shall not be used as a requirement that all

cord-and-plug-connected equipment be of the grounded type.

FPN: See 2.50.6.5 for types of cord-and-plug-connected equipment to be grounded.

(f) Noninterchangeable Types. Receptacles connected to circuits that have different voltages, frequencies, or types of current (ac or dc) on the same premises shall be of such design that the attachment plugs used on these circuits are not interchangeable.

4.6.1.4 Receptacle Mounting. Receptacles shall be mounted in boxes or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place unless otherwise permitted elsewhere in this Code.

(a) Boxes That Are Set Back. Receptacles mounted in boxes that are set back from the finished surface as permitted in 3.14.2.6 shall be installed such that the mounting yoke or strap of the receptacle is held rigidly at the finished surface.

(b) Boxes That Are Flush. Receptacles mounted in boxes that are flush with the finished surface or project therefrom shall be installed such that the mounting yoke or strap of the receptacle is held rigidly against the box or box cover.

(c) Receptacles Mounted on Covers. Receptacles mounted to and supported by a cover shall be held rigidly against the cover by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw.

(d) Position of Receptacle Faces. After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.38 mm from metal faceplates.

Exception No. 1: Listed kits or assemblies encompassing receptacles and nonmetallic faceplates that cover the receptacle face, where the plate cannot be installed on any other receptacle, shall be permitted.

Exception No. 2: Listed nonmetallic faceplates that cover the receptacle face to a maximum thickness of 1.00 mm shall be permitted.

(e) Receptacles in Countertops and Similar Work Surfaces in

Dwelling Units. Receptacles shall not be installed in a face-up position in countertops or similar work surfaces.

(f) Exposed Terminals. Receptacles shall be enclosed so that live wiring terminals are not exposed to contact.

4.6.1.5 Receptacle Faceplates (Cover Plates). Receptacle faceplates shall be installed so as to completely cover the opening and seat against the mounting surface.

(a) Thickness of Metal Faceplates. Metal faceplates shall be of ferrous metal not less than 0.75 mm in thickness or of nonferrous metal not less than 1.00 mm in thickness.

(b) Grounding. Metal faceplates shall be grounded.

(c) Faceplates of Insulating Material. Faceplates of insulating material shall be noncombustible and not less than 0.25 mm in thickness but shall be permitted to be less than 0.25 mm in thickness if formed or reinforced to provide adequate mechanical strength.

4.6.1.6 Attachment Plugs, Cord Connectors, and Flanged Surface Devices. All attachment plugs, cord connectors, and flanged surface devices (inlets and outlets) shall be listed and marked with the manufacturer's name or identification and voltage and ampere ratings.

(a) Construction of Attachment Plugs and Cord Connectors. Attachment plugs and cord connectors shall be constructed so that there are no exposed current-carrying parts except the prongs, blades, or pins. The cover for wire terminations shall be a part that is essential for the operation of an attachment plug or connector (dead-front construction).

(b) Connection of Attachment Plugs. Attachment plugs shall be installed so that their prongs, blades, or pins are not energized unless inserted into an energized receptacle. No receptacle shall be installed so as to require the insertion of an energized attachment plug as its source of supply.

(c) Attachment Plug Ejector Mechanisms. Attachment plug ejector mechanisms shall not adversely affect engagement of the blades of the

attachment plug with the contacts of the receptacle.

(d) Flanged Surface Inlet. A flanged surface inlet shall be installed such that the prongs, blades, or pins are not energized unless an energized cord connector is inserted into it.

4.6.1.7 Noninterchangeability. Receptacles, cord connectors, and attachment plugs shall be constructed such that receptacle or cord connectors do not accept an attachment plug with a different voltage or current rating from that for which the device is intended. However, a 20-ampere T-slot receptacle or cord connector shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Non-grounding-type receptacles and connectors shall not accept grounding-type attachment plugs.

4.6.1.8 Receptacles in Damp or Wet Locations.

(a) Damp Locations. A receptacle installed outdoors in a location protected from the weather or in other damp locations shall have an enclosure for the receptacle that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed).

An installation suitable for wet locations shall also be considered suitable for damp locations.

A receptacle shall be considered to be in a location protected from the weather where located under roofed open porches, canopies, marquees, and the like, and will not be subjected to a beating rain or water runoff.

(b) Wet Locations.

(1) 15- and 20-Ampere Receptacles in a Wet Location. 15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof whether or not the attachment plug cap is inserted.

(2) Other Receptacles. All other receptacles installed in a wet location shall comply with (b)(2)a or (b)(2)b.

a. A receptacle installed in a wet location, where the product intended to be plugged into it is not attended while in use, shall have an enclosure that is weatherproof with the attachment plug cap inserted or

removed.

b. A receptacle installed in a wet location where the product intended to be plugged into it will be attended while in use (e.g., portable tools) shall have an enclosure that is weatherproof when the attachment plug is removed.

(c) Bathtub and Shower Space. Receptacles shall not be installed within or directly over a bathtub or shower stall.

(d) Protection for Floor Receptacles. Standpipes of floor receptacles shall allow floor-cleaning equipment to be operated without damage to receptacles.

(e) Flush Mounting with Faceplate. The enclosure for a receptacle installed in an outlet box flush-mounted in a finished surface shall be made weatherproof by means of a weatherproof faceplate assembly that provides a watertight connection between the plate and the finished surface.

4.6.1.9 Grounding-Type Receptacles, Adapters, Cord Connectors, and Attachment Plugs.

(a) Grounding Poles. Grounding-type receptacles, cord connectors, and attachment plugs shall be provided with one fixed grounding pole in addition to the circuit poles. The grounding contacting pole of grounding-type plug-in ground-fault circuit interrupters shall be permitted to be of the movable, self-restoring type on circuits operating at not over 150 volts between any two conductors or any conductor and ground.

(b) Grounding-Pole Identification. Grounding-type receptacles, adapters, cord connections, and attachment plugs shall have a means for connection of a grounding conductor to the grounding pole.

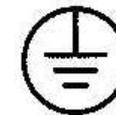

A terminal for connection to the grounding pole shall be designated by one of the following:

- (1) A green-colored hexagonal-headed or -shaped terminal screw or nut, not readily removable.
- (2) A green-colored pressure wire connector body (a wire barrel).
- (3) A similar green-colored connection device, in the case of adapters. The grounding terminal of a grounding adapter shall be a

green-colored rigid ear, lug, or similar device. The grounding connection shall be so designed that it cannot make contact with current-carrying parts of the receptacle, adapter, or attachment plug. The adapter shall be polarized.

(4) If the terminal for the grounding conductor is not visible, the conductor entrance hole shall be marked with the word green or ground, the letters G or GR, a grounding symbol, or otherwise identified by a distinctive green color. If the terminal for the equipment grounding conductor is readily removable, the area adjacent to the terminal shall be similarly marked.

FPN: See FPN Figure 4.6.1.9(b)(4).

FPN Figure 4.6.1.9(b)(4) One Example of a Symbol Used to Identify the Termination Point for an Equipment Grounding Conductor.

(c) Grounding Terminal Use. A grounding terminal or grounding-type device shall not be used for purposes other than grounding.

(d) Grounding-Pole Requirements. Grounding-type attachment plugs and mating cord connectors and receptacles shall be designed such that the grounding connection is made before the current-carrying connections. Grounding-type devices shall be so designed that grounding poles of attachment plugs cannot be brought into contact with current-carrying parts of receptacles or cord connectors.

(e) Use. Grounding-type attachment plugs shall be used only with a cord having an equipment grounding conductor.

FPN: See 2.0.1.10(b) for identification of grounded conductor terminals.

4.6.1.10 Connecting Receptacle Grounding Terminal to Box. The connection of the receptacle grounding terminal shall comply with 2.50.7.17.

ARTICLE 4.8 — SWITCHBOARDS AND PANELBOARDS

4.8.1 General

4.8.1.1 Scope. This article covers the following:

- (1) All switchboards, panelboards, and distribution boards installed for the control of light and power circuits
- (2) Battery-charging panels supplied from light or power circuits

4.8.1.2 Other Articles. Switches, circuit breakers, and overcurrent devices used on switchboards, panelboards, and distribution boards, and their enclosures shall comply with this article and also with the requirements of Articles 2.40, 2.50, 3.12, 3.14, 4.4, and other articles that apply. Switchboards and panelboards in hazardous (classified) locations shall comply with the requirements of Articles 5.0 through 5.17.

4.8.1.3 Support and Arrangement of Busbars and Conductors.

(a) Conductors and Busbars on a Switchboard or Panelboard. Conductors and busbars on a switchboard or panelboard shall comply with 4.8.1.3(a)(1), (a)(2), and (a)(3) as applicable.

(1) Location. Conductors and busbars shall be located so as to be free from physical damage and shall be held firmly in place.

(2) Service Switchboards. Barriers shall be placed in all service switchboards such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.

(3) Same Vertical Section. Other than the required interconnections and control wiring, only those conductors that are intended for termination in a vertical section of a switchboard shall be located in that section.

Exception: Conductors shall be permitted to travel horizontally through vertical sections of switchboards where such conductors are isolated from busbars by a barrier.

(b) Overheating and Inductive Effects. The arrangement of busbars and conductors shall be such as to avoid overheating due to inductive effects.

(c) Used as Service Equipment. Each switchboard or panelboard, if used as service equipment, shall be provided with a main bonding jumper sized in accordance with 2.50.2.9(d) or the equivalent placed within the panelboard or one of the sections of the switchboard for connecting the grounded service conductor on its supply side to the switchboard or panelboard frame. All sections of a switchboard shall be bonded together using an equipment bonding conductor sized in accordance with Table 2.50.6.13 or Table 2.50.3.17 as appropriate.

Exception: Switchboards and panelboards used as service equipment on high-impedance grounded-neutral systems in accordance with 2.50.2.17 shall not be required to be provided with a main bonding jumper.

(d) Terminals. In switchboards and panelboards, load terminals for field wiring, including grounded circuit conductor load terminals and connections to the ground bus for load equipment grounding conductors, shall be so located that it is not necessary to reach across or beyond an uninsulated ungrounded line bus in order to make connections.

(e) Phase Arrangement. The phase arrangement on 3-phase buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the switchboard or panelboard. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.

Exception: Equipment within the same single section or multisection switchboard or panelboard as the meter on 3-phase, 4-wire, delta-connected systems shall be permitted to have the same phase configuration as the metering equipment.

FPN: See 1.10.1.15 for requirements on marking the busbar or phase conductor having the higher voltage to ground where supplied from a 4-wire, delta-connected system.

(f) **Minimum Wire-Bending Space.** The minimum wire-bending space at terminals and minimum gutter space provided in panelboards and switchboards shall be as required in 3.12.1.6.

4.8.1.4 Circuit Directory or Circuit Identification. Every circuit and circuit modification shall be legibly identified as to its clear, evident, and specific purpose or use. The identification shall include sufficient detail to allow each circuit to be distinguished from all others. The identification shall be included in a circuit directory that is located on the face or inside of the panel door in the case of a panelboard, and located at each switch on a switchboard.

4.8.1.5 Clearance for Conductor Entering Bus Enclosures. Where conduits or other raceways enter a switchboard, floor-standing panelboard, or similar enclosure at the bottom, sufficient space shall be provided to permit installation of conductors in the enclosure. The wiring space shall not be less than shown in Table 4.8.1.5 where the conduit or raceways enter or leave the enclosure below the busbars, their supports, or other obstructions. The conduit or raceways, including their end fittings, shall not rise more than 75 mm above the bottom of the enclosure.

Table 4.8.1.5 Clearance for Conductors Entering Bus Enclosures

Conductor	Minimum Spacing Between Bottom of Enclosure and Busbars, Their Supports, or Other Obstructions (mm)
Insulated busbars, their supports, or other obstructions	200
Noninsulated busbars	250

4.8.1.7 Unused Openings. Unused openings for circuit breakers and switches shall be closed using identified closures, or other approved means that provide protection substantially equivalent to the wall of the enclosure.

4.8.2 Switchboards

4.8.2.1 Switchboards in Damp or Wet Locations. Switchboards in damp or wet locations shall be installed in accordance with 3.12.1.2(a).

4.8.2.2 Location Relative to Easily Ignitable Material. Switchboards shall be placed so as to reduce to a minimum the probability of communicating fire to adjacent combustible materials. Where installed over a combustible floor, suitable protection thereto shall be provided.

4.8.2.3 Clearances.

(a) **From Ceiling.** For other than a totally enclosed switchboard, a space not less than 900 mm shall be provided between the top of the switchboard and any combustible ceiling, unless a noncombustible shield is provided between the switchboard and the ceiling.

(b) **Around Switchboards.** Clearances around switchboards shall comply with the provisions of 1.10.2.1.

4.8.2.4 Conductor Insulation. An insulated conductor used within a switchboard shall be listed, shall be flame retardant, and shall be rated not less than the voltage applied to it and not less than the voltage applied to other conductors or busbars with which it may come in contact.

4.8.2.5 Location of Switchboards. Switchboards that have any exposed live parts shall be located in permanently dry locations and then only where under competent supervision and accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. Switchboards shall be located such that the probability of damage from equipment or processes is reduced to a minimum.

4.8.2.7 Grounding of Instruments, Relays, Meters, and Instrument Transformers on Switchboards. Instruments, relays, meters, and instrument transformers located on switchboards shall be grounded as specified in 2.50.9.1 through 2.50.9.9.

4.8.3 Panelboards

4.8.3.1 General. All panelboards shall have a rating not less than the

minimum feeder capacity required for the load calculated in accordance with Article 2.20. Panelboards shall be durably marked by the manufacturer with the voltage and the current rating and the number of phases for which they are designed and with the manufacturer's name or trademark in such a manner so as to be visible after installation, without disturbing the interior parts or wiring.

FPN: See 1.10.1.22 for additional requirements.

4.8.3.5 Classification of Panelboards. Panelboards shall be classified for the purposes of this article as either lighting and appliance branch-circuit panelboards or power panelboards, based on their content. A lighting and appliance branch circuit is a branch circuit that has a connection to the neutral of the panelboard and that has overcurrent protection of 30 amperes or less in one or more conductors.

(a) Lighting and Appliance Branch-Circuit Panelboard. A lighting and appliance branch-circuit panelboard is one having more than 10 percent of its overcurrent devices protecting lighting and appliance branch circuits.

(b) Power Panelboard. A power panelboard is one having 10 percent or fewer of its overcurrent devices protecting lighting and appliance branch circuits.

4.8.3.6 Number of Overcurrent Devices on One Panelboard. Not more than 42 overcurrent devices (other than those provided for in the mains) of a lighting and appliance branch-circuit panelboard shall be installed in any one cabinet or cutout box.

A lighting and appliance branch-circuit panelboard shall be provided with physical means to prevent the installation of more overcurrent devices than that number for which the panelboard was designed, rated, and approved.

For the purposes of this article, a 2-pole circuit breaker shall be considered two overcurrent devices; a 3-pole circuit breaker shall be considered three overcurrent devices.

4.8.3.7 Overcurrent Protection.

(a) Lighting and Appliance Branch-Circuit Panelboard Individually Protected. Each lighting and appliance branch-circuit

panelboard shall be individually protected on the supply side by not more than two main circuit breakers or two sets of fuses having a combined rating not greater than that of the panelboard.

Exception No. 1: Individual protection for a lighting and appliance panelboard shall not be required if the panelboard feeder has overcurrent protection not greater than the rating of the panelboard.

Exception No. 2: For existing installations, individual protection for lighting and appliance branch-circuit panelboards shall not be required where such panelboards are used as service equipment in supplying an individual residential occupancy.

(b) Power Panelboard Protection. In addition to the requirements of 4.8.3.1, a power panelboard with supply conductors that include a neutral, and having more than 10 percent of its overcurrent devices protecting branch circuits rated 30 amperes or less, shall be protected by an overcurrent protective device having a rating not greater than that of the panelboard. This overcurrent protective device shall be located within or at any point on the supply side of the panelboard.

Exception: This individual protection shall not be required for a power panelboard used as service equipment with multiple disconnecting means in accordance with 2.30.6.2.

(c) Snap Switches Rated at 30 Amperes or Less. Panelboards equipped with snap switches rated at 30 amperes or less shall have overcurrent protection of 200 amperes or less.

(d) Supplied Through a Transformer. Where a panelboard is supplied through a transformer, the overcurrent protection required by 4.8.3.7(a), (b), and (c) shall be located on the secondary side of the transformer.

Exception: A panelboard supplied by the secondary side of a transformer shall be considered as protected by the overcurrent protection provided on the primary side of the transformer where that protection is in accordance with 2.40.2.2(c)(1).

(e) Delta Breakers. A 3-phase disconnect or overcurrent device shall not be connected to the bus of any panelboard that has less than 3-phase buses. Delta breakers shall not be installed in panelboards.

(f) Back-Fed Devices. Plug-in-type overcurrent protection devices or plug-in type main lug assemblies that are backfed and used to terminate field-installed ungrounded supply conductors shall be secured in place by an additional fastener that requires other than a pull to release the device from the mounting means on the panel.

4.8.3.8 Panelboards in Damp or Wet Locations. Panelboards in damp or wet locations shall be installed to comply with 3.12.1.2(a).

4.8.3.9 Enclosure. Panelboards shall be mounted in cabinets, cutout boxes, or enclosures designed for the purpose and shall be dead-front.

Exception: Panelboards other than of the dead-front, externally operable type shall be permitted where accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

4.8.3.10 Relative Arrangement of Switches and Fuses. In panelboards, fuses of any type shall be installed on the load side of any switches.

Exception: Fuses installed as part of service equipment in accordance with the provisions of 2.30.7.5 shall be permitted on the line side of the service switch.

4.8.3.11 Grounding of Panelboards. Panelboard cabinets and panelboard frames, if of metal, shall be in physical contact with each other and shall be grounded. Where the panelboard is used with nonmetallic raceway or cable or where separate grounding conductors are provided, a terminal bar for the grounding conductors shall be secured inside the cabinet. The terminal bar shall be bonded to the cabinet and panelboard frame, if of metal; otherwise it shall be connected to the grounding conductor that is run with the conductors feeding the panelboard.

Exception: Where an isolated equipment grounding conductor is provided as permitted by 2.50.7.17(d), the insulated equipment grounding conductor that is run with the circuit conductors shall be permitted to pass through the panelboard without being connected to the panelboard's equipment grounding terminal bar.

Grounding conductors shall not be connected to a terminal bar provided for grounded conductors (may be a neutral) unless the bar is identified for the purpose and is located where interconnection between equipment grounding conductors and grounded circuit conductors is permitted or required by Article 2.50.

4.8.3.12 Grounded Conductor Terminations. Each grounded conductor shall terminate within the panelboard in an individual terminal that is not also used for another conductor.

Exception: Grounded conductors of circuits with parallel conductors shall be permitted to terminate in a single terminal if the terminal is identified for connection of more than one conductor.

4.8.4 Construction Specifications

4.8.4.1 Panels. The panels of switchboards shall be made of moisture-resistant, noncombustible material.

4.8.4.2 Busbars. Insulated or bare busbars shall be rigidly mounted.

4.8.4.3 Protection of Instrument Circuits. Instruments, pilot lights, potential transformers, and other switchboard devices with potential coils shall be supplied by a circuit that is protected by standard overcurrent devices rated 15 amperes or less.

Exception No. 1: Overcurrent devices rated more than 15 amperes shall be permitted where the interruption of the circuit could create a hazard. Short-circuit protection shall be provided.

Exception No. 2: For ratings of 2 amperes or less, special types of enclosed fuses shall be permitted.

4.8.4.4 Component Parts. Switches, fuses, and fuseholders used on panelboards shall comply with the applicable requirements of Articles 2.40 and 4.4.

4.8.4.6 Wire-Bending Space in Panelboards. The enclosure for a panelboard shall have the top and bottom wire-bending space sized in accordance with Table 3.12.1.6(b) for the largest conductor entering or leaving the enclosure. Side wire-bending space shall be in accordance

with Table 3.12.1.6(a) for the largest conductor to be terminated in that space.

Exception No. 1: Either the top or bottom wire-bending space shall be permitted to be sized in accordance with Table 3.12.1.6(a) for a lighting and appliance branch-circuit panelboard rated 225 amperes or less.

Exception No. 2: Either the top or bottom wire-bending space for any panelboard shall be permitted to be sized in accordance with Table 3.12.1.6(a) where at least one side wire-bending space is sized in accordance with Table 3.12.1.6(b) for the largest conductor to be terminated in any side wire-bending space.

Exception No. 3: The top and bottom wire-bending space shall be permitted to be sized in accordance with Table 3.12.1.6(a) spacings if the panelboard is designed and constructed for wiring using only one single 90 degree bend for each conductor, including the grounded circuit conductor, and the wiring diagram shows and specifies the method of wiring that shall be used.

Exception No. 4: Either the top or the bottom wire-bending space, but not both, shall be permitted to be sized in accordance with Table 3.12.1.6(a) where there are no conductors terminated in that space.

4.8.4.7 Minimum Spacings. The distance between bare metal parts, busbars, and so forth shall not be less than specified in Table 4.8.4.7. Where close proximity does not cause excessive heating, parts of the same polarity at switches, enclosed fuses, and so forth shall be permitted to be placed as close together as convenience in handling will allow.

Exception: The distance shall be permitted to be less than that specified in Table 4.8.4.7 at circuit breakers and switches and in listed components installed in switchboards and panelboards.

ARTICLE 4.9 — INDUSTRIAL CONTROL PANELS

4.9.1 General

4.9.1.1 Scope. This article covers industrial control panels intended for general use and operating at 600 volts or less.

FPN: UL 508A is a safety standard for industrial control panels.

Table 4.8.4.7 Minimum Spacings Between Bare Metal Parts

Voltage	Opposite Polarity Where Mounted on the Same Surface (mm)	Opposite Polarity Where Held Free in Air (mm)	Live Parts to Ground* (mm)
Not over 125 volts, nominal	19.1	12.7	12.7
Not over 250 volts, nominal	31.8	19.1	12.7
Not over 600 volts, nominal	50.8	25.4	25.4

*For spacing between live parts and doors of cabinets, see 3.12.2.2(a)(1), (2), and (3).

4.9.1.2 Definitions.

Industrial Control Panel. An assembly of a systematic and standard arrangement of two or more components such as motor controllers, overload relays, fused disconnect switches, and circuit breakers and related control devices such as pushbutton stations, selector switches, timers, switches, control relays, and the like with associated wiring, terminal blocks, pilot lights, and similar components. The industrial control panel does not include the controlled equipment.

4.9.1.3 Other Articles. In addition to the requirements of Article 4.9, industrial control panels that contain branch circuits for specific loads or components, or are for control of specific types of equipment addressed in other articles of this Code, shall be constructed and installed in accordance with the applicable requirements from the specific articles in Table 4.9.1.3.

4.9.2 Installation

4.9.2.1 Conductor — Minimum Size and Ampacity. The size of the industrial control panel supply conductor shall have an ampacity not less than 125 percent of the full-load current rating of all resistance

heating loads plus 125 percent of the full-load current rating of the highest rated motor plus the sum of the full-load current ratings of all other connected motors and apparatus based on their duty cycle that may be in operation at the same time.

Table 4.9.1.3 Other Articles

Equipment/Occupancy	Article	Section
Branch circuits	2.10	
Luminaires	4.10	
Motors, motor circuits, and controllers	4.30	
Air-conditioning and refrigerating equipment	4.40

Resistors and reactors	4.70	
Transformers	4.50	
Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits	7.25	

4.9.2.2 Overcurrent Protection.

(a) General. Industrial control panels shall be provided with overcurrent protection in accordance with Parts 2.40.1, 2.40.2, and 2.40.9.

(b) Location. This protection shall be provided by either of the following:

(1) An overcurrent protective device located ahead of the industrial control panel.

(2) A single main overcurrent protective device located within the industrial control panel. Where overcurrent protection is provided as part of the industrial control panel, the supply conductors shall be considered as either feeders or taps as covered by 2.40.2.2.

(c) Rating. The rating or setting of the overcurrent protective device for the circuit supplying the industrial control panel shall not be greater than the sum of the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device provided with the industrial control panel, plus 125 percent of the full-load current rating of all resistance heating loads, plus the sum of the full-load currents of all other motors and apparatus that could be in operation at the same time.

Exception: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted by 4.30.4.2(c), the procedure specified above for determining the maximum rating of the protective device for the circuit supplying the industrial control panel shall apply with the following provision: For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 4.30.4.2 for the type of control panel supply circuit protective device employed.

Where no branch-circuit short-circuit and ground-fault protective device is provided with the industrial control panel for motor or combination of motor and non-motor loads, the rating or setting of the overcurrent protective device shall be based on 4.30.4.2 and 4.30.4.3,

as applicable.

4.9.2.11 Disconnecting Means. Disconnecting means that supply motor loads shall comply with Part 4.30.9.

4.9.2.41 Grounding. Multisection industrial control panels shall be bonded together with an equipment grounding conductor or an equivalent grounding bus sized in accordance with Table 2.50.6.13. Equipment grounding conductors shall terminate on this grounding bus or to a grounding termination point provided in a single-section industrial control panel.

4.9.3 Construction Specifications

4.9.3.1 Enclosures. Table 4.30.7.11 shall be used as the basis for selecting industrial control panel enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings.

4.9.3.3 Busbars and Conductors. Industrial control panels utilizing busbars shall comply with 4.9.3.3(a) and 4.9.3.3(b).

(a) Support and Arrangement. Busbars shall be protected from physical damage and be held firmly in place.

(b) Phase Arrangement. The phase arrangement on 3-phase horizontal common power and vertical buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the industrial control panel. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.

4.9.3.5 Wiring Space in Industrial Control Panels.

(a) General. Industrial control panel enclosures shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to other switches or overcurrent devices, unless adequate space for this purpose is provided. The conductors shall not

fill the wiring space at any cross section to more than 40 percent of the cross-sectional area of the space, and the conductors, splices, and taps shall not fill the wiring space at any cross section to more than 75 percent of the cross-sectional area of that space.

(b) Wire Bending Space. Wire bending space for the main supply terminals shall be in accordance with the requirements in 3.12.1.6. Wire bending space for other terminals shall be in accordance with the requirements in 4.30.1.10(b). The gutter space shall comply with 3.12.1.8.

4.9.3.9 Service-Entrance Equipment. Where used as service equipment, each industrial control panel shall be of the type that is suitable for use as service equipment.

Where a grounded conductor is provided, the industrial control panel shall be provided with a main bonding jumper, sized in accordance with 2.50.2.9(d), for connecting the grounded conductor, on its supply side, to the industrial control panel equipment ground bus or terminal.

4.9.3.11 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:

- (1) Manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified.
- (2) Supply voltage, phase, frequency, and full-load current.
- (3) Short-circuit current rating of the industrial control panel based on one of the following:

- a. Short-circuit current rating of a listed and labeled assembly
- b. Short-circuit current rating established utilizing an approved method

FPN: UL 508A-2001, Supplement SB, is an example of an approved method.

(4) If the industrial control panel is intended as service equipment, it shall be marked to identify it as being suitable for use as service equipment.

(5) Electrical wiring diagram or the number of the index to the electrical drawings showing the electrical wiring diagram.

(6) An enclosure type number shall be marked on the industrial control panel enclosure.

ARTICLE 4.10 — LUMINAIRES (LIGHTING FIXTURES), LAMP HOLDERS, AND LAMPS

4.10.1 General

4.10.1.1 Scope. This article covers luminaires (lighting fixtures), lampholders, pendants, incandescent filament lamps, arc lamps, electric-discharge lamps, decorative lighting products, lighting accessories for temporary seasonal and holiday use, portable flexible lighting products, and the wiring and equipment forming part of such products and lighting installations.

4.10.1.2 Application of Other Articles. Equipment for use in hazardous (classified) locations shall conform to Articles 5.0 through 5.17. Lighting systems operating at 30 volts or less shall conform to Article 4.11. Arc lamps used in theaters shall comply with 5.20.5.1, and arc lamps used in projection machines shall comply with 5.40.2.11. Arc lamps used on constant-current systems shall comply with the general requirements of Article 4.90.

4.10.1.3 Live Parts. Luminaires (fixtures), lampholders, and lamps shall have no live parts normally exposed to contact. Exposed accessible terminals in lampholders and switches shall not be installed in metal luminaire (fixture) canopies or in open bases of portable table or floor lamps.

Exception: Cleat-type lampholders located at least 2 400 mm above the floor shall be permitted to have exposed terminals.

4.10.2 Luminaire (Fixture) Locations

4.10.2.1 Luminaires (Fixtures) in Specific Locations.

(a) Wet and Damp Locations. Luminaires (fixtures) installed in wet or damp locations shall be installed so that water cannot enter or accumulate in wiring compartments, lampholders, or other electrical parts. All luminaires (fixtures) installed in wet locations shall be marked, “Suitable for Wet Locations.” All luminaires (fixtures) installed in damp locations shall be marked, “Suitable for Wet

Locations” or “Suitable for Damp Locations.”

(b) Corrosive Locations. Luminaires (fixtures) installed in corrosive locations shall be of a type suitable for such locations.

(c) In Ducts or Hoods. Luminaires (fixtures) shall be permitted to be installed in commercial cooking hoods where all of the following conditions are met:

(1) The luminaire (fixture) shall be identified for use within commercial cooking hoods and installed such that the temperature limits of the materials used are not exceeded.

(2) The luminaire (fixture) shall be constructed so that all exhaust vapors, grease, oil, or cooking vapors are excluded from the lamp and wiring compartment. Diffusers shall be resistant to thermal shock.

(3) Parts of the luminaire (fixture) exposed within the hood shall be corrosion resistant or protected against corrosion, and the surface shall be smooth so as not to collect deposits and to facilitate cleaning.

(4) Wiring methods and materials supplying the luminaire(s) [fixture(s)] shall not be exposed within the cooking hood.

FPN: See 1.10.1.11 for conductors and equipment exposed to deteriorating agents.

(d) Bathtub and Shower Areas. No parts of cord-connected luminaires (fixtures), chain-, cable-, or cord-suspended-luminaires (fixtures), lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm horizontally and 2 400 mm vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the zone directly over the tub or shower stall. Luminaires (lighting fixtures) located in this zone shall be listed for damp locations, or listed for wet locations where subject to shower spray.

(e) Luminaires (Fixtures) in Indoor Sports, Mixed-Use, and All-Purpose Facilities. Luminaires (fixtures) subject to physical damage, using a mercury vapor or metal halide lamp, installed in playing and spectator seating areas of indoor sports, mixed-use, or all-purpose facilities shall be of the type that protects the lamp with a glass or plastic lens. Such luminaires (fixtures) shall be permitted to have an additional guard.

4.10.2.2 Luminaires (Fixtures) Near Combustible Material.

Luminaires (fixtures) shall be constructed, installed, or equipped with shades or guards so that combustible material is not subjected to temperatures in excess of 90°C (194°F).

4.10.2.3 Luminaires (Fixtures) Over Combustible Material.

Lampholders installed over highly combustible material shall be of the unswitched type. Unless an individual switch is provided for each luminaire (fixture), lampholders shall be located at least 2 400 mm above the floor or shall be located or guarded so that the lamps cannot be readily removed or damaged.

4.10.2.4 Luminaires (Fixtures) in Show Windows. Chain-supported luminaires (fixtures) used in a show window shall be permitted to be externally wired. No other externally wired luminaires (fixtures) shall be used.

4.10.2.5 Luminaires (Fixtures) in Clothes Closets.

(a) Definition.

Storage Space. The volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1 800 mm or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm or the width of the shelf, whichever is greater; for a closet that permits access to both sides of a hanging rod, this space includes the volume below the highest rod extending 300 mm on either side of the rod on a plane horizontal to the floor extending the entire length of the rod.

FPN: See Figure 4.10.2.5.

(b) Luminaire (Fixture) Types Permitted. Listed luminaires (fixtures) of the following types shall be permitted to be installed in a closet:

- (1) A surface-mounted or recessed incandescent luminaire (fixture) with a completely enclosed lamp
- (2) A surface-mounted or recessed fluorescent luminaire (fixture)

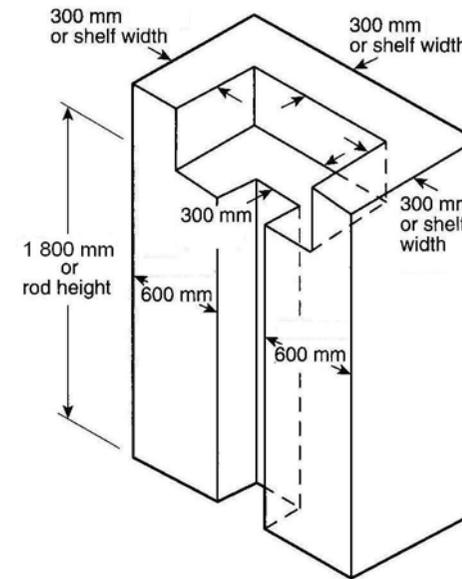

Figure 4.10.2.5 Closet Storage Space.

(c) Luminaire (Fixture) Types Not Permitted. Incandescent luminaires (fixtures) with open or partially enclosed lamps and pendant luminaires (fixtures) or lampholders shall not be permitted.

(d) Location. Luminaires (fixtures) in clothes closets shall be permitted to be installed as follows:

- (1) Surface-mounted incandescent luminaires (fixtures) installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 300 mm between the luminaire (fixture) and the nearest point of a storage space
- (2) Surface-mounted fluorescent luminaires (fixtures) installed on the wall above the door or on the ceiling, provided there is a minimum clearance of 150 mm between the luminaire (fixture) and the nearest point of a storage space
- (3) Recessed incandescent luminaires (fixtures) with a completely enclosed lamp installed in the wall or the ceiling, provided there is a minimum clearance of 150 mm between the luminaire (fixture) and the nearest point of a storage space

(4) Recessed fluorescent luminaires (fixtures) installed in the wall or the ceiling, provided there is a minimum clearance of 150 mm between the luminaire (fixture) and the nearest point of a storage space

4.10.2.6 Space for Cove Lighting. Coves shall have adequate space and shall be located so that lamps and equipment can be properly installed and maintained.

4.10.3 Provisions at Luminaire (Fixture) Outlet Boxes, Canopies, and Pans

4.10.3.1 Space for Conductors. Canopies and outlet boxes taken together shall provide adequate space so that luminaire (fixture) conductors and their connecting devices can be properly installed.

4.10.3.2 Temperature Limit of Conductors in Outlet Boxes. Luminaires (fixtures) shall be of such construction or installed so that the conductors in outlet boxes shall not be subjected to temperatures greater than that for which the conductors are rated.

Branch-circuit wiring, other than 2-wire or multiwire branch circuits supplying power to luminaires (fixtures) connected together, shall not be passed through an outlet box that is an integral part of a luminaire (fixture) unless the luminaire (fixture) is identified for through-wiring.

FPN: See 4.10.6.11 for wiring supplying power to fixtures connected together.

4.10.3.3 Outlet Boxes to Be Covered. In a completed installation, each outlet box shall be provided with a cover unless covered by means of a luminaire (fixture) canopy, lampholder, receptacle, or similar device.

4.10.3.4 Covering of Combustible Material at Outlet Boxes. Any combustible wall or ceiling finish exposed between the edge of a luminaire (fixture) canopy or pan and an outlet box shall be covered with noncombustible material.

4.10.3.5 Connection of Electric-Discharge Luminaires (Lighting Fixtures).

(a) **Independent of the Outlet Box.** Electric-discharge luminaires (lighting fixtures) supported independently of the outlet box shall be

connected to the branch circuit through metal raceway, nonmetallic raceway, Type MC cable, Type AC cable, Type MI cable, nonmetallic sheathed cable, or by flexible cord as permitted in 4.10.6.9(b) or 4.10.6.9(c).

(b) **Access to Boxes.** Electric-discharge luminaires (fixtures) surface mounted over concealed outlet, pull, or junction boxes and designed not to be supported solely by the outlet box shall be provided with suitable openings in the back of the luminaire (fixture) to provide access to the wiring in the box.

4.10.4 Luminaire (Fixture) Supports

4.10.4.1 Supports.

(a) **General.** Luminaires (fixtures) and lampholders shall be securely supported. A luminaire (fixture) that weighs more than **3 kg (6 lb)** or exceeds 410 mm in any dimension shall not be supported by the screw shell of a lampholder.

(b) **Metal or Nonmetallic Poles Supporting Luminaires (Lighting Fixtures).** Metal or nonmetallic poles shall be permitted to be used to support luminaires (lighting fixtures) and as a raceway to enclose supply conductors, provided the following conditions are met:

(1) A pole shall have a handhole not less than 50 mm × 100 mm with a raintight cover to provide access to the supply terminations within the pole or pole base.

Exception No. 1: No handhole shall be required in a pole 2 400 mm or less in height above grade where the supply wiring method continues without splice or pull point, and where the interior of the pole and any splices are accessible by removing the luminaire (fixture).

Exception No. 2: No handhole shall be required in a pole 6 000 mm or less in height above grade that is provided with a hinged base.

(2) Where raceway risers or cable is not installed within the pole, a threaded fitting or nipple shall be brazed, welded, or attached to the pole opposite the handhole for the supply connection.

(3) A metal pole shall be provided with a grounding terminal as follows:

a. A pole with a handhole shall have the grounding terminal accessible from the handhole.

b. A pole with a hinged base shall have the grounding terminal accessible within the base.

Exception to (3): No grounding terminal shall be required in a pole 2 400 mm or less in height above grade where the supply wiring method continues without splice or pull, and where the interior of the pole and any splices are accessible by removing the luminaire (fixture).

(4) A metal pole with a hinged base shall have the hinged base and pole bonded together.

(5) Metal raceways or other equipment grounding conductors shall be bonded to the metal pole with an equipment grounding conductor recognized by 2.50.6.9 and sized in accordance with 2.50.6.13.

(6) Conductors in vertical poles used as raceway shall be supported as provided in 3.0.1.19.

4.10.4.2 Means of Support.

(a) **Outlet Boxes.** Outlet boxes or fittings installed as required by 3.14.2.9 and complying with the provisions of 3.14.2.13(a) and 3.14.2.13(b) shall be permitted to support luminaires (fixtures).

(b) **Inspection.** Luminaires (fixtures) shall be installed such that the connections between the luminaire (fixture) conductors and the circuit conductors can be inspected without requiring the disconnection of any part of the wiring unless the luminaires (fixtures) are connected by attachment plugs and receptacles.

(c) **Suspended Ceilings.** Framing members of suspended ceiling systems used to support luminaires (fixtures) shall be securely fastened to each other and shall be securely attached to the building structure at appropriate intervals. Luminaires (fixtures) shall be securely fastened to the ceiling framing member by mechanical means such as bolts, screws, or rivets. Listed clips identified for use with the type of ceiling framing member(s) and luminaire(s) [fixture(s)] shall also be permitted.

(d) **Luminaire (Fixture) Studs.** Luminaire (fixture) studs that are not a part of outlet boxes, hickey, tripods, and crowfeet shall be made of steel, malleable iron, or other material suitable for the application.

(e) **Insulating Joints.** Insulating joints that are not designed to be mounted with screws or bolts shall have an exterior metal casing, insulated from both screw connections.

(f) **Raceway Fittings.** Raceway fittings used to support a luminaire(s) [lighting fixture(s)] shall be capable of supporting the weight of the complete fixture assembly and lamp(s).

(g) **Busways.** Luminaires (fixtures) shall be permitted to be connected to busways in accordance with 3.68.2.8(c).

(h) **Trees.** Outdoor luminaires (lighting fixtures) and associated equipment shall be permitted to be supported by trees.

FPN No. 1: See 2.25.1.26 for restrictions for support of overhead conductors.

FPN No. 2: See 3.0.1.5(d) for protection of conductors.

4.10.5 Grounding

4.10.5.1 General. Luminaires (fixtures) and lighting equipment shall be grounded as required in Part 2.50.5.

4.10.5.2 Exposed Luminaire (Fixture) Parts.

(a) **Exposed Conductive Parts.** Exposed metal parts shall be grounded or insulated from ground and other conducting surfaces or be inaccessible to unqualified personnel. Lamp tie wires, mounting screws, clips, and decorative bands on glass spaced at least 40 mm from lamp terminals shall not be required to be grounded.

(b) **Made of Insulating Material.** Luminaires (fixtures) directly wired or attached to outlets supplied by a wiring method that does not provide a ready means for grounding shall be made of insulating material and shall have no exposed conductive parts.

Exception No. 1: Replacement luminaires (fixtures) shall be permitted to connect an equipment grounding conductor from the outlet in

compliance with 2.50.7.1(c). The luminaire (fixture) shall then be grounded in accordance with 4.10.5.2(a).

Exception No. 2: Where no equipment grounding conductor exists at the outlet, replacement luminaires (fixtures) that are GFCI protected shall not be required to be connected to an equipment grounding conductor.

4.10.5.4 Equipment Grounding Conductor Attachment. Luminaires (fixtures) with exposed metal parts shall be provided with a means for connecting an equipment grounding conductor for such luminaires (fixtures).

4.10.5.5 Methods of Grounding. Luminaires (fixtures) and equipment shall be considered grounded where mechanically connected to an equipment grounding conductor as specified in 2.50.6.9 and sized in accordance with 2.50.6.13.

4.10.6 Wiring of Luminaires (Fixtures)

4.10.6.1 Luminaire (Fixture) Wiring — General. Wiring on or within fixtures shall be neatly arranged and shall not be exposed to physical damage. Excess wiring shall be avoided. Conductors shall be arranged so that they are not subjected to temperatures above those for which they are rated.

4.10.6.2 Polarization of Luminaires (Fixtures). Luminaires (fixtures) shall be wired so that the screw shells of lampholders are connected to the same luminaire (fixture) or circuit conductor or terminal. The grounded conductor, where connected to a screw-shell lampholder, shall be connected to the screw shell.

4.10.6.3 Conductor Insulation. Luminaires (fixtures) shall be wired with conductors having insulation suitable for the environmental conditions, current, voltage, and temperature to which the conductors will be subjected.

FPN: For ampacity of luminaire (fixture) wire, maximum operating temperature, voltage limitations, minimum wire size, and so forth, see Article 4.2.

4.10.6.6 Pendant Conductors for Incandescent Filament Lamps.

(a) Support. Pendant lampholders with permanently attached leads, where used for other than festoon wiring, shall be hung from separate stranded rubber-covered conductors that are soldered directly to the circuit conductors but supported independently thereof.

(b) Size. Unless part of listed decorative lighting assemblies, pendant conductors shall not be smaller than 2.0 mm^2 (1.6 mm dia.) for mogul-base or medium-base screw-shell lampholders or smaller than **18 AWG** for intermediate or candelabra-base lampholders.

(c) Twisted or Cabled. Pendant conductors longer than 900 mm shall be twisted together where not cabled in a listed assembly.

4.10.6.7 Protection of Conductors and Insulation.

(a) Properly Secured. Conductors shall be secured in a manner that does not tend to cut or abrade the insulation.

(b) Protection Through Metal. Conductor insulation shall be protected from abrasion where it passes through metal.

(c) Luminaire (Fixture) Stems. Splices and taps shall not be located within luminaire (fixture) arms or stems.

(d) Splices and Taps. No unnecessary splices or taps shall be made within or on a luminaire (fixture).

FPN: For approved means of making connections, see 1.10.1.14.

(e) Stranding. Stranded conductors shall be used for wiring on luminaire (fixture) chains and on other movable or flexible parts.

(f) Tension. Conductors shall be arranged so that the weight of the luminaire (fixture) or movable parts does not put tension on the conductors.

4.10.6.8 Cord-Connected Showcases. Individual showcases, other than fixed, shall be permitted to be connected by flexible cord to permanently installed receptacles, and groups of not more than six such

showcases shall be permitted to be coupled together by flexible cord and separable locking-type connectors with one of the group connected by flexible cord to a permanently installed receptacle.

The installation shall comply with 4.10.6.8(a) through 4.10.6.8(e).

(a) Cord Requirements. Flexible cord shall be of the hard-service type, having conductors not smaller than the branch-circuit conductors, having ampacity at least equal to the branch-circuit overcurrent device, and having an equipment grounding conductor.

FPN: See Table 2.50.6.13 for size of equipment grounding conductor.

(b) Receptacles, Connectors, and Attachment Plugs. Receptacles, connectors, and attachment plugs shall be of a listed grounding type rated 15 or 20 amperes.

(c) Support. Flexible cords shall be secured to the undersides of showcases such that all of the following conditions are ensured:

(1) The wiring is not exposed to mechanical damage.

(2) The separation between cases is not in excess of 50 mm, or more than 300 mm between the first case and the supply receptacle.

(3) The free lead at the end of a group of showcases has a female fitting not extending beyond the case.

(d) No Other Equipment. Equipment other than showcases shall not be electrically connected to showcases.

(e) Secondary Circuit(s). Where showcases are cord-connected, the secondary circuit(s) of each electric-discharge lighting ballast shall be limited to one showcase.

4.10.6.9 Cord-Connected Lampholders and Luminaires (Fixtures).

(a) Lampholders. Where a metal lampholder is attached to a flexible cord, the inlet shall be equipped with an insulating bushing that, if threaded, is not smaller than metric designator 12 (trade size) pipe size. The cord hole shall be of a size appropriate for the cord, and all burrs and fins shall be removed in order to provide a smooth bearing surface for the cord.

Bushing having holes 7 mm in diameter shall be permitted for use with plain pendant cord and holes 11 mm in diameter with reinforced cord.

(b) Adjustable Luminaires (Fixtures). Luminaires (fixtures) that require adjusting or aiming after installation shall not be required to be equipped with an attachment plug or cord connector, provided the exposed cord is of the hard-usage or extra-hard-usage type and is not longer than that required for maximum adjustment. The cord shall not be subject to strain or physical damage.

(c) Electric-Discharge Luminaires (Fixtures).

(1) Cord Connected Installation. A listed luminaire (fixture) or a listed assembly shall be permitted to be cord connected if the following conditions apply:

a. The luminaire (fixture) is located directly below the outlet or busway.

b. The flexible cord meets all the following:

1. Is visible for its entire length outside the luminaire (fixture)

2. Is not subject to strain or physical damage

3. Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a listed assembly incorporating a manufactured wiring system connector in accordance with 6.4.1.6(c), or has a luminaire (fixture) assembly with a strain relief and canopy

(2) Provided with Mogul-Base, Screw-Shell Lampholders. Electric-discharge luminaires (lighting fixtures) provided with mogul-base, screw-shell lampholders shall be permitted to be connected to branch circuits of 50 amperes or less by cords complying with 2.40.1.5. Receptacles and attachment plugs shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire (fixture) full-load current.

(3) Equipped with Flanged Surface Inlet. Electric-discharge luminaires (lighting fixtures) equipped with a flanged surface inlet shall be permitted to be supplied by cord pendants equipped with cord connectors. Inlets and connectors shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of

the luminaire (fixture) load current.

4.10.6.10 Luminaires (Fixtures) as Raceways. Luminaires (fixtures) shall not be used as a raceway for circuit conductors unless listed and marked for use as a raceway.

4.10.6.11 Wiring Supplying Luminaires (Fixtures) Connected Together. Luminaires (fixtures) designed for end-to-end connection to form a continuous assembly, or luminaires (fixtures) connected together by recognized wiring methods, shall be permitted to contain the conductors of a 2-wire branch circuit, or one multiwire branch circuit, supplying the connected luminaires (fixtures) and need not be listed as a raceway. One additional 2-wire branch circuit separately supplying one or more of the connected luminaires (fixtures) shall also be permitted.

FPN: See Article 100 for the definition of Multiwire Branch Circuit.

4.10.6.12 Branch Circuit Conductors and Ballasts. Branch-circuit conductors within 75 mm of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a luminaire (fixture) listed and marked as suitable for a different insulation temperature.

4.10.7 Construction of Luminaires (Fixtures)

4.10.7.1 Combustible Shades and Enclosures. Adequate airspace shall be provided between lamps and shades or other enclosures of combustible material.

4.10.7.2 Luminaire (Fixture) Rating.

(a) **Marking.** All luminaires (fixtures) shall be marked with the maximum lamp wattage or electrical rating, manufacturer's name, trademark, or other suitable means of identification. A luminaire (fixture) requiring supply wire rated higher than 60°C (140°F) shall be marked in letters not smaller than 6 mm high, prominently displayed on the luminaire (fixture) and shipping carton or equivalent.

(b) **Electrical Rating.** The electrical rating shall include the voltage and frequency and shall indicate the current rating of the unit,

including the ballast, transformer, or autotransformer.

4.10.7.3 Design and Material. Luminaires (fixtures) shall be constructed of metal, wood, or other material suitable for the application and shall be designed and assembled so as to secure requisite mechanical strength and rigidity. Wiring compartments, including their entrances, shall be designed and constructed to permit conductors to be drawn in and withdrawn without physical damage.

4.10.7.4 Nonmetallic Luminaires (Fixtures). When luminaire (fixture) wiring compartments are constructed from combustible material, armored or lead-covered conductors with suitable fittings shall be used or the wiring compartment shall be lined with metal.

4.10.7.5 Mechanical Strength.

(a) **Tubing for Arms.** Tubing used for arms and stems where provided with cut threads shall not be less than 1.00 mm in thickness and, where provided with rolled (pressed) threads, shall not be less than 0.65 mm in thickness. Arms and other parts shall be fastened to prevent turning.

(b) **Metal Canopies.** Metal canopies supporting lampholders, shades, and so forth exceeding 4 kg (8 lb), or incorporating attachment-plug receptacles, shall not be less than 0.50 mm in thickness. Other canopies shall not be less than 0.40 mm if made of steel and not less than 0.50 mm if of other metals.

(c) **Canopy Switches.** Pull-type canopy switches shall not be inserted in the rims of metal canopies that are less than 0.65 mm in thickness, unless the rims are reinforced by the turning of a bead or the equivalent. Pull-type canopy switches, whether mounted in the rims or elsewhere in sheet metal canopies, shall not be located more than 90 mm from the center of the canopy. Double set-screws, double canopy rings, a screw ring, or equal method shall be used where the canopy supports a pull-type switch or pendant receptacle.

The thickness requirements in the preceding paragraph shall apply to measurements made on finished (formed) canopies.

4.10.7.6 Wiring Space. Bodies of luminaires (fixtures), including portable lamps, shall provide ample space for splices and taps and for

the installation of devices, if any. Splice compartments shall be of nonabsorbent, noncombustible material.

4.10.7.9 Portable Lamps.

(a) **General.** Portable lamps shall be wired with flexible cord recognized by 4.0.1.4 and an attachment plug of the polarized or grounding type. Where used with Edison-base lampholders, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug.

(b) **Portable Handlamps.** In addition to the provisions of 4.10.7.9(a), portable handlamps shall comply with the following:

(1) Metal shell, paper-lined lampholders shall not be used.

(2) Handlamps shall be equipped with a handle of molded composition or other insulating material.

(3) Handlamps shall be equipped with a substantial guard attached to the lampholder or handle.

(4) Metallic guards shall be grounded by means of an equipment grounding conductor run with circuit conductors within the power-supply cord.

(5) Portable handlamps shall not be required to be grounded where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

4.10.7.11 Cord Bushings. A bushing or the equivalent shall be provided where flexible cord enters the base or stem of a portable lamp. The bushing shall be of insulating material unless a jacketed type of cord is used.

4.10.7.12 Tests. All wiring shall be free from short circuits and grounds and shall be tested for these defects prior to being connected to the circuit.

4.10.7.13 Live Parts. Exposed live parts within porcelain luminaires (fixtures) shall be suitably recessed and located so as to make it improbable that wires come in contact with them. There shall be a spacing of at least 13 mm between live parts and the mounting plane of the luminaire (fixture).

4.10.8 Installation of Lampholders

4.10.8.1 Screw-Shell Type. Lampholders of the screw-shell type shall be installed for use as lampholders only. Where supplied by a circuit having a grounded conductor, the grounded conductor shall be connected to the screw shell.

4.10.8.2 Double-Pole Switched Lampholders. Where supplied by the ungrounded conductors of a circuit, the switching device of lampholders of the switched type shall simultaneously disconnect both conductors of the circuit.

4.10.8.3 Lampholders in Wet or Damp Locations. Lampholders installed in wet or damp locations shall be of the weatherproof type.

4.10.9 Construction of Lampholders

4.10.9.1 Insulation. The outer metal shell and the cap shall be lined with insulating material that prevents the shell and cap from becoming a part of the circuit. The lining shall not extend beyond the metal shell more than 3 mm but shall prevent any current-carrying part of the lamp base from being exposed when a lamp is in the lampholding device.

4.10.9.3 Switched Lampholders. Switched lampholders shall be of such construction that the switching mechanism interrupts the electrical connection to the center contact. The switching mechanism shall also be permitted to interrupt the electrical connection to the screw shell if the connection to the center contact is simultaneously interrupted.

4.10.10 Lamps and Auxiliary Equipment

4.10.10.1 Bases, Incandescent Lamps. An incandescent lamp for general use on lighting branch circuits shall not be equipped with a medium base if rated over 300 watts, or with a mogul base if rated over 1 500 watts. Special bases or other devices shall be used for over 1 500 watts.

4.10.10.2 Electric-Discharge Lamp Auxiliary Equipment.

(a) **Enclosures.** Auxiliary equipment for electric-discharge lamps

shall be enclosed in noncombustible cases and treated as sources of heat.

(b) Switching. Where supplied by the ungrounded conductors of a circuit, the switching device of auxiliary equipment shall simultaneously disconnect all conductors.

4.10.11 Special Provisions for Flush and Recessed Luminaires (Fixtures)

4.10.11.1 General. Luminaires (fixtures) installed in recessed cavities in walls or ceilings shall comply with 4.10.11.2 through 4.10.12.5.

4.10.11.2 Temperature.

(a) Combustible Material. Luminaires (fixtures) shall be installed so that adjacent combustible material will not be subjected to temperatures in excess of 90°C (194°F).

(b) Fire-Resistant Construction. Where a luminaire (fixture) is recessed in fire-resistant material in a building of fire-resistant construction, a temperature higher than 90°C (194°F) but not higher than 150°C (302°F) shall be considered acceptable if the luminaire (fixture) is plainly marked that it is listed for that service.

(c) Recessed Incandescent Luminaires (Fixtures). Incandescent luminaires (fixtures) shall have thermal protection and shall be identified as thermally protected.

Exception No. 1: Thermal protection shall not be required in a recessed luminaire (fixture) identified for use and installed in poured concrete.

Exception No. 2: Thermal protection shall not be required in a recessed luminaire (fixture) whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire (fixture) and are identified as inherently protected.

4.10.11.3 Clearance and Installation.

(a) Clearance.

(1) Non-Type IC. A recessed luminaire (fixture) that is not identified for contact with insulation shall have all recessed parts spaced not less than 13 mm from combustible materials. The points of support and the trim finishing off the opening in the ceiling or wall surface shall be permitted to be in contact with combustible materials.

(2) Type IC. A recessed luminaire (fixture) that is identified for contact with insulation, Type IC, shall be permitted to be in contact with combustible materials at recessed parts, points of support, and portions passing through or finishing off the opening in the building structure.

(b) Installation. Thermal insulation shall not be installed above a recessed luminaire (fixture) or with 75 mm of the recessed luminaire's (fixture's) enclosure, wiring compartment, or ballast unless it is identified for contact with insulation, Type IC.

4.10.11.4 Wiring.

(a) General. Conductors that have insulation suitable for the temperature encountered shall be used.

(b) Circuit Conductors. Branch-circuit conductors that have an insulation suitable for the temperature encountered shall be permitted to terminate in the luminaire (fixture).

(c) Tap Conductors. Tap conductors of a type suitable for the temperature encountered shall be permitted to run from the luminaire (fixture) terminal connection to an outlet box placed at least 300 mm from the luminaire (fixture). Such tap conductors shall be in suitable raceway or Type AC or MC cable of at least 450 mm but not more than 1 800 mm in length.

4.10.12 Construction of Flush and Recessed Luminaires (Fixtures)

4.10.12.1 Temperature. Luminaires (fixtures) shall be constructed such that adjacent combustible material is not subject to temperatures

in excess of 90°C (194°F).

4.10.12.3 Lamp Wattage Marking. Incandescent lamp luminaires (fixtures) shall be marked to indicate the maximum allowable wattage of lamps. The markings shall be permanently installed, in letters at least 6 mm high, and shall be located where visible during relamping.

4.10.12.4 Solder Prohibited. No solder shall be used in the construction of a luminaire (fixture) box.

4.10.12.5 Lampholders. Lampholders of the screw-shell type shall be of porcelain or other suitable insulating materials. Where used, cements shall be of the high-heat type.

4.10.13 Special Provisions for Electric-Discharge Lighting Systems of 1 000 Volts or Less

4.10.13.1 General.

(a) Open-Circuit Voltage of 1 000 Volts or Less. Equipment for use with electric-discharge lighting systems and designed for an open-circuit voltage of 1 000 volts or less shall be of a type intended for such service.

(b) Considered as Energized. The terminals of an electric-discharge lamp shall be considered as energized where any lamp terminal is connected to a circuit of over 300 volts.

(c) Transformers of the Oil-Filled Type. Transformers of the oil-filled type shall not be used.

(d) Additional Requirements. In addition to complying with the general requirements for luminaires (lighting fixtures), such equipment shall comply with Part 4.10.13.

(e) Thermal Protection — Fluorescent Luminaires (Fixtures).

(1) Integral Thermal Protection. The ballast of a fluorescent luminaire (fixture) installed indoors shall have integral thermal

protection. Replacement ballasts shall also have thermal protection integral with the ballast.

(2) Simple Reactance Ballasts. A simple reactance ballast in a fluorescent luminaire (fixture) with straight tubular lamps shall not be required to be thermally protected.

(3) Exit Fixtures. A ballast in a fluorescent exit luminaire (fixture) shall not have thermal protection.

(4) Egress Luminaires (Fixtures). A ballast in a fluorescent luminaire (fixture) that is used for egress lighting and energized only during a failure of the normal supply shall not have thermal protection.

(f) High-Intensity Discharge Luminaires (Fixtures).

(1) Recessed. Recessed high-intensity luminaires (fixtures) designed to be installed in wall or ceiling cavities shall have thermal protection and be identified as thermally protected.

(2) Inherently Protected. Thermal protection shall not be required in a recessed high-intensity luminaire (fixture) whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire (fixture) and are identified as inherently protected.

(3) Installed in Poured Concrete. Thermal protection shall not be required in a recessed high-intensity discharge luminaire (fixture) identified for use and installed in poured concrete.

(4) Recessed Remote Ballasts. A recessed remote ballast for a high-intensity discharge luminaire (fixture) shall have thermal protection that is integral with the ballast and be identified as thermally protected.

(5) Metal Halide Lamp Containment. Luminaires (fixtures) that use a metal halide lamp other than a thick-glass parabolic reflector lamp (PAR) shall be provided with a containment barrier that encloses the lamp, or shall be provided with a physical means that only allows the use of a lamp that is Type O.

FPN: See ANSI Standard C78.387, American National Standard for Electric Lamps — Metal Halide Lamps, Methods of Measuring Characteristics.

(g) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place or ballasted luminaires that are supplied from

multiwire branch circuits and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner before servicing or maintaining the ballast. This requirement shall become effective January 1, 2008.

Exception No. 1: A disconnecting means shall not be required for luminaires (fixtures) installed in hazardous (classified) location(s).

Exception No. 2: A disconnecting means shall not be required for emergency illumination required in 700.16.

Exception No. 3: For cord-and-plug-connected luminaires, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means.

Exception No. 4: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation by written procedures.

Exception No. 5: Where more than one luminaire is installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes locally accessible disconnects, such that the illuminated space cannot be left in total darkness.

4.10.13.2 Direct-Current Equipment. Luminaires (fixtures) installed on dc circuits shall be equipped with auxiliary equipment and resistors designed for dc operation. The luminaires (fixtures) shall be marked for dc operation.

4.10.13.3 Open-Circuit Voltage Exceeding 300 Volts. Equipment having an open-circuit voltage exceeding 300 volts shall not be installed in dwelling occupancies unless such equipment is designed so that there will be no exposed live parts when lamps are being inserted, are in place, or are being removed.

4.10.13.4 Luminaire (Fixture) Mounting.

(a) Exposed Ballasts. Luminaires (fixtures) that have exposed ballasts or transformers shall be installed so that such ballasts or transformers will not be in contact with combustible material.

(b) Combustible Low-Density Cellulose Fiberboard. Where a surface-mounted luminaire (fixture) containing a ballast is to be installed on combustible low-density cellulose fiberboard, it shall be listed for this condition or shall be spaced not less than 40 mm from the surface of the fiberboard. Where such luminaires (fixtures) are partially or wholly recessed, the provisions of 4.10.11.1 through 4.10.12.5 shall apply.

FPN: Combustible low-density cellulose fiberboard includes sheets, panels, and tiles that have a density of 320 kg/m³ (20 lb/ft³) or less and that are formed of bonded plant fiber material but does not include solid or laminated wood or fiberboard that has a density in excess of 320 kg/m³ (20 lb/ft³) or is a material that has been integrally treated with fire-retarding chemicals to the degree that the flame spread in any plane of the material will not exceed 25, determined in accordance with tests for surface burning characteristics of building materials. See ANSI/ASTM E84-1997, Test Method for Surface Burning Characteristics of Building Materials.

4.10.13.5 Equipment Not Integral with Luminaire (Fixture).

(a) Metal Cabinets. Auxiliary equipment, including reactors, capacitors, resistors, and similar equipment, where not installed as part of a luminaire (lighting fixture) assembly, shall be enclosed in accessible, permanently installed metal cabinets.

(b) Separate Mounting. Separately mounted ballasts that are intended for direct connection to a wiring system shall not be required to be separately enclosed.

(c) Wired Luminaire (Fixture) Sections. Wired luminaire (fixture) sections are paired, with a ballast(s) supplying a lamp or lamps in both. For interconnection between paired units, it shall be permissible to use metric designator 12 (trade size) flexible metal conduit in lengths not exceeding 7 600 mm, in conformance with Article 3.48. Luminaire (fixture) wire operating at line voltage, supplying only the ballast(s) of one of the paired luminaires (fixtures), shall be permitted in the same raceway as the lamp supply wires of the paired luminaires (fixtures).

4.10.13.6 Autotransformers. An autotransformer that is used to raise the voltage to more than 300 volts, as part of a ballast for supplying lighting units, shall be supplied only by a grounded system.

4.10.13.7 Switches. Snap switches shall comply with 4.4.1.14.

4.10.14 Special Provisions for Electric-Discharge Lighting Systems of More Than 1000 Volts

4.10.14.1 General.

(a) Listing. Electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with that listing.

(b) Dwelling Occupancies. Equipment that has an open-circuit voltage exceeding 1 000 volts shall not be installed in or on dwelling occupancies.

(c) Live Parts. The terminal of an electric-discharge lamp shall be considered as a live part.

(d) Additional Requirements. In addition to complying with the general requirements for luminaires (lighting fixtures), such equipment shall comply with Part 4.10.14.

FPN: For signs and outline lighting, see Article 6.0.

4.10.14.2 Control.

(a) Disconnection. Luminaires (fixtures) or lamp installation shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

(b) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the luminaires (fixtures) or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

4.10.14.3 Lamp Terminals and Lampholders. Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders shall be designed so that there are no exposed live parts when lamps are being inserted or removed.

4.10.14.4 Transformers.

(a) Type. Transformers shall be enclosed, identified for the use, and listed.

(b) Voltage. The secondary-circuit voltage shall not exceed 15 000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7 500 volts, under any load conditions.

(c) Rating. Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7 500 volts, and not more than 300 mA if the open-circuit voltage rating is 7 500 volts or less.

(d) Secondary Connections. Secondary circuit outputs shall not be connected in parallel or in series.

4.10.14.5 Transformer Locations.

(a) Accessible. Transformers shall be accessible after installation.

(b) Secondary Conductors. Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

(c) Adjacent to Combustible Materials. Transformers shall be located so that adjacent combustible materials are not subjected to temperatures in excess of 90°C (194°F).

4.10.14.6 Exposure to Damage. Lamps shall not be located where normally exposed to physical damage.

4.10.14.7 Marking. Each luminaire (fixture) or each secondary circuit of tubing having an open-circuit voltage of over 1 000 volts shall have a clearly legible marking in letters not less than 6 mm high reading

“Caution ____ volts.” The voltage indicated shall be the rated open-circuit voltage.

4.10.14.8 Switches. Snap switches shall comply with 4.4.1.4.

4.10.15 Lighting Track

4.10.15.1 Definition.

Lighting Track. A manufactured assembly designed to support and energize luminaires (lighting fixtures) that are capable of being readily repositioned on the track. Its length can be altered by the addition or subtraction of sections of track.

4.10.15.2 Installation.

(a) **Lighting Track.** Lighting track shall be permanently installed and permanently connected to a branch circuit. Only lighting track fittings shall be installed on lighting track. Lighting track fittings shall not be equipped with general-purpose receptacles.

(b) **Connected Load.** The connected load on lighting track shall not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track.

(c) **Locations Not Permitted.** Lighting track shall not be installed in the following locations:

- (1) Where likely to be subjected to physical damage
- (2) In wet or damp locations
- (3) Where subject to corrosive vapors
- (4) In storage battery rooms
- (5) In hazardous (classified) locations
- (6) Where concealed
- (7) Where extended through walls or partitions
- (8) Less than 1 500 mm above the finished floor except where protected from physical damage or track operating at less than 30 volts rms open-circuit voltage
- (9) Where prohibited by 4.10.2.1(d)

(d) **Support.** Fittings identified for use on lighting track shall be

designed specifically for the track on which they are to be installed. They shall be securely fastened to the track, shall maintain polarization and grounding, and shall be designed to be suspended directly from the track.

4.10.15.4 Heavy-Duty Lighting Track. Heavy-duty lighting track is lighting track identified for use exceeding 20 amperes. Each fitting attached to a heavy-duty lighting track shall have individual overcurrent protection.

4.10.15.5 Fastening. Lighting track shall be securely mounted so that each fastening is suitable for supporting the maximum weight of luminaires (fixtures) that can be installed. Unless identified for supports at greater intervals, a single section 1 200 mm or shorter in length shall have two supports, and, where installed in a continuous row, each individual section of not more than 1 200 mm in length shall have one additional support.

4.10.15.6 Construction Requirements.

(a) **Construction.** The housing for the lighting track system shall be of substantial construction to maintain rigidity. The conductors shall be installed within the track housing, permitting insertion of a luminaire (fixture), and designed to prevent tampering and accidental contact with live parts. Components of lighting track systems of different voltages shall not be interchangeable. The track conductors shall be a minimum 3.5 mm² (2.0 mm dia.) or equal and shall be copper. The track system ends shall be insulated and capped.

(b) **Grounding.** Lighting track shall be grounded in accordance with Article 2.50, and the track sections shall be securely coupled to maintain continuity of the circuitry, polarization, and grounding throughout.

4.10.16 Decorative Lighting and Similar Accessories

4.10.16.1 Listing of Decorative Lighting. Decorative lighting and similar accessories used for holiday lighting and similar purposes, in accordance with 5.90.1.3(b), shall be listed.

ARTICLE 4.11 — LIGHTING SYSTEMS OPERATING AT 30 VOLTS OR LESS

4.11.1.1 Scope. This article covers lighting systems operating at 30 volts or less and their associated components.

4.11.1.2 Definition.

Lighting Systems Operating at 30 Volts or Less. A lighting system consisting of an isolating power supply operating at 30 volts (42.4 volts peak) or less under any load condition, with one or more secondary circuits, each limited to 25 amperes maximum, supplying luminaires (lighting fixtures) and associated equipment identified for the use.

4.11.1.3 Listing Required. Lighting systems operating at 30 volts or less shall be listed.

4.11.1.4 Locations Not Permitted. Lighting systems operating at 30 volts or less shall not be installed in the locations described in 4.11.1.4(a) and 4.11.1.4(b).

(a) Where concealed or extended through a building wall unless permitted in (1) or (2):

(1) Installed using any of the wiring methods specified in Chapter 3

(2) Installed using wiring supplied by a listed Class 2 power source and installed in accordance with 7.25.3.12

(b) Where installed within 3 000 mm of pools, spas, fountains, or similar locations, unless permitted by Article 6.80.

4.11.1.5 Secondary Circuits.

(a) **Grounding.** Secondary circuits shall not be grounded.

(b) **Isolation.** The secondary circuit shall be insulated from the branch circuit by an isolating transformer.

(c) **Bare Conductors.** Exposed bare conductors and current-carrying

parts shall be permitted for indoor installations only. Bare conductors shall not be installed less than 2 100 mm above the finished floor, unless specifically listed for a lower installation height.

4.11.1.6 Branch Circuit. Lighting systems operating at 30 volts or less shall be supplied from a maximum 20-ampere branch circuit.

4.11.1.7 Hazardous (Classified) Locations. Where installed in hazardous (classified) locations, these systems shall conform with Articles 5.0 through 5.17 in addition to this article.

ARTICLE 4.22 — APPLIANCES

4.22.1 General

4.22.1.1 Scope. This article covers electric appliances used in any occupancy.

4.22.1.3 Other Articles. The requirements of Article 4.30 shall apply to the installation of motor-operated appliances, and the requirements of Article 4.40 shall apply to the installation of appliances containing a hermetic refrigerant motor-compressor(s), except as specifically amended in this article.

4.22.1.4 Live Parts. Appliances shall have no live parts normally exposed to contact other than those parts functioning as open-resistance heating elements, such as the heating element of a toaster, which are necessarily exposed.

4.22.2 Installation

4.22.2.1 Branch-Circuit Rating. This section specifies the ratings of branch circuits capable of carrying appliance current without overheating under the conditions specified.

(a) **Individual Circuits.** The rating of an individual branch circuit shall not be less than the marked rating of the appliance or the marked rating of an appliance having combined loads as provided in 4.22.5.3.

The rating of an individual branch circuit for motor-operated appliances not having a marked rating shall be in accordance with Part 4.30.2.

The branch-circuit rating for an appliance that is continuously loaded, other than a motor-operated appliance, shall not be less than 125 percent of the marked rating, or not less than 100 percent of the marked rating if the branch-circuit device and its assembly are listed for continuous loading at 100 percent of its rating.

Branch circuits for household cooking appliances shall be permitted to be in accordance with Table 2.20.3.16.

(b) Circuits Supplying Two or More Loads. For branch circuits supplying appliance and other loads, the rating shall be determined in accordance with 2.10.2.4.

4.22.2.2 Overcurrent Protection. Appliances shall be protected against overcurrent in accordance with 4.22.2.2(a) through 4.22.2.2(g) and 4.22.2.1.

(a) Branch-Circuit Overcurrent Protection. Branch circuits shall be protected in accordance with 2.40.1.4.

If a protective device rating is marked on an appliance, the branch-circuit overcurrent device rating shall not exceed the protective device rating marked on the appliance.

(b) Household-Type Appliances with Surface Heating Elements. Household-type appliances with surface heating elements having a maximum demand of more than 60 amperes calculated in accordance with Table 2.20.3.16 shall have its power supply subdivided into two or more circuits, each of which shall be provided with overcurrent protection rated at not over 50 amperes.

(c) Infrared Lamp Commercial and Industrial Heating Appliances. Infrared lamp commercial and industrial heating appliances shall have overcurrent protection not exceeding 50 amperes.

(d) Open-Coil or Exposed Sheathed-Coil Types of Surface Heating Elements in Commercial-Type Heating Appliances. Open-coil or exposed sheathed-coil types of surface heating elements in commercial-type heating appliances shall be protected by overcurrent protective devices rated at not over 50 amperes.

(e) Single Non-motor-Operated Appliance. If the branch circuit supplies a single non-motor-operated appliance, the rating of overcurrent protection shall:

(1) Not exceed that marked on the appliance.

(2) Not exceed 20 amperes if the overcurrent protection rating is not marked and the appliance is rated 13.3 amperes or less; or

(3) Not exceed 150 percent of the appliance rated current if the overcurrent protection rating is not marked and the appliance is rated over 13.3 amperes. Where 150 percent of the appliance rating does not correspond to a standard overcurrent device ampere rating, the next higher standard rating shall be permitted.

(f) Electric Heating Appliances Employing Resistance-Type Heating Elements Rated More Than 48 Amperes.

(1) Electric Heating Appliances. Electric heating appliances employing resistance-type heating elements rated more than 48 amperes, other than household appliances with surface heating elements covered by 4.22.2.2(b), and commercial-type heating appliances covered by 4.22.2.2(d), shall have the heating elements subdivided. Each subdivided load shall not exceed 48 amperes and shall be protected at not more than 60 amperes.

These supplementary overcurrent protective devices shall be (1) factory-installed within or on the heater enclosure or provided as a separate assembly by the heater manufacturer; (2) accessible; and (3) suitable for branch-circuit protection.

The main conductors supplying these overcurrent protective devices shall be considered branch-circuit conductors.

(2) Commercial Kitchen and Cooking Appliances. Commercial kitchen and cooking appliances using sheathed-type heating elements not covered in 4.22.2.2(d) shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes where one of the following is met:

a.Elements are integral with and enclosed within a cooking surface.

b.Elements are completely contained within an enclosure identified as suitable for this use.

c. Elements are contained within an ASME-rated and stamped vessel.

(3) Water Heaters and Steam Boilers. Water heaters and steam boilers employing resistance-type immersion electric heating elements contained in an ASME-rated and stamped vessel or listed instantaneous water heaters shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes.

(g) Motor-Operated Appliances. Motors of motor-operated appliances shall be provided with overload protection in accordance with Part III of Article 4.30. Hermetic refrigerant motor-compressors in air-conditioning or refrigerating equipment shall be provided with overload protection in accordance with Part 4.40.6. Where appliance overcurrent protective devices that are separate from the appliance are required, data for selection of these devices shall be marked on the appliance. The minimum marking shall be that specified in 4.30.1.7 and 4.40.1.4.

4.22.2.3 Central Heating Equipment. Central heating equipment other than fixed electric space-heating equipment shall be supplied by an individual branch circuit.

Exception No. 1: Auxiliary equipment, such as a pump, valve, humidifier, or electrostatic air cleaner directly associated with the heating equipment, shall be permitted to be connected to the same branch circuit.

Exception No. 2: Permanently connected air-conditioning equipment shall be permitted to be connected to the same branch circuit.

4.22.2.4 Storage-Type Water Heaters. A fixed storage-type water heater that has a capacity of 450 L (120 gal) or less shall be considered a continuous load.

FPN: For branch-circuit rating, see 4.22.2.1.

4.22.2.5 Infrared Lamp Industrial Heating Appliances. In industrial occupancies, infrared heating appliance lampholders shall be permitted to be operated in series on circuits of over 150 volts to ground, provided the voltage rating of the lampholders is not less than the circuit voltage.

Each section, panel, or strip carrying a number of infrared lampholders (including the internal wiring of such section, panel, or strip) shall be considered an appliance. The terminal connection block of each such assembly shall be considered an individual outlet.

4.22.2.6 Central Vacuum Outlet Assemblies.

(a) Listed central vacuum outlet assemblies shall be permitted to be connected to a branch circuit in accordance with 2.10.2.4(a).

(b) The ampacity of the connecting conductors shall not be less than the ampacity of the branch circuit conductors to which they are connected.

(c) An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible non-current-carrying metal parts.

4.22.2.7 Flexible Cords.

(a) **General.** Flexible cord shall be permitted (1) for the connection of appliances to facilitate their frequent interchange or to prevent the transmission of noise or vibration or (2) to facilitate the removal or disconnection of appliances that are fastened in place, where the fastening means and mechanical connections are specifically designed to permit ready removal for maintenance or repair and the appliance is intended or identified for flexible cord connection.

(b) Specific Appliances.

(1) Electrically Operated Kitchen Waste Disposers. Electrically operated kitchen waste disposers shall be permitted to be cord-and-plug connected with a flexible cord identified as suitable for the purpose in the installation instructions of the appliance manufacturer, where all of the following conditions are met.

a. The flexible cord shall be terminated with a grounding-type attachment plug.

Exception: A listed kitchen waste disposer distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment

plug.

b. The length of the cord shall not be less than 450 mm and not over 900 mm.

c. Receptacles shall be located to avoid physical damage to the flexible cord.

d. The receptacle shall be accessible.

(2) Built-in Dishwashers and Trash Compactors. Built-in dishwashers and trash compactors shall be permitted to be cord-and-plug connected with a flexible cord identified as suitable for the purpose in the installation instructions of the appliance manufacturer where all of the following conditions are met.

a. The flexible cord shall be terminated with a grounding-type attachment plug.

Exception: A listed dishwasher or trash compactor distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.

b. The length of the cord shall be 900 mm to 1 200 mm measured from the face of the attachment plug to the plane of the rear of the appliance.

c. Receptacles shall be located to avoid physical damage to the flexible cord.

d. The receptacle shall be located in the space occupied by the appliance or adjacent thereto.

e. The receptacle shall be accessible.

(3) Wall-Mounted Ovens and Counter-Mounted Cooking Units. Wall-mounted ovens and counter-mounted cooking units complete with provisions for mounting and for making electrical connections shall be permitted to be permanently connected or, only for ease in servicing or for installation, cord-and-plug connected.

A separable connector or a plug and receptacle combination in the supply line to an oven or cooking unit shall be approved for the temperature of the space in which it is located.

(4) Range Hoods. Range hoods shall be permitted to be cord-and-

plug connected with a flexible cord identified as suitable for use on range hoods in the installation instructions of the appliance manufacturer, where all of the following conditions are met:

a. The flexible cord is terminated with a grounding-type attachment plug.

Exception: A listed range hood distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.

b. The length of the cord is not less than 450 mm and not over 900 mm.

c. Receptacles are located to avoid physical damage to the flexible cord.

d. The receptacle is accessible.

e. The receptacle is supplied by an individual branch circuit.

4.22.2.8 Protection of Combustible Material. Each electrically heated appliance that is intended by size, weight, and service to be located in a fixed position shall be placed so as to provide ample protection between the appliance and adjacent combustible material.

4.22.2.9 Support of Ceiling-Suspended (Paddle) Fans. Ceiling-suspended (paddle) fans shall be supported independently of an outlet box or by listed outlet box or outlet box systems identified for the use and installed in accordance with 3.14.2.13(d).

4.22.2.11 Other Installation Methods. Appliances employing methods of installation other than covered by this article shall be permitted to be used only by special permission.

4.22.3 Disconnecting Means

4.22.3.1 General. A means shall be provided to disconnect each appliance from all ungrounded conductors in accordance with the following sections of Part 4.22.3. If an appliance is supplied by more than one source, the disconnecting means shall be grouped and identified.

4.22.3.2 Disconnection of Permanently Connected Appliances.

(a) **Rated at Not Over 300 Volt-Amperes or Horsepower.** For permanently connected appliances rated at not over 300 volt-amperes or hp, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.

(b) **Appliances Rated Over 300 Volt-Amperes or 1/8 Horsepower.** For permanently connected appliances rated over 300 volt-amperes or hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the appliance or is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

FPN: For appliances employing unit switches, see 4.22.3.5.

4.22.3.3 Disconnecting Means for Motor-Driven Appliance. If a switch or circuit breaker serves as the disconnecting means for a permanently connected motor-driven appliance of more than 1/8 hp, it shall be located within sight from the motor controller and shall comply with Part 4.30.9.

Exception: If a motor-driven appliance of more than 1/8 hp is provided with a unit switch that complies with 4.22.3.5(a), (b), (c), or (d), the switch or circuit breaker serving as the other disconnecting means shall be permitted to be out of sight from the motor controller.

4.22.3.4 Disconnection of Cord-and-Plug-Connected Appliances.

(a) **Separable Connector or an Attachment Plug and Receptacle.** For cord-and-plug-connected appliances, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means. Where the separable connector or plug and receptacle are not accessible, cord-and-plug-connected appliances shall be provided with disconnecting means in accordance with 4.22.3.2.

(b) **Connection at the Rear Base of a Range.** For cord-and-plug-

connected household electric ranges, an attachment plug and receptacle connection at the rear base of a range, if it is accessible from the front by removal of a drawer, shall be considered as meeting the intent of 4.22.3.4(a).

(c) **Rating.** The rating of a receptacle or of a separable connector shall not be less than the rating of any appliance connected thereto.

Exception: Demand factors authorized elsewhere in this Code shall be permitted to be applied to the rating of a receptacle or of a separable connector.

4.22.3.5 Unit Switch(es) as Disconnecting Means. A unit switch(es) with a marked-off position that is a part of an appliance and disconnects all ungrounded conductors shall be permitted as the disconnecting means required by this article where other means for disconnection are provided in occupancies specified in 4.22.3.5(a) through 4.22.3.5(d).

(a) **Multifamily Dwellings.** In multifamily dwellings, the other disconnecting means shall be within the dwelling unit, or on the same floor as the dwelling unit in which the appliance is installed, and shall be permitted to control lamps and other appliances.

(b) **Two-Family Dwellings.** In two-family dwellings, the other disconnecting means shall be permitted either inside or outside of the dwelling unit in which the appliance is installed. In this case, an individual switch or circuit breaker for the dwelling unit shall be permitted and shall also be permitted to control lamps and other appliances.

(c) **One-Family Dwellings.** In one-family dwellings, the service disconnecting means shall be permitted to be the other disconnecting means.

(d) **Other Occupancies.** In other occupancies, the branch-circuit switch or circuit breaker, where readily accessible for servicing of the appliance, shall be permitted as the other disconnecting means.

4.22.3.6 Switch and Circuit Breaker to Be Indicating. Switches and circuit breakers used as disconnecting means shall be of the indicating type.

4.22.4 Construction

4.22.4.1 Polarity in Cord-and-Plug-Connected Appliances. If the appliance is provided with a manually operated, line-connected, single-pole switch for appliance on-off operation, an Edison-base lampholder, or a 15- or 20-ampere receptacle, the attachment plug shall be of the polarized or grounding type.

A 2-wire, nonpolarized attachment plug shall be permitted to be used on a listed double-insulated shaver.

FPN: For polarity of Edison-base lampholders, see 4.10.7.9(a).

4.22.4.2 Cord-and-Plug-Connected Appliances Subject to Immersion. Cord-and-plug-connected portable, freestanding hydromassage units and hand-held hair dryers shall be constructed to provide protection for personnel against electrocution when immersed while in the “on” or “off” position.

4.22.4.3 Signals for Heated Appliances. In other than dwelling-type occupancies, each electrically heated appliance or group of appliances intended to be applied to combustible material shall be provided with a signal or an integral temperature-limiting device.

4.22.4.4 Flexible Cords.

(a) Heater Cords. All cord-and-plug-connected smoothing irons and electrically heated appliances that are rated at more than 50 watts and produce temperatures in excess of 121°C (250°F) on surfaces with which the cord is likely to be in contact shall be provided with one of the types of approved heater cords listed in Table 4.0.1.4.

(b) Other Heating Appliances. All other cord-and-plug-connected electrically heated appliances shall be connected with one of the approved types of cord listed in Table 4.0.1.4, selected in accordance with the usage specified in that table.

4.22.4.5 Cord-and-Plug-Connected Immersion Heaters. Electric

heaters of the cord-and-plug-connected immersion type shall be constructed and installed so that current-carrying parts are effectively insulated from electrical contact with the substance in which they are immersed.

4.22.4.6 Stands for Cord-and-Plug-Connected Appliances. Each smoothing iron and other cord-and-plug-connected electrically heated appliance intended to be applied to combustible material shall be equipped with an approved stand, which shall be permitted to be a separate piece of equipment or a part of the appliance.

4.22.4.7 Flatirons. Electrically heated smoothing irons shall be equipped with an identified temperature-limiting means.

4.22.4.8 Water Heater Controls. All storage or instantaneous-type water heaters shall be equipped with a temperature-limiting means in addition to its control thermostat to disconnect all ungrounded conductors. Such means shall comply with both of the following:

- (1) Installed to sense maximum water temperature.
- (2) Be either a trip-free, manually reset type or a type having a replacement element. Such water heaters shall be marked to require the installation of a temperature and pressure relief valve.

Exception No. 1: Storage water heaters that are identified as being suitable for use with supply water temperature of 82°C (180°F) or above and a capacity of 60 kW or above.

Exception No. 2: Instantaneous-type water heaters that are identified as being suitable for such use, with a capacity of 4 L (1 gal) or less.

FPN: See ANSI Z21.22-1999/CSA 4.4-M99, Relief Valves for Hot Water Supply Systems.

4.22.4.9 Infrared Lamp Industrial Heating Appliances.

(a) 300 Watts or Less. Infrared heating lamps rated at 300 watts or less shall be permitted with lampholders of the medium-base, unswitched porcelain type or other types identified as suitable for use with infrared heating lamps rated 300 watts or less.

(b) Over 300 Watts. Screw-shell lampholders shall not be used with

infrared lamps rated over 300 watts, unless the lampholders are identified as being suitable for use with infrared heating lamps rated over 300 watts.

4.22.4.10 High-Pressure Spray Washers. All single-phase cord-and-plug-connected high-pressure spray washing machines rated at 250 volts or less shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 300 mm of the attachment plug.

4.22.4.11 Cord-and-Plug-Connected Pipe Heating Assemblies. Cord-and-plug-connected pipe heating assemblies intended to prevent freezing of piping shall be listed.

4.22.4.12 Cord-and-Plug-Connected Vending Machines. Cord-and-plug-connected vending machines manufactured or re-manufactured on or after January 1, 2006, shall include a ground-fault circuit-interrupter as an integral part of the attachment plug or located in the power supply cord within 300 mm of the attachment plug. Cord-and-plug-connected vending machines not incorporating integral GFCI protection shall be connected to a GFCI protected outlet.

4.22.5 Marking

4.22.5.1 Nameplate.

(a) Nameplate Marking. Each electric appliance shall be provided with a nameplate giving the identifying name and the rating in volts and amperes, or in volts and watts. If the appliance is to be used on a specific frequency or frequencies, it shall be so marked.

Where motor overload protection external to the appliance is required, the appliance shall be so marked.

FPN: See 4.22.2.2 for overcurrent protection requirements.

(b) To Be Visible. Marking shall be located so as to be visible or easily accessible after installation.

4.22.5.2 Marking of Heating Elements. All heating elements that are rated over one ampere, replaceable in the field, and a part of an

appliance shall be legibly marked with the ratings in volts and amperes, or in volts and watts, or with the manufacturer's part number.

4.22.5.3 Appliances Consisting of Motors and Other Loads.

(a) Nameplate Horsepower Markings. Where a motor-operated appliance nameplate includes a horsepower rating, that rating shall not be less than the horsepower rating on the motor nameplate. Where an appliance consists of multiple motors, or one or more motors and other loads, the nameplate value shall not be less than the equivalent horsepower of the combined loads, calculated in accordance with 4.30.9.10(c)(1).

(b) Additional Nameplate Markings. Appliances, other than those factory-equipped with cords and attachment plugs and with nameplates in compliance with 4.22.5.1, shall be marked in accordance with 4.22.5.3(b)(1) or (b)(2).

(1) Marking. In addition to the marking required in 4.22.5.1, the marking on an appliance consisting of a motor with other load(s) or motors with or without other load(s) shall specify the minimum supply circuit conductor ampacity and the maximum rating of the circuit overcurrent protective device. This requirement shall not apply to an appliance with a nameplate in compliance with 4.22.5.1 where both the minimum supply circuit conductor ampacity and maximum rating of the circuit overcurrent protective device are not more than 15 amperes.

(2) Alternate Marking Method. An alternative marking method shall be permitted to specify the rating of the largest motor in volts and amperes, and the additional load(s) in volts and amperes, or volts and watts in addition to the marking required in 4.22.5.1. The ampere rating of a motor horsepower or less or a nonmotor load 1 ampere or less shall be permitted to be omitted unless such loads constitute the principal load.

ARTICLE 4.24 — FIXED ELECTRIC SPACE-HEATING EQUIPMENT

4.24.1 General

4.24.1.1 Scope. This article covers fixed electric equipment used for

space heating. For the purpose of this article, heating equipment shall include heating cable, unit heaters, boilers, central systems, or other approved fixed electric space-heating equipment. This article shall not apply to process heating and room air conditioning.

4.24.1.2 Other Articles. Fixed electric space-heating equipment incorporating a hermetic refrigerant motor-compressor shall also comply with Article 4.40.

4.24.1.3 Branch Circuits.

(a) Branch-Circuit Requirements. Individual branch circuits shall be permitted to supply any size fixed electric space-heating equipment.

Branch circuits supplying two or more outlets for fixed electric space-heating equipment shall be rated 15, 20, 25, or 30 amperes. In nondwelling occupancies, fixed infrared heating equipment shall be permitted to be supplied from branch circuits rated not over 50 amperes.

(b) Branch-Circuit Sizing. Fixed electric space heating equipment shall be considered continuous load.

4.24.1.6 Listed Equipment. Electric baseboard heaters, heating cables, duct heaters, and radiant heating systems shall be listed and labeled.

4.24.2 Installation

4.24.2.1 General. All fixed electric space-heating equipment shall be installed in an approved manner.

Permanently installed electric baseboard heaters equipped with factory-installed receptacle outlets, or outlets provided as a separate listed assembly, shall be permitted in lieu of a receptacle outlet(s) that is required by 2.10.3.1(b). Such receptacle outlets shall not be connected to the heater circuits.

FPN: Listed baseboard heaters include instructions that may not permit their installation below receptacle outlets.

4.24.2.2 Special Permission. Fixed electric space-heating equipment and systems installed by methods other than covered by this article shall be permitted only by special permission.

4.24.2.3 Supply Conductors. Fixed electric space-heating equipment requiring supply conductors with over 60°C insulation shall be clearly and permanently marked. This marking shall be plainly visible after installation and shall be permitted to be adjacent to the field connection box.

4.24.2.4 Locations.

(a) Exposed to Physical Damage. Where subject to physical damage, fixed electric space-heating equipment shall be protected in an approved manner.

(b) Damp or Wet Locations. Heaters and related equipment installed in damp or wet locations shall be listed for such locations and shall be constructed and installed so that water or other liquids cannot enter or accumulate in or on wired sections, electrical components, or ductwork.

FPN No. 1: See 1.10.1.11 for equipment exposed to deteriorating agents.

FPN No. 2: See 6.80.2.8(c) for pool deck areas.

4.24.2.5 Spacing from Combustible Materials. Fixed electric space-heating equipment shall be installed to provide the required spacing between the equipment and adjacent combustible material, unless it is listed to be installed in direct contact with combustible material.

4.24.3 Control and Protection of Fixed Electric Space-Heating Equipment

4.24.3.1 Disconnecting Means. Means shall be provided to disconnect the heater, motor controller(s), and supplementary overcurrent protective device(s) of all fixed electric space-heating equipment from all ungrounded conductors. Where heating equipment is supplied by more than one source, the disconnecting means shall be grouped and marked.

(a) Heating Equipment with Supplementary Overcurrent Protection. The disconnecting means for fixed electric space-heating equipment with supplementary overcurrent protection shall be within sight from the supplementary overcurrent protective device(s), on the

supply side of these devices, if fuses, and, in addition, shall comply with either 4.24.3.1(a)(1) or (a)(2).

(1) Heater Containing No Motor Rated Over 1/8 Horsepower. The above disconnecting means or unit switches complying with 4.24.3.1(c) shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater under either of the following conditions:

a. The disconnecting means provided is also within sight from the motor controller(s) and the heater.

b. The disconnecting means provided is capable of being locked in the open position.

(2) Heater Containing a Motor(s) Rated Over 1/8 Horsepower. The above disconnecting means shall be permitted to serve as the required disconnecting means for both the motor controller(s) and heater by one of the following means:

a. Where the disconnecting means is also in sight from the motor controller(s) and the heater.

b. Where the disconnecting means is not within sight from the heater, a separate disconnecting means shall be installed, or the disconnecting means shall be capable of being locked in the open position, or unit switches complying with 4.24.3.1(c) shall be permitted.

c. Where the disconnecting means is not within sight from the motor controller location, a disconnecting means complying with 4.30.9.2 shall be provided.

d. Where the motor is not in sight from the motor controller location, 4.30.9.2(b) shall apply.

(b) Heating Equipment Without Supplementary Overcurrent Protection.

(1) Without Motor or with Motor Not Over 1/8 Horsepower. For fixed electric space-heating equipment without a motor rated over 1/8 hp, the branch-circuit switch or circuit breaker shall be permitted to serve as the disconnecting means where the switch or circuit breaker is within sight from the heater or is capable of being locked in the open position.

(2) Over 1/8 Horsepower. For motor-driven electric space-heating equipment with a motor rated over 1/8 hp, a disconnecting means shall be located within sight from the motor controller or shall be permitted to comply with the requirements in 4.24.3.1(a)(2).

(c) Unit Switch(es) as Disconnecting Means. A unit switch(es) with a marked “off” position that is part of a fixed heater and disconnects all ungrounded conductors shall be permitted as the disconnecting means required by this article where other means for disconnection are provided in the types of occupancies in 4.24.3.1(c)(1) through (c)(4).

(1) Multifamily Dwellings. In multifamily dwellings, the other disconnecting means shall be within the dwelling unit, or on the same floor as the dwelling unit in which the fixed heater is installed, and shall also be permitted to control lamps and appliances.

(2) Two-Family Dwellings. In two-family dwellings, the other disconnecting means shall be permitted either inside or outside of the dwelling unit in which the fixed heater is installed. In this case, an individual switch or circuit breaker for the dwelling unit shall be permitted and shall also be permitted to control lamps and appliances.

(3) One-Family Dwellings. In one-family dwellings, the service disconnecting means shall be permitted to be the other disconnecting means.

(4) Other Occupancies. In other occupancies, the branch-circuit switch or circuit breaker, where readily accessible for servicing of the fixed heater, shall be permitted as the other disconnecting means.

4.24.3.2 Thermostatically Controlled Switching Devices.

(a) Serving as Both Controllers and Disconnecting Means. Thermostatically controlled switching devices and combination thermostats and manually controlled switches shall be permitted to serve as both controllers and disconnecting means, provided all of the following conditions are met:

(1) Provided with a marked “off” position

(2) Directly open all ungrounded conductors when manually placed in the “off” position

(3) Designed so that the circuit cannot be energized automatically after the device has been manually placed in the “off” position

(4) Located as specified in 4.24.3.1

(b) Thermostats That Do Not Directly Interrupt All Ungrounded Conductors. Thermostats that do not directly interrupt all ungrounded conductors and thermostats that operate remote-control circuits shall not be required to meet the requirements of 4.24.3.2(a). These devices shall not be permitted as the disconnecting means.

4.24.3.3 Switch and Circuit Breaker to Be Indicating. Switches and circuit breakers used as disconnecting means shall be of the indicating type.

4.24.3.4 Overcurrent Protection.

(a) Branch-Circuit Devices. Electric space-heating equipment, other than such motor-operated equipment as required by Article 4.30 and Article 4.40 to have additional overcurrent protection, shall be permitted to be protected against overcurrent where supplied by one of the branch circuits in Article 2.10.

(b) Resistance Elements. Resistance-type heating elements in electric space-heating equipment shall be protected at not more than 60 amperes. Equipment rated more than 48 amperes and employing such elements shall have the heating elements subdivided, and each subdivided load shall not exceed 48 amperes. Where a subdivided load is less than 48 amperes, the rating of the supplementary overcurrent protective device shall comply with 4.24.1.3(b). A boiler employing resistance-type immersion heating elements contained in an ASME rated and stamped vessel shall be permitted to comply with 4.24.7.3(a).

(c) Overcurrent Protective Devices. The supplementary overcurrent protective devices for the subdivided loads specified in 4.24.3.4(b) shall be (1) factory-installed within or on the heater enclosure or supplied for use with the heater as a separate assembly by the heater manufacturer; (2) accessible, but shall not be required to be readily accessible; and (3) suitable for branch-circuit protection.

FPN: See 2.40.1.10.

Where cartridge fuses are used to provide this overcurrent protection, a single disconnecting means shall be permitted to be used for the several subdivided loads.

FPN No. 1: For supplementary overcurrent protection, see 2.40.1.10.

FPN No. 2: For disconnecting means for cartridge fuses in circuits of any voltage, see 2.40.4.1.

(d) Branch-Circuit Conductors. The conductors supplying the supplementary overcurrent protective devices shall be considered branch-circuit conductors.

Where the heaters are rated 50 kW or more, the conductors supplying the supplementary overcurrent protective devices specified in 4.24.3.4(c) shall be permitted to be sized at not less than 100 percent of the nameplate rating of the heater, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature-actuated device controls the cyclic operation of the equipment.

(e) Conductors for Subdivided Loads. Field-wired conductors between the heater and the supplementary overcurrent protective devices shall be sized at not less than 125 percent of the load served. The supplementary overcurrent protective devices specified in 4.24.3.4(c) shall protect these conductors in accordance with 2.40.1.4.

Where the heaters are rated 50 kW or more, the ampacity of field-wired conductors between the heater and the supplementary overcurrent protective devices shall be permitted to be not less than 100 percent of the load of their respective subdivided circuits, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature-activated device controls the cyclic operation of the equipment.

4.24.4 Marking of Heating Equipment

4.24.4.1 Nameplate.

(a) Marking Required. Each unit of fixed electric space-heating equipment shall be provided with a nameplate giving the identifying name and the normal rating in volts and watts or in volts and amperes.

Electric space-heating equipment intended for use on alternating current only or direct current only shall be marked to so indicate. The marking of equipment consisting of motors over 1/8 hp and other loads shall specify the rating of the motor in volts, amperes, and frequency, and the heating load in volts and watts or in volts and amperes.

(b) Location. This nameplate shall be located so as to be visible or easily accessible after installation.

4.24.4.2 Marking of Heating Elements. All heating elements that are replaceable in the field and are part of an electric heater shall be legibly marked with the ratings in volts and watts or in volts and amperes.

4.24.5 Electric Space-Heating Cables

4.24.5.1 Heating Cable Construction. Heating cables shall be furnished complete with factory-assembled nonheating leads at least 2 100 mm in length.

4.24.5.2 Marking of Heating Cables. Each unit shall be marked with the identifying name or identification symbol, catalog number, and ratings in volts and watts or in volts and amperes.

Each unit length of heating cable shall have a permanent legible marking on each nonheating lead located within 75 mm of the terminal end. The lead wire shall have the following color identification to indicate the circuit voltage on which it is to be used:

- (1) 120 volt, nominal — yellow
- (2) 208 volt, nominal — blue
- (3) 240 volt, nominal — red
- (4) 277 volt, nominal — brown
- (5) 480 volt, nominal — orange

4.24.5.3 Clearances of Wiring in Ceilings. Wiring located above heated ceilings shall be spaced not less than 50 mm above the heated ceiling and shall be considered as operating at an ambient temperature of 50°C (122°F). The ampacity of conductors shall be calculated on the basis of the correction factors shown in the 0–2 000 volt ampacity tables of Article 3.10. If this wiring is located above thermal insulation having a minimum thickness of 50 mm, the wiring shall not require correction for temperature.

4.24.5.5 Area Restrictions.

(a) Shall Not Extend Beyond the Room or Area. Heating cables shall not extend beyond the room or area in which they originate.

(b) Uses Prohibited. Heating cables shall not be installed in the following:

- (1) In closets
- (2) Over walls
- (3) Over partitions that extend to the ceiling, unless they are isolated single runs of embedded cable
- (4) Over cabinets whose clearance from the ceiling is less than the minimum horizontal dimension of the cabinet to the nearest cabinet edge that is open to the room or area

(c) In Closet Ceilings as Low-Temperature Heat Sources to Control Relative Humidity. The provisions of 4.24.5.5(b) shall not prevent the use of cable in closet ceilings as low-temperature heat sources to control relative humidity, provided they are used only in those portions of the ceiling that are unobstructed to the floor by shelves or other permanent luminaires (fixtures).

4.24.5.6 Clearance from Other Objects and Openings. Heating elements of cables shall be separated at least 200 mm from the edge of outlet boxes and junction boxes that are to be used for mounting surface luminaires (lighting fixtures). A clearance of not less than 50 mm shall be provided from recessed luminaires (fixtures) and their trims, ventilating openings, and other such openings in room surfaces. Sufficient area shall be provided to ensure that no heating cable is covered by any surface-mounted units.

4.24.5.7 Splices. Embedded cables shall be spliced only where necessary and only by approved means, and in no case shall the length of the heating cable be altered.

4.24.5.8 Installation of Heating Cables on Dry Board, in Plaster, and on Concrete Ceilings.

(a) In Walls. Cables shall not be installed in walls unless it is

necessary for an isolated single run of cable to be installed down a vertical surface to reach a dropped ceiling.

(b) Adjacent Runs. Adjacent runs of cable not exceeding 9 watts/m (2¾ watts/ft) shall not be installed less than 40 mm on centers.

(c) Surfaces to Be Applied. Heating cables shall be applied only to gypsum board, plaster lath, or other fire-resistant material. With metal lath or other electrically conductive surfaces, a coat of plaster shall be applied to completely separate the metal lath or conductive surface from the cable.

FPN: See also 4.24.5.8(f).

(d) Splices. All heating cables, the splice between the heating cable and nonheating leads, and 75 mm minimum of the nonheating lead at the splice shall be embedded in plaster or dry board in the same manner as the heating cable.

(e) Ceiling Surface. The entire ceiling surface shall have a finish of thermally noninsulating sand plaster that has a nominal thickness of 13 mm, or other noninsulating material identified as suitable for this use and applied according to specified thickness and directions.

(f) Secured. Cables shall be secured by means of approved stapling, tape, plaster, nonmetallic spreaders, or other approved means either at intervals not exceeding 410 mm or at intervals not exceeding 1 800 mm for cables identified for such use. Staples or metal fasteners that straddle the cable shall not be used with metal lath or other electrically conductive surfaces.

(g) Dry Board Installations. In dry board installations, the entire ceiling below the heating cable shall be covered with gypsum board not exceeding 13 mm thickness. The void between the upper layer of gypsum board, plaster lath, or other fire-resistant material and the surface layer of gypsum board shall be completely filled with thermally conductive, nonshrinking plaster or other approved material or equivalent thermal conductivity.

(h) Free from Contact with Conductive Surfaces. Cables shall be kept free from contact with metal or other electrically conductive

surfaces.

(i) Joists. In dry board applications, cable shall be installed parallel to the joist, leaving a clear space centered under the joist of 65 mm (width) between centers of adjacent runs of cable. A surface layer of gypsum board shall be mounted so that the nails or other fasteners do not pierce the heating cable.

(j) Crossing Joists. Cables shall cross joists only at the ends of the room unless the cable is required to cross joists elsewhere in order to satisfy the manufacturer's instructions that the installer avoid placing the cable too close to ceiling penetrations and luminaires (lighting fixtures).

4.24.5.9 Finished Ceilings. Finished ceilings shall not be covered with decorative panels or beams constructed of materials that have thermal insulating properties, such as wood, fiber, or plastic. Finished ceilings shall be permitted to be covered with paint, wallpaper, or other approved surface finishes.

4.24.5.10 Installation of Nonheating Leads of Cables.

(a) Free Nonheating Leads. Free nonheating leads of cables shall be installed in accordance with approved wiring methods from the junction box to a location within the ceiling. Such installations shall be permitted to be single conductors in approved raceways, single or multiconductor Type UF, Type NMC, Type MI, or other approved conductors.

(b) Leads in Junction Box. Not less than 150 mm of free nonheating lead shall be within the junction box. The marking of the leads shall be visible in the junction box.

(c) Excess Leads. Excess leads of heating cables shall not be cut but shall be secured to the underside of the ceiling and embedded in plaster or other approved material, leaving only a length sufficient to reach the junction box with not less than 150 mm of free lead within the box.

4.24.5.11 Installation of Cables in Concrete or Poured Masonry Floors.

(a) **Watts per Linear Foot.** Constant wattage heating cables shall not exceed 54 watts/linear meter (16½ watts/linear foot) of cable.

(b) **Spacing Between Adjacent Runs.** The spacing between adjacent runs of cable shall not be less than 25 mm on centers.

(c) **Secured in Place.** Cables shall be secured in place by nonmetallic frames or spreaders or other approved means while the concrete or other finish is applied.

Cables shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

(d) **Spacings Between Heating Cable and Metal Embedded in the Floor.** Spacings shall be maintained between the heating cable and metal embedded in the floor, unless the cable is a grounded metal-clad cable.

(e) **Leads Protected.** Leads shall be protected where they leave the floor by rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, or by other approved means.

(f) **Bushings or Approved Fittings.** Bushings or approved fittings shall be used where the leads emerge within the floor slab.

(g) **Ground-Fault Circuit-Interrupter Protection.** Ground-fault circuit-interrupter protection for personnel shall be provided for cables installed in electrically heated floors of bathrooms and in hydromassage bathtub locations.

4.24.5.12 Inspection and Tests. Cable installations shall be made with due care to prevent damage to the cable assembly and shall be inspected and approved before cables are covered or concealed.

4.24.6 Duct Heaters

4.24.6.1 General. Part 4.24.6 shall apply to any heater mounted in the airstream of a forced-air system where the air-moving unit is not

provided as an integral part of the equipment.

4.24.6.2 Identification. Heaters installed in an air duct shall be identified as suitable for the installation.

4.24.6.3 Airflow. Means shall be provided to ensure uniform and adequate airflow over the face of the heater in accordance with the manufacturer's instructions.

FPN: Heaters installed within 1 200 mm of the outlet of an air-moving device, heat pump, air conditioner, elbows, baffle plates, or other obstructions in ductwork may require turning vanes, pressure plates, or other devices on the inlet side of the duct heater to ensure an even distribution of air over the face of the heater.

4.24.6.4 Elevated Inlet Temperature. Duct heaters intended for use with elevated inlet air temperature shall be identified as suitable for use at the elevated temperatures.

4.24.6.5 Installation of Duct Heaters with Heat Pumps and Air Conditioners. Heat pumps and air conditioners having duct heaters closer than 1 200 mm to the heat pump or air conditioner shall have both the duct heater and heat pump or air conditioner identified as suitable for such installation and so marked.

4.24.6.6 Condensation. Duct heaters used with air conditioners or other air-cooling equipment that could result in condensation of moisture shall be identified as suitable for use with air conditioners.

4.24.6.7 Fan Circuit Interlock. Means shall be provided to ensure that the fan circuit is energized when any heater circuit is energized. However, time- or temperature-controlled delay in energizing the fan motor shall be permitted.

4.24.6.8 Limit Controls. Each duct heater shall be provided with an approved, integral, automatic-reset temperature-limiting control or controllers to de-energize the circuit or circuits. In addition, an integral independent supplementary control or controllers shall be provided in each duct heater that disconnects a sufficient number of conductors to interrupt current flow. This device shall be manually resettable or replaceable.

4.24.6.9 Location of Disconnecting Means. Duct heater controller

equipment shall be either accessible with the disconnecting means installed at or within sight from the controller or as permitted by 4.24.3.1(a).

4.24.6.10 Installation. Duct heaters shall be installed in accordance with the manufacturer's instructions in such a manner that operation does not create a hazard to persons or property. Furthermore, duct heaters shall be located with respect to building construction and other equipment so as to permit access to the heater. Sufficient clearance shall be maintained to permit replacement of controls and heating elements and for adjusting and cleaning of controls and other parts requiring such attention. See 1.10.2.1.

FPN: For additional installation information, see NFPA 90A-2002, Standard for the Installation of Air-Conditioning and Ventilating Systems, and NFPA 90B-2002, Standard for the Installation of Warm Air Heating and Air-Conditioning Systems.

4.24.7 Resistance-Type Boilers

4.24.7.1 Scope. The provisions in Part 4.24.7 shall apply to boilers employing resistance-type heating elements. Electrode-type boilers shall not be considered as employing resistance-type heating elements. See Part 4.24.8.

4.24.7.2 Identification. Resistance-type boilers shall be identified as suitable for the installation.

4.24.7.3 Overcurrent Protection.

(a) Boiler Employing Resistance-Type Immersion Heating Elements in an ASME Rated and Stamped Vessel. A boiler employing resistance-type immersion heating elements contained in an ASME rated and stamped vessel shall have the heating elements protected at not more than 150 amperes. Such a boiler rated more than 120 amperes shall have the heating elements subdivided into loads not exceeding 120 amperes.

Where a subdivided load is less than 120 amperes, the rating of the overcurrent protective device shall comply with 4.24.1.3(b).

(b) Boiler Employing Resistance-Type Heating Elements Rated More Than 48 Amperes and Not Contained in an ASME Rated and Stamped Vessel. A boiler employing resistance-type heating

elements not contained in an ASME rated and stamped vessel shall have the heating elements protected at not more than 60 amperes. Such a boiler rated more than 48 amperes shall have the heating elements subdivided into loads not exceeding 48 amperes.

Where a subdivided load is less than 48 amperes, the rating of the overcurrent protective device shall comply with 4.24.1.3(b).

(c) Supplementary Overcurrent Protective Devices. The supplementary overcurrent protective devices for the subdivided loads as required by 4.24.7.3(a) and 4.24.7.3(b) shall be as follows:

- (1) Factory-installed within or on the boiler enclosure or provided as a separate assembly by the boiler manufacturer
- (2) Accessible, but need not be readily accessible
- (3) Suitable for branch-circuit protection

Where cartridge fuses are used to provide this overcurrent protection, a single disconnecting means shall be permitted for the several subdivided circuits. See 2.40.4.1.

(d) Conductors Supplying Supplementary Overcurrent Protective Devices. The conductors supplying these supplementary overcurrent protective devices shall be considered branch-circuit conductors.

Where the heaters are rated 50 kW or more, the conductors supplying the overcurrent protective device specified in 4.24.7.3(c) shall be permitted to be sized at not less than 100 percent of the nameplate rating of the heater, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature- or pressure-actuated device controls the cyclic operation of the equipment.

(e) Conductors for Subdivided Loads. Field-wired conductors between the heater and the supplementary overcurrent protective devices shall be sized at not less than 125 percent of the load served. The supplementary overcurrent protective devices specified in 4.24.7.3(c) shall protect these conductors in accordance with 2.40.1.4.

Where the heaters are rated 50 kW or more, the ampacity of field-wired conductors between the heater and the supplementary overcurrent protective devices shall be permitted to be not less than 100 percent of the load of their respective subdivided circuits, provided all of the following conditions are met:

- (1) The heater is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature-activated device controls the cyclic operation of the equipment.

4.24.7.4 Overtemperature Limit Control. Each boiler designed so that in normal operation there is no change in state of the heat transfer medium shall be equipped with a temperature-sensitive limiting means. It shall be installed to limit maximum liquid temperature and shall directly or indirectly disconnect all ungrounded conductors to the heating elements. Such means shall be in addition to a temperature regulating system and other devices protecting the tank against excessive pressure.

4.24.7.5 Overpressure Limit Control. Each boiler designed so that in normal operation there is a change in state of the heat transfer medium from liquid to vapor shall be equipped with a pressure-sensitive limiting means. It shall be installed to limit maximum pressure and shall directly or indirectly disconnect all ungrounded conductors to the heating elements. Such means shall be in addition to a pressure regulating system and other devices protecting the tank against excessive pressure.

4.24.8 Electrode-Type Boilers

4.24.8.1 Scope. The provisions in Part 4.24.8 shall apply to boilers for operation at 600 volts, nominal, or less, in which heat is generated by the passage of current between electrodes through the liquid being heated.

FPN: For over 600 volts, see Part 4.90.5.

4.24.8.2 Identification. Electrode-type boilers shall be identified as suitable for the installation.

4.24.8.3 Branch-Circuit Requirements. The size of branch-circuit conductors and overcurrent protective devices shall be calculated on the basis of 125 percent of the total load (motors not included). A contactor, relay, or other device, approved for continuous operation at 100 percent of its rating, shall be permitted to supply its full-rated load. See 2.10.2.1(a), Exception. The provisions of this section shall not apply to conductors that form an integral part of an approved boiler. Where an electrode boiler is rated 50 kW or more, the conductors supplying the boiler electrode(s) shall be permitted to be sized at not less than 100 percent of the nameplate rating of the electrode boiler, provided all the following conditions are met:

- (1) The electrode boiler is marked with a minimum conductor size.
- (2) The conductors are not smaller than the marked minimum size.
- (3) A temperature- or pressure-actuated device controls the cyclic operation of the equipment.

4.24.8.4 Overtemperature Limit Control. Each boiler, designed so that in normal operation there is no change in state of the heat transfer medium, shall be equipped with a temperature-sensitive limiting means. It shall be installed to limit maximum liquid temperature and shall directly or indirectly interrupt all current flow through the electrodes. Such means shall be in addition to the temperature regulating system and other devices protecting the tank against excessive pressure.

4.24.8.5 Overpressure Limit Control. Each boiler, designed so that in normal operation there is a change in state of the heat transfer medium from liquid to vapor, shall be equipped with a pressure-sensitive limiting means. It shall be installed to limit maximum pressure and shall directly or indirectly interrupt all current flow through the electrodes. Such means shall be in addition to a pressure regulating system and other devices protecting the tank against excessive pressure.

4.24.8.6 Grounding. For those boilers designed such that fault currents do not pass through the pressure vessel, and the pressure vessel is electrically isolated from the electrodes, all exposed non-current-carrying metal parts, including the pressure vessel, supply, and return connecting piping, shall be grounded in accordance with Article 2.50.

For all other designs, the pressure vessel containing the electrodes shall be isolated and electrically insulated from ground.

4.24.8.7 Markings. All electrode-type boilers shall be marked to show the following:

- (1) The manufacturer's name
- (2) The normal rating in volts, amperes, and kilowatts
- (3) The electrical supply required specifying frequency, number of phases, and number of wires
- (4) The marking "Electrode-Type Boiler"
- (5) A warning marking, "All Power Supplies Shall Be Disconnected Before Servicing, Including Servicing the Pressure Vessel"

The nameplate shall be located so as to be visible after installation.

4.24.9 Electric Radiant Heating Panels and Heating Panel Sets

4.24.9.1 Scope. The provisions of Part 4.24.9 shall apply to radiant heating panels and heating panel sets.

4.24.9.2 Definitions.

Heating Panel. A complete assembly provided with a junction box or a length of flexible conduit for connection to a branch circuit.

Heating Panel Set. A rigid or nonrigid assembly provided with nonheating leads or a terminal junction assembly identified as being suitable for connection to a wiring system.

4.24.9.3 Markings.

(a) Location. Markings shall be permanent and in a location that is visible prior to application of panel finish.

(b) Identified as Suitable. Each unit shall be identified as suitable for the installation.

(c) Required Markings. Each unit shall be marked with the identifying name or identification symbol, catalog number, and rating

in volts and watts or in volts and amperes.

(d) Labels Provided by Manufacturer. The manufacturers of heating panels or heating panel sets shall provide marking labels that indicate that the space-heating installation incorporates heating panels or heating panel sets and instructions that the labels shall be affixed to the panelboards to identify which branch circuits supply the circuits to those space-heating installations. If the heating panels and heating panel set installations are visible and distinguishable after installation, the labels shall not be required to be provided and affixed to the panelboards.

4.24.9.4 Installation.

(a) General.

(1) **Manufacturer's Instructions.** Heating panels and heating panel sets shall be installed in accordance with the manufacturer's instructions.

(2) **Locations Not Permitted.** The heating portion shall not be installed as follows:

- a. In or behind surfaces where subject to physical damage
- b. Run through or above walls, partitions, cupboards, or similar portions of structures that extend to the ceiling.
- c. Run in or through thermal insulation, but shall be permitted to be in contact with the surface of thermal insulation.

(3) **Separation from Outlets for Luminaires (Lighting Fixtures).** Edges of panels and panel sets shall be separated by not less than 200 mm from the edges of any outlet boxes and junction boxes that are to be used for mounting surface luminaires (lighting fixtures). A clearance of not less than 50 mm shall be provided from recessed luminaires (fixtures) and their trims, ventilating openings, and other such openings in room surfaces, unless the heating panels and panel sets are listed and marked for lesser clearances, in which case they shall be permitted to be installed at the marked clearances. Sufficient area shall be provided to ensure that no heating panel or heating panel set is to be covered by any surface-mounted units.

(4) **Surfaces Covering Heating Panels.** After the heating panels or heating panel sets are installed and inspected, it shall be permitted to

install a surface that has been identified by the manufacturer's instructions as being suitable for the installation. The surface shall be secured so that the nails or other fastenings do not pierce the heating panels or heating panel sets.

(5) **Surface Coverings.** Surfaces permitted by 4.24.9.4(a)(4) shall be permitted to be covered with paint, wallpaper, or other approved surfaces identified in the manufacturer's instructions as being suitable.

(b) Heating Panel Sets.

(1) **Mounting Location.** Heating panel sets shall be permitted to be secured to the lower face of joists or mounted in between joists, headers, or nailing strips.

(2) **Parallel to Joists or Nailing Strips.** Heating panel sets shall be installed parallel to joists or nailing strips.

(3) **Installation of Nails, Staples, or Other Fasteners.** Nailing or stapling of heating panel sets shall be done only through the unheated portions provided for this purpose. Heating panel sets shall not be cut through or nailed through any point closer than 6 mm to the element. Nails, staples, or other fasteners shall not be used where they penetrate current-carrying parts.

(4) **Installed as Complete Unit.** Heating panel sets shall be installed as complete units unless identified as suitable for field cutting in an approved manner.

4.24.9.5 Clearances of Wiring in Ceilings. Wiring located above heated ceilings shall be spaced not less than 50 mm above the heated ceiling and shall be considered as operating at an ambient of 50°C (122°F). The ampacity shall be calculated on the basis of the correction factors given in the 0–2 000 volt ampacity tables of Article 3.10. If this wiring is located above thermal insulations having a minimum thickness of 50 mm, the wiring shall not require correction for temperature.

4.24.9.6 Location of Branch-Circuit and Feeder Wiring in Walls.

(a) **Exterior Walls.** Wiring methods shall comply with Article 300 and 3.10.1.10.

(b) **Interior Walls.** Any wiring behind heating panels or heating panel sets located in interior walls or partitions shall be considered as

operating at an ambient temperature of 40°C (104°F), and the ampacity shall be calculated on the basis of the correction factors given in the 0–2 000 volt ampacity tables of Article 3.10.

4.24.9.7 Connection to Branch-Circuit Conductors.

(a) **General.** Heating panels or heating panel sets assembled together in the field to form a heating installation in one room or area shall be connected in accordance with the manufacturer's instructions.

(b) **Heating Panels.** Heating panels shall be connected to branch-circuit wiring by an approved wiring method.

(c) Heating Panel Sets.

(1) **Connection to Branch Circuit Wiring.** Heating panel sets shall be connected to branch-circuit wiring by a method identified as being suitable for the purpose.

(2) **Panel Sets with Terminal Junction Assembly.** A heating panel set provided with terminal junction assembly shall be permitted to have the nonheating leads attached at the time of installation in accordance with the manufacturer's instructions.

4.24.9.8 Nonheating Leads. Excess nonheating leads of heating panels or heating panel sets shall be permitted to be cut to the required length. They shall meet the installation requirements of the wiring method employed in accordance with 4.24.9.7. Nonheating leads shall be an integral part of a heating panel and a heating panel set and shall not be subjected to the ampacity requirements of 4.24.1.3(b) for branch circuits.

4.24.9.9 Installation in Concrete or Poured Masonry.

(a) **Maximum Heated Area.** Heating panels or heating panel sets shall not exceed 355 watts/m² (33 watts/ft²) of heated area.

(b) **Secured in Place and Identified as Suitable.** Heating panels or heating panel sets shall be secured in place by means specified in the manufacturer's instructions and identified as suitable for the installation.

(c) **Expansion Joints.** Heating panels or heating panel sets shall not

be installed where they bridge expansion joints unless provision is made for expansion and contraction.

(d) Spacings. Spacings shall be maintained between heating panels or heating panel sets and metal embedded in the floor. Grounded metal-clad heating panels shall be permitted to be in contact with metal embedded in the floor.

(e) Protection of Leads. Leads shall be protected where they leave the floor by rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing, or by other approved means.

(f) Bushings or Fittings Required. Bushings or approved fittings shall be used where the leads emerge within the floor slabs.

4.24.9.10 Installation Under Floor Covering.

(a) Identification. Heating panels or heating panel sets for installation under floor covering shall be identified as suitable for installation under floor covering.

(b) Maximum Heated Area. Heating panels or panel sets installed under floor covering shall not exceed 160 watts/m² (15 watts/ft²) of heated area.

(c) Installation. Listed heating panels or panel sets, if installed under floor covering, shall be installed on floor surfaces that are smooth and flat in accordance with the manufacturer's instructions and shall also comply with 4.24.9.10(c)(1) through (c)(5).

(1) Expansion Joints. Heating panels or heating panel sets shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

(2) Connection to Conductors. Heating panels and heating panel sets shall be connected to branch-circuit and supply wiring by wiring methods recognized in Chapter 3.

(3) Anchoring. Heating panels and heating panel sets shall be firmly anchored to the floor using an adhesive or anchoring system identified for this use.

(4) Coverings. After heating panels or heating panel sets are installed and inspected, they shall be permitted to be covered by a floor covering that has been identified by the manufacturer as being suitable for the installation. The covering shall be secured to the heating panel or heating panel sets with release-type adhesives or by means identified for this use.

(5) Fault Protection. A device to open all ungrounded conductors supplying the heating panels or heating panel sets, provided by the manufacturer, shall function when a low- or high-resistance line-to-line, line-to-grounded conductor, or line-to-ground fault occurs, such as the result of a penetration of the element or element assembly.

FPN: An integral grounding shield may be required to provide this protection.

ARTICLE 4.27 — FIXED ELECTRIC HEATING EQUIPMENT FOR PIPELINES AND VESSELS

4.27.1 General

4.27.1.1 Scope. The requirements of this article shall apply to electrically energized heating systems and the installation of these systems used with pipelines or vessels or both.

FPN: For further information, see ANSI/IEEE Std. 515-1997, Standard for the Testing, Design, Installation and Maintenance of Electrical Resistance Heat Tracing for Industrial Applications, and ANSI/IEEE Std. 844-2000, Recommended Practice for Electrical Impedance, Induction, and Skin Effect Heating of Pipelines and Vessels.

4.27.1.2 Definitions.

Impedance Heating System. A system in which heat is generated in a pipeline or vessel wall by causing current to flow through the pipeline or vessel wall by direct connection to an ac voltage source from a dual-winding transformer.

Induction Heating System. A system in which heat is generated in a pipeline or vessel wall by inducing current and hysteresis effect in the pipeline or vessel wall from an external isolated ac field source.

Integrated Heating System. A complete system consisting of components such as pipelines, vessels, heating elements, heat transfer

medium, thermal insulation, moisture barrier, nonheating leads, temperature controllers, safety signs, junction boxes, raceways, and fittings.

Pipeline. A length of pipe including pumps, valves, flanges, control devices, strainers, and/or similar equipment for conveying fluids.

Resistance Heating Element. A specific separate element to generate heat that is applied to the pipeline or vessel externally or internally.

FPN: Tubular heaters, strip heaters, heating cable, heating tape, heating blankets, and immersion heaters are examples of resistance heaters.

Skin-Effect Heating System. A system in which heat is generated on the inner surface of a ferromagnetic envelope attached to a pipeline or vessel, or both.

FPN: Typically, an electrically insulated conductor is routed through and connected to the envelope at the other end. The envelope and the electrically insulated conductor are connected to an ac voltage source from a dual-winding transformer.

Vessel. A container such as a barrel, drum, or tank for holding fluids or other material.

4.27.1.3 Application of Other Articles. Cord-connected pipe heating assemblies intended for specific use and identified as suitable for this use shall be installed according to Article 4.22.

4.27.1.4 Continuous Load. Fixed electric heating equipment for pipelines and vessels shall be considered continuous load.

4.27.2 Installation

4.27.2.1 General. Equipment for pipeline and vessel electrical heating shall be identified as being suitable for (1) the chemical, thermal, and physical environment and (2) installation in accordance with the manufacturer's drawings and instructions.

4.27.2.2 Use. Electrical heating equipment shall be installed in such a manner as to be afforded protection from physical damage.

4.27.2.3 Thermal Protection. External surfaces of pipeline and vessel heating equipment that operate at temperatures exceeding 60°C (140°F) shall be physically guarded, isolated, or thermally insulated to protect against contact by personnel in the area.

4.27.2.4 Identification. The presence of electrically heated pipelines, vessels, or both, shall be evident by the posting of appropriate caution signs or markings at frequent intervals along the pipeline or vessel.

4.27.3 Resistance Heating Elements

4.27.3.1 Secured. Heating element assemblies shall be secured to the surface being heated by means other than the thermal insulation.

4.27.3.2 Not in Direct Contact. Where the heating element is not in direct contact with the pipeline or vessel being heated, means shall be provided to prevent overtemperature of the heating element unless the design of the heater assembly is such that its temperature limitations will not be exceeded.

4.27.3.3 Expansion and Contraction. Heating elements and assemblies shall not be installed where they bridge expansion joints unless provisions are made for expansion and contraction.

4.27.3.4 Flexural Capability. Where installed on flexible pipelines, the heating elements and assemblies shall have a flexural capability that is compatible with the pipeline.

4.27.3.5 Power Supply Leads.

(a) **Nonheating Leads.** Power supply nonheating leads (cold leads) for resistance elements shall be suitable for the temperature encountered. Not less than 150 mm of nonheating leads shall be provided within the junction box. Preassembled factory supplied and field assembled nonheating leads on approved heaters shall be permitted to be shortened if the markings specified in 4.27.3.7 are retained.

(b) **Power Supply Leads Protection.** Nonheating power supply leads shall be protected where they emerge from electrically heated pipeline or vessel heating units by rigid metal conduit, intermediate

metal conduit, electrical metallic tubing, or other raceways identified as suitable for the application.

(c) **Interconnecting Leads.** Interconnecting nonheating leads connecting portions of the heating system shall be permitted to be covered by thermal insulation in the same manner as the heaters.

4.27.3.6 Electrical Connections.

(a) **Nonheating Interconnections.** Nonheating interconnections, where required under thermal insulation, shall be made with insulated connectors identified as suitable for this use.

(b) **Circuit Connections.** Splices and terminations outside the thermal insulation shall be installed in a box or fitting in accordance with 1.10.1.14 and 3.0.1.15.

4.27.3.7 Marking. Each factory-assembled heating unit shall be legibly marked within 75 mm of each end of the nonheating leads with the permanent identification symbol, catalog number, and ratings in volts and watts or in volts and amperes.

4.27.3.9 Equipment Protection. Ground-fault protection of equipment shall be provided for electric heat tracing and heating panels. This requirement shall not apply in industrial establishments where there is alarm indication of ground faults and the following conditions apply:

(1) Conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installed systems.

(2) Continued circuit operation is necessary for safe operation of equipment or processes.

4.27.3.10 Grounded Conductive Covering. Electric heating equipment shall be listed and have a grounded conductive covering in accordance with 4.27.3.10(a) or 4.27.3.10(b). The conductive covering shall provide an effective ground path for equipment protection.

(a) **Heating Wires or Cables.** Heating wires or cables shall have a grounded conductive covering that surrounds the heating element and

bus wires, if any, and their electrical insulation.

(b) **Heating Panels.** Heating panels shall have a grounded conductive covering over the heating element and its electrical insulation on the side opposite the side attached to the surface to be heated.

4.27.4 Impedance Heating

4.27.4.1 Personnel Protection. All accessible external surfaces of the pipeline, vessel, or both, being heated shall be physically guarded, isolated, or thermally insulated (with a weatherproof jacket for outside installations) to protect against contact by personnel in the area.

4.27.4.2 Isolation Transformer. A dual-winding transformer with a grounded shield between the primary and secondary windings shall be used to isolate the distribution system from the heating system.

4.27.4.3 Voltage Limitations. Unless protected by ground-fault circuit-interrupter protection for personnel, the secondary winding of the isolation transformer connected to the pipeline or vessel being heated shall not have an output voltage greater than 30 volts ac.

Where ground-fault circuit-interrupter protection for personnel is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.

Exception: In industrial establishments, the isolation transformer connected to the pipeline or vessel being heated shall be permitted to have an output voltage not greater than 132 volts ac to ground where all of the following conditions apply:

(1) *Conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installed systems.*

(2) *Ground fault protection of equipment is provided.*

(3) *The pipeline or vessel being heated is completely enclosed in a grounded metal enclosure.*

(4) *The transformer secondary connections to the pipeline or vessel being heated are completely enclosed in a grounded metal mesh or metal enclosure.*

4.27.4.4 Induced Currents. All current-carrying components shall be installed in accordance with 3.0.1.20.

4.27.4.5 Grounding. The pipeline, vessel, or both, that is being heated and operating at a voltage greater than 30 but not more than 80 shall be grounded at designated points.

4.27.4.6 Secondary Conductor Sizing. The ampacity of the conductors connected to the secondary of the transformer shall be at least 100 percent of the total load of the heater.

4.27.5 Induction Heating

4.27.5.1 Scope. This part covers the installation of line frequency induction heating equipment and accessories for pipelines and vessels.

FPN: See Article 6.65 for other applications.

4.27.5.2 Personnel Protection. Induction coils that operate or may operate at a voltage greater than 30 volts ac shall be enclosed in a nonmetallic or split metallic enclosure, isolated, or made inaccessible by location to protect personnel in the area.

4.27.5.3 Induced Current. Induction coils shall be prevented from inducing circulating currents in surrounding metallic equipment, supports, or structures by shielding, isolation, or insulation of the current paths. Stray current paths shall be bonded to prevent arcing.

4.27.6 Skin-Effect Heating

4.27.6.1 Conductor Ampacity. The ampacity of the electrically insulated conductor inside the ferromagnetic envelope shall be permitted to exceed the values given in Article 3.10, provided it is identified as suitable for this use.

4.27.6.2 Pull Boxes. Pull boxes for pulling the electrically insulated conductor in the ferromagnetic envelope shall be permitted to be buried under the thermal insulation, provided their locations are indicated by permanent markings on the insulation jacket surface and on drawings. For outdoor installations, pull boxes shall be of watertight construction.

4.27.6.3 Single Conductor in Enclosure. The provisions of 3.0.1.20 shall not apply to the installation of a single conductor in a ferromagnetic envelope (metal enclosure).

4.27.6.4 Grounding. The ferromagnetic envelope shall be grounded at both ends, and, in addition, it shall be permitted to be grounded at intermediate points as required by its design. The ferromagnetic envelope shall be bonded at all joints to ensure electrical continuity. The provisions of 2.50.2.11 shall not apply to the installation of skin-effect heating systems.

FPN: See Article 2.50 for grounding methods.

4.27.7 Control and Protection

4.27.7.1 Disconnecting Means.

(a) **Switch or Circuit Breaker.** Means shall be provided to disconnect all fixed electric pipeline or vessel heating equipment from all ungrounded conductors. The branch-circuit switch or circuit breaker, where readily accessible to the user of the equipment, shall be permitted to serve as the disconnecting means. The disconnecting means shall be of the indicating type and shall be provided with a positive lockout in the “off” position.

(b) **Cord-and-Plug-Connected Equipment.** The factory-installed attachment plug of cord-and-plug-connected equipment rated 20 amperes or less and 150 volts or less to ground shall be permitted to be the disconnecting means.

4.27.7.2 Controls.

(a) **Temperature Control with “Off” Position.** Temperature controlled switching devices that indicate an “off” position and that interrupt line current shall open all ungrounded conductors when the control device is in this “off” position. These devices shall not be permitted to serve as the disconnecting means unless provided with a positive lockout in the “off” position.

(b) **Temperature Control Without “Off” Position.** Temperature

controlled switching devices that do not have an “off” position shall not be required to open all ungrounded conductors and shall not be permitted to serve as the disconnecting means.

(c) Remote Temperature Controller. Remote controlled temperature-actuated devices shall not be required to meet the requirements of 4.27.7.2(a) and 4.27.7.2(b). These devices shall not be permitted to serve as the disconnecting means.

(d) Combined Switching Devices. Switching devices consisting of combined temperature-actuated devices and manually controlled switches that serve both as the controllers and the disconnecting means shall comply with all the following conditions:

- (1) Open all ungrounded conductors when manually placed in the “off” position
- (2) Be designed so that the circuit cannot be energized automatically if the device has been manually placed in the “off” position
- (3) Be provided with a positive lockout in the “off” position

4.27.7.3 Overcurrent Protection. Heating equipment shall be considered as protected against overcurrent where supplied by a branch circuit as specified in 2.10.1.3 and 2.10.2.4.

ARTICLE 4.30 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

4.30.1 General

4.30.1.1 Scope. This article covers motors, motor branch-circuit and feeder conductors and their protection, motor overload protection, motor control circuits, motor controllers, and motor control centers.

FPN No. 1: Installation requirements for motor control centers are covered in 1.10.2.1(f). Air conditioning and refrigerating equipment are covered in Article 4.40.
FPN No. 2: Figure 4.30.1.1 is for information only.

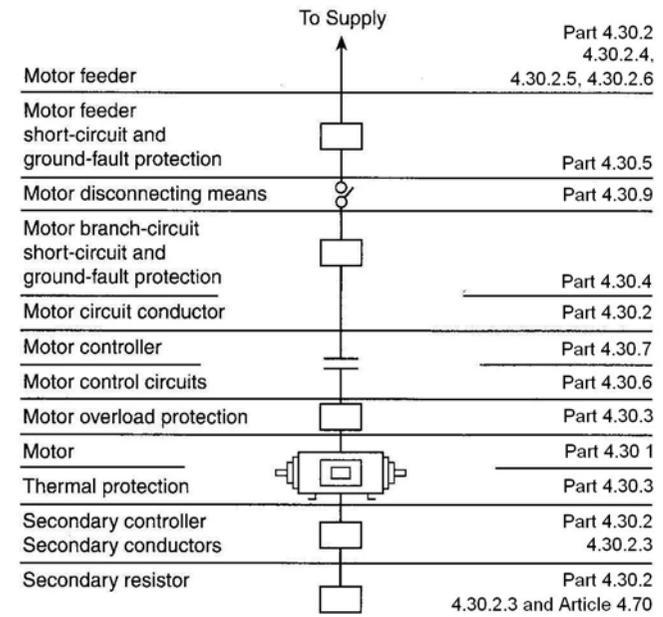

Figure 4.30.1.1 Article 4.30 Contents.

4.30.1.2 Definitions.

Adjustable Speed Drive. A combination of the power converter, motor, and motor mounted auxiliary devices such as encoders, tachometers, thermal switches and detectors, air blowers, heaters, and vibration sensors.

Adjustable-Speed Drive System. An interconnected combination of equipment that provides a means of adjusting the speed of a mechanical load coupled to a motor. A drive system typically consists of an adjustable speed drive and auxiliary electrical apparatus.

Controller. For the purpose of this article, a controller is any switch or device that is normally used to start and stop a motor by making and breaking the motor circuit current.

Motor Control Circuit. The circuit of a control apparatus or system that carries the electric signals directing the performance of the controller but does not carry the main power current.

System Isolation Equipment. A redundantly monitored, remotely operated contactor-isolating system, packaged to provide the disconnection/isolation function, capable of verifiable operation from multiple remote locations by means of lockout switches, each having the capability of being padlocked in the “off” (open) position.

4.30.1.4 Part-Winding Motors. A part-winding start induction or synchronous motor is one that is arranged for starting by first energizing part of its primary (armature) winding and, subsequently, energizing the remainder of this winding in one or more steps. A standard part-winding start induction motor is arranged so that one-half of its primary winding can be energized initially, and, subsequently, the remaining half can be energized, both halves then carrying equal current. A hermetic refrigerant compressor motor shall not be considered a standard part-winding start induction motor.

Where separate overload devices are used with a standard part-winding start induction motor, each half of the motor winding shall be individually protected in accordance with 4.30.3.2 and 4.30.3.7 with a trip current one-half that specified.

Each motor-winding connection shall have branch-circuit short-circuit and ground-fault protection rated at not more than one-half that specified by 4.30.4.2.

Exception: A short-circuit and ground-fault protective device shall be permitted for both windings if the device will allow the motor to start. Where time-delay (dual-element) fuses are used, they shall be permitted to have a rating not exceeding 150 percent of the motor full-load current.

4.30.1.5 Other Articles. Motors and controllers shall also comply with the applicable provisions of Table 4.30.1.5.

4.30.1.6 Ampacity and Motor Rating Determination. The size of conductors supplying equipment covered by Article 4.30 shall be selected from the allowable ampacity tables in accordance with 3.10.1.15(b) or shall be calculated in accordance with 3.10.1.15(c). Where flexible cord is used, the size of the conductor shall be selected

in accordance with 4.0.1.5. The required ampacity and motor ratings shall be determined as specified in 4.30.1.6(a), (b), and (c).

Table 4.30.1.5 Other Articles

Equipment/Occupancy	Article	Section
Air-conditioning and refrigerating equipment	4.40	
Capacitors		4.60.1.8,
Commercial garages; aircraft hangars; motor fuel dispensing facilities; bulk storage plants; spray application, dipping, and coating processes; and inhalation anesthetizing locations	5.11, 5.13, 5.14, 5.15, 5.16, and Part 5.17.4	4.60.1.9
Cranes and hoists	6.10	
Electrically driven or controlled irrigation machines	6.75	
Elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chair lifts	6.20	
Fire pumps	6.95	
Hazardous (classified) locations	5.0–5.3 and 5.5	
Industrial machinery	6.70	
Motion picture projectors		
Motion picture and television studios and similar locations	5.30	5.40.2.2 and 5.40.2.11
Resistors and reactors	4.70	
Theaters, audience areas of motion picture and television studios, and similar locations		5.20.3.8
Transformers and transformer vaults	4.50	

(a) General Motor Applications. For general motor applications, current ratings shall be determined based on (a)(1) and (a)(2).

(1) Table Values. Other than for motors built for low speeds (less than 1 200 RPM) or high torques, and for multispeed motors, the values given in Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, and Table 4.30.14.4 shall be used to determine the ampacity of conductors or ampere ratings of switches, branch-circuit short-circuit and ground-fault protection, instead of the actual current rating marked on the motor nameplate. Where a motor is marked in amperes, but not horsepower, the horsepower rating shall be assumed to be that corresponding to the value given in Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, and Table 4.30.14.4, interpolated if necessary. Motors built for low speeds (less than 1 200 RPM) or high torques may have higher full-load currents, and multispeed motors will have full-load current varying with speed, in which case the nameplate current ratings shall be used.

Exception No. 1: Multispeed motors shall be in accordance with 4.30.2.2(a) and 4.30.4.2.

Exception No. 2: For equipment that employs a shaded-pole or permanent-split capacitor-type fan or blower motor that is marked with the motor type, the full load current for such motor marked on the nameplate of the equipment in which the fan or blower motor is employed shall be used instead of the horsepower rating to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and the separate overload protection. This marking on the equipment nameplate shall not be less than the current marked on the fan or blower motor nameplate.

Exception No. 3: For a listed motor-operated appliance that is marked with both motor horsepower and full-load current, the motor full-load current marked on the nameplate of the appliance shall be used instead of the horsepower rating on the appliance nameplate to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and any separate overload protection.

(2) Nameplate Values. Separate motor overload protection shall be based on the motor nameplate current rating.

(b) Torque Motors. For torque motors, the rated current shall be locked-rotor current, and this nameplate current shall be used to determine the ampacity of the branch-circuit conductors covered in 4.30.2.2 and 4.30.2.4, the ampere rating of the motor overload protection, and the ampere rating of motor branch-circuit short-circuit and ground-fault protection in accordance with 4.30.4.2(b).

FPN: For motor controllers and disconnecting means, see 4.30.7.3(d) and 4.30.9.10.

(c) Alternating-Current Adjustable Voltage Motors. For motors used in alternating-current, adjustable voltage, variable torque drive systems, the ampacity of conductors, or ampere ratings of switches, branch-circuit short-circuit and ground-fault protection, and so forth, shall be based on the maximum operating current marked on the motor or control nameplate, or both. If the maximum operating current does not appear on the nameplate, the ampacity determination shall be based on 150 percent of the values given in Table 4.30.14.3 and Table 4.30.14.4.

4.30.1.7 Marking on Motors and Multimotor Equipment.

(a) Usual Motor Applications. A motor shall be marked with the following information.

- (1) Manufacturer's name.
- (2) Rated volts and full-load current. For a multispeed motor, full-load current for each speed, except shaded-pole and permanent-split capacitor motors where amperes are required only for maximum speed.
- (3) Rated frequency and number of phases if an ac motor.
- (4) Rated full-load speed.
- (5) Rated temperature rise or the insulation system class and rated ambient temperature.
- (6) Time rating. The time rating shall be 5, 15, 30, or 60 minutes, or continuous.
- (7) Rated horsepower if 1/8 hp or more. For a multispeed motor 1/8 hp or more, rated horsepower for each speed, except shaded-pole and permanent-split capacitor motors 1/8 hp or more where rated horsepower is required only for maximum speed. Motors of arc welders are not required to be marked with the horsepower rating.
- (8) Code letter or locked-rotor amperes if an alternating-current

motor rated ½ hp or more. On polyphase wound-rotor motors, the code letter shall be omitted.

FPN: See 4.30.1.7(b).

(9) Design letter for design B, C, or D motors.

FPN: Motor design letter definitions are found in ANSI/NEMA MG 1-1993, Motors and Generators, Part 1, Definitions and in IEEE 100-1996, Standard Dictionary of Electrical and Electronic Terms.

(10) Secondary volts and full-load current if a wound-rotor induction motor.

(11) Field current and voltage for dc excited synchronous motors.

(12) Winding — straight shunt, stabilized shunt, compound, or series, if a dc motor. Fractional horsepower dc motors 180 mm or less in diameter shall not be required to be marked.

(13) A motor provided with a thermal protector complying with 4.30.3.2(a)(2) or (b)(2) shall be marked “Thermally Protected.” Thermally protected motors rated 100 watts or less and complying with 4.30.3.2(b)(2) shall be permitted to use the abbreviated marking “T.P.”

(14) A motor complying with 4.30.3.2(b)(4) shall be marked “Impedance Protected.” Impedance protected motors rated 100 watts or less and complying with 4.30.3.2(b)(4) shall be permitted to use the abbreviated marking “Z.P.”

(15) Motors equipped with electrically powered condensation prevention heaters shall be marked with the rated heater voltage, number of phases, and the rated power in watts.

(b) Locked-Rotor Indicating Code Letters. Code letters marked on motor nameplates to show motor input with locked rotor shall be in accordance with Table 4.30.1.7(b).

The code letter indicating motor input with locked rotor shall be in an individual block on the nameplate, properly designated.

(1) Multispeed Motors. Multispeed motors shall be marked with the code letter designating the locked-rotor kilovolt-ampere (kVA) per horsepower for the highest speed at which the motor can be started.

Exception: Constant horsepower multispeed motors shall be marked with the code letter giving the highest locked-rotor kilovolt-ampere (kVA) per horsepower.

Table 4.30.1.7(b) Locked-Rotor Indicating Code Letters

Code Letter	Kilovolt-Amperes per Horsepower with Locked Rotor
A	0–3.14
B	3.15–3.54
C	3.55–3.99
D	4.0–4.49
E	4.5–4.99
F	5.0–5.59
G	5.6–6.29
H	6.3–7.09
J	7.1–7.99
K	8.0–8.99
L	9.0–9.99
M	10.0–11.19
N	11.2–12.49
P	12.5–13.99
R	14.0–15.99
S	16.0–17.99
T	18.0–19.99
U	20.0–22.39
V	22.4 and up

(2) Single-Speed Motors. Single-speed motors starting on wye connection and running on delta connections shall be marked with a code letter corresponding to the locked-rotor kilovolt-ampere (kVA) per horsepower for the wye connection.

(3) Dual-Voltage Motors. Dual-voltage motors that have a different locked-rotor kilovolt-ampere (kVA) per horsepower on the two voltages shall be marked with the code letter for the voltage giving the highest locked-rotor kilovolt-ampere (kVA) per horsepower.

(4) 50/60 Hz Motors. Motors with 50- and 60-Hz ratings shall be marked with a code letter designating the locked-rotor kilovolt-ampere

(kVA) per horsepower on 60 Hz.

(5) Part Winding Motors. Part-winding start motors shall be marked with a code letter designating the locked-rotor kilovolt-ampere (kVA) per horsepower that is based on the locked-rotor current for the full winding of the motor.

(c) Torque Motors. Torque motors are rated for operation at standstill and shall be marked in accordance with 4.30.1.7(a), except that locked-rotor torque shall replace horsepower.

(d) Multimotor and Combination-Load Equipment.

(1) Factory-Wired. Multimotor and combination-load equipment shall be provided with a visible nameplate marked with the manufacturer's name, the rating in volts, frequency, number of phases, minimum supply circuit conductor ampacity, and the maximum ampere rating of the circuit short-circuit and ground-fault protective device. The conductor ampacity shall be calculated in accordance with 4.30.2.4 and counting all of the motors and other loads that will be operated at the same time. The short-circuit and ground-fault protective device rating shall not exceed the value calculated in accordance with 4.30.4.3. Multimotor equipment for use on two or more circuits shall be marked with the preceding information for each circuit.

(2) Not Factory-Wired. Where the equipment is not factory-wired and the individual nameplates of motors and other loads are visible after assembly of the equipment, the individual nameplates shall be permitted to serve as the required marking.

4.30.1.8 Marking on Controllers. A controller shall be marked with the manufacturer's name or identification, the voltage, the current or horsepower rating, the short-circuit current rating, and such other necessary data to properly indicate the applications for which it is suitable.

Exception No. 1: The short-circuit current rating is not required for controllers applied in accordance with 4.30.7.1(a) or (b).

Exception No. 2: The short-circuit rating is not required to be marked on the controller when the short-circuit current rating of the controller is marked elsewhere on the assembly.

Exception No. 3: The short-circuit rating is not required to be marked on the controller when the assembly into which it is installed has a

marked short-circuit current rating.

Exception No. 4: Short-circuit ratings are not required for controllers rated less than 2 hp at 300 V or less and listed exclusively for general-purpose branch circuits.

A controller that includes motor overload protection suitable for group motor application shall be marked with the motor overload protection and the maximum branch-circuit short-circuit and ground-fault protection for such applications.

Combination controllers that employ adjustable instantaneous trip circuit breakers shall be clearly marked to indicate the ampere settings of the adjustable trip element.

Where a controller is built-in as an integral part of a motor or of a motor-generator set, individual marking of the controller shall not be required if the necessary data are on the nameplate. For controllers that are an integral part of equipment approved as a unit, the above marking shall be permitted on the equipment nameplate.

FPN: See 1.10.1.10 for information on circuit impedance and other characteristics.

4.30.1.9 Terminals.

(a) Markings. Terminals of motors and controllers shall be suitably marked or colored where necessary to indicate the proper connections.

(b) Conductors. Motor controllers and terminals of control circuit devices shall be connected with copper conductors unless identified for use with a different conductor.

(c) Torque Requirements. Control circuit devices with screw-type pressure terminals used with 2.0 mm² (1.6 mm dia.) or smaller copper conductors shall be torqued to a minimum of 0.8 Nm (7 lb-in.) unless identified for a different torque value.

4.30.1.10 Wiring Space in Enclosures.

(a) General. Enclosures for motor controllers and disconnecting means shall not be used as junction boxes, auxiliary gutters, or raceways for conductors feeding through or tapping off to the other apparatus unless designs are employed that provide adequate space for this purpose.

FPN: See 3.12.1.8 for switch and overcurrent-device enclosures.

(b) Wire-Bending Space in Enclosures. Minimum wire-bending space within the enclosures for motor controllers shall be in accordance with Table 4.30.1.10(b) where measured in a straight line from the end of the lug or wire connector (in the direction the wire leaves the terminal) to the wall or barrier. Where alternate wire termination means are substituted for that supplied by the manufacturer of the controller, they shall be of a type identified by the manufacturer for use with the controller and shall not reduce the minimum wire-bending space.

4.30.1.11 Protection Against Liquids. Suitable guards or enclosures shall be provided to protect exposed current-carrying parts of motors and the insulation of motor leads where installed directly under equipment, or in other locations where dripping or spraying oil, water, or other injurious liquid may occur, unless the motor is designed for the existing conditions.

Table 4.30.1.10(b) Minimum Wire-Bending Space at the Terminals of Enclosed Motor Controllers

Size of Wire mm ² (mm dia.)	Wires per Terminal*	
	1 (mm)	2 (mm)
2.0(1.6)–5.5(2.6)	Not specified	—
8.0(3.2)–14	38	—
22	50	—
30	65	—
38	75	—
50	125	125
60	150	150
80–100	175	175
125	200	200
150	250	250
175–250	300	300
325	350	400
400	450	475

*Where provision for three or more wires per terminal exists, the minimum wire-bending space shall be in accordance with the requirements of Article 3.12.

4.30.1.12 Motor Terminal Housings.

(a) Material. Where motors are provided with terminal housings, the housings shall be of metal and of substantial construction.

Exception: In other than hazardous (classified) locations, substantial, nonmetallic, nonburning housings shall be permitted, provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing.

(b) Dimensions and Space — Wire-to-Wire Connections. Where these terminal housings enclose wire-to-wire connections, they shall have minimum dimensions and usable volumes in accordance with Table 4.30.1.12(b).

(c) Dimensions and Space — Fixed Terminal Connections. Where these terminal housings enclose rigidly mounted motor terminals, the terminal housing shall be of sufficient size to provide minimum terminal spacings and usable volumes in accordance with Table 4.30.1.12(c)(1) and Table 4.30.1.12(c)(2).

(d) Large Wire or Factory Connections. For motors with larger ratings, greater number of leads, or larger wire sizes, or where motors are installed as a part of factory-wired equipment, without additional connection being required at the motor terminal housing during equipment installation, the terminal housing shall be of ample size to make connections, but the foregoing provisions for the volumes of terminal housings shall not be considered applicable.

(e) Equipment Grounding Connections. A means for attachment of an equipment grounding conductor termination in accordance with 2.50.1.8 shall be provided at motor terminal housings for wire-to-wire connections or fixed terminal connections. The means for such connections shall be permitted to be located either inside or outside the motor terminal housing.

Exception: Where a motor is installed as a part of factory-wired equipment that is required to be grounded and without additional connection being required at the motor terminal housing during equipment installation, a separate means for motor grounding at the motor terminal housing shall not be required.

Table 4.30.1.12(b) Terminal Housings — Wire-to-Wire Connections

Motors 280 mm in Diameter or Less			
Horsepower	Cover Opening Minimum Dimension (mm)	Usable Volume Minimum (cm³)	
1 and smaller ^a	41	170	
1½, 2, and 3 ^b	45	275	
5 and 7½	50	365	
10 and 15	65	595	
Motors Over 280 mm in Diameter — Alternating-Current Motors			
Maximum Full Load Current for 3-Phase Motors with Maximum of 12 Leads (Amperes)	Terminal Box Cover Opening Minimum Dimension (mm)	Usable Volume Minimum (cm³)	Typical Maximum Horsepower 3-Phase (230 Volt)
45	65	595	15
70	84	1 265	25
110	100	2 295	40
160	125	4 135	60
250	150	7 380	100
400	175	13 775	150
600	200	25 255	250
Direct-Current Motors			
Maximum Full-Load Current for Motors with Maximum of 6 Leads (Amperes)	Terminal Box Minimum Dimensions (mm)	Usable Volume Minimum (cm³)	
68	65	425	
105	84	900	
165	100	1 640	
240	125	2 950	
375	150	5 410	
600	175	9 840	
900	200	18 040	

Note: Auxiliary leads for such items as brakes, thermostats, space heaters, and exciting fields shall be permitted to be neglected if their current-carrying area does not exceed 25 percent of the current-carrying area of the machine power leads.

^aFor motors rated 1 hp and smaller and with the terminal housing partially or wholly integral with the frame or end shield, the volume of the terminal housing shall not be less than 18.0 cm³ (1.1 in.³) per wire-to-wire connection. The minimum cover opening dimension is not specified.

^bFor motors rated 1½, 2, and 3 hp and with the terminal housing partially or wholly integral with the frame or end shield, the volume of the terminal housing shall not be less than 23.0 cm³ (1.4 in.³) per wire-to-wire connection. The minimum cover opening dimension is not specified.

Table 4.30.1.12(c)(1) Terminal Spacings — Fixed Terminals

Nominal Volts	Minimum Spacing	
	Between Line Terminals (mm)	Between Line Terminals and Other Uninsulated Metal Parts (mm)
240 or less	6	6
Over 250 – 600	10	10

Table 4.30.1.12(c)(2) Usable Volumes — Fixed Terminals

Power-Supply Conductor Size mm² (mm dia.)	Minimum Usable Volume per Power-Supply Conductor (cm³)
2.0(1.6)	16
3.5(2.0) and 5.5(2.6)	20
8.0(3.2) and 14	37

4.30.1.13 Bushing. Where wires pass through an opening in an enclosure, conduit box, or barrier, a bushing shall be used to protect the conductors from the edges of openings having sharp edges. The bushing shall have smooth, well-rounded surfaces where it may be in contact with the conductors. If used where oils, greases, or other contaminants may be present, the bushing shall be made of material not deleteriously affected.

FPN: For conductors exposed to deteriorating agents, see 3.10.1.9.

4.30.1.14 Location of Motors.

(a) Ventilation and Maintenance. Motors shall be located so that adequate ventilation is provided and so that maintenance, such as lubrication of bearings and replacing of brushes, can be readily accomplished.

Exception: Ventilation shall not be required for submersible types of motors.

(b) Open Motors. Open motors that have commutators or collector rings shall be located or protected so that sparks cannot reach adjacent combustible material.

Exception: Installation of these motors on wooden floors or supports shall be permitted.

4.30.1.16 Exposure to Dust Accumulations. In locations where dust or flying material collects on or in motors in such quantities as to seriously interfere with the ventilation or cooling of motors and thereby cause dangerous temperatures, suitable types of enclosed motors that do not overheat under the prevailing conditions shall be used.

FPN: Especially severe conditions may require the use of enclosed pipe-ventilated motors, or enclosure in separate dusttight rooms, properly ventilated from a source of clean air.

4.30.1.17 Highest Rated or Smallest Rated Motor. In determining compliance with 4.30.2.4, 4.30.4.3(b), and 4.30.4.3(c), the highest rated or smallest rated motor shall be based on the rated full-load current as selected from Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, and Table 4.30.14.4.

4.30.1.18 Nominal Voltage of Rectifier Systems. The nominal value of the ac voltage being rectified shall be used to determine the voltage of a rectifier derived system.

Exception: The nominal dc voltage of the rectifier shall be used if it exceeds the peak value of the ac voltage being rectified.

4.30.2 Motor Circuit Conductors

4.30.2.1 General. Part 4.30.2 specifies ampacities of conductors that are capable of carrying the motor current without overheating under the conditions specified.

The provisions of Part II shall not apply to motor circuits rated over 600 volts, nominal.

The provisions of Articles 2.50, 3.0, and 3.10 shall not apply to conductors that form an integral part of equipment, such as motors, motor controllers, motor control centers, or other factory-assembled

control equipment.

FPN No. 1: See 3.0.1.1(b) and 3.10.1.1 for similar requirements.

FPN No. 2: See 1.10.1.14(c) and 4.30.1.9(b) for equipment device terminal requirements.

FPN No. 3: For over 600 volts, nominal, see Part 4.30.9.

4.30.2.2 Single Motor.

(a) General. Conductors that supply a single motor used in a continuous duty application shall have an ampacity of not less than 125 percent of the motor's full-load current rating as determined by 4.30.1.6(a)(1).

Exception: For dc motors operating from a rectified single-phase power supply, the conductors between the field wiring terminals of the rectifier and the motor shall have an ampacity of not less than the following percent of the motor full-load current rating:

(a) Where a rectifier bridge of the single-phase half-wave type is used, 190 percent.

(b) Where a rectifier bridge of the single-phase full-wave type is used, 150 percent.

(b) Multispeed Motor. For a multispeed motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the highest of the full-load current ratings shown on the motor nameplate. The selection of branch-circuit conductors between the controller and the motor shall be based on the current rating of the winding(s) that the conductors energize.

(c) Wye-Start, Delta-Run Motor. For a wye-start, delta-run connected motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor full-load current. The selection of conductors between the controller and the motor shall be based on 58 percent of the motor full-load current.

(d) Part-Winding Motor. For a part-winding connected motor, the selection of branch-circuit conductors on the line side of the controller shall be based on the motor full-load current. The selection of conductors between the controller and the motor shall be based on 50 percent of the motor full-load current.

(e) Other Than Continuous Duty. Conductors for a motor used in a short-time, intermittent, periodic, or varying duty application shall have an ampacity of not less than the percentage of the motor nameplate current rating shown in Table 4.30.2.2(e), unless the authority having jurisdiction grants special permission for conductors of lower ampacity.

Table 4.30.2.2(e) Duty-Cycle Service

Classification of Service	Nameplate Current Rating Percentages			
	5-Minute Rated Motor	15-Minute Rated Motor	30- & 60-Minute Rated Motor	Continuous Rated Motor
Short-time duty operating valves, raising or lowering rolls, etc.	110	120	150	—
Intermittent duty freight and passenger elevators, tool heads, pumps, drawbridges, turntables, etc. (for arc welders, see 630.11)	85	85	90	140
Periodic duty rolls, ore- and coal-handling machines, etc.	85	90	95	140
Varying duty	110	120	150	200

Note: Any motor application shall be considered as continuous duty unless the nature of the apparatus it drives is such that the motor will not operate continuously with load under any condition of use.

(f) Separate Terminal Enclosure. The conductors between a stationary motor rated 1 hp or less and the separate terminal enclosure permitted in 4.30.13.5(b) shall be permitted to be smaller than 2.0 mm² (1.6 mm dia.) but not smaller than 18 AWG, provided they have an ampacity as specified in 4.30.2.2(a).

4.30.2.3 Wound-Rotor Secondary.

(a) Continuous Duty. For continuous duty, the conductors connecting the secondary of a wound-rotor ac motor to its controller shall have an ampacity not less than 125 percent of the full-load secondary current of the motor.

(b) Other Than Continuous Duty. For other than continuous duty, these conductors shall have an ampacity, in percent of full-load secondary current, not less than that specified in Table 4.30.2.2(e).

(c) Resistor Separate from Controller. Where the secondary resistor is separate from the controller, the ampacity of the conductors between controller and resistor shall not be less than that shown in Table 4.30.2.3(c).

Table 4.30.2.3(c) Secondary Conductor

Resistor Duty Classification	Ampacity of Conductor in Percent of Full-Load Secondary Current
Light starting duty	35
Heavy starting duty	45
Extra-heavy starting duty	55
Light intermittent duty	65
Medium intermittent duty	75
Heavy intermittent duty	85
Continuous duty	110

4.30.2.4 Several Motors or a Motor(s) and Other Load(s).

Conductors supplying several motors, or a motor(s) and other load(s), shall have an ampacity not less than 125 percent of the full-load current rating of the highest rated motor plus the sum of the full-load current ratings of all the other motors in the group, as determined by 4.30.1.6(a), plus the ampacity required for the other loads.

FPN: See Annex D, Example No. D8.

Exception No. 1: Where one or more of the motors of the group are used for short-time, intermittent, periodic, or varying duty, the ampere rating of such motors to be used in the summation shall be determined in accordance with 4.30.2.2(e). For the highest rated motor, the greater of either the ampere rating from 4.30.2.2(e) or the largest continuous duty motor full-load current multiplied by 1.25 shall be used in the summation.

Exception No. 2: The ampacity of conductors supplying motor-operated fixed electric space-heating equipment shall conform with 4.24.1.3(b).

Exception No. 3: Where the circuitry is interlocked so as to prevent operation of selected motors or other loads at the same time, the conductor ampacity shall be permitted to be based on the summation of the currents of the motors and other loads to be operated at the same time that results in the highest total current.

4.30.2.5 Multimotor and Combination-Load Equipment. The ampacity of the conductors supplying multimotor and combination-load equipment shall not be less than the minimum circuit ampacity marked on the equipment in accordance with 4.30.1.7(d). Where the equipment is not factory-wired and the individual nameplates are visible in accordance with 4.30.1.7(d)(2), the conductor ampacity shall be determined in accordance with 4.30.2.4.

4.30.2.6 Feeder Demand Factor. Where reduced heating of the conductors results from motors operating on duty-cycle, intermittently, or from all motors not operating at one time, the authority having jurisdiction may grant permission for feeder conductors to have an ampacity less than specified in 4.30.2.4, provided the conductors have sufficient ampacity for the maximum load determined in accordance with the sizes and number of motors supplied and the character of their loads and duties.

FPN: Demand factors determined in the design of new facilities can often be validated against actual historical experience from similar installations. Refer to ANSI/IEEE Std. 141, IEEE Recommended Practice for Electric Power Distribution for Industrial Plants, and ANSI/IEEE Std. 241, Recommended Practice for Electric Power Systems in Commercial Buildings, for information on the calculation of loads and demand factor.

4.30.2.7 Capacitors with Motors. Where capacitors are installed in motor circuits, conductors shall comply with 4.60.1.8 and 4.60.1.9.

4.30.2.8 Feeder Taps. Feeder tap conductors shall have an ampacity not less than that required by Part II, shall terminate in a branch-circuit protective device, and, in addition, shall meet one of the following requirements:

(1) Be enclosed either by an enclosed controller or by a raceway, be not more than 3 000 mm in length, and, for field installation, be protected by an overcurrent device on the line side of the tap conductor, the rating or setting of which shall not exceed 1000 percent of the tap conductor ampacity

(2) Have an ampacity of at least one-third that of the feeder conductors, be suitably protected from physical damage or enclosed in a raceway, and be not more than 7.5 m (25 ft) in length

(3) Have an ampacity not less than the feeder conductors

Exception: Feeder taps over 7 600 mm long. In high-bay manufacturing buildings [over 11 m high at walls], where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the systems, conductors tapped to a feeder shall be permitted to be not over 7 600 mm long horizontally and not over 30 m in total length where all of the following conditions are met:

(a) *The ampacity of the tap conductors is not less than one-third that of the feeder conductors.*

(b) *The tap conductors terminate with a single circuit breaker or a single set of fuses conforming with (1) Part 4.30.4, where the load-side conductors are a branch circuit, or (2) Part 4.30.5, where the load-side conductors are a feeder.*

(c) *The tap conductors are suitably protected from physical damage and are installed in raceways.*

(d) *The tap conductors are continuous from end-to-end and contain no splices.*

(e) *The tap conductors shall be 14 mm² copper or 22 mm² aluminum or larger.*

(f) *The tap conductors shall not penetrate walls, floors, or ceilings.*

(g) *The tap shall not be made less than 9 000 mm from the floor.*

4.30.2.9 Constant Voltage Direct-Current Motors — Power Resistors. Conductors connecting the motor controller to separately

mounted power accelerating and dynamic braking resistors in the armature circuit shall have an ampacity not less than the value calculated from Table 4.30.2.9 using motor full-load current. If an armature shunt resistor is used, the power accelerating resistor conductor ampacity shall be calculated using the total of motor full-load current and armature shunt resistor current.

Armature shunt resistor conductors shall have an ampacity of not less than that calculated from Table 4.30.2.9 using rated shunt resistor current as full-load current.

Table 4.30.2.9 Conductor Rating Factors for Power Resistors

Time in Seconds		Ampacity of Conductor in Percent of Full-Load Current
On	Off	
5	75	35
10	70	45
15	75	55
15	45	65
15	30	75
15	15	85
Continuous Duty		110

4.30.3 Motor and Branch-Circuit Overload Protection

4.30.3.1 General. Part 4.30.3 specifies overload devices intended to protect motors, motor-control apparatus, and motor branch-circuit conductors against excessive heating due to motor overloads and failure to start.

Overload in electrical apparatus is an operating overcurrent that, when it persists for a sufficient length of time, would cause damage or dangerous overheating of the apparatus. It does not include short circuits or ground faults.

These provisions shall not be interpreted as requiring overload protection where it might introduce additional or increased hazards, as in the case of fire pumps.

FPN: For protection of fire pump supply conductors, see 6.95.1.6.

The provisions of Part 4.30.3 shall not apply to motor circuits rated over 600 volts, nominal.

FPN No. 1: For over 600 volts, nominal, see Part 4.30.9.

FPN No. 2: See Appendix D, Example No. D8.

4.30.3.2 Continuous-Duty Motors.

(a) More Than 1 Horsepower. Each motor used in a continuous duty application and rated more than 1 hp shall be protected against overload by one of the means in 4.30.3.2(a)(1) through (a)(4).

(1) Separate Overload Device. A separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated at no more than the following percent of the motor nameplate full-load current rating:

Motors with a marked service factor 1.15 or greater	125%
Motors with a marked temperature rise 40°C or less	125%
All other motors	115%

Modification of this value shall be permitted as provided in 4.30.3.2(c). For a multispeed motor, each winding connection shall be considered separately.

Where a separate motor overload device is connected so that it does not carry the total current designated on the motor nameplate, such as for wye-delta starting, the proper percentage of nameplate current applying to the selection or setting of the overload device shall be clearly designated on the equipment, or the manufacturer's selection table shall take this into account.

FPN: Where power factor correction capacitors are installed on the load side of the motor overload device, see 4.60.1.9.

(2) Thermal Protector. A thermal protector integral with the motor, approved for use with the motor it protects on the basis that it will prevent dangerous overheating of the motor due to overload and failure

to start. The ultimate trip current of a thermally protected motor shall not exceed the following percentage of motor full-load current given in Table 4.30.14.2, Table 4.30.14.3, and Table 4.30.14.4:

Motor full-load current 9 amperes or less	170%
Motor full-load current from 9.1 to, and including, 20 amperes	156%
Motor full-load current greater than 20 amperes	140%

If the motor current-interrupting device is separate from the motor and its control circuit is operated by a protective device integral with the motor, it shall be arranged so that the opening of the control circuit will result in interruption of current to the motor.

(3) Integral with Motor. A protective device integral with a motor that will protect the motor against damage due to failure to start shall be permitted if the motor is part of an approved assembly that does not normally subject the motor to overloads.

(4) Larger Than 1 500 Horsepower. For motors larger than 1 500 hp, a protective device having embedded temperature detectors that cause current to the motor to be interrupted when the motor attains a temperature rise greater than marked on the nameplate in an ambient temperature of 40°C.

(b) One Horsepower or Less, Automatically Started. Any motor of 1 hp or less that is started automatically shall be protected against overload by one of the following means.

(1) Separate Overload Device. By a separate overload device following the requirements of 4.30.3.2(a)(1).

For a multispeed motor, each winding connection shall be considered separately. Modification of this value shall be permitted as provided in 4.30.3.2(c).

(2) Thermal Protector. A thermal protector integral with the motor, approved for use with the motor that it protects on the basis that it will prevent dangerous overheating of the motor due to overload and failure

to start. Where the motor current-interrupting device is separate from the motor and its control circuit is operated by a protective device integral with the motor, it shall be arranged so that the opening of the control circuit results in interruption of current to the motor.

(3) Integral with Motor. A protective device integral with a motor that protects the motor against damage due to failure to start shall be permitted (1) if the motor is part of an approved assembly that does not subject the motor to overloads, or (2) if the assembly is also equipped with other safety controls (such as the safety combustion controls on a domestic oil burner) that protect the motor against damage due to failure to start. Where the assembly has safety controls that protect the motor, it shall be so indicated on the nameplate of the assembly where it will be visible after installation.

(4) Impedance-Protected. If the impedance of the motor windings is sufficient to prevent overheating due to failure to start, the motor shall be permitted to be protected as specified in 4.30.3.2(d)(2)a for manually started motors if the motor is part of an approved assembly in which the motor will limit itself so that it will not be dangerously overheated.

FPN: Many ac motors of less than 1/20 hp, such as clock motors, series motors, and so forth, and also some larger motors such as torque motors, come within this classification. It does not include split-phase motors having automatic switches that disconnect the starting windings.

(c) Selection of Overload Relay. Where the sensing element or setting of the overload relay selected in accordance with 4.30.3.2(a)(1) and 4.30.3.2(b)(1) is not sufficient to start the motor or to carry the load, higher size sensing elements or incremental settings shall be permitted to be used, provided the trip current of the overload relay does not exceed the following percentage of motor nameplate full-load current rating:

Motors with marked service factor 1.15 or greater	140%
Motors with a marked temperature rise 40°C or less	140%
All other motors	130%

If not shunted during the starting period of the motor as provided in 4.30.3.5, the overload device shall have sufficient time delay to permit the motor to start and accelerate its load.

FPN: A Class 20 or Class 30 overload relay will provide a longer motor acceleration time than a Class 10 or Class 20, respectively. Use of a higher class overload relay may preclude the need for selection of a higher trip current.

(d) One Horsepower or Less, Nonautomatically Started.

(1) Permanently Installed. Overload protection shall be in accordance with 4.30.3.2(b).

(2) Not Permanently Installed.

a. Within Sight from Controller. Overload protection shall be permitted to be furnished by the branch circuit short-circuit and ground-fault protective device; such device, however, shall not be larger than that specified in Part 4.30.4.

Exception: Any such motor shall be permitted on a nominal 120 volt branch circuit protected at not over 20 amperes.

b. Not Within Sight from Controller. Overload protection shall be in accordance with 4.30.3.2(b).

(e) Wound-Rotor Secondaries. The secondary circuits of wound-rotor ac motors, including conductors, controllers, resistors, and so forth, shall be permitted to be protected against overload by the motor-overload device.

4.30.3.3 Intermittent and Similar Duty. A motor used for a condition of service that is inherently short-time, intermittent, periodic, or varying duty, as illustrated by Table 4.30.2.2(e), shall be permitted to be protected against overload by the branch-circuit short-circuit and ground-fault protective device, provided the protective device rating or setting does not exceed that specified in Table 4.30.4.2.

Any motor application shall be considered to be for continuous duty unless the nature of the apparatus it drives is such that the motor cannot operate continuously with load under any condition of use.

4.30.3.5 Shunting During Starting Period.

(a) Nonautomatically Started. For a nonautomatically started motor, the overload protection shall be permitted to be shunted or cut out of the circuit during the starting period of the motor if the device by which the overload protection is shunted or cut out cannot be left in the starting position and if fuses or inverse time circuit breakers rated or set at not over 400 percent of the full-load current of the motor are located in the circuit so as to be operative during the starting period of the motor.

(b) Automatically Started. The motor overload protection shall not be shunted or cut out during the starting period if the motor is automatically started.

Exception: The motor overload protection shall be permitted to be shunted or cut out during the starting period on an automatically started motor where the following apply:

(a) *The motor starting period exceeds the time delay of available motor overload protective devices, and*

(b) *Listed means are provided to perform the following:*

(1) *Sense motor rotation and automatically prevent the shunting or cutout in the event that the motor fails to start, and*

(2) *Limit the time of overload protection shunting or cutout to less than the locked rotor time rating of the protected motor, and*

(3) *Provide for shutdown and manual restart if motor running condition is not reached.*

4.30.3.6 Fuses — In Which Conductor. Where fuses are used for motor overload protection, a fuse shall be inserted in each ungrounded conductor and also in the grounded conductor if the supply system is 3-wire, 3-phase ac with one conductor grounded.

4.30.3.7 Devices Other Than Fuses — In Which Conductor. Where devices other than fuses are used for motor overload protection, Table 4.30.3.7 shall govern the minimum allowable number and location of overload units such as trip coils or relays.

4.30.3.8 Number of Conductors Opened by Overload Device. Motor overload devices, other than fuses or thermal protectors, shall

simultaneously open a sufficient number of ungrounded conductors to interrupt current flow to the motor.

Table 4.30.3.7 Overload Units

Kind of Motor	Supply System	Number and Location of Overload Units, Such as Trip Coils or Relays
1-phase ac or dc	2-wire, 1-phase ac or dc ungrounded	1 in either conductor
1-phase ac or dc	2-wire, 1-phase ac or dc, one conductor grounded	1 in ungrounded conductor
1-phase ac or dc	3-wire, 1-phase ac or dc, grounded neutral	1 in either ungrounded conductor
1-phase ac	Any 3-phase	1 in ungrounded conductor
2-phase ac	3-wire, 2-phase ac, ungrounded	2, one in each phase
2-phase ac	3-wire, 2-phase ac, one conductor grounded	2 in ungrounded conductors
2-phase ac	4-wire, 2-phase ac, grounded or ungrounded	2, one per phase in ungrounded conductors
2-phase ac	Grounded neutral or 5-wire, 2-phase ac, ungrounded	2, one per phase in any ungrounded phase wire
3-phase ac	Any 3-phase	3, one in each phase*

*Exception: An overload unit in each phase shall not be required where overload protection is provided by other approved means.

4.30.3.9 Motor Controller as Overload Protection. A motor controller shall also be permitted to serve as an overload device if the number of overload units complies with Table 4.30.3.7 and if these units are operative in both the starting and running position in the case

of a dc motor, and in the running position in the case of an ac motor.

4.30.3.10 Overload Relays. Overload relays and other devices for motor overload protection that are not capable of opening short circuits or ground faults shall be protected by fuses or circuit breakers with ratings or settings in accordance with 4.30.4.2 or by a motor short-circuit protector in accordance with 4.30.4.2.

Exception: Where approved for group installation and marked to indicate the maximum size of fuse or inverse time circuit breaker by which they must be protected, the overload devices shall be protected in accordance with this marking.

FPN: For instantaneous trip circuit breakers or motor short-circuit protectors, see 4.30.4.2.

4.30.3.12 Motors on General-Purpose Branch Circuits. Overload protection for motors used on general-purpose branch circuits as permitted in Article 2.10 shall be provided as specified in 4.30.3.12(a), (b), (c), or (d).

(a) Not Over 1 Horsepower. One or more motors without individual overload protection shall be permitted to be connected to a general-purpose branch circuit only where the installation complies with the limiting conditions specified in 4.30.3.2(b) and 4.30.3.2(d) and 4.30.4.3(a)(1) and (a)(2).

(b) Over 1 Horsepower. Motors of ratings larger than specified in 4.30.4.3(a) shall be permitted to be connected to general-purpose branch circuits only where each motor is protected by overload protection selected to protect the motor as specified in 4.30.3.2. Both the controller and the motor overload device shall be approved for group installation with the short-circuit and ground-fault protective device selected in accordance with 4.30.4.3.

(c) Cord-and-Plug Connected. Where a motor is connected to a branch circuit by means of an attachment plug and receptacle and individual overload protection is omitted as provided in 4.30.3.12(a), the rating of the attachment plug and receptacle shall not exceed 15 amperes at 125 volts or 250 volts. Where individual overload protection is required as provided in 4.30.3.12(b) for a motor or motor-

operated appliance that is attached to the branch circuit through an attachment plug and receptacle, the overload device shall be an integral part of the motor or of the appliance. The rating of the attachment plug and receptacle shall determine the rating of the circuit to which the motor may be connected, as provided in Article 2.10.

(d) Time Delay. The branch-circuit short-circuit and ground-fault protective device protecting a circuit to which a motor or motor-operated appliance is connected shall have sufficient time delay to permit the motor to start and accelerate its load.

4.30.3.13 Automatic Restarting. A motor overload device that can restart a motor automatically after overload tripping shall not be installed unless approved for use with the motor it protects. A motor overload device that can restart a motor automatically after overload tripping shall not be installed if automatic restarting of the motor can result in injury to persons.

4.30.3.14 Orderly Shutdown. If immediate automatic shutdown of a motor by a motor overload protective device(s) would introduce additional or increased hazard(s) to a person(s) and continued motor operation is necessary for safe shutdown of equipment or process, a motor overload sensing device(s) conforming with the provisions of Part 4.30.3 shall be permitted to be connected to a supervised alarm instead of causing immediate interruption of the motor circuit, so that corrective action or an orderly shutdown can be initiated.

4.30.4 Motor Branch-Circuit Short-Circuit and Ground-Fault Protection

4.30.4.1 General. Part 4.30.4 specifies devices intended to protect the motor branch-circuit conductors, the motor control apparatus, and the motors against overcurrent due to short circuits or grounds. These rules add to or amend the provisions of Article 2.40. The devices specified in Part 4.30.4 do not include the types of devices required by 2.10.1.8, 2.30.7.6, and 5.90.1.6.

The provisions of Part 4.30.4 shall not apply to motor circuits rated over 600 volts, nominal.

FPN No. 1: For over 600 volts, nominal, see Part 4.30.9.

FPN No. 2: See Appendix D, Example D8.

4.30.4.2 Rating or Setting for Individual Motor Circuit.

(a) General. The motor branch-circuit short-circuit and ground-fault protective device shall comply with 4.30.4.2(b) and either 4.30.4.2(c) or 4.30.4.2(d), as applicable.

(b) All Motors. The motor branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the motor.

(c) Rating or Setting.

(1) In Accordance with Table 4.30.4.2. A protective device that has a rating or setting not exceeding the value calculated according to the values given in Table 4.30.4.2 shall be used.

Exception No. 1: Where the values for branch-circuit short-circuit and ground-fault protective devices determined by Table 4.30.4.2 do not correspond to the standard sizes or ratings of fuses, nonadjustable circuit breakers, thermal protective devices, or possible settings of adjustable circuit breakers, a higher size, rating, or possible setting that does not exceed the next higher standard ampere rating shall be permitted.

Exception No. 2: Where the rating specified in Table 4.30.4.2, as modified by Exception No. 1, is not sufficient for the starting current of the motor:

(a) The rating of a nontime-delay fuse not exceeding 600 amperes or a time-delay Class CC fuse shall be permitted to be increased but shall in no case exceed 400 percent of the full-load current.

(b) The rating of a time-delay (dual-element) fuse shall be permitted to be increased but shall in no case exceed 225 percent of the full-load current.

(c) The rating of an inverse time circuit breaker shall be permitted to be increased but shall in no case exceed 400 percent for full-load currents of 100 amperes or less or 300 percent for full-load currents greater than 100 amperes.

(d) The rating of a fuse of 601–6000 ampere classification shall be permitted to be increased but shall in no case exceed 300 percent of the full-load current.

FPN: See Appendix D, Example D8, and Figure 4.30.1.1.

Table 4.30.4.2 Maximum Rating or Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices

Type of Motor	Percentage of Full-Load Current			
	Nontime Delay Fuse ¹	Dual Element (Time-Delay) Fuse ¹	Instantaneous Trip Breaker	Inverse Time Breaker ²
Single-phase motors	300	175	800	250
AC polyphase motors other than wound-rotor				
Squirrel cage — other than Design B energy-efficient	300	175	800	250
Design B energy-efficient	300	175	1 100	250
Synchronous ³	300	175	800	250
Wound rotor	150	150	800	150
Direct current (constant voltage)	150	150	250	150

Note: For certain exceptions to the values specified, see 4.30.4.4.

¹The values in the Nontime Delay Fuse column apply to Time-Delay Class CC fuses.

²The values given in the last column also cover the ratings of nonadjustable inverse time types of circuit breakers that may be modified as in 4.30.4.2(c), Exception No. 1 and No. 2.

³Synchronous motors of the low-torque, low-speed type (usually 450 rpm or lower), such as are used to drive reciprocating compressors, pumps, and so forth, that start unloaded, do not require a fuse rating or circuit-breaker setting in excess of 200 percent of full-load current.

(2) Overload Relay Table. Where maximum branch-circuit short-circuit and ground-fault protective device ratings are shown in the manufacturer's overload relay table for use with a motor controller or are otherwise marked on the equipment, they shall not be exceeded even if higher values are allowed as shown above.

(3) Instantaneous Trip Circuit Breaker. An instantaneous trip circuit breaker shall be used only if adjustable and if part of a listed combination motor controller having coordinated motor overload and

short-circuit and ground-fault protection in each conductor, and the setting is adjusted to no more than the value specified in Table 4.30.4.2.

FPN: For the purpose of this article, instantaneous trip circuit breakers may include a damping means to accommodate a transient motor inrush current without nuisance tripping of the circuit breaker.

Exception No. 1: Where the setting specified in Table 4.30.4.2 is not sufficient for the starting current of the motor, the setting of an instantaneous trip circuit breaker shall be permitted to be increased but shall in no case exceed 1 300 percent of the motor full-load current for other than Design B energy-efficient motors and no more than 1 700 percent of full-load motor current for Design B energy-efficient motors. Trip settings above 800 percent for other than Design B energy-efficient motors and above 1 100 percent for Design B energy-efficient motors shall be permitted where the need has been demonstrated by engineering evaluation. In such cases, it shall not be necessary to first apply an instantaneous-trip circuit breaker at 800 percent or 1 100 percent.

FPN: For additional information on the requirements for a motor to be classified "energy efficient," see NEMA Standards Publication No. MG1-1993, Revision, Motors and Generators, Part 12.59.

Exception No. 2: Where the motor full-load current is 8 amperes or less, the setting of the instantaneous-trip circuit breaker with a continuous current rating of 15 amperes or less in a listed combination motor controller that provides coordinated motor branch-circuit overload and short-circuit and ground-fault protection shall be permitted to be increased to the value marked on the controller.

(4) Multispeed Motor. For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted for two or more windings of the motor, provided the rating of the protective device does not exceed the above applicable percentage of the nameplate rating of the smallest winding protected.

Exception: For a multispeed motor, a single short-circuit and ground-fault protective device shall be permitted to be used and sized according to the full-load current of the highest current winding, where all of the following conditions are met:

(a) Each winding is equipped with individual overload protection sized according to its full-load current.

(b) The branch-circuit conductors supplying each winding are sized according to the full-load current of the highest full-load current winding.

(c) The controller for each winding has a horsepower rating not less than that required for the winding having the highest horsepower rating.

(5) Power Electronic Devices. Suitable fuses shall be permitted in lieu of devices listed in Table 4.30.4.2 for power electronic devices in a solid state motor controller system, provided that the marking for replacement fuses is provided adjacent to the fuses.

(6) Self-Protected Combination Controller. A listed self-protected combination controller shall be permitted in lieu of the devices specified in Table 4.30.4.2. Adjustable instantaneous-trip settings shall not exceed 1 300 percent of full-load motor current for other than Design B energy-efficient motors and not more than 1 700 percent of full-load motor current for Design B energy-efficient motors.

FPN: Proper application of self-protected combination controllers on 3-phase systems, other than solidly grounded wye, particularly on corner grounded delta systems, considers the self-protected combination controllers' individual pole-interrupting capability.

(7) Motor Short-Circuit Protector. A motor short-circuit protector shall be permitted in lieu of devices listed in Table 4.30.4.2 if the motor short-circuit protector is part of a listed combination motor controller having coordinated motor overload protection and short-circuit and ground-fault protection in each conductor and it will open the circuit at currents exceeding 1 300 percent of motor full-load current for other than Design B energy-efficient motors and 1 700 percent of motor full-load motor current for Design B energy-efficient motors.

(d) **Torque Motors.** Torque motor branch circuits shall be protected based on the motor nameplate current rating in accordance with 2.40.1.4(b).

4.30.4.3 Several Motors or Loads on One Branch Circuit. Two or more motors or one or more motors and other loads shall be permitted to be connected to the same branch circuit under conditions specified

in 4.30.4.3(d) and in 4.30.4.3(a), (b), or (c).

(a) **Not Over 1 Horsepower.** Several motors, each not exceeding 1 hp in rating, shall be permitted on a nominal 120-volt branch circuit protected at not over 20 amperes or a branch circuit of 600 volts, nominal, or less, protected at not over 15 amperes, if all of the following conditions are met:

(1) The full-load rating of each motor does not exceed 6 amperes.

(2) The rating of the branch-circuit short-circuit and ground-fault protective device marked on any of the controllers is not exceeded.

(3) Individual overload protection conforms to 4.30.3.2.

(b) **If Smallest Rated Motor Protected.** If the branch-circuit short-circuit and ground-fault protective device is selected not to exceed that allowed by 4.30.4.2 for the smallest rated motor, two or more motors or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to a branch circuit where it can be determined that the branch-circuit short-circuit and ground-fault protective device will not open under the most severe normal conditions of service that might be encountered.

(c) **Other Group Installations.** Two or more motors of any rating or one or more motors and other load(s), with each motor having individual overload protection, shall be permitted to be connected to one branch circuit where the motor controller(s) and overload device(s) are (1) installed as a listed factory assembly and the motor branch-circuit short-circuit and ground-fault protective device either is provided as part of the assembly or is specified by a marking on the assembly, or (2) the motor branch-circuit short-circuit and ground-fault protective device, the motor controller(s), and overload device(s) are field-installed as separate assemblies listed for such use and provided with manufacturers' instructions for use with each other, and (3) all of the following conditions are complied with:

(1) Each motor overload device is listed for group installation with a specified maximum rating of fuse, inverse time circuit breaker, or both.

(2) Each motor controller is listed for group installation with a specified maximum rating of fuse, circuit breaker, or both.

(3) Each circuit breaker is listed and is of the inverse time type.

(4) The branch circuit shall be protected by fuses or inverse time circuit breakers having a rating not exceeding that specified in 4.30.4.2 for the highest rated motor connected to the branch circuit plus an amount equal to the sum of the full-load current ratings of all other motors and the ratings of other loads connected to the circuit. Where this calculation results in a rating less than the ampacity of the supply conductors, it shall be permitted to increase the maximum rating of the fuses or circuit breaker to a value not exceeding that permitted by 2.40.1.4(b).

(5) The branch-circuit fuses or inverse time circuit breakers are not larger than allowed by 4.30.3.10 for the overload relay protecting the smallest rated motor of the group.

(6) Overcurrent protection for loads other than motor loads shall be in accordance with Parts 2.40.1 through 2.40.7.

FPN: See 1.10.1.10 for circuit impedance and other characteristics.

(d) Single Motor Taps. For group installations described above, the conductors of any tap supplying a single motor shall not be required to have an individual branch-circuit short-circuit and ground-fault protective device, provided they comply with one of the following:

(1) No conductor to the motor shall have an ampacity less than that of the branch-circuit conductors.

(2) No conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with 4.30.2.2, the conductors to the motor overload device being not more than 7 600 mm long and being protected from physical damage.

(3) Conductors from the branch-circuit short-circuit and ground-fault protective device to a listed manual motor controller additionally marked “Suitable for Tap Conductor Protection in Group Installations” shall be permitted to have an ampacity not less than the rating or setting of the branch-circuit short-circuit and ground-fault protective device. The conductors from the controller to the motor shall have an ampacity in accordance with 4.30.2.2. The conductors from the branch-circuit short-circuit and ground-fault protective device to the controller shall (1) be suitably protected from physical damage and enclosed either by an enclosed controller or by a raceway and shall be not more than 3 000 mm long or (2) shall have an ampacity not less than that of the branch circuit conductors.

4.30.4.4 Multimotor and Combination-Load Equipment. The rating of the branch-circuit short-circuit and ground-fault protective device for multimotor and combination-load equipment shall not exceed the rating marked on the equipment in accordance with 4.30.1.7(d).

4.30.4.5 Combined Overcurrent Protection. Motor branch-circuit short-circuit and ground-fault protection and motor overload protection shall be permitted to be combined in a single protective device where the rating or setting of the device provides the overload protection specified in 4.30.3.2.

4.30.4.6 Branch-Circuit Protective Devices — In Which Conductor. Branch-circuit protective devices shall comply with the provisions of 2.40.2.1.

4.30.4.7 Size of Fuseholder. Where fuses are used for motor branch-circuit short-circuit and ground-fault protection, the fuseholders shall not be of a smaller size than required to accommodate the fuses specified by Table 4.30.4.2.

Exception: Where fuses having time delay appropriate for the starting characteristics of the motor are used, it shall be permitted to use fuseholders sized to fit the fuses that are used.

4.30.4.8 Rating of Circuit Breaker. A circuit breaker for motor branch-circuit short-circuit and ground-fault protection shall have a current rating in accordance with 4.30.4.2 and 4.30.9.10.

4.30.5 Motor Feeder Short-Circuit and Ground-Fault Protection

4.30.5.1 General. Part 4.30.5 specifies protective devices intended to protect feeder conductors supplying motors against overcurrents due to short circuits or grounds.

FPN: See Appendix D, Example D8.

4.30.5.2 Rating or Setting — Motor Load.

(a) Specific Load. A feeder supplying a specific fixed motor load(s) and consisting of conductor sizes based on 4.30.2.4 shall be provided

with a protective device having a rating or setting not greater than the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device for any motor supplied by the feeder [based on the maximum permitted value for the specific type of a protective device in accordance with 4.30.4.2, or 4.40.3.2(a) for hermetic refrigerant motor-compressors], plus the sum of the full-load currents of the other motors of the group.

Where the same rating or setting of the branch-circuit short-circuit and ground-fault protective device is used on two or more of the branch circuits supplied by the feeder, one of the protective devices shall be considered the largest for the above calculations.

Exception No. 1: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted in 4.30.4.2(c), the procedure provided above for determining the maximum rating of the feeder protective device shall apply with the following provision: For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 4.30.4.2 for the type of feeder protective device employed.

Exception No. 2: Where the feeder overcurrent protective device also provides overcurrent protection for a motor control center, the provisions of 4.30.8.3 shall apply.

FPN: See Appendix D, Example D8.

(b) Other Installations. Where feeder conductors have an ampacity greater than required by 4.30.2.4, the rating or setting of the feeder overcurrent protective device shall be permitted to be based on the ampacity of the feeder conductors.

4.30.5.3 Rating or Setting — Power and Lighting Loads. Where a feeder supplies a motor load and, in addition, a lighting or a lighting and appliance load, the feeder protective device shall have a rating sufficient to carry the lighting or lighting and appliance load, plus the following:

- (1) For a single motor, the rating permitted by 4.30.4.2
- (2) For a single hermetic refrigerant motor-compressor, the rating

permitted by 4.40.3.2

- (3) For two or more motors, the rating permitted by 4.30.5.2

Exception: Where the feeder overcurrent device provides the overcurrent protection for a motor control center, the provisions of 4.30.8.3 shall apply.

4.30.6 Motor Control Circuits

4.30.6.1 General. Part 4.30.6 contains modifications of the general requirements and applies to the particular conditions of motor control circuits.

FPN: See 4.30.1.9(b) for equipment device terminal requirements.

4.30.6.2 Overcurrent Protection.

(a) General. A motor control circuit tapped from the load side of a motor branch-circuit short-circuit and ground-fault protective device(s) and functioning to control the motor(s) connected to that branch circuit shall be protected against overcurrent in accordance with 4.30.6.2. Such a tapped control circuit shall not be considered to be a branch circuit and shall be permitted to be protected by either a supplementary or branch-circuit overcurrent protective device(s). A motor control circuit other than such a tapped control circuit shall be protected against overcurrent in accordance with 7.25.2.3 or the notes to Table 11(a) and Table 11(b) in Chapter 9, as applicable.

(b) Conductor Protection. The overcurrent protection for conductors shall be provided as specified in 4.30.6.2(b)(1) or (b)(2).

Exception No. 1: Where the opening of the control circuit would create a hazard as, for example, the control circuit of a fire pump motor, and the like, conductors of control circuits shall require only short-circuit and ground-fault protection and shall be permitted to be protected by the motor branch-circuit short-circuit and ground-fault protective device(s).

Exception No. 2: Conductors supplied by the secondary side of a single-phase transformer having only a two-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided on the primary (supply) side of the transformer, provided this protection does not exceed the value determined by multiplying the

appropriate maximum rating of the overcurrent device for the secondary conductor from Table 4.30.6.2(b) by the secondary-to-primary voltage ratio. Transformer secondary conductors (other than two-wire) shall not be considered to be protected by the primary overcurrent protection.

(1) Separate Overcurrent Protection. Where the motor branch-circuit short-circuit and ground-fault protective device does not provide protection in accordance with 4.30.6.2(b)(2), separate overcurrent protection shall be provided. The overcurrent protection shall not exceed the values specified in Column A of Table 4.30.6.2(b).

(2) Branch-Circuit Overcurrent Protective Device. Conductors shall be permitted to be protected by the motor branch-circuit short-circuit and ground-fault protective device and shall require only short-circuit and ground-fault protection. Where the conductors do not extend beyond the motor control equipment enclosure, the rating of the protective device(s) shall not exceed the value specified in Column B of Table 4.30.6.2(b). Where the conductors extend beyond the motor control equipment enclosure, the rating of the protective device(s) shall not exceed the value specified in Column C of Table 4.30.6.2(b).

(c) Control Circuit Transformer. Where a motor control circuit transformer is provided, the transformer shall be protected in accordance with 4.30.6.2(c)(1), (c)(2), (c)(3), (c)(4), or (c)(5).

Exception: Overcurrent protection shall be omitted where the opening of the control circuit would create a hazard as, for example, the control circuit of a fire pump motor and the like.

(1) Compliance with Article 7.25. Where the transformer supplies a Class 1 power-limited circuit, Class 2, or Class 3 remote-control circuit conforming with the requirements of Article 7.25, protection shall comply with Article 7.25.

(2) Compliance with Article 4.50. Protection shall be permitted to be provided in accordance with 4.50.1.3.

(3) Less Than 50 Volt-Amperes. Control circuit transformers rated less than 50 volt-amperes (VA) and that are an integral part of the motor controller and located within the motor controller enclosure shall be permitted to be protected by primary overcurrent devices, impedance limiting means, or other inherent protective means.

Table 4.30.6.2(b) Maximum Rating of Overcurrent Protective Device in Amperes

Control Circuit Conductor Size mm ² (mm dia.)	Protection Provided by Motor Branch-Circuit Protective Device(s)					
	Column A Separate Protection Provided		Column B Conductors Within Enclosure		Column C Conductors Extend Beyond Enclosure	
	Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum	Copper	Aluminum or Copper-Clad Aluminum
18	7	—	25	—	7	—
16	10	—	40	—	10	—
2.0(1.6)	(Note 1)	—	100	—	45	—
3.5(2.0)	(Note 1)	(Note 1)	120	100	60	45
5.5(2.6)	(Note 1)	(Note 1)	160	140	90	75
Larger than 5.5(2.6)	(Note 1)	(Note 1)	(Note 2)	(Note 2)	(Note 3)	(Note 3)

Notes:

1. Value specified in 3.10.1.15 as applicable.
2. 400 percent of value specified in Table 310.17 for 60°C conductors.
3. 300 percent of value specified in Table 3.10.1.16 for 60°C conductors.

(4) Primary Less Than 2 Amperes. Where the control circuit transformer rated primary current is less than 2 amperes, an overcurrent device rated or set at not more than 500 percent of the rated primary current shall be permitted in the primary circuit.

(5) Other Means. Protection shall be permitted to be provided by other approved means.

4.30.6.3 Mechanical Protection of Conductor. Where damage to a motor control circuit would constitute a hazard, all conductors of such a remote motor control circuit that are outside the control device itself shall be installed in a raceway or be otherwise suitably protected from physical damage.

Where one side of the motor control circuit is grounded, the motor control circuit shall be arranged so that an accidental ground in the control circuit remote from the motor controller will (1) not start the motor and (2) not bypass manually operated shutdown devices or automatic safety shutdown devices.

4.30.6.4 Disconnection.

(a) **General.** Motor control circuits shall be arranged so that they will be disconnected from all sources of supply when the disconnecting means is in the open position. The disconnecting means shall be permitted to consist of two or more separate devices, one of which disconnects the motor and the controller from the source(s) of power supply for the motor, and the other(s), the motor control circuit(s) from its power supply. Where separate devices are used, they shall be located immediately adjacent to each other.

Exception No. 1: Where more than 12 motor control circuit conductors are required to be disconnected, the disconnecting means shall be permitted to be located other than immediately adjacent to each other where all of the following conditions are complied with:

(a) *Access to energized parts is limited to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner in accordance with Part 4.30.11.*

(b) *A warning sign is permanently located on the outside of each equipment enclosure door or cover permitting access to the live parts in the motor control circuit(s), warning that motor control circuit disconnecting means are remotely located and specifying the location*

and identification of each disconnect. Where energized parts are not in an equipment enclosure as permitted by 4.30.12.2 and 4.30.12.3, an additional warning sign(s) shall be located where visible to persons who may be working in the area of the energized parts.

Exception No. 2: The motor control circuit disconnecting means shall be permitted to be remote from the motor controller power supply disconnecting means where the opening of one or more motor control circuit disconnect means may result in potentially unsafe conditions for personnel or property and the conditions of items (a) and (b) of Exception No. 1 are complied with.

(b) **Control Transformer in Controller Enclosure.** Where a transformer or other device is used to obtain a reduced voltage for the motor control circuit and is located in the controller enclosure, such transformer or other device shall be connected to the load side of the disconnecting means for the motor control circuit.

4.30.7 Motor Controllers

4.30.7.1 General. Part 4.30.7 is intended to require suitable controllers for all motors.

(a) **Stationary Motor of 1/8 Horsepower or Less.** For a stationary motor rated at 1/8 hp or less that is normally left running and is constructed so that it cannot be damaged by overload or failure to start, such as clock motors and the like, the branch-circuit protective device shall be permitted to serve as the controller.

(b) **Portable Motor of 1/3 Horsepower or Less.** For a portable motor rated at 1/3 hp or less, the controller shall be permitted to be an attachment plug and receptacle.

4.30.7.2 Controller Design.

(a) **Starting and Stopping.** Each controller shall be capable of starting and stopping the motor it controls and shall be capable of interrupting the locked-rotor current of the motor.

(b) **Autotransformer.** An autotransformer starter shall provide an “off” position, a running position, and at least one starting position. It shall be designed so that it cannot rest in the starting position or in any

position that will render the overload device in the circuit inoperative.

(c) Rheostats. Rheostats shall be in compliance with the following:

(1) Motor-starting rheostats shall be designed so that the contact arm cannot be left on intermediate segments. The point or plate on which the arm rests when in the starting position shall have no electrical connection with the resistor.

(2) Motor-starting rheostats for dc motors operated from a constant voltage supply shall be equipped with automatic devices that will interrupt the supply before the speed of the motor has fallen to less than one-third its normal rate.

4.30.7.3 Ratings. The controller shall have a rating as specified in 4.30.7.3(a), unless otherwise permitted in 4.30.7.3(b) or 4.30.7.3(c), or as specified in 4.30.7.3(d), under the conditions specified.

(a) General.

(1) Horsepower Ratings. Controllers, other than inverse time circuit breakers and molded case switches, shall have horsepower ratings at the application voltage not lower than the horsepower rating of the motor.

(2) Circuit Breaker. A branch-circuit inverse time circuit breaker rated in amperes shall be permitted as a controller for all motors. Where this circuit breaker is also used for overload protection, it shall conform to the appropriate provisions of this article governing overload protection.

(3) Molded Case Switch. A molded case switch rated in amperes shall be permitted as a controller for all motors.

(b) Small Motors. Devices as specified in 4.30.7.1(a) and 4.30.7.1(b) shall be permitted as a controller.

(c) Stationary Motors of 2 Horsepower or Less. For stationary motors rated at 2 hp or less and 300 volts or less, the controller shall be permitted to be either of the following:

(1) A general-use switch having an ampere rating not less than twice the full-load current rating of the motor

(2) On ac circuits, a general-use snap switch suitable only for use on ac (not general-use ac-dc snap switches) where the motor full-load current rating is not more than 80 percent of the ampere rating of the switch

(d) Torque Motors. For torque motors, the controller shall have a continuous-duty, full-load current rating not less than the nameplate current rating of the motor. For a motor controller rated in horsepower but not marked with the foregoing current rating, the equivalent current rating shall be determined from the horsepower rating by using Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4.

(e) Voltage Rating. A controller with a straight voltage rating, for example, 240 volts or 480 volts, shall be permitted to be applied in a circuit in which the nominal voltage between any two conductors does not exceed the controller's voltage rating. A controller with a slash rating, for example, 240/120 volts or 480Y/277 volts, shall only be applied in a solidly grounded circuit in which the nominal voltage to ground from any conductor does not exceed the lower of the two values of the controller's voltage rating and the nominal voltage between any two conductors does not exceed the higher value of the controller's voltage rating.

4.30.7.4 Need Not Open All Conductors. The controller shall not be required to open all conductors to the motor.

Exception: Where the controller serves also as a disconnecting means, it shall open all ungrounded conductors to the motor as provided in 4.30.9.11.

4.30.7.5 In Grounded Conductors. One pole of the controller shall be permitted to be placed in a permanently grounded conductor, provided the controller is designed so that the pole in the grounded conductor cannot be opened without simultaneously opening all conductors of the circuit.

4.30.7.7 Number of Motors Served by Each Controller. Each motor shall be provided with an individual controller.

Exception: For motors rated 600 volts or less, a single controller rated at not less than the equivalent horsepower, as determined in

accordance with 4.30.9.10(c)(1), of all the motors in the group shall be permitted to serve the group under any of the following conditions:

(a) Where a number of motors drive several parts of a single machine or piece of apparatus, such as metal and woodworking machines, cranes, hoists, and similar apparatus

(b) Where a group of motors is under the protection of one overcurrent device as permitted in 4.30.4.3(a)

(c) Where a group of motors is located in a single room within sight from the controller location

4.30.7.8 Adjustable-Speed Motors. Adjustable-speed motors that are controlled by means of field regulation shall be equipped and connected so that they cannot be started under a weakened field.

Exception: Starting under a weakened field shall be permitted where the motor is designed for such starting.

4.30.7.9 Speed Limitation. Machines of the following types shall be provided with speed-limiting devices or other speed-limiting means:

- (1) Separately excited dc motors
- (2) Series motors
- (3) Motor-generators and converters that can be driven at excessive speed from the dc end, as by a reversal of current or decrease in load

Exception: Separate speed-limiting devices or means shall not be required under either of the following conditions:

(1) Where the inherent characteristics of the machines, the system, or the load and the mechanical connection thereto are such as to safely limit the speed

(2) Where the machine is always under the manual control of a qualified operator

4.30.7.10 Combination Fuseholder and Switch as Controller. The rating of a combination fuseholder and switch used as a motor controller shall be such that the fuseholder will accommodate the size of the fuse specified in Part 4.30.3 for motor overload protection.

Exception: Where fuses having time delay appropriate for the starting characteristics of the motor are used, fuseholders of smaller size than

specified in Part 4.30.3 shall be permitted.

4.30.7.11 Motor Controller Enclosure Types. Table 4.30.7.11 provides the basis for selecting enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. These internal conditions shall require special consideration by the installer and user.

4.30.8 Motor Control Centers

4.30.8.1 General. Part 4.30.8 covers motor control centers installed for the control of motors, lighting, and power circuits.

4.30.8.3 Overcurrent Protection. Motor control centers shall be provided with overcurrent protection in accordance with Parts 2.40.1, 2.40.2, and 2.40.9. The ampere rating or setting of the overcurrent protective device shall not exceed the rating of the common power bus. This protection shall be provided by (1) an overcurrent protective device located ahead of the motor control center or (2) a main overcurrent protective device located within the motor control center.

4.30.8.4 Service-Entrance Equipment. Where used as service equipment, each motor control center shall be provided with a single main disconnecting means to disconnect all ungrounded service conductors.

Exception: A second service disconnect shall be permitted to supply additional equipment.

Where a grounded conductor is provided, the motor control center shall be provided with a main bonding jumper, sized in accordance with 2.50.2.9(d), within one of the sections for connecting the grounded conductor, on its supply side, to the motor control center equipment ground bus.

Exception: High-impedance grounded neutral systems shall be permitted to be connected as provided in 2.50.2.17.

Table 4.30.7.11 Motor Controller Enclosure Selection

For Outdoor Use										
Provides a Degree of Protection Against the Following Environmental Conditions	Enclosure Type Number ¹									
	3	3R	3S	3X	3RX	3SX	4	4X	6	6P
Incidental contact with the enclosed equipment	X	X	X	X	X	X	X	X	X	X

Corrosive agents	—	—	—	X	—	—	X	—	—	—
Temporary submersion	—	—	—	—	—	X	X	—	—	—
Prolonged submersion	—	—	—	—	—	—	X	—	—	—

¹Enclosure type number shall be marked on the motor controller enclosure.

²Mechanism shall be operable when ice covered.

FPN: The term raintight is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 4, 4X, 6, 6P. The term rainproof is typically used in conjunction with Enclosure Type 3R, 3RX. The term watertight is typically used in conjunction with Enclosure Types 4, 4X, 6, 6P. The term driptight is typically used in conjunction with Enclosure Types 2, 5, 12, 12K, 13. The term dusttight is typically used in conjunction with Enclosure Types 3, 3S, 3SX, 3X, 5, 12, 12K, 13.

4.30.8.5 Grounding. Multisection motor control centers shall be bonded together with an equipment grounding conductor or an equivalent grounding bus sized in accordance with Table 2.50.6.13. Equipment grounding conductors shall terminate on this grounding bus or to a grounding termination point provided in a single-section motor control center.

4.30.8.6 Busbars and Conductors.

(a) Support and Arrangement. Busbars shall be protected from physical damage and be held firmly in place. Other than for required interconnections and control wiring, only those conductors that are intended for termination in a vertical section shall be located in that section.

Exception: Conductors shall be permitted to travel horizontally through vertical sections where such conductors are isolated from the busbars by a barrier.

(b) Phase Arrangement. The phase arrangement on 3-phase horizontal common power and vertical buses shall be A, B, C from front to back, top to bottom, or left to right, as viewed from the front of the motor control center. The B phase shall be that phase having the higher voltage to ground on 3-phase, 4-wire, delta-connected systems. Other busbar arrangements shall be permitted for additions to existing installations and shall be marked.

Exception: Rear-mounted units connected to a vertical bus that is common to front-mounted units shall be permitted to have a C, B, A phase arrangement where properly identified.

(c) Minimum Wire-Bending Space. The minimum wire-bending space at the motor control center terminals and minimum gutter space shall be as required in Article 3.12.

(d) Spacings. Spacings between motor control center bus terminals and other bare metal parts shall not be less than specified in Table 4.30.8.6 or as specified in related PNS, IEC, or ANSI.

(e) Barriers. Barriers shall be placed in all service-entrance motor

control centers to isolate service busbars and terminals from the remainder of the motor control center.

Table 4.30.8.6 Minimum Spacing Between Bare Metal Parts

Nominal Voltage	Opposite Polarity Where Mounted on the Same Surface	Opposite Polarity Where Held Free in Air	Live Parts to Ground
Not over 125 volts, nominal	19.1	12.7	12.7
Not over 250 volts, nominal	31.8	19.7	12.7
Not over 600 volts, nominal	50.8	25.4	25.4

4.30.8.7 Marking.

(a) Motor Control Centers. Motor control centers shall be marked according to 1.10.1.21, and such marking shall be plainly visible after installation. Marking shall also include common power bus current rating and motor control center short-circuit rating.

(b) Motor Control Units. Motor control units in a motor control center shall comply with 4.30.1.8.

4.30.9 Disconnecting Means

4.30.9.1 General. Part 4.30.9 is intended to require disconnecting means capable of disconnecting motors and controllers from the circuit.

FPN No. 1: See Figure 4.30.1.1.

FPN No. 2: See 1.10.1.22 for identification of disconnecting means.

4.30.9.2 Location.

(a) Controller. An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight from the controller

location.

Exception No. 1: For motor circuits over 600 volts, nominal, a controller disconnecting means capable of being locked in the open position shall be permitted to be out of sight of the controller, provided the controller is marked with a warning label giving the location of the disconnecting means.

Exception No. 2: A single disconnecting means shall be permitted for a group of coordinated controllers that drive several parts of a single machine or piece of apparatus. The disconnecting means shall be located in sight from the controllers, and both the disconnecting means and the controllers shall be located in sight from the machine or apparatus.

(b) Motor. A disconnecting means shall be located in sight from the motor location and the driven machinery location.

Exception: The disconnecting means shall not be required to be in sight from the motor and the driven machinery location under either condition (a) or (b), provided the disconnecting means required in accordance with 4.30.9.2(a) is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

(a) Where such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property

(b) In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or under the supervision of a licensed electrical practitioner service the equipment

FPN No. 1: Some examples of increased or additional hazards include, but are not limited to, motors rated in excess of 100 hp, multimotor equipment, submersible motors, motors associated with adjustable speed drives, and motors located in hazardous (classified) locations.

FPN No. 2: For information on lockout/tagout procedures, see NFPA 70E-2004, Standard for Electrical Safety in the Workplace.

The disconnecting means required in accordance with 4.30.9.2(a) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery

location.

4.30.9.3 Operation. The disconnecting means shall open all ungrounded supply conductors and shall be designed so that no pole can be operated independently. The disconnecting means shall be permitted in the same enclosure with the controller.

FPN: See 4.30.9.13 for equipment receiving energy from more than one source.

4.30.9.4 To Be Indicating. The disconnecting means shall plainly indicate whether it is in the open (off) or closed (on) position.

4.30.9.5 Grounded Conductors. One pole of the disconnecting means shall be permitted to disconnect a permanently grounded conductor, provided the disconnecting means is designed so that the pole in the grounded conductor cannot be opened without simultaneously disconnecting all conductors of the circuit.

4.30.9.7 Readily Accessible. At least one of the disconnecting means shall be readily accessible.

4.30.9.8 Every Disconnecting Means. Every disconnecting means in the motor circuit between the point of attachment to the feeder and the point of connection to the motor shall comply with the requirements of 4.30.9.9 and 4.30.9.10.

4.30.9.9 Type. The disconnecting means shall be a type specified in 4.30.9.9(a), unless otherwise permitted in 4.30.9.9(b) through 4.30.9.9(g), under the conditions specified.

(a) General.

(1) Motor Circuit Switch. A listed motor-circuit switch rated in horsepower.

(2) Molded Case Circuit Breaker. A listed molded case circuit breaker.

(3) Molded Case Switch. A listed molded case switch.

(4) Instantaneous Trip Circuit Breaker. An instantaneous trip circuit breaker that is part of a listed combination motor controller.

(5) Self-Protected Combination Controller. Listed self-protected combination controller.

(6) **Manual Motor Controller.** Listed manual motor controllers additionally marked “Suitable as Motor Disconnect” shall be permitted as a disconnecting means where installed between the final motor branch-circuit short-circuit protective device and the motor. Listed manual motor controllers additionally marked “Suitable as Motor Disconnect” shall be permitted as disconnecting means on the line side of the fuses permitted in 4.30.4.2(c)(5). In this case, the fuses permitted in 4.30.4.2(c)(5) shall be considered supplementary fuses, and suitable branch-circuit short-circuit and ground-fault protective devices shall be installed on the line side of the manual motor controller additionally marked “Suitable as Motor Disconnect.”

(7) **System Isolation Equipment.** System isolation equipment shall be listed for disconnection purposes. System isolation equipment shall be installed on the load side of the overcurrent protection and its disconnecting means. The disconnecting means shall be one of the types permitted by 4.30.9.9(a)(1) through (a)(3).

(b) Stationary Motors of 1/8 Horsepower or Less. For stationary motors of 1/8 hp or less, the branch-circuit overcurrent device shall be permitted to serve as the disconnecting means.

(c) Stationary Motors of 2 Horsepower or Less. For stationary motors rated at 2 hp or less and 300 volts or less, the disconnecting means shall be permitted to be one of the devices specified in (1), (2), or (3):

(1) A general-use switch having an ampere rating not less than twice the full-load current rating of the motor

(2) On ac circuits, a general-use snap switch suitable only for use on ac (not general-use ac-dc snap switches) where the motor full-load current rating is not more than 80 percent of the ampere rating of the switch

(3) A listed manual motor controller having a horsepower rating not less than the rating of the motor and marked “Suitable as Motor Disconnect”

(d) Autotransformer-Type Controlled Motors. For motors of over 2 hp to and including 100 hp, the separate disconnecting means required for a motor with an autotransformer-type controller shall be permitted to be a general-use switch where all of the following provisions are met:

(1) The motor drives a generator that is provided with overload protection.

(2) The controller is capable of interrupting the locked-rotor current of the motors, is provided with a no voltage release, and is provided with running overload protection not exceeding 125 percent of the motor full-load current rating.

(3) Separate fuses or an inverse time circuit breaker rated or set at not more than 150 percent of the motor full-load current are provided in the motor branch circuit.

(e) Isolating Switches. For stationary motors rated at more than 40 hp dc or 100 hp ac, the disconnecting means shall be permitted to be a general-use or isolating switch where plainly marked “Do not operate under load.”

(f) Cord-and-Plug-Connected Motors. For a cord-and-plug-connected motor, a horsepower-rated attachment plug and receptacle having ratings no less than the motor ratings shall be permitted to serve as the disconnecting means. A horsepower-rated attachment plug and receptacle shall not be required for a cord-and-plug-connected appliance in accordance with 4.22.3.3, a room air conditioner in accordance with 4.40.7.4, or a portable motor rated 1/3 hp or less.

(g) Torque Motors. For torque motors, the disconnecting means shall be permitted to be a general-use switch.

4.30.9.10 Ampere Rating and Interrupting Capacity.

(a) General. The disconnecting means for motor circuits rated 600 volts, nominal, or less shall have an ampere rating not less than 115 percent of the full-load current rating of the motor.

Exception: A listed nonfused motor-circuit switch having a horsepower rating not less than the motor horsepower shall be permitted to have an ampere rating less than 115 percent of the full-load current rating of the motor.

(b) For Torque Motors. Disconnecting means for a torque motor shall have an ampere rating of at least 115 percent of the motor nameplate current.

(c) For Combination Loads. Where two or more motors are used together or where one or more motors are used in combination with other loads, such as resistance heaters, and where the combined load may be simultaneous on a single disconnecting means, the ampere and horsepower ratings of the combined load shall be determined as follows.

(1) **Horsepower Rating.** The rating of the disconnecting means shall be determined from the sum of all currents, including resistance loads, at the full-load condition and also at the locked-rotor condition. The combined full-load current and the combined locked-rotor current so obtained shall be considered as a single motor for the purpose of this requirement as follows.

The full-load current equivalent to the horsepower rating of each motor shall be selected from Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4. These full-load currents shall be added to the rating in amperes of other loads to obtain an equivalent full-load current for the combined load.

The locked-rotor current equivalent to the horsepower rating of each motor shall be selected from Table 4.30.14.5(a) or Table 4.30.14.5(b). The locked-rotor currents shall be added to the rating in amperes of other loads to obtain an equivalent locked-rotor current for the combined load. Where two or more motors or other loads cannot be started simultaneously, the largest sum of locked rotor currents of a motor or group of motors that can be started simultaneously and the full load currents of other concurrent loads shall be permitted to be used to determine the equivalent locked-rotor current for the simultaneous combined loads.

Exception: Where part of the concurrent load is resistance load, and where the disconnecting means is a switch rated in horsepower and amperes, the switch used shall be permitted to have a horsepower rating that is not less than the combined load of the motor(s), if the ampere rating of the switch is not less than the locked-rotor current of the motor(s) plus the resistance load.

(2) **Ampere Rating.** The ampere rating of the disconnecting means shall not be less than 115 percent of the sum of all currents at the full-load condition determined in accordance with 4.30.9.10(c)(1).

Exception: A listed nonfused motor-circuit switch having a horsepower rating equal to or greater than the equivalent horsepower of the combined loads, determined in accordance with 4.30.9.10(c)(1), shall be permitted to have an ampere rating less than 115 percent of the sum of all currents at the full-load condition.

(3) **Small Motors.** For small motors not covered by Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4, the locked-rotor current shall be assumed to be six times the full-load current.

4.30.9.11 Switch or Circuit Breaker as Both Controller and Disconnecting Means. A switch or circuit breaker shall be permitted to be used as both the controller and disconnecting means if it complies with 4.30.9.11(a) and is one of the types specified in 4.30.9.11(b).

(a) **General.** The switch or circuit breaker complies with the requirements for controllers specified in 4.30.7.3, opens all ungrounded conductors to the motor, and is protected by an overcurrent device in each ungrounded conductor (which shall be permitted to be the branch-circuit fuses). The overcurrent device protecting the controller shall be permitted to be part of the controller assembly or shall be permitted to be separate. An autotransformer-type controller shall be provided with a separate disconnecting means.

(b) **Type.** The device shall be one of the types specified in 4.30.9.11(b)(1), (b)(2), or (b)(3).

(1) **Air-Break Switch.** An air-break switch, operable directly by applying the hand to a lever or handle.

(2) **Inverse Time Circuit Breaker.** An inverse time circuit breaker operable directly by applying the hand to a lever or handle. The circuit breaker shall be permitted to be both power and manually operable.

(3) **Oil Switch.** An oil switch used on a circuit whose rating does not exceed 600 volts or 100 amperes, or by special permission on a circuit exceeding this capacity where under expert supervision. The oil switch shall be permitted to be both power and manually operable.

4.30.9.12 Motors Served by Single Disconnecting Means. Each motor shall be provided with an individual disconnecting means.

Exception: A single disconnecting means shall be permitted to serve a group of motors under any one of the conditions of (a), (b), and (c). The single disconnecting means shall be rated in accordance with 4.30.9.10(c).

(a) Where a number of motors drive several parts of a single machine or piece of apparatus, such as metal- and woodworking machines, cranes, and hoists.

(b) Where a group of motors is under the protection of one set of branch-circuit protective devices as permitted by 4.30.4.3(a).

(c) Where a group of motors is in a single room within sight from the location of the disconnecting means.

4.30.9.13 Energy from More Than One Source. Motor and motor-operated equipment receiving electrical energy from more than one source shall be provided with disconnecting means from each source of electrical energy immediately adjacent to the equipment served. Each source shall be permitted to have a separate disconnecting means. Where multiple disconnecting means are provided, a permanent warning sign shall be provided on or adjacent to each disconnecting means.

Exception No. 1: Where a motor receives electrical energy from more than one source, the disconnecting means for the main power supply to the motor shall not be required to be immediately adjacent to the motor, provided the controller disconnecting means is capable of being locked in the open position.

Exception No. 2: A separate disconnecting means shall not be required for a Class 2 remote-control circuit conforming with Article 7.25, rated not more than 30 volts, and isolated and ungrounded.

4.30.10 Adjustable-Speed Drive Systems

4.30.10.1 General. The installation provisions of Part 4.30.1 through Part 4.30.9 are applicable unless modified or supplemented by Part 4.30.10.

FPN: Electrical resonance can result from the interaction of the nonsinusoidal currents from this type of load with power factor correction capacitors.

4.30.10.3 Conductors — Minimum Size and Ampacity.

(a) Branch/Feeder Circuit Conductors. Circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system shall have an ampacity not less than 125 percent of the rated input to the power conversion equipment.

(b) Bypass Device. For an adjustable speed drive system that utilizes a bypass device, the conductor ampacity shall not be less than required by 4.30.1.6. The ampacity of circuit conductors supplying power conversion equipment included as part of an adjustable-speed drive system that utilizes a bypass device shall be the larger of either of the following:

(1) 125 percent of the rated input to the power conversion equipment

(2) 125 percent of the motor full-load current rating as determined by 4.30.1.6

4.30.10.5 Overload Protection. Overload protection of the motor shall be provided.

(a) Included in Power Conversion Equipment. Where the power conversion equipment is marked to indicate that motor overload protection is included, additional overload protection shall not be required.

(b) Bypass Circuits. For adjustable speed drive systems that utilize a bypass device to allow motor operation at rated full load speed, motor overload protection as described in Article 4.30, Part III, shall be provided in the bypass circuit.

(c) Multiple Motor Applications. For multiple motor application, individual motor overload protection shall be provided in accordance with Part 4.30.3.

4.30.10.7 Motor Overtemperature Protection.

(a) General. Adjustable speed drive systems shall protect against motor overtemperature conditions. Overtemperature protection is in

addition to the conductor protection required in 4.30.3.2. Protection shall be provided by one of the following means.

- (1) Motor thermal protector in accordance with 4.30.3.2
- (2) Adjustable speed drive controller with load and speed-sensitive overload protection and thermal memory retention upon shutdown or power loss
- (3) Overtemperature protection relay utilizing thermal sensors embedded in the motor and meeting the requirements of 4.30.3.2(a)(2) or (b)(2)
- (4) Thermal sensor embedded in the motor that is received and acted upon by an adjustable speed drive

(b) Motors with Cooling Systems. Motors that utilize external forced air or liquid cooling systems shall be provided with protection that shall be continuously enabled or enabled automatically if the cooling system fails.

FPN: Protection against cooling system failure can take many forms. Some examples of protection against inoperative or failed cooling systems are direct sensing of the motor temperature as described in 4.30.3.2(a)(1), (a)(3), and (a)(4) or sensing of the presence or absence of the cooling media (flow or pressure sensing).

(c) Multiple Motor Applications. For multiple motor application, individual motor overtemperature protection shall be provided.

FPN: The relationship between motor current and motor temperature changes when the motor is operated by an adjustable speed drive. When operated at reduced speed, overheating of motors may occur at current levels less than or equal to a motor's rated full load current. This is the result of reduced motor cooling when its shaft-mounted fan is operating less than rated nameplate RPM.

(d) Automatic Restarting and Orderly Shutdown. The provisions of 4.30.3.13 and 4.30.3.14 shall apply to the motor over temperature protection means.

4.30.10.9 Disconnecting Means. The disconnecting means shall be permitted to be in the incoming line to the conversion equipment and shall have a rating not less than 115 percent of the rated input current of the conversion unit.

4.30.11 Over 600 Volts, Nominal

4.30.11.1 General. Part 4.30.11 recognizes the additional hazard due to the use of higher voltages. It adds to or amends the other provisions of this article.

4.30.11.2 Marking on Controllers. In addition to the marking required by 4.30.1.8, a controller shall be marked with the control voltage.

4.30.11.3 Conductor Enclosures Adjacent to Motors. Flexible metal conduit or liquidtight flexible metal conduit not exceeding 1 800 mm in length shall be permitted to be employed for raceway connection to a motor terminal enclosure.

4.30.11.4 Size of Conductors. Conductors supplying motors shall have an ampacity not less than the current at which the motor overload protective device(s) is selected to trip.

4.30.11.5 Motor-Circuit Overcurrent Protection.

(a) General. Each motor circuit shall include coordinated protection to automatically interrupt overload and fault currents in the motor, the motor-circuit conductors, and the motor control apparatus.

Exception: Where a motor is vital to operation of the plant and the motor should operate to failure if necessary to prevent a greater hazard to persons, the sensing device(s) shall be permitted to be connected to a supervised annunciator or alarm instead of interrupting the motor circuit.

(b) Overload Protection.

(1) Type of Overload Device. Each motor shall be protected against dangerous heating due to motor overloads and failure to start by a thermal protector integral with the motor or external current-sensing devices, or both.

(2) Wound-Rotor AC Motors. The secondary circuits of wound-rotor ac motors, including conductors, controllers, and resistors rated for the application, shall be considered as protected against overcurrent by the motor overload protection means.

(3) Operation. Operation of the overload interrupting device shall simultaneously disconnect all ungrounded conductors.

(4) Automatic Reset. Overload sensing devices shall not automatically reset after trip unless resetting of the overload sensing device does not cause automatic restarting of the motor or there is no hazard to persons created by automatic restarting of the motor and its connected machinery.

(c) Fault-Current Protection.

(1) Type of Protection. Fault-current protection shall be provided in each motor circuit by one of the following means.

a. A circuit breaker of suitable type and rating arranged so that it can be serviced without hazard. The circuit breaker shall simultaneously disconnect all ungrounded conductors. The circuit breaker shall be permitted to sense the fault current by means of integral or external sensing elements.

b. Fuses of a suitable type and rating placed in each ungrounded conductor. Fuses shall be used with suitable disconnecting means, or they shall be of a type that can also serve as the disconnecting means. They shall be arranged so that they cannot be serviced while they are energized.

(2) Reclosing. Fault-current interrupting devices shall not automatically reclose the circuit.

Exception: Automatic reclosing of a circuit shall be permitted where the circuit is exposed to transient faults and where such automatic reclosing does not create a hazard to persons.

(3) Combination Protection. Overload protection and fault-current protection shall be permitted to be provided by the same device.

4.30.11.6 Rating of Motor Control Apparatus. The ultimate trip current of overcurrent (overload) relays or other motor-protective devices used shall not exceed 115 percent of the controller's continuous current rating. Where the motor branch-circuit disconnecting means is separate from the controller, the disconnecting means current rating shall not be less than the ultimate trip setting of the overcurrent relays in the circuit.

4.30.11.7 Disconnecting Means. The controller disconnecting means shall be capable of being locked in the open position.

4.30.12 Protection of Live Parts — All Voltages

4.30.12.1 General. Part 4.30.12 specifies that live parts shall be protected in a manner judged adequate for the hazard involved.

4.30.12.2 Where Required. Exposed live parts of motors and controllers operating at 50 volts or more between terminals shall be guarded against accidental contact by enclosure or by location as follows:

- (1) By installation in a room or enclosure that is accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner
- (2) By installation on a suitable balcony, gallery, or platform, elevated and arranged so as to exclude unqualified persons
- (3) By elevation 2 400 mm or more above the floor

Exception: Live parts of motors operating at more than 50 volts between terminals shall not require additional guarding for stationary motors that have commutators, collectors, and brush rigging located inside of motor-end brackets and not conductively connected to supply circuits operating at more than 150 volts to ground.

4.30.12.3 Guards for Attendants. Where live parts of motors or controllers operating at over 150 volts to ground are guarded against accidental contact only by location as specified in 4.30.12.2, and where adjustment or other attendance may be necessary during the operation of the apparatus, suitable insulating mats or platforms shall be provided so that the attendant cannot readily touch live parts unless standing on the mats or platforms.

FPN: For working space, see 1.10.2.1 and 1.10.3.5.

4.30.13 Grounding — All Voltages

4.30.13.1 General. Part 4.30.13 specifies the grounding of exposed non-current-carrying metal parts, likely to become energized, of motor

and controller frames to prevent a voltage above ground in the event of accidental contact between energized parts and frames. Insulation, isolation, or guarding are suitable alternatives to grounding of motors under certain conditions.

4.30.13.2 Stationary Motors. The frames of stationary motors shall be grounded under any of the following conditions:

- (1) Where supplied by metal-enclosed wiring
- (2) Where in a wet location and not isolated or guarded
- (3) If in a hazardous (classified) location as covered in Articles 5.0 through 5.17
- (4) If the motor operates with any terminal at over 150 volts to ground

Where the frame of the motor is not grounded, it shall be permanently and effectively insulated from the ground.

4.30.13.3 Portable Motors. The frames of portable motors that operate at over 150 volts to ground shall be guarded or grounded.

FPN No. 1: See 2.50.6.5(4) for grounding of portable appliances in other than residential occupancies.

FPN No. 2: See 2.50.6.10(c) for color of equipment grounding conductor.

4.30.13.4 Controllers. Controller enclosures shall be grounded regardless of voltage. Controller enclosures shall have means for attachment of an equipment grounding conductor termination in accordance with 2.50.1.8.

Exception: Enclosures attached to ungrounded portable equipment shall not be required to be grounded.

4.30.13.5 Method of Grounding. Where required, grounding shall be done in the manner specified in Part 2.50.6.

(a) Grounding Through Terminal Housings. Where the wiring to fixed motors is metal-enclosed cable or in metal raceways, junction boxes to house motor terminals shall be provided, and the armor of the cable or the metal raceways shall be connected to them in the manner specified in Article 2.50.

FPN: See 4.30.1.12(e) for equipment grounding connection means required at motor terminal housings.

(b) Separation of Junction Box from Motor. The junction box required by 4.30.13.5(a) shall be permitted to be separated from the motor by not more than 1 800 mm, provided the leads to the motor are stranded conductors within Type AC cable, interlocked metal tape Type MC cable where listed and identified in accordance with 2.50.6.9(10)(a), or armored cord or are stranded leads enclosed in liquidtight flexible metal conduit, flexible metal conduit, intermediate metal conduit, rigid metal conduit, or electrical metallic tubing not smaller than metric designator 12 (trade size), the armor or raceway being connected both to the motor and to the box.

Liquidtight flexible nonmetallic conduit and rigid nonmetallic conduit shall be permitted to enclose the leads to the motor, provided the leads are stranded and the required equipment grounding conductor is connected to both the motor and to the box.

Where stranded leads are used, protected as specified above, each strand within the conductor shall be not larger than 5.5 mm² (2.6 mm dia.) and shall comply with other requirements of this Code for conductors to be used in raceways.

(c) Grounding of Controller-Mounted Devices. Instrument transformer secondaries and exposed non-current-carrying metal or other conductive parts or cases of instrument transformers, meters, instruments, and relays shall be grounded as specified in 2.50.9.1 through 2.50.9.9.

4.30.14 Tables

Table 4.30.14.1 Full-Load Current in Amperes, Direct-Current Motors

The following values of full-load currents* are for motors running at base speed.

Horsepower	Armature Voltage Rating*					
	90 Volts	120 Volts	180 Volts	240 Volts	500 Volts	550 Volts
¼	4.0	3.1	2.0	1.6	—	—

7½	80	46.0	44.0	40
10	100	57.5	55.0	50

Table 4.30.14.3 Full-Load Current, Two-Phase Alternating-Current Motors (4-Wire)

The following values of full-load current are for motors running at speeds usual for belted motors and motors with normal torque characteristics. Current in the common conductor of a 2-phase, 3-wire system will be 1.41 times the value given. The voltages listed are rated motor voltages. The currents listed shall be permitted for system voltage ranges of 110 to 120, 220 to 240, 440 to 480, and 550 to 600 volts.

Horsepower	Induction-Type Squirrel Cage and Wound Rotor (Amperes)

*Design A motors are not limited to a maximum starting current or locked rotor current.

ARTICLE 4.40 — AIR-CONDITIONING AND REFRIGERATING EQUIPMENT

4.40.1 General

4.40.1.1 Scope. The provisions of this article apply to electric motor-driven air-conditioning and refrigerating equipment and to the branch circuits and controllers for such equipment. It provides for the special considerations necessary for circuits supplying hermetic refrigerant motor-compressors and for any air-conditioning or refrigerating equipment that is supplied from a branch circuit that supplies a hermetic refrigerant motor-compressor.

4.40.1.2 Definitions.

Branch-Circuit Selection Current. The value in amperes to be used instead of the rated-load current in determining the ratings of motor branch-circuit conductors, disconnecting means, controllers, and branch-circuit short-circuit and ground-fault protective devices wherever the running overload protective device permits a sustained current greater than the specified percentage of the rated-load current. The value of branch-circuit selection current will always be equal to or greater than the marked rated-load current.

Hermetic Refrigerant Motor-Compressor. A combination consisting of a compressor and motor, both of which are enclosed in the same housing, with no external shaft or shaft seals, the motor operating in the refrigerant.

Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current.

Rated-Load Current. The rated-load current for a hermetic refrigerant motor-compressor is the current resulting when the motor-compressor is operated at the rated load, rated voltage, and rated frequency of the equipment it serves.

4.40.1.3 Other Articles.

(a) **Article 4.30.** These provisions are in addition to, or amendatory of, the provisions of Article 4.30 and other articles in this Code, which apply except as modified in this article.

(b) **Articles 4.22, 4.24, or 4.30.** The rules of Articles 4.22, 4.24, or 4.30, as applicable, shall apply to air-conditioning and refrigerating equipment that does not incorporate a hermetic refrigerant motor-compressor. This equipment includes devices that employ refrigeration compressors driven by conventional motors, furnaces with air-conditioning evaporator coils installed, fan-coil units, remote forced air-cooled condensers, remote commercial refrigerators, and so forth.

(c) **Article 4.22.** Equipment such as room air conditioners, household refrigerators and freezers, drinking water coolers, and beverage dispensers shall be considered appliances, and the provisions of Article 4.22 shall also apply.

(d) **Other Applicable Articles.** Hermetic refrigerant motor-compressors, circuits, controllers, and equipment shall also comply with the applicable provisions of Table 4.40.1.3(d).

Table 4.40.1.3(d) Other Articles

Equipment/Occupancy	Article	Section
Capacitors		4.60.1.9
Commercial garages, aircraft hangars, motor fuel dispensing facilities, bulk storage plants, spray application, dipping, and coating processes, and inhalation anesthetizing locations	5.11, 5.13, 5.14, 5.15, 5.16, and Part 5.17.4	
Hazardous (classified) locations	5.0–5.3 and 5.5	
Motion picture and television studios and similar locations	5.30	
Resistors and reactors	4.70	

4.40.1.4 Marking on Hermetic Refrigerant Motor-Compressors and Equipment.

(a) Hermetic Refrigerant Motor-Compressor Nameplate. A hermetic refrigerant motor-compressor shall be provided with a nameplate that shall indicate the manufacturer's name, trademark, or symbol; identifying designation; phase; voltage; and frequency. The rated-load current in amperes of the motor-compressor shall be marked by the equipment manufacturer on either or both the motor-compressor nameplate and the nameplate of the equipment in which the motor-compressor is used. The locked-rotor current of each single-phase motor-compressor having a rated-load current of more than 9 amperes at 115 volts, or more than 4.5 amperes at 230 volts, and each polyphase motor-compressor shall be marked on the motor-compressor nameplate. Where a thermal protector complying with 4.40.6.2(a)(2) and (b)(2) is used, the motor-compressor nameplate or the equipment nameplate shall be marked with the words "thermally protected." Where a protective system complying with 4.40.6.2(a)(4) and (b)(4) is used and is furnished with the equipment, the equipment nameplate shall be marked with the words, "thermally protected system." Where a protective system complying with 4.40.6.2(a)(4) and (b)(4) is specified, the equipment nameplate shall be appropriately marked.

(b) Multimotor and Combination-Load Equipment. Multimotor and combination-load equipment shall be provided with a visible nameplate marked with the maker's name, the rating in volts, frequency and number of phases, minimum supply circuit conductor ampacity, the maximum rating of the branch-circuit short-circuit and ground-fault protective device, and the short-circuit current rating of the motor controllers or industrial control panel. The ampacity shall be calculated by using Part 4.40.4 and counting all the motors and other loads that will be operated at the same time. The branch-circuit short-circuit and ground-fault protective device rating shall not exceed the value calculated by using Part 4.40.3. Multimotor or combination-load equipment for use on two or more circuits shall be marked with the above information for each circuit.

Exception No. 1: Multimotor and combination-load equipment that is suitable under the provisions of this article for connection to a single

15- or 20-ampere, 120-volt, or a 15-ampere, 208- or 240-volt, single-phase branch circuit shall be permitted to be marked as a single load.

Exception No. 2: The minimum supply circuit conductor ampacity and the maximum rating of the branch-circuit short-circuit and ground-fault protective device shall not be required to be marked on a room air conditioner conforming with 4.40.7.3(a).

Exception No. 3: Multimotor and combination-load equipment used in one- and two-family dwellings, cord-and- attachment-plug-connected equipment, or equipment supplied from a branch circuit protected at 60 A or less shall not be required to be marked with a short-circuit current rating.

(c) Branch-Circuit Selection Current. A hermetic refrigerant motor-compressor, or equipment containing such a compressor, having a protection system that is approved for use with the motor-compressor that it protects and that permits continuous current in excess of the specified percentage of nameplate rated-load current given in 4.40.6.2(b)(2) or (b)(4) shall also be marked with a branch-circuit selection current that complies with 4.40.6.2(b)(2) or (b)(4). This marking shall be provided by the equipment manufacturer and shall be on the nameplate(s) where the rated-load current(s) appears.

4.40.1.5 Marking on Controllers. A controller shall be marked with the manufacturer's name, trademark, or symbol; identifying designation; voltage; phase; full-load and locked-rotor current (or horsepower) rating; and such other data as may be needed to properly indicate the motor-compressor for which it is suitable.

4.40.1.6 Ampacity and Rating. The size of conductors for equipment covered by this article shall be selected from Table 3.10.1.16 through Table 3.10.1.19 or calculated in accordance with 3.10.1.15 as applicable. The required ampacity of conductors and rating of equipment shall be determined according to 4.40.1.6(a) and 4.40.1.6(b).

(a) Hermetic Refrigerant Motor-Compressor. For a hermetic refrigerant motor-compressor, the rated-load current marked on the nameplate of the equipment in which the motor-compressor is employed shall be used in determining the rating or ampacity of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and the

separate motor overload protection. Where no rated-load current is shown on the equipment nameplate, the rated-load current shown on the compressor nameplate shall be used.

Exception No. 1: Where so marked, the branch-circuit selection current shall be used instead of the rated-load current to determine the rating or ampacity of the disconnecting means, the branch-circuit conductors, the controller, and the branch-circuit short-circuit and ground-fault protection.

Exception No. 2: For cord-and-plug-connected equipment, the nameplate marking shall be used in accordance with 4.40.3.2(b), Exception No. 2.

FPN: For disconnecting means and controllers, see 4.40.2.2 and 4.40.5.1.

(b) Multimotor Equipment. For multimotor equipment employing a shaded-pole or permanent split-capacitor-type fan or blower motor, the full-load current for such motor marked on the nameplate of the equipment in which the fan or blower motor is employed shall be used instead of the horsepower rating to determine the ampacity or rating of the disconnecting means, the branch-circuit conductors, the controller, the branch-circuit short-circuit and ground-fault protection, and the separate overload protection. This marking on the equipment nameplate shall not be less than the current marked on the fan or blower motor nameplate.

4.40.1.7 Highest Rated (Largest) Motor. In determining compliance with this article and with 4.30.2.4, 4.30.4.3(b) and 4.30.4.3(c), and 4.30.5.2(a), the highest rated (largest) motor shall be considered to be the motor that has the highest rated-load current. Where two or more motors have the same highest rated-load current, only one of them shall be considered as the highest rated (largest) motor. For other than hermetic refrigerant motor-compressors, and fan or blower motors as covered in 4.40.1.6(b), the full-load current used to determine the highest rated motor shall be the equivalent value corresponding to the motor horsepower rating selected from Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4.

Exception: Where so marked, the branch-circuit selection current shall be used instead of the rated-load current in determining the highest rated (largest) motor-compressor.

4.40.1.8 Single Machine. An air-conditioning or refrigerating system shall be considered to be a single machine under the provisions of 4.30.7.7, Exception, and 4.30.9.12, Exception. The motors shall be permitted to be located remotely from each other.

4.40.2 Disconnecting Means

4.40.2.1 General. The provisions of Part 4.40.2 are intended to require disconnecting means capable of disconnecting air-conditioning and refrigerating equipment, including motor-compressors and controllers from the circuit conductors.

4.40.2.2 Rating and Interrupting Capacity.

(a) Hermetic Refrigerant Motor-Compressor. A disconnecting means serving a hermetic refrigerant motor-compressor shall be selected on the basis of the nameplate rated-load current or branch-circuit selection current, whichever is greater, and locked-rotor current, respectively, of the motor-compressor as follows.

(1) Ampere Rating. The ampere rating shall be at least 115 percent of the nameplate rated-load current or branch-circuit selection current, whichever is greater.

Exception: A listed nonfused motor circuit switch having a horsepower rating not less than the equivalent horsepower determined in accordance with 4.40.2.2(a)(2) shall be permitted to have an ampere rating less than 115 percent of the specified current.

(2) Equivalent Horsepower. To determine the equivalent horsepower in complying with the requirements of 4.30.9.9, the horsepower rating shall be selected from Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4 corresponding to the rated-load current or branch-circuit selection current, whichever is greater, and also the horsepower rating from Table 4.30.14.5(a) or Table 4.30.14.5(b) corresponding to the locked-rotor current. In case the nameplate rated-load current or branch-circuit selection current and locked-rotor current do not correspond to the currents shown in Table 4.30.14.2, Table 4.30.14.3, Table 4.30.14.4, Table 4.30.14.5(a), or Table 4.30.14.5(b), the horsepower rating corresponding to the next higher

value shall be selected. In case different horsepower ratings are obtained when applying these tables, a horsepower rating at least equal to the larger of the values obtained shall be selected.

(b) Combination Loads. Where the combined load of two or more hermetic refrigerant motor-compressors or one or more hermetic refrigerant motor-compressor with other motors or loads may be simultaneous on a single disconnecting means, the rating for the disconnecting means shall be determined in accordance with 4.40.2.2(b)(1) and (b)(2).

(1) **Horsepower Rating.** The horsepower rating of the disconnecting means shall be determined from the sum of all currents, including resistance loads, at the rated-load condition and also at the locked-rotor condition. The combined rated-load current and the combined locked-rotor current so obtained shall be considered as a single motor for the purpose of this requirement as follows.

a The full-load current equivalent to the horsepower rating of each motor, other than a hermetic refrigerant motor-compressor, and fan or blower motors as covered in 4.40.1.6(b) shall be selected from Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4. These full-load currents shall be added to the motor-compressor rated-load current(s) or branch-circuit selection current(s), whichever is greater, and to the rating in amperes of other loads to obtain an equivalent full-load current for the combined load.

b The locked-rotor current equivalent to the horsepower rating of each motor, other than a hermetic refrigerant motor-compressor, shall be selected from Table 4.30.14.5(a) or Table 4.30.14.5(b), and, for fan and blower motors of the shaded-pole or permanent split-capacitor type marked with the locked-rotor current, the marked value shall be used. The locked-rotor currents shall be added to the motor-compressor locked-rotor current(s) and to the rating in amperes of other loads to obtain an equivalent locked-rotor current for the combined load. Where two or more motors or other loads such as resistance heaters, or both, cannot be started simultaneously, appropriate combinations of locked-rotor and rated-load current or branch-circuit selection current, whichever is greater, shall be an acceptable means of determining the equivalent locked-rotor current for the simultaneous combined load.

Exception: Where part of the concurrent load is a resistance load and the disconnecting means is a switch rated in horsepower and amperes, the switch used shall be permitted to have a horsepower rating not less than the combined load to the motor-compressor(s) and other motor(s) at the locked-rotor condition, if the ampere rating of the switch is not less than this locked-rotor load plus the resistance load.

(2) **Full-Load Current Equivalent.** The ampere rating of the disconnecting means shall be at least 115 percent of the sum of all currents at the rated-load condition determined in accordance with 4.40.2.2(b)(1).

Exception: A listed nonfused motor circuit switch having a horsepower rating not less than the equivalent horsepower determined by 4.40.2.2(b)(1) shall be permitted to have an ampere rating less than 115 percent of the sum of all currents.

(c) Small Motor-Compressors. For small motor-compressors not having the locked-rotor current marked on the nameplate, or for small motors not covered by Table 4.30.14.1, Table 4.30.14.2, Table 4.30.14.3, or Table 4.30.14.4, the locked-rotor current shall be assumed to be six times the rated-load current.

(d) Disconnecting Means. Every disconnecting means in the refrigerant motor-compressor circuit between the point of attachment to the feeder and the point of connection to the refrigerant motor-compressor shall comply with the requirements of 4.40.2.2.

(e) Disconnecting Means Rated in Excess of 100 Horsepower. Where the rated-load or locked-rotor current as determined above would indicate a disconnecting means rated in excess of 100 hp, the provisions of 4.30.9.9(e) shall apply.

4.40.2.3 Cord-Connected Equipment. For cord-connected equipment such as room air conditioners, household refrigerators and freezers, drinking water coolers, and beverage dispensers, a separable connector or an attachment plug and receptacle shall be permitted to serve as the disconnecting means.

FPN: For room air conditioners, see 4.40.7.4.

4.40.2.4 Location. Disconnecting means shall be located within sight from and readily accessible from the air-conditioning or refrigerating equipment. The disconnecting means shall be permitted to be installed on or within the air-conditioning or refrigerating equipment. The disconnecting means shall not be located on panels that are designed to allow access to the air-conditioning or refrigeration equipment.

Exception No. 1: Where the disconnecting means provided in accordance with 4.30.9.2(a) is capable of being locked in the open position, and the refrigerating or air-conditioning equipment is essential to an industrial process in a facility with written safety procedures, and where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the equipment, a disconnecting means within sight from the equipment shall not be required. The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.

Exception No. 2: Where an attachment plug and receptacle serve as the disconnecting means in accordance with 4.40.2.3, their location shall be accessible but shall not be required to be readily accessible.

FPN: See Parts 4.30.7 and 4.30.9 for additional requirements.

4.40.3 Branch-Circuit Short-Circuit and Ground-Fault Protection

4.40.3.1 General. The provisions of Part 4.40.3 specify devices intended to protect the branch-circuit conductors, control apparatus, and motors in circuits supplying hermetic refrigerant motor-compressors against overcurrent due to short circuits and grounds. They are in addition to or amendatory of the provisions of Article 2.40.

4.40.3.2 Application and Selection.

(a) Rating or Setting for Individual Motor-Compressor. The motor-compressor branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the motor. A

protective device having a rating or setting not exceeding 175 percent of the motor-compressor rated-load current or branch-circuit selection current, whichever is greater, shall be permitted, provided that, where the protection specified is not sufficient for the starting current of the motor, the rating or setting shall be permitted to be increased but shall not exceed 225 percent of the motor rated-load current or branch-circuit selection current, whichever is greater.

Exception: The rating of the branch-circuit short-circuit and ground-fault protective device shall not be required to be less than 15 amperes.

(b) Rating or Setting for Equipment. The equipment branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the equipment. Where the hermetic refrigerant motor-compressor is the only load on the circuit, the protection shall conform with 4.40.3.2(a). Where the equipment incorporates more than one hermetic refrigerant motor-compressor or a hermetic refrigerant motor-compressor and other motors or other loads, the equipment short-circuit and ground-fault protection shall conform with 4.30.4.3 and 4.40.3.2(b)(1) and (b)(2).

(1) Motor-Compressor Largest Load. Where a hermetic refrigerant motor-compressor is the largest load connected to the circuit, the rating or setting of the branch-circuit short-circuit and ground-fault protective device shall not exceed the value specified in 4.40.3.2(a) for the largest motor-compressor plus the sum of the rated-load current or branch-circuit selection current, whichever is greater, of the other motor-compressor(s) and the ratings of the other loads supplied.

(2) Motor-Compressor Not Largest Load. Where a hermetic refrigerant motor-compressor is not the largest load connected to the circuit, the rating or setting of the branch-circuit short-circuit and ground-fault protective device shall not exceed a value equal to the sum of the rated-load current or branch-circuit selection current, whichever is greater, rating(s) for the motor-compressor(s) plus the value specified in 4.30.4.3(c)(4) where other motor loads are supplied, or the value specified in 2.40.1.4 where only nonmotor loads are supplied in addition to the motor-compressor(s).

Exception No. 1: Equipment that starts and operates on a 15- or 20-ampere 120-volt, or 15-ampere 208- or 240-volt single-phase branch

circuit, shall be permitted to be protected by the 15- or 20-ampere overcurrent device protecting the branch circuit, but if the maximum branch-circuit short-circuit and ground-fault protective device rating marked on the equipment is less than these values, the circuit protective device shall not exceed the value marked on the equipment nameplate.

Exception No. 2: The nameplate marking of cord-and-plug-connected equipment rated not greater than 250 volts, single-phase, such as household refrigerators and freezers, drinking water coolers, and beverage dispensers, shall be used in determining the branch-circuit requirements, and each unit shall be considered as a single motor unless the nameplate is marked otherwise.

(c) Protective Device Rating Not to Exceed the Manufacturer's Values. Where maximum protective device ratings shown on a manufacturer's overload relay table for use with a motor controller are less than the rating or setting selected in accordance with 4.40.3.2(a) and 4.40.3.2(b), the protective device rating shall not exceed the manufacturer's values marked on the equipment.

4.40.4 Branch-Circuit Conductors

4.40.4.1 General. The provisions of Part 4.40.4 and Article 3.10 specify ampacities of conductors required to carry the motor current without overheating under the conditions specified, except as modified in 4.40.1.6(a), Exception No. 1.

The provisions of these articles shall not apply to integral conductors of motors, motor controllers and the like, or to conductors that form an integral part of approved equipment.

FPN: See 3.0.1.1(b) and 3.10.1.1 for similar requirements.

4.40.4.2 Single Motor-Compressor. Branch-circuit conductors supplying a single motor-compressor shall have an ampacity not less than 125 percent of either the motor-compressor rated-load current or the branch-circuit selection current, whichever is greater.

For a wye-start, delta-run connected motor-compressor, the selection of branch-circuit conductors between the controller and the motor-compressor shall be permitted to be based on 72 percent of either the motor-compressor rated-load current or the branch-circuit selection current, whichever is greater.

FPN: The individual motor circuit conductors of wye-start, delta-run connected motor-compressors carry 58 percent of the rated load current. The multiplier of 72 percent is obtained by multiplying 58 percent by 1.25.

4.40.4.3 Motor-Compressor(s) With or Without Additional Motor Loads. Conductors supplying one or more motor-compressor(s) with or without an additional load(s) shall have an ampacity not less than the sum of the rated-load or branch-circuit selection current ratings, whichever is larger, of all the motor-compressors plus the full-load currents of the other motors, plus 25 percent of the highest motor or motor-compressor rating in the group.

Exception No. 1: Where the circuitry is interlocked so as to prevent the starting and running of a second motor-compressor or group of motor-compressors, the conductor size shall be determined from the largest motor-compressor or group of motor-compressors that is to be operated at a given time.

Exception No. 2: The branch circuit conductors for room air conditioners shall be in accordance with Part 4.40.7.

4.40.4.4 Combination Load. Conductors supplying a motor-compressor load in addition to a lighting or appliance load as calculated from Article 2.20 and other applicable articles shall have an ampacity sufficient for the lighting or appliance load plus the required ampacity for the motor-compressor load determined in accordance with 4.40.4.3 or, for a single motor-compressor, in accordance with 4.40.4.2.

Exception: Where the circuitry is interlocked so as to prevent simultaneous operation of the motor-compressor(s) and all other loads connected, the conductor size shall be determined from the largest size required for the motor-compressor(s) and other loads to be operated at a given time.

4.40.4.5 Multimotor and Combination-Load Equipment. The ampacity of the conductors supplying multimotor and combination-load equipment shall not be less than the minimum circuit ampacity marked on the equipment in accordance with 4.40.1.4(b).

4.40.5 Controllers for Motor-Compressors

4.40.5.1 Rating.

(a) Motor-Compressor Controller. A motor-compressor controller shall have both a continuous-duty full-load current rating and a locked-rotor current rating not less than the nameplate rated-load current or branch-circuit selection current, whichever is greater, and locked-rotor current, respectively, of the compressor. In case the motor controller is rated in horsepower but is without one or both of the foregoing current ratings, equivalent currents shall be determined from the ratings as follows. Table 4.30.14.2, Table 4.30.14.3, and Table 4.30.14.4 shall be used to determine the equivalent full-load current rating. Table 4.30.14.5(a) and Table 4.30.14.5(b) shall be used to determine the equivalent locked-rotor current ratings.

(b) Controller Serving More Than One Load. A controller serving more than one motor-compressor or a motor-compressor and other loads shall have a continuous-duty full-load current rating and a locked-rotor current rating not less than the combined load as determined in accordance with 4.40.2.2(b).

4.40.6 Motor-Compressor and Branch-Circuit Overload Protection

4.40.6.1 General. The provisions of Part 4.40.6 specify devices intended to protect the motor-compressor, the motor-control apparatus, and the branch-circuit conductors against excessive heating due to motor overload and failure to start.

FPN: See 2.40.1.4(g) for application of Parts 4.40.3 and 4.40.6.

4.40.6.2 Application and Selection.

(a) Protection of Motor-Compressor. Each motor-compressor shall be protected against overload and failure to start by one of the following means:

(1) A separate overload relay that is responsive to motor-compressor current. This device shall be selected to trip at not more than 140 percent of the motor-compressor rated-load current.

(2) A thermal protector integral with the motor-compressor, approved for use with the motor-compressor that it protects on the basis that it will prevent dangerous overheating of the motor-compressor due to overload and failure to start. If the current-interrupting device is separate from the motor-compressor and its control circuit is operated by a protective device integral with the motor-compressor, it shall be arranged so that the opening of the control circuit will result in interruption of current to the motor-compressor.

(3) A fuse or inverse time circuit breaker responsive to motor current, which shall also be permitted to serve as the branch-circuit short-circuit and ground-fault protective device. This device shall be rated at not more than 125 percent of the motor-compressor rated-load current. It shall have sufficient time delay to permit the motor-compressor to start and accelerate its load. The equipment or the motor-compressor shall be marked with this maximum branch-circuit fuse or inverse time circuit breaker rating.

(4) A protective system, furnished or specified and approved for use with the motor-compressor that it protects on the basis that it will prevent dangerous overheating of the motor-compressor due to overload and failure to start. If the current-interrupting device is separate from the motor-compressor and its control circuit is operated by a protective device that is not integral with the current-interrupting device, it shall be arranged so that the opening of the control circuit will result in interruption of current to the motor-compressor.

(b) Protection of Motor-Compressor Control Apparatus and Branch-Circuit Conductors. The motor-compressor controller(s), the disconnecting means, and the branch-circuit conductors shall be protected against overcurrent due to motor overload and failure to start by one of the following means, which shall be permitted to be the same device or system protecting the motor-compressor in accordance with 4.40.6.2(a):

Exception: Overload protection of motor-compressors and equipment on 15- and 20-ampere, single-phase, branch circuits shall be permitted to be in accordance with 4.40.6.4 and 4.40.6.5.

(1) An overload relay selected in accordance with 4.40.6.2(a)(1)

(2) A thermal protector applied in accordance with 4.40.6.2(a)(2) that will not permit a continuous current in excess of 156 percent of

the marked rated-load current or branch-circuit selection current

(3) A fuse or inverse time circuit breaker selected in accordance with 4.40.6.2(a)(3)

(4) A protective system, in accordance with 4.40.6.2(a)(4), that will not permit a continuous current in excess of 156 percent of the marked rated-load current or branch-circuit selection current

4.40.6.3 Overload Relays. Overload relays and other devices for motor overload protection that are not capable of opening short circuits shall be protected by fuses or inverse time circuit breakers with ratings or settings in accordance with Part 4.40.3 unless approved for group installation or for part-winding motors and marked to indicate the maximum size of fuse or inverse time circuit breaker by which they shall be protected.

Exception: The fuse or inverse time circuit breaker size marking shall be permitted on the nameplate of approved equipment in which the overload relay or other overload device is used.

4.40.6.4 Motor-Compressors and Equipment on 15- or 20-Ampere Branch Circuits — Not Cord-and-Attachment-Plug-Connected. Overload protection for motor-compressors and equipment used on 15- or 20-ampere 120-volt, or 15-ampere 208- or 240-volt single-phase branch circuits as permitted in Article 210 shall be permitted as indicated in 4.40.6.4(a) and 4.40.6.4(b).

(a) Overload Protection. The motor-compressor shall be provided with overload protection selected as specified in 4.40.6.2(a). Both the controller and motor overload protective device shall be approved for installation with the short-circuit and ground-fault protective device for the branch circuit to which the equipment is connected.

(b) Time Delay. The short-circuit and ground-fault protective device protecting the branch circuit shall have sufficient time delay to permit the motor-compressor and other motors to start and accelerate their loads.

4.40.6.5 Cord-and-Attachment-Plug-Connected Motor-Compressors and Equipment on 15- or 20-Ampere Branch Circuits. Overload protection for motor-compressors and equipment that are cord-and-attachment-plug-connected and used on 15- or 20-

ampere 120-volt, or 15-ampere 208- or 240-volt, single-phase branch circuits as permitted in Article 210 shall be permitted as indicated in 4.40.6.5(a), (b), and (c).

(a) Overload Protection. The motor-compressor shall be provided with overload protection as specified in 4.40.6.2(a). Both the controller and the motor overload protective device shall be approved for installation with the short-circuit and ground-fault protective device for the branch circuit to which the equipment is connected.

(b) Attachment Plug and Receptacle Rating. The rating of the attachment plug and receptacle shall not exceed 20 amperes at 125 volts or 15 amperes at 250 volts.

(c) Time Delay. The short-circuit and ground-fault protective device protecting the branch circuit shall have sufficient time delay to permit the motor-compressor and other motors to start and accelerate their loads.

4.40.7 Provisions for Room Air Conditioners

4.40.7.1 General. The provisions of Part 4.40.7 shall apply to electrically energized room air conditioners that control temperature and humidity. For the purpose of Part 4.40.7, a room air conditioner (with or without provisions for heating) shall be considered as an appliance of the air-cooled window, console, or in-wall type that is installed in the conditioned room and that incorporates a hermetic refrigerant motor-compressor(s). The provisions of Part 4.40.7 cover equipment rated not over 250 volts, single phase, and such equipment shall be permitted to be cord-and-attachment-plug-connected. A room air conditioner that is rated three phase or rated over 250 volts shall be directly connected to a wiring method recognized in Chapter 3, and provisions of Part 4.40.7 shall not apply.

4.40.7.2 Grounding. Room air conditioners shall be grounded in accordance with 2.50.6.1, 2.50.6.3, and 2.50.6.5.

4.40.7.3 Branch-Circuit Requirements.

(a) Room Air Conditioner as a Single Motor Unit. A room air conditioner shall be considered as a single motor unit in determining its branch-circuit requirements where all the following conditions are

met:

- (1) It is cord-and-attachment-plug-connected.
- (2) Its rating is not more than 40 amperes and 250 volts, single phase.
- (3) Total rated-load current is shown on the room air-conditioner nameplate rather than individual motor currents.
- (4) The rating of the branch-circuit short-circuit and ground-fault protective device does not exceed the ampacity of the branch-circuit conductors or the rating of the receptacle, whichever is less.

(b) Where No Other Loads Are Supplied. The total marked rating of a cord-and-attachment-plug-connected room air conditioner shall not exceed 80 percent of the rating of a branch circuit where no other loads are supplied.

(c) Where Lighting Units or Other Appliances Are Also Supplied. The total marked rating of a cord-and-attachment-plug-connected room air conditioner shall not exceed 50 percent of the rating of a branch circuit where lighting outlets, other appliances, or general-use receptacles are also supplied. Where the circuitry is interlocked to prevent simultaneous operation of the room air conditioner and energization of other outlets on the same branch circuit, a cord-and-attachment-plug-connected room air conditioner shall not exceed 80 percent of the branch-circuit rating.

4.40.7.4 Disconnecting Means. An attachment plug and receptacle shall be permitted to serve as the disconnecting means for a single-phase room air conditioner rated 250 volts or less if (1) the manual controls on the room air conditioner are readily accessible and located within 1 800 mm of the floor or (2) an approved manually operable disconnecting means is installed in a readily accessible location within sight from the room air conditioner.

4.40.7.5 Supply Cords. Where a flexible cord is used to supply a room air conditioner, the length of such cord shall not exceed 3 000 mm for a nominal, 120-volt rating or 1 800 mm for a nominal, 208- or 240-volt rating.

4.40.7.6 Leakage Current Detection and Interruption (LCDI) and Arc Fault Circuit Interrupter (AFCI). Single-phase cord-and-plug-

connected room air conditioners shall be provided with factory-installed LCDI or AFCI protection. The LCDI or AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm of the attachment plug.

ARTICLE 4.45 — GENERATORS

4.45.1.1 Scope. This article covers the installation of generators.

4.45.1.10 Location. Generators shall be of a type suitable for the locations in which they are installed. They shall also meet the requirements for motors in 4.30.1.14.

4.45.1.11 Marking. Each generator shall be provided with a nameplate giving the manufacturer's name, the rated frequency, power factor, number of phases if of alternating current, the subtransient and transient impedances, the rating in kilowatts or kilovolt amperes, the normal volts and amperes corresponding to the rating, rated revolutions per minute, insulation system class and rated ambient temperature or rated temperature rise, and time rating.

4.45.1.12 Overcurrent Protection.

(a) Constant-Voltage Generators. Constant-voltage generators, except ac generator exciters, shall be protected from overloads by inherent design, circuit breakers, fuses, or other acceptable overcurrent protective means suitable for the conditions of use.

(b) Two-Wire Generators. Two-wire, dc generators shall be permitted to have overcurrent protection in one conductor only if the overcurrent device is actuated by the entire current generated other than the current in the shunt field. The overcurrent device shall not open the shunt field.

(c) 65 Volts or Less. Generators operating at 65 volts or less and driven by individual motors shall be considered as protected by the overcurrent device protecting the motor if these devices will operate when the generators are delivering not more than 150 percent of their full-load rated current.

(d) Balancer Sets. Two-wire, dc generators used in conjunction with balancer sets to obtain neutrals for 3-wire systems shall be equipped with overcurrent devices that disconnect the 3-wire system in case of excessive unbalancing of voltages or currents.

(e) Three-Wire, Direct-Current Generators. Three-wire, dc generators, whether compound or shunt wound, shall be equipped with overcurrent devices, one in each armature lead, and connected so as to be actuated by the entire current from the armature. Such overcurrent devices shall consist either of a double-pole, double-coil circuit breaker or of a 4-pole circuit breaker connected in the main and equalizer leads and tripped by two overcurrent devices, one in each armature lead. Such protective devices shall be interlocked so that no one pole can be opened without simultaneously disconnecting both leads of the armature from the system.

Exception to (a) through (e): Where deemed by the authority having jurisdiction, a generator is vital to the operation of an electrical system and the generator should operate to failure to prevent a greater hazard to persons. The overload sensing device(s) shall be permitted to be connected to an annunciator or alarm supervised by authorized personnel instead of interrupting the generator circuit.

4.45.1.13 Ampacity of Conductors. The ampacity of the conductors from the generator terminals to the first distribution device(s) containing overcurrent protection shall not be less than 115 percent of the nameplate current rating of the generator. It shall be permitted to size the neutral conductors in accordance with 2.20.3.22. Conductors that must carry ground-fault currents shall not be smaller than required by 2.50.2.5(c). Neutral conductors of dc generators that must carry ground-fault currents shall not be smaller than the minimum required size of the largest conductor.

Exception: Where the design and operation of the generator prevent overloading, the ampacity of the conductors shall not be less than 100 percent of the nameplate current rating of the generator.

4.45.1.14 Protection of Live Parts. Live parts of generators operated at more than 50 volts to ground shall not be exposed to accidental contact where accessible to unqualified persons.

4.45.1.15 Guards for Attendants. Where necessary for the safety of attendants, the requirements of 4.30.12.3 shall apply.

4.45.1.16 Bushings. Where wires pass through an opening in an enclosure, conduit box, or barrier, a bushing shall be used to protect the conductors from the edges of an opening having sharp edges. The bushing shall have smooth, well-rounded surfaces where it may be in contact with the conductors. If used where oils, grease, or other contaminants may be present, the bushing shall be made of a material not deleteriously affected.

4.45.1.17 Generator Terminal Housings. Generator terminal housings shall comply with 4.30.1.12. Where a horsepower rating is required to determine the required minimum size of the generator terminal housing, the full-load current of the generator shall be compared with comparable motors in Table 4.30.14.1 through Table 4.30.14.4. The higher horsepower rating of Table 4.30.14.1 and Table 4.30.14.4 shall be used whenever the generator selection is between two ratings.

4.45.1.18 Disconnecting Means Required for Generators. Generators shall be equipped with disconnect(s) by means of which the generator and all protective devices and control apparatus are able to be disconnected entirely from the circuits supplied by the generator except where both of the following conditions apply:

- (1) The driving means for the generator can be readily shut down.
- (2) The generator is not arranged to operate in parallel with another generator or other source of voltage.

ARTICLE 4.50 — TRANSFORMERS AND TRANSFORMER VAULTS (INCLUDING SECONDARY TIES)

4.50.1.1 Scope. This article covers the installation of all transformers.

Exception No. 1: Current transformers.

Exception No. 2: Dry-type transformers that constitute a component part of other apparatus and comply with the requirements for such apparatus.

Exception No. 3: Transformers that are an integral part of an X-ray, high-frequency, or electrostatic-coating apparatus.

Exception No. 4: Transformers used with Class 2 and Class 3 circuits that comply with Article 7.25.

Exception No. 5: Transformers for sign and outline lighting that comply with Article 6.0.

Exception No. 6: Transformers for electric-discharge lighting that comply with Article 4.10.

Exception No. 7: Transformers used for power-limited fire alarm circuits that comply with Part 7.60.3.

Exception No. 8: Transformers used for research, development, or testing, where effective arrangements are provided to safeguard persons from contacting energized parts.

This article covers the installation of transformers dedicated to supplying power to a fire pump installation as modified by Article 6.95.

This article also covers the installation of transformers in hazardous (classified) locations as modified by Articles 5.1 through 5.4.

4.50.1 General Provisions

4.50.1.2 Definition. For the purpose of this article, the following definition shall apply.

Transformer. An individual transformer, single- or polyphase, identified by a single nameplate, unless otherwise indicated in this article.

4.50.1.3 Overcurrent Protection. Overcurrent protection of transformers shall comply with 4.50.1.3(a), (b), or (c). As used in this section, the word transformer shall mean a transformer or polyphase bank of two or more single-phase transformers operating as a unit.

FPN No. 1: See 2.40.1.4, 2.40.2.2, 2.40.9.1, and 2.40.9.2 for overcurrent protection of conductors.

FPN No. 2: Nonlinear loads can increase heat in a transformer without operating its overcurrent protective device.

(a) Transformers Over 600 Volts, Nominal. Overcurrent protection shall be provided in accordance with Table 4.50.1.3(a).

(b) Transformers 600 Volts, Nominal, or Less. Overcurrent protection shall be provided in accordance with Table 4.50.1.3(b).

Exception: Where the transformer is installed as a motor-control circuit transformer in accordance with 4.30.6.2(c)(1) through (c)(5).

(c) Voltage Transformers. Voltage transformers installed indoors or enclosed shall be protected with primary fuses.

FPN: For protection of instrument circuits including voltage transformers, see 4.8.4.3.

4.50.1.4 Autotransformers 600 Volts, Nominal, or Less.

(a) Overcurrent Protection. Each autotransformer 600 volts, nominal, or less shall be protected by an individual overcurrent device installed in series with each ungrounded input conductor. Such overcurrent device shall be rated or set at not more than 125 percent of the rated full-load input current of the autotransformer. Where this calculation does not correspond to a standard rating of a fuse or nonadjustable circuit breaker and the rated input current is 9 amperes or more, the next higher standard rating described in 2.40.1.6 shall be permitted. An overcurrent device shall not be installed in series with the shunt winding (the winding common to both the input and the output circuits) of the autotransformer between Points A and B as shown in Figure 4.50.1.4.

Exception: Where the rated input current of the autotransformer is less than 9 amperes, an overcurrent device rated or set at not more than 167 percent of the input current shall be permitted.

(b) Transformer Field-Connected as an Autotransformer. A transformer field-connected as an autotransformer shall be identified for use at elevated voltage.

FPN: For information on permitted uses of autotransformers, see 2.10.1.9 and 2.15.1.11.

**Table 4.50.1.3(a) Maximum Rating or Setting of Overcurrent Protection for Transformers Over 600 Volts
(as a Percentage of Transformer-Rated Current)**

Location Limitations	Transformer Rated Impedance	Primary Protection Over 600 Volts		Secondary Protection (See Note 2.)		
				Over 600 Volts		Circuit Breaker or Fuse Rating
		Circuit Breaker (See Note 4.)	Fuse Rating	Circuit Breaker (See Note 4.)	Fuse Rating	Circuit Breaker or Fuse Rating
Any location	Not more than 6%	600% (See Note 1.)	300% (See Note 1.)	300% (See Note 1.)	250% (See Note 1.)	125% (See Note 1.)
	More than 6% and not more than 10%	400% (See Note 1.)	300% (See Note 1.)	250% (See Note 1.)	225% (See Note 1.)	125% (See Note 1.)
Supervised locations only (See Note 3.)	Any	300% (See Note 1.)	250% (See Note 1.)	Not required	Not required	Not required
	Not more than 6%	600%	300%	300% (See Note 5.)	250% (See Note 5.)	250% (See Note 5.)
	More than 6% and not more than 10%	400%	300%	250% (See Note 5.)	225% (See Note 5.)	250% (See Note 5.)

Notes:

1. Where the required fuse rating or circuit breaker setting does not correspond to a standard rating or setting, a higher rating or setting that does not exceed the next higher standard rating or setting shall be permitted.
2. Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed the allowed value of a single overcurrent device. If both circuit breakers and fuses are used as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.
3. A supervised location is a location where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner monitor and service the transformer installation.
4. Electronically actuated fuses that may be set to open at a specific current shall be set in accordance with settings for circuit breakers.
5. A transformer equipped with a coordinated thermal overload protection by the manufacturer shall be permitted to have separate secondary protection omitted.

Table 4.50.1.3(b) Maximum Rating or Setting of Overcurrent Protection for Transformers
600 Volts and Less (as a Percentage of Transformer-Rated Current)

Protection Method	Primary Protection			Secondary Protection (See Note 2.)	
	Currents of 9 Amperes or More	Currents Less Than 9 Amperes	Currents Less Than 2 Amperes	Currents of 9 Amperes or More	Currents Less Than 9 Amperes
Primary only protection	125% (See Note 1.)	167%	300%	Not required	Not required
Primary and secondary protection	250% (See Note 3.)	250% (See Note 3.)	250% (See Note 3.)	125% (See Note 1.)	167%

Notes:

1. Where 125 percent of this current does not correspond to a standard rating of a fuse or nonadjustable circuit breaker, a higher rating that does not exceed the next higher standard rating shall be permitted.

2. Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed the allowed value of a single overcurrent device. If both breakers and fuses are utilized as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.

3. A transformer equipped with coordinated thermal overload protection by the manufacturer and arranged to interrupt the primary current shall be permitted to have primary overcurrent protection rated or set at a current value that is not more than six times the rated current of the transformer for transformers having not more than 6 percent impedance and not more than four times the rated current of the transformer for transformers having more than 6 percent but not more than 10 percent impedance.

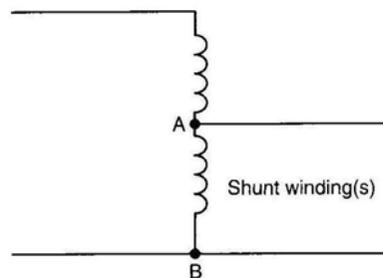

Figure 4.50.1.4 Autotransformer.

4.50.1.5 Grounding Autotransformers. Grounding autotransformers covered in this section are zigzag or T-connected transformers connected to 3-phase, 3-wire ungrounded systems for the purpose of creating a 3-phase, 4-wire distribution system or providing a neutral reference for grounding purposes. Such transformers shall have a continuous per-phase current rating and a continuous neutral current rating. Zig-zag connected transformers shall not be installed on the load side of any system grounding connection, including those made in accordance with 2.50.2.5(b), 2.50.2.11(a)(1), or 2.50.2.13(b)(2).

FPN: The phase current in a grounding autotransformer is one-third the neutral current.

(a) Three-Phase, 4-Wire System. A grounding autotransformer used to create a 3-phase, 4-wire distribution system from a 3-phase, 3-wire ungrounded system shall conform to 4.50.1.5(a)(1) through (a)(4).

(1) Connections. The transformer shall be directly connected to the ungrounded phase conductors and shall not be switched or provided with overcurrent protection that is independent of the main switch and common-trip overcurrent protection for the 3-phase, 4-wire system.

(2) Overcurrent Protection. An overcurrent sensing device shall be provided that will cause the main switch or common-trip overcurrent protection referred to in 4.50.1.5(a)(1) to open if the load on the autotransformer reaches or exceeds 125 percent of its continuous current per-phase or neutral rating. Delayed tripping for temporary overcurrents sensed at the autotransformer overcurrent device shall be permitted for the purpose of allowing proper operation of branch or feeder protective devices on the 4-wire system.

(3) Transformer Fault Sensing. A fault-sensing system that causes the opening of a main switch or common-trip overcurrent device for the 3-phase, 4-wire system shall be provided to guard against single-phasing or internal faults.

FPN: This can be accomplished by the use of two subtractive-connected donut-type current transformers installed to sense and signal when an unbalance occurs in the line current to the autotransformer of 50 percent or more of rated current.

(4) Rating. The autotransformer shall have a continuous neutral-

current rating that is sufficient to handle the maximum possible neutral unbalanced load current of the 4-wire system.

(b) Ground Reference for Fault Protection Devices. A grounding autotransformer used to make available a specified magnitude of ground-fault current for operation of a ground-responsive protective device on a 3-phase, 3-wire ungrounded system shall conform to 4.50.1.5(b)(1) and (b)(2).

(1) Rating. The autotransformer shall have a continuous neutral-current rating sufficient for the specified ground-fault current.

(2) Overcurrent Protection. An overcurrent protective device of adequate short-circuit rating that will open simultaneously all ungrounded conductors when it operates shall be applied in the grounding autotransformer branch circuit and shall be rated or set at a current not exceeding 125 percent of the autotransformer continuous per-phase current rating or 42 percent of the continuous-current rating of any series connected devices in the autotransformer neutral connection. Delayed tripping for temporary overcurrents to permit the proper operation of ground-responsive tripping devices on the main system shall be permitted but shall not exceed values that would be more than the short-time current rating of the grounding autotransformer or any series connected devices in the neutral connection thereto.

(c) Ground Reference for Damping Transitory Overvoltages. A grounding autotransformer used to limit transitory overvoltages shall be of suitable rating and connected in accordance with 4.50.1.5(a)(1).

4.50.1.6 Secondary Ties. As used in this article, a secondary tie is a circuit operating at 600 volts, nominal, or less between phases that connects two power sources or power supply points, such as the secondaries of two transformers. The tie shall be permitted to consist of one or more conductors per phase or neutral. Conductors connecting the secondaries of transformers in accordance with 4.50.1.7 shall not be considered secondary ties.

As used in this section, the word transformer means a transformer or a bank of transformers operating as a unit.

(a) Tie Circuits. Tie circuits shall be provided with overcurrent

protection at each end as required in Parts 2.40.1, 2.40.2, and 2.40.8.

Under the conditions described in 4.50.1.6(a)(1) and 4.50.1.6(a)(2), the overcurrent protection shall be permitted to be in accordance with 4.50.1.6(a)(3).

(1) Loads at Transformer Supply Points Only. Where all loads are connected at the transformer supply points at each end of the tie and overcurrent protection is not provided in accordance with Parts 2.40.1, 2.40.2, and 2.40.8, the rated ampacity of the tie shall not be less than 67 percent of the rated secondary current of the highest rated transformer supplying the secondary tie system.

(2) Loads Connected Between Transformer Supply Points. Where load is connected to the tie at any point between transformer supply points and overcurrent protection is not provided in accordance with Parts 2.40.1, 2.40.2, and 2.40.8, the rated ampacity of the tie shall not be less than 100 percent of the rated secondary current of the highest rated transformer supplying the secondary tie system.

Exception: Tie circuits comprised of multiple conductors per phase shall be permitted to be sized and protected in accordance with 4.50.1.6(a)(4).

(3) Tie Circuit Protection. Under the conditions described in 4.50.1.6(a)(1) and (a)(2), both supply ends of each ungrounded tie conductor shall be equipped with a protective device that opens at a predetermined temperature of the tie conductor under short-circuit conditions. This protection shall consist of one of the following: (1) a fusible link cable connector, terminal, or lug, commonly known as a limiter, each being of a size corresponding with that of the conductor and of construction and characteristics according to the operating voltage and the type of insulation on the tie conductors or (2) automatic circuit breakers actuated by devices having comparable time-current characteristics.

(4) Interconnection of Phase Conductors Between Transformer Supply Points. Where the tie consists of more than one conductor per phase or neutral, the conductors of each phase or neutral shall comply with one of the following provisions.

a. Interconnected. The conductors shall be interconnected in

order to establish a load supply point, and the protective device specified in 4.50.1.6(a)(3) shall be provided in each ungrounded tie conductor at this point on both sides of the interconnection. The means of interconnection shall have an ampacity not less than the load to be served.

b. **Not Interconnected.** The loads shall be connected to one or more individual conductors of a paralleled conductor tie without interconnecting the conductors of each phase or neutral and without the protection specified in 4.50.1.6(a)(3) at load connection points. Where this is done, the tie conductors of each phase or neutral shall have a combined capacity ampacity of not less than 133 percent of the rated secondary current of the highest rated transformer supplying the secondary tie system, the total load of such taps shall not exceed the rated secondary current of the highest rated transformer, and the loads shall be equally divided on each phase and on the individual conductors of each phase as far as practicable.

(5) **Tie Circuit Control.** Where the operating voltage exceeds 150 volts to ground, secondary ties provided with limiters shall have a switch at each end that, when open, de-energizes the associated tie conductors and limiters. The current rating of the switch shall not be less than the rated current ampacity of the conductors connected to the switch. It shall be capable of interrupting its rated current, and it shall be constructed so that it will not open under the magnetic forces resulting from short-circuit current.

(b) **Overcurrent Protection for Secondary Connections.** Where secondary ties are used, an overcurrent device rated or set at not more than 250 percent of the rated secondary current of the transformers shall be provided in the secondary connections of each transformer supplying the tie system. In addition, an automatic circuit breaker actuated by a reverse-current relay set to open the circuit at not more than the rated secondary current of the transformer shall be provided in the secondary connection of each transformer.

(c) **Grounding.** Where the secondary tie system is grounded, each transformer secondary supplying the tie system shall be grounded in accordance with the requirements of 2.50.2.11 for separately derived systems.

4.50.1.7 Parallel Operation. Transformers shall be permitted to be operated in parallel and switched as a unit, provided the overcurrent protection for each transformer meets the requirements of 4.50.1.3(a) for primary and secondary protective devices over 600 volts, or 4.50.1.3(b) for primary and secondary protective devices 600 volts or less.

4.50.1.8 Guarding. Transformers shall be guarded as specified in 4.50.1.8(a) through 4.50.1.8(d).

(a) **Mechanical Protection.** Appropriate provisions shall be made to minimize the possibility of damage to transformers from external causes where the transformers are exposed to physical damage.

(b) **Case or Enclosure.** Dry-type transformers shall be provided with a noncombustible moisture-resistant case or enclosure that provides protection against the accidental insertion of foreign objects.

(c) **Exposed Energized Parts.** Switches or other equipment operating at 600 volts, nominal, or less and serving only equipment within a transformer enclosure shall be permitted to be installed in the transformer enclosure if accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner only. All energized parts shall be guarded in accordance with 1.10.2.2 and 1.10.3.5.

(d) **Voltage Warning.** The operating voltage of exposed live parts of transformer installations shall be indicated by signs or visible markings on the equipment or structures.

4.50.1.9 Ventilation. The ventilation shall be adequate to dispose of the transformer full-load losses without creating a temperature rise that is in excess of the transformer rating.

FPN No. 1: See ANSI/IEEE C57.12.00-1993, General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers, and ANSI/IEEE C57.12.01-1989, General Requirements for Dry-Type Distribution and Power Transformers.

FPN No. 2: Additional losses may occur in some transformers where nonsinusoidal currents are present, resulting in increased heat in the transformer above its rating. See ANSI/IEEE C57.110-1993, Recommended Practice for Establishing Transformer Capability When Supplying Nonsinusoidal Load Currents, where transformers are utilized with nonlinear loads.

Transformers with ventilating openings shall be installed so that the ventilating openings are not blocked by walls or other obstructions. The required clearances shall be clearly marked on the transformer.

4.50.1.10 Grounding. Exposed non-current-carrying metal parts of transformer installations, including fences, guards, and so forth, shall be grounded where required under the conditions and in the manner specified for electric equipment and other exposed metal parts in Article 2.50.

4.50.1.11 Marking. Each transformer shall be provided with a nameplate giving the name of the manufacturer, rated kilovolt-amperes, frequency, primary and secondary voltage, impedance of transformers 25 kVA and larger, required clearances for transformers with ventilating openings, and the amount and kind of insulating liquid where used. In addition, the nameplate of each dry-type transformer shall include the temperature class for the insulation system.

4.50.1.12 Terminal Wiring Space. The minimum wire-bending space at fixed, 600-volt and below terminals of transformer line and load connections shall be as required in 3.12.1.6. Wiring space for pigtail connections shall conform to Table 3.14.2.2(b).

4.50.1.13 Accessibility. All transformers and transformer vaults shall be readily accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner for inspection and maintenance or shall meet the requirements of 4.50.1.13(a) or 4.50.1.13(b).

(a) Open Installations. Dry-type transformers 600 volts, nominal, or less, located in the open on walls, columns, or structures, shall not be required to be readily accessible.

(b) Hollow Space Installations. Dry-type transformers 600 volts, nominal, or less and not exceeding 50 kVA shall be permitted in hollow spaces of buildings not permanently closed in by structure, provided they meet the ventilation requirements of 4.50.1.9 and separation from combustible materials requirements of 4.50.2.1(a). Transformers so installed shall not be required to be readily accessible.

4.50.2 Specific Provisions Applicable to Different Types of Transformers

4.50.2.1 Dry-Type Transformers Installed Indoors.

(a) Not Over 112½ kVA. Dry-type transformers installed indoors and rated 112½ kVA or less shall have a separation of at least 305 mm (12 in.) from combustible material unless separated from the combustible material by a fire-resistant, heat-insulated barrier.

Exception: This rule shall not apply to transformers rated for 600 volts, nominal, or less that are completely enclosed, with or without ventilating openings.

(b) Over 112½ kVA. Individual dry-type transformers of more than 112½ kVA rating shall be installed in a transformer room of fire-resistant construction. Unless specified otherwise in this article, the term fire resistant means a construction having a minimum fire rating of 1 hour.

Exception No. 1: Transformers with Class 155 or higher insulation systems and separated from combustible material by a fire-resistant, heat-insulating barrier or by not less than 1 800 mm horizontally and 3 600 mm vertically.

Exception No. 2: Transformers with Class 155 or higher insulation systems and completely enclosed except for ventilating openings.

FPN: See ANSI/ASTM E119-1995, Method for Fire Tests of Building Construction and Materials, and NFPA 251-1999, Standard Methods of Tests of Fire Endurance of Building Construction and Materials.

(c) Over 35,000 Volts. Dry-type transformers rated over 35 000 volts shall be installed in a vault complying with Part 4.50.3.

4.50.2.2 Dry-Type Transformers Installed Outdoors. Dry-type transformers installed outdoors shall have a weatherproof enclosure.

Transformers exceeding 112½ kVA shall not be located within 300 mm of combustible materials of buildings unless the transformer has Class 155 insulation systems or higher and is completely enclosed except for ventilating openings.

4.50.2.3 Less-Flammable Liquid-Insulated Transformers.

Transformers insulated with listed less-flammable liquids that have a fire point of not less than 300°C shall be permitted to be installed in accordance with 4.50.2.3(a) or 4.50.2.3(b).

(a) Indoor Installations. Indoor installations shall be permitted in accordance with one of the following:

(1) In Type I or Type II buildings, in areas where all of the following requirements are met:

- a. The transformer is rated 35 000 volts or less.
- b. No combustible materials are stored.
- c. A liquid confinement area is provided.
- d. The installation complies with all restrictions provided for in the listing of the liquid.

(2) With an automatic fire extinguishing system and a liquid confinement area, provided the transformer is rated 35 000 volts or less

(3) In accordance with 4.50.2.6

(b) Outdoor Installations. Less-flammable liquid-filled transformers shall be permitted to be installed outdoors, attached to, adjacent to, or on the roof of buildings, where installed in accordance with (1) or (2):

(1) For Type I and Type II buildings, the installation shall comply with all restrictions provided for in the listing of the liquid.

FPN: Installations adjacent to combustible material, fire escapes, or door and window openings may require additional safeguards such as those listed in 4.50.2.7.

(2) In accordance with 4.50.2.7.

FPN No. 1: As used in this section, Type I and Type II buildings refers to Type I and Type II building construction as defined in NFPA 220-1999, Standard on Types of Building Construction. Combustible materials refers to those materials not classified as noncombustible or limited-combustible as defined in NFPA 220-1999, Standard on Types of Building Construction.

FPN No. 2: See definition of Listed in Article 1.1.

4.50.2.4 Nonflammable Fluid-Insulated Transformers.

Transformers insulated with a dielectric fluid identified as nonflammable shall be permitted to be installed indoors or outdoors. Such transformers installed indoors and rated over 35 000 volts shall be installed in a vault. Such transformers installed indoors shall be furnished with a liquid confinement area and a pressure-relief vent. The transformers shall be furnished with a means for absorbing any gases generated by arcing inside the tank, or the pressure-relief vent shall be connected to a chimney or flue that will carry such gases to an environmentally safe area.

FPN: Safety may be increased if fire hazard analyses are performed for such transformer installations.

For the purposes of this section, a nonflammable dielectric fluid is one that does not have a flash point or fire point and is not flammable in air.

4.50.2.5 Askarel-Insulated Transformers Installed Indoors.

Askarel-insulated transformers installed indoors and rated over 25 kVA shall be furnished with a pressure-relief vent. Where installed in a poorly ventilated place, they shall be furnished with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vent shall be connected to a chimney or flue that carries such gases outside the building. Askarel-insulated transformers rated over 35 000 volts shall be installed in a vault.

4.50.2.6 Oil-Insulated Transformers Installed Indoors.

Oil-insulated transformers installed indoors shall be installed in a vault constructed as specified in Part 4.50.3.

Exception No. 1: Where the total capacity does not exceed 112½ kVA, the vault specified in Part 4.50.3 shall be permitted to be constructed of reinforced concrete that is not less than 100 mm thick.

Exception No. 2: Where the nominal voltage does not exceed 600, a vault shall not be required if suitable arrangements are made to prevent a transformer oil fire from igniting other materials and the total capacity in one location does not exceed 10 kVA in a section of the building classified as combustible or 75 kVA where the surrounding structure is classified as fire-resistant construction.

Exception No. 3: Electric furnace transformers that have a total rating not exceeding 75 kVA shall be permitted to be installed without a vault in a building or room of fire-resistant construction, provided suitable arrangements are made to prevent a transformer oil fire from spreading to other combustible material.

Exception No. 4: A transformer that has a total rating not exceeding 75 kVA and a supply voltage of 600 volts or less that is an integral part of charged-particle-accelerating equipment shall be permitted to be installed without a vault in a building or room of noncombustible or fire-resistant construction, provided suitable arrangements are made to prevent a transformer oil fire from spreading to other combustible material.

Exception No. 5: Transformers shall be permitted to be installed in a detached building that does not comply with Part III of this article if neither the building nor its contents present a fire hazard to any other building or property, and if the building is used only in supplying electric service and the interior is accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

Exception No. 6: Oil-insulated transformers shall be permitted to be used without a vault in portable and mobile surface mining equipment (such as electric excavators) if each of the following conditions is met:

- (a) Provision is made for draining leaking fluid to the ground.*
- (b) Safe egress is provided for personnel.*
- (c) A minimum 6 mm steel barrier is provided for personnel protection.*

4.50.2.7 Oil-Insulated Transformers Installed Outdoors.

Combustible material, combustible buildings, and parts of buildings, fire escapes, and door and window openings shall be safeguarded from fires originating in oil-insulated transformers installed on roofs, attached to or adjacent to a building or combustible material.

In cases where the transformer installation presents a fire hazard, one or more of the following safeguards shall be applied according to the degree of hazard involved:

- (1) Space separations
- (2) Fire-resistant barriers
- (3) Automatic fire suppression systems
- (4) Enclosures that confine the oil of a ruptured transformer tank

Oil enclosures shall be permitted to consist of fire-resistant dikes, curbed areas or basins, or trenches filled with coarse, crushed stone. Oil enclosures shall be provided with trapped drains where the exposure and the quantity of oil involved are such that removal of oil is important.

FPN: For additional information on transformers installed on poles or structures or under ground, see ANSI C2-2002, National Electrical Safety Code.

4.50.2.8 Modification of Transformers. When modifications are made to a transformer in an existing installation that change the type of the transformer with respect to Part 4.50.2, such transformer shall be marked to show the type of insulating liquid installed, and the modified transformer installation shall comply with the applicable requirements for that type of transformer.

4.50.3 Transformer Vaults

4.50.3.1 Location. Vaults shall be located where they can be ventilated to the outside air without using flues or ducts wherever such an arrangement is practicable.

4.50.3.2 Walls, Roofs, and Floors. The walls and roofs of vaults shall be constructed of materials that have adequate structural strength for the conditions with a minimum fire resistance of 3 hours. The floors of vaults in contact with the earth shall be of concrete that is not less than 100 mm thick, but where the vault is constructed with a vacant space or other stories below it, the floor shall have adequate structural strength for the load imposed thereon and a minimum fire resistance of 3 hours. For the purposes of this section, studs and wallboard construction shall not be acceptable.

Exception: Where transformers are protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction of 1 hour rating shall be permitted.

FPN No. 1: For additional information, see ANSI/ASTM E119-1995, Method for Fire Tests of Building Construction and Materials, and NFPA 251-1999, Standard Methods of Tests of Fire Endurance of Building Construction and Materials.

FPN No. 2: A typical 3-hour construction is 150 mm thick reinforced concrete.

4.50.3.3 Doorways. Vault doorways shall be protected in accordance with 4.50.3.3(a), (b), and (c).

(a) Type of Door. Each doorway leading into a vault from the building interior shall be provided with a tight-fitting door that has a minimum fire rating of 3 hours. The authority having jurisdiction shall be permitted to require such a door for an exterior wall opening where conditions warrant.

Exception: Where transformers are protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction of 1 hour rating shall be permitted.

FPN: For additional information, see NFPA 80-1999, Standard for Fire Doors and Fire Windows.

(b) Sills. A door sill or curb that is of sufficient height to confine the oil from the largest transformer within the vault shall be provided, and in no case shall the height be less than 100 mm.

(c) Locks. Doors shall be equipped with locks, and doors shall be kept locked, access being allowed only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. Personnel doors shall swing out and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure.

4.50.3.5 Ventilation Openings. Where required by 4.50.1.9, openings for ventilation shall be provided in accordance with 4.50.3.5(a) through 4.50.3.5(f).

(a) Location. Ventilation openings shall be located as far as possible from doors, windows, fire escapes, and combustible material.

(b) Arrangement. A vault ventilated by natural circulation of air shall be permitted to have roughly half of the total area of openings required for ventilation in one or more openings near the floor and the remainder in one or more openings in the roof or in the sidewalls near the roof, or all of the area required for ventilation shall be permitted in one or more openings in or near the roof.

(c) Size. For a vault ventilated by natural circulation of air to an outdoor area, the combined net area of all ventilating openings, after deducting the area occupied by screens, gratings, or louvers, shall not be less than 1 900 mm² (3 in.²) per kVA of transformer capacity in service, and in no case shall the net area be less than 0.1 m² (1 ft²) for any capacity under 50 kVA.

(d) Covering. Ventilation openings shall be covered with durable gratings, screens, or louvers, according to the treatment required in order to avoid unsafe conditions.

(e) Dampers. All ventilation openings to the indoors shall be provided with automatic closing fire dampers that operate in response to a vault fire. Such dampers shall possess a standard fire rating of not less than 1½ hours.

FPN: See ANSI/UL 555-1995, Standard for Fire Dampers.

(f) Ducts. Ventilating ducts shall be constructed of fire-resistant material.

4.50.3.6 Drainage. Where practicable, vaults containing more than 100 kVA transformer capacity shall be provided with a drain or other means that will carry off any accumulation of oil or water in the vault unless local conditions make this impracticable. The floor shall be pitched to the drain where provided.

4.50.3.7 Water Pipes and Accessories. Any pipe or duct system foreign to the electrical installation shall not enter or pass through a transformer vault. Piping or other facilities provided for vault fire protection, or for transformer cooling, shall not be considered foreign to the electrical installation.

4.50.3.8 Storage in Vaults. Materials shall not be stored in transformer vaults.

ARTICLE 4.55 — PHASE CONVERTERS

4.55.1 General

4.55.1.1 Scope. This article covers the installation and use of phase converters.

4.55.1.2 Definitions.

Manufactured Phase. The manufactured or derived phase originates at the phase converter and is not solidly connected to either of the single-phase input conductors.

Phase Converter. An electrical device that converts single-phase power to 3-phase electrical power.

FPN: Phase converters have characteristics that modify the starting torque and locked-rotor current of motors served, and consideration is required in selecting a phase converter for a specific load.

Rotary-Phase Converter. A device that consists of a rotary transformer and capacitor panel(s) that permits the operation of 3-phase loads from a single-phase supply.

Static-Phase Converter. A device without rotating parts, sized for a given 3-phase load to permit operation from a single-phase supply.

4.55.1.3 Other Articles. All applicable requirements of this Code shall apply to phase converters except as amended by this article.

4.55.1.4 Marking. Each phase converter shall be provided with a permanent nameplate indicating the following:

- (1) Manufacturer's name
- (2) Rated input and output voltages
- (3) Frequency
- (4) Rated single-phase input full-load amperes
- (5) Rated minimum and maximum single load in kilovolt-amperes (kVA) or horsepower
- (6) Maximum total load in kilovolt-amperes (kVA) or horsepower
- (7) For a rotary-phase converter, 3-phase amperes at full load

4.55.1.5 Equipment Grounding Connection. A means for attachment of an equipment grounding conductor termination in accordance with 2.50.1.8 shall be provided.

4.55.1.6 Conductors.

(a) Ampacity. The ampacity of the single-phase supply conductors shall be determined by 4.55.1.6(a)(1) or (a)(2).

FPN: Single-phase conductors sized to prevent a voltage drop not exceeding 3 percent from the source of supply to the phase converter may help ensure proper starting and operation of motor loads.

(1) Variable Loads. Where the loads to be supplied are variable, the conductor ampacity shall not be less than 125 percent of the phase converter nameplate single-phase input full-load amperes.

(2) Fixed Loads. Where the phase converter supplies specific fixed loads, and the conductor ampacity is less than 125 percent of the phase converter nameplate single-phase input full-load amperes, the conductors shall have an ampacity not less than 250 percent of the sum of the full-load, 3-phase current rating of the motors and other loads served where the input and output voltages of the phase converter are identical. Where the input and output voltages of the phase converter are different, the current as determined by this section shall be multiplied by the ratio of output to input voltage.

(b) Manufactured Phase Marking. The manufactured phase conductors shall be identified in all accessible locations with a distinctive marking. The marking shall be consistent throughout the system and premises.

4.55.1.7 Overcurrent Protection. The single-phase supply conductors and phase converter shall be protected from overcurrent by 4.55.1.7(a) or 4.55.1.7(b). Where the required fuse or nonadjustable circuit breaker rating or settings of adjustable circuit breakers do not correspond to a standard rating or setting, a higher rating or setting that does not exceed the next higher standard rating shall be permitted.

(a) Variable Loads. Where the loads to be supplied are variable, overcurrent protection shall be set at not more than 125 percent of the phase converter nameplate single-phase input full-load amperes.

(b) Fixed Loads. Where the phase converter supplies specific fixed loads and the conductors are sized in accordance with 4.55.1.6(a)(2), the conductors shall be protected in accordance with their ampacity. The overcurrent protection determined from this section shall not exceed 125 percent of the phase converter nameplate single-phase input amperes.

4.55.1.8 Disconnecting Means. Means shall be provided to disconnect simultaneously all ungrounded single-phase supply conductors to the phase converter.

(a) Location. The disconnecting means shall be readily accessible and located in sight from the phase converter.

(b) Type. The disconnecting means shall be a switch rated in horsepower, a circuit breaker, or a molded-case switch. Where only nonmotor loads are served, an ampere-rated switch shall be permitted.

(c) Rating. The ampere rating of the disconnecting means shall not be less than 115 percent of the rated maximum single-phase input full-load amperes or, for specific fixed loads, shall be permitted to be selected from 4.55.1.8(c)(1) or (c)(2).

(1) Current Rated Disconnect. The disconnecting means shall be a circuit breaker or molded-case switch with an ampere rating not less than 250 percent of the sum of the following:

- a. Full-load, 3-phase current ratings of the motors
- b. Other loads served

(2) Horsepower Rated Disconnect. The disconnecting means shall be a switch with a horsepower rating. The equivalent locked rotor current of the horsepower rating of the switch shall not be less than 200 percent of the sum of the following:

- a. Nonmotor loads
- b. The 3-phase, locked-rotor current of the largest motor as determined from Table 4.30.14.5(b)
- c. The full-load current of all other 3-phase motors operating at the same time

(d) Voltage Ratios. The calculations in 4.55.1.8(c) shall apply directly where the input and output voltages of the phase converter are identical. Where the input and output voltages of the phase converter are different, the current shall be multiplied by the ratio of the output to input voltage.

4.55.1.9 Connection of Single-Phase Loads. Where single-phase loads are connected on the load side of a phase converter, they shall not be connected to the manufactured phase.

4.55.1.10 Terminal Housings. A terminal housing in accordance with the provisions of 4.30.1.12 shall be provided on a phase converter.

4.55.2 Specific Provisions Applicable to Different Types of Phase Converters

4.55.2.1 Disconnecting Means. The single-phase disconnecting means for the input of a static phase converter shall be permitted to serve as the disconnecting means for the phase converter and a single load if the load is within sight of the disconnecting means.

4.55.2.2 Start-Up. Power to the utilization equipment shall not be supplied until the rotary-phase converter has been started.

4.55.2.3 Power Interruption. Utilization equipment supplied by a rotary-phase converter shall be controlled in such a manner that power to the equipment will be disconnected in the event of a power interruption.

FPN: Magnetic motor starters, magnetic contactors, and similar devices, with manual or time delay restarting for the load, provide restarting after power interruption.

4.55.2.4 Capacitors. Capacitors that are not an integral part of the rotary-phase conversion system but are installed for a motor load shall be connected to the line side of that motor overload protective device.

ARTICLE 4.60 — CAPACITORS

4.60.1.1 Scope. This article covers the installation of capacitors on electric circuits.

Surge capacitors or capacitors included as a component part of other apparatus and conforming with the requirements of such apparatus are excluded from these requirements.

This article also covers the installation of capacitors in hazardous (classified) locations as modified by Articles 5.1 through 5.3.

4.60.1.2 Enclosing and Guarding.

(a) Containing More Than 11 L (3 gal) of Flammable Liquid. Capacitors containing more than 11 L (3 gal) of flammable liquid shall be enclosed in vaults or outdoor fenced enclosures complying with Part 1.10.3. This limit shall apply to any single unit in an installation of capacitors.

(b) Accidental Contact. Where capacitors are accessible to unauthorized and unqualified persons, they shall be enclosed, located, or guarded so that persons cannot come into accidental contact or bring conducting materials into accidental contact with exposed energized parts, terminals, or buses associated with them. However, no additional guarding is required for enclosures accessible only to authorized and licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

4.60.1 600 Volts, Nominal, and Under

4.60.1.6 Discharge of Stored Energy. Capacitors shall be provided with a means of discharging stored energy.

(a) Time of Discharge. The residual voltage of a capacitor shall be reduced to 50 volts, nominal, or less within 1 minute after the capacitor is disconnected from the source of supply.

(b) Means of Discharge. The discharge circuit shall be either permanently connected to the terminals of the capacitor or capacitor bank or provided with automatic means of connecting it to the terminals of the capacitor bank on removal of voltage from the line. Manual means of switching or connecting the discharge circuit shall not be used.

4.60.1.8 Conductors.

(a) Ampacity. The ampacity of capacitor circuit conductors shall not be less than 135 percent of the rated current of the capacitor. The ampacity of conductors that connect a capacitor to the terminals of a motor or to motor circuit conductors shall not be less than one-third the ampacity of the motor circuit conductors and in no case less than 135 percent of the rated current of the capacitor.

(b) Overcurrent Protection. An overcurrent device shall be provided in each ungrounded conductor for each capacitor bank. The rating or setting of the overcurrent device shall be as low as practicable.

Exception: A separate overcurrent device shall not be required for a capacitor connected on the load side of a motor overload protective device.

(c) Disconnecting Means. A disconnecting means shall be provided in each ungrounded conductor for each capacitor bank and shall meet the following requirements:

(1) The disconnecting means shall open all ungrounded conductors simultaneously.

(2) The disconnecting means shall be permitted to disconnect the capacitor from the line as a regular operating procedure.

(3) The rating of the disconnecting means shall not be less than 135 percent of the rated current of the capacitor.

Exception: A separate disconnecting means shall not be required where a capacitor is connected on the load side of a motor controller.

4.60.1.9 Rating or Setting of Motor Overload Device. Where a motor installation includes a capacitor connected on the load side of the motor overload device, the rating or setting of the motor overload device shall be based on the improved power factor of the motor circuit.

The effect of the capacitor shall be disregarded in determining the motor circuit conductor rating in accordance with 4.30.2.2.

4.60.1.10 Grounding. Capacitor cases shall be grounded in accordance with Article 2.50.

Exception: Capacitor cases shall not be grounded where the capacitor units are supported on a structure designed to operate at other than ground potential.

4.60.1.12 Marking. Each capacitor shall be provided with a nameplate giving the name of the manufacturer, rated voltage, frequency, kilovar or amperes, number of phases, and, if filled with a combustible liquid, the volume of liquid. Where filled with a nonflammable liquid, the nameplate shall so state. The nameplate shall also indicate whether a capacitor has a discharge device inside the case.

4.60.2 Over 600 Volts, Nominal

4.60.2.1 Switching.

(a) Load Current. Group-operated switches shall be used for capacitor switching and shall be capable of the following:

- (1) Carrying continuously not less than 135 percent of the rated current of the capacitor installation
- (2) Interrupting the maximum continuous load current of each capacitor, capacitor bank, or capacitor installation that will be switched as a unit
- (3) Withstanding the maximum inrush current, including contributions from adjacent capacitor installations
- (4) Carrying currents due to faults on capacitor side of switch

(b) Isolation.

(1) General. A means shall be installed to isolate from all sources of voltage each capacitor, capacitor bank, or capacitor installation that will be removed from service as a unit. The isolating means shall provide a visible gap in the electrical circuit adequate for the operating voltage.

(2) Isolating or Disconnecting Switches with No Interrupting Rating. Isolating or disconnecting switches (with no interrupting rating) shall be interlocked with the load-interrupting device or shall

be provided with prominently displayed caution signs in accordance with 4.90.2.2 to prevent switching load current.

(c) Additional Requirements for Series Capacitors. The proper switching sequence shall be ensured by use of one of the following:

- (1) Mechanically sequenced isolating and bypass switches
- (2) Interlocks
- (3) Switching procedure prominently displayed at the switching location

4.60.2.2 Overcurrent Protection.

(a) Provided to Detect and Interrupt Fault Current. A means shall be provided to detect and interrupt fault current likely to cause dangerous pressure within an individual capacitor.

(b) Single Pole or Multipole Devices. Single-pole or multipole devices shall be permitted for this purpose.

(c) Protected Individually or in Groups. Capacitors shall be permitted to be protected individually or in groups.

(d) Protective Devices Rated or Adjusted. Protective devices for capacitors or capacitor equipment shall be rated or adjusted to operate within the limits of the safe zone for individual capacitors. If the protective devices are rated or adjusted to operate within the limits for Zone 1 or Zone 2, the capacitors shall be enclosed or isolated.

In no event shall the rating or adjustment of the protective devices exceed the maximum limit of Zone 2.

FPN: For definitions of Safe Zone, Zone 1, and Zone 2, see ANSI/IEEE 18-1992, Shunt Power Capacitors.

4.60.2.3 Identification. Each capacitor shall be provided with a permanent nameplate giving the manufacturer's name, rated voltage, frequency, kilovar or amperes, number of phases, and the volume of liquid identified as flammable, if such is the case.

4.60.2.4 Grounding. Capacitor neutrals and cases, if grounded, shall

be grounded in accordance with Article 2.50.

Exception: Where the capacitor units are supported on a structure that is designed to operate at other than ground potential.

4.60.2.5 Means for Discharge.

(a) Means to Reduce the Residual Voltage. A means shall be provided to reduce the residual voltage of a capacitor to 50 volts or less within 5 minutes after the capacitor is disconnected from the source of supply.

(b) Connection to Terminals. A discharge circuit shall be either permanently connected to the terminals of the capacitor or provided with automatic means of connecting it to the terminals of the capacitor bank after disconnection of the capacitor from the source of supply. The windings of motors, transformers, or other equipment directly connected to capacitors without a switch or overcurrent device interposed shall meet the requirements of 4.60.2.5(a).

ARTICLE 4.70 — RESISTORS AND REACTORS

4.70.1 600 Volts, Nominal, and Under

4.70.1.1 Scope. This article covers the installation of separate resistors and reactors on electric circuits.

Exception: Resistors and reactors that are component parts of other apparatus.

This article also covers the installation of resistors and reactors in hazardous (classified) locations as modified by Articles 5.1 through 5.4.

4.70.1.2 Location. Resistors and reactors shall not be placed where exposed to physical damage.

4.70.1.3 Space Separation. A thermal barrier shall be required if the space between the resistors and reactors and any combustible material is less than 300 mm.

4.70.1.4 Conductor Insulation. Insulated conductors used for connections between resistance elements and controllers shall be suitable for an operating temperature of not less than 90°C (194°F).

Exception: Other conductor insulations shall be permitted for motor starting service.

4.70.2 Over 600 Volts, Nominal

4.70.2.1 General.

(a) Protected Against Physical Damage. Resistors and reactors shall be protected against physical damage.

(b) Isolated by Enclosure or Elevation. Resistors and reactors shall be isolated by enclosure or elevation to protect personnel from accidental contact with energized parts.

(c) Combustible Materials. Resistors and reactors shall not be installed in close enough proximity to combustible materials to constitute a fire hazard and shall have a clearance of not less than 305 mm (12 in.) from combustible materials.

(d) Clearances. Clearances from resistors and reactors to grounded surfaces shall be adequate for the voltage involved.

FPN: See Article 4.90.

(e) Temperature Rise from Induced Circulating Currents. Metallic enclosures of reactors and adjacent metal parts shall be installed so that the temperature rise from induced circulating currents is not hazardous to personnel or does not constitute a fire hazard.

4.70.2.2 Grounding. Resistor and reactor cases or enclosures shall be grounded in accordance with Article 2.50.

Exception: Resistor or reactor cases or enclosures supported on a structure designed to operate at other than ground potential shall not be grounded.

4.70.2.3 Oil-Filled Reactors. Installation of oil-filled reactors, in addition to the above requirements, shall comply with applicable requirements of Article 4.50.

ARTICLE 4.80 — STORAGE BATTERIES

4.80.1.1 Scope. The provisions of this article shall apply to all stationary installations of storage batteries.

4.80.1.2 Definitions.

Nominal Battery Voltage. The voltage calculated on the basis of 2 volts per cell for the lead-acid type and 1.2 volts per cell for the alkali type.

Sealed Cell or Battery. A sealed cell or battery is one that has no provision for the addition of water or electrolyte or for external measurement of electrolyte specific gravity. The individual cells shall be permitted to contain a venting arrangement as described in 4.80.1.10(b).

Storage Battery. A battery comprised of one or more rechargeable cells of the lead-acid, nickel-cadmium, or other rechargeable electrochemical types.

4.80.1.3 Wiring and Equipment Supplied from Batteries. Wiring and equipment supplied from storage batteries shall be subject to the requirements of this Code applying to wiring and equipment operating at the same voltage, unless otherwise permitted by 4.80.1.4.

4.80.1.4 Overcurrent Protection for Prime Movers. Overcurrent protection shall not be required for conductors from a battery rated less than 50 volts if the battery provides power for starting, ignition, or control of prime movers. Section 3.0.1.3 shall not apply to these conductors.

4.80.1.6 Insulation of Batteries Not Over 250 Volts. This section shall apply to storage batteries having cells connected so as to operate at a nominal battery voltage of not over 250 volts.

(a) Vented Lead-Acid Batteries. Cells and multicompart ment batteries with covers sealed to containers of nonconductive, heat-resistant material shall not require additional insulating support.

(b) Vented Alkaline-Type Batteries. Cells with covers sealed to jars of nonconductive, heat-resistant material shall require no additional insulation support. Cells in jars of conductive material shall be installed in trays of nonconductive material with not more than 20 cells (24 volts, nominal) in the series circuit in any one tray.

(c) Rubber Jars. Cells in rubber or composition containers shall require no additional insulating support where the total nominal voltage of all cells in series does not exceed 150 volts. Where the total voltage exceeds 150 volts, batteries shall be sectionalized into groups of 150 volts or less, and each group shall have the individual cells installed in trays or on racks.

(d) Sealed Cells or Batteries. Sealed cells and multicompart ment sealed batteries constructed of nonconductive, heat-resistant material shall not require additional insulating support. Batteries constructed of a conducting container shall have insulating support if a voltage is present between the container and ground.

4.80.1.7 Insulation of Batteries of Over 250 Volts. The provisions of 4.80.1.6 shall apply to storage batteries having the cells connected so as to operate at a nominal voltage exceeding 250 volts, and, in addition, the provisions of this section shall also apply to such batteries. Cells shall be installed in groups having a total nominal voltage of not over 250 volts. Insulation, which can be air, shall be provided between groups and shall have a minimum separation between live battery parts of opposite polarity of 50 mm for battery voltages not exceeding 600 volts.

4.80.1.8 Racks and Trays. Racks and trays shall comply with 4.80.1.8(a) and 4.80.1.8(b).

(a) Racks. Racks, as required in this article, are rigid frames designed to support cells or trays. They shall be substantial and be made of one of the following:

(1) Metal, treated so as to be resistant to deteriorating action by

the electrolyte and provided with nonconducting members directly supporting the cells or with continuous insulating material other than paint on conducting members

(2) Other construction such as fiberglass or other suitable nonconductive materials

(b) Trays. Trays are frames, such as crates or shallow boxes usually of wood or other nonconductive material, constructed or treated so as to be resistant to deteriorating action by the electrolyte.

4.80.1.9 Battery Locations. Battery locations shall conform to 4.80.1.9(a), (b), and (c).

(a) Ventilation. Provisions shall be made for sufficient diffusion and ventilation of the gases from the battery to prevent the accumulation of an explosive mixture.

(b) Live Parts. Guarding of live parts shall comply with 1.10.2.2.

(c) Working Space. Working space about the battery systems shall comply with 1.10.2.1. Working clearance shall be measured from the edge of the battery rack.

4.80.1.10 Vents.

(a) Vented Cells. Each vented cell shall be equipped with a flame arrester that is designed to prevent destruction of the cell due to ignition of gases within the cell by an external spark or flame under normal operating conditions.

(b) Sealed Cells. Sealed battery or cells shall be equipped with a pressure-release vent to prevent excessive accumulation of gas pressure, or the battery or cell shall be designed to prevent scatter of cell parts in event of a cell explosion.

ARTICLE 490 — EQUIPMENT, OVER 600 VOLTS, NOMINAL

4.90.1 General

4.90.1.1 Scope. This article covers the general requirements for equipment operating at more than 600 volts, nominal.

FPN No. 1: See NFPA 70E-2004, Standard for Electrical Safety in the Workplace, for electrical safety requirements for employee workplaces.

FPN No. 2: For further information on hazard signs and labels, see ANSI Z535-4, Product Signs and Safety Labels.

4.90.1.2 Definition.

High Voltage. For the purposes of this article, more than 600 volts, nominal.

4.90.1.3 Oil-Filled Equipment. Installation of electrical equipment, other than transformers covered in Article 4.50, containing more than 38 L (10 gal) of flammable oil per unit shall meet the requirements of Parts 4.50.2 and 4.50.3.

4.90.2 Equipment — Specific Provisions

4.90.2.1 Circuit-Interrupting Devices.

(a) Circuit Breakers.

(1) Location.

a. Circuit breakers installed indoors shall be mounted either in metal-enclosed units or fire-resistant cell-mounted units, or they shall be permitted to be open-mounted in locations accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner only.

b. Circuit breakers used to control oil-filled transformers shall either be located outside the transformer vault or be capable of operation from outside the vault.

c. Oil circuit breakers shall be arranged or located so that adjacent readily combustible structures or materials are safeguarded in an approved manner.

(2) Operating Characteristics. Circuit breakers shall have the following equipment or operating characteristics:

- a. An accessible mechanical or other approved means for manual tripping, independent of control power.
- b. Be release free (trip free).
- c. If capable of being opened or closed manually while energized, main contacts that operate independently of the speed of the manual operation.
- d. A mechanical position indicator at the circuit breaker to show the open or closed position of the main contacts.
- e. A means of indicating the open and closed position of the breaker at the point(s) from which they may be operated.

(3) Nameplate. A circuit breaker shall have a permanent and legible nameplate showing manufacturer's name or trademark, manufacturer's type or identification number, continuous current rating, interrupting rating in megavolt-amperes (MVA) or amperes, and maximum voltage rating. Modification of a circuit breaker affecting its rating(s) shall be accompanied by an appropriate change of nameplate information.

(4) Rating. Circuit breakers shall have the following ratings:

- a. The continuous current rating of a circuit breaker shall not be less than the maximum continuous current through the circuit breaker.
- b. The interrupting rating of a circuit breaker shall not be less than the maximum fault current the circuit breaker will be required to interrupt, including contributions from all connected sources of energy.
- c. The closing rating of a circuit breaker shall not be less than the maximum asymmetrical fault current into which the circuit breaker can be closed.
- d. The momentary rating of a circuit breaker shall not be less than the maximum asymmetrical fault current at the point of installation.
- e. The rated maximum voltage of a circuit breaker shall not be less than the maximum circuit voltage.

(b) Power Fuses and Fuseholders.

(1) Use. Where fuses are used to protect conductors and equipment, a fuse shall be placed in each ungrounded conductor. Two power fuses shall be permitted to be used in parallel to protect the same load if both fuses have identical ratings and both fuses are installed in an identified common mounting with electrical connections that divide the current equally. Power fuses of the vented type shall not be used indoors, under ground, or in metal enclosures unless identified for the use.

(2) Interrupting Rating. The interrupting rating of power fuses shall not be less than the maximum fault current the fuse is required to interrupt, including contributions from all connected sources of energy.

(3) Voltage Rating. The maximum voltage rating of power fuses shall not be less than the maximum circuit voltage. Fuses having a minimum recommended operating voltage shall not be applied below this voltage.

(4) Identification of Fuse Mountings and Fuse Units. Fuse mountings and fuse units shall have permanent and legible nameplates showing the manufacturer's type or designation, continuous current rating, interrupting current rating, and maximum voltage rating.

(5) Fuses. Fuses that expel flame in opening the circuit shall be designed or arranged so that they function properly without hazard to persons or property.

(6) Fuseholders. Fuseholders shall be designed or installed so that they are de-energized while a fuse is being replaced.

Exception: Fuses and fuseholders designed to permit fuse replacement by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner using equipment designed for the purpose without de-energizing the fuseholder shall be permitted.

(7) High-Voltage Fuses. Metal-enclosed switchgear and substations that utilize high-voltage fuses shall be provided with a gang-operated disconnecting switch. Isolation of the fuses from the circuit shall be provided by either connecting a switch between the source and the fuses or providing roll-out switch and fuse-type construction. The switch shall be of the load-interrupter type, unless mechanically or electrically interlocked with a load-interrupting

device arranged to reduce the load to the interrupting capability of the switch.

Exception: More than one switch shall be permitted as the disconnecting means for one set of fuses where the switches are installed to provide connection to more than one set of supply conductors. The switches shall be mechanically or electrically interlocked to permit access to the fuses only when all switches are open. A conspicuous sign shall be placed at the fuses identifying the presence of more than one source.

(c) Distribution Cutouts and Fuse Links — Expulsion Type.

(1) Installation. Cutouts shall be located so that they may be readily and safely operated and re-fused, and so that the exhaust of the fuses does not endanger persons. Distribution cutouts shall not be used indoors, underground, or in metal enclosures.

(2) Operation. Where fused cutouts are not suitable to interrupt the circuit manually while carrying full load, an approved means shall be installed to interrupt the entire load. Unless the fused cutouts are interlocked with the switch to prevent opening of the cutouts under load, a conspicuous sign shall be placed at such cutouts identifying that they shall not be operated under load.

(3) Interrupting Rating. The interrupting rating of distribution cutouts shall not be less than the maximum fault current the cutout is required to interrupt, including contributions from all connected sources of energy.

(4) Voltage Rating. The maximum voltage rating of cutouts shall not be less than the maximum circuit voltage.

(5) Identification. Distribution cutouts shall have on their body, door, or fuse tube a permanent and legible nameplate or identification showing the manufacturer's type or designation, continuous current rating, maximum voltage rating, and interrupting rating.

(6) Fuse Links. Fuse links shall have a permanent and legible identification showing continuous current rating and type.

(7) Structure Mounted Outdoors. The height of cutouts mounted outdoors on structures shall provide safe clearance between lowest energized parts (open or closed position) and standing surfaces, in accordance with 1.10.3.5(e).

(d) Oil-Filled Cutouts.

(1) Continuous Current Rating. The continuous current rating of oil-filled cutouts shall not be less than the maximum continuous current through the cutout.

(2) Interrupting Rating. The interrupting rating of oil-filled cutouts shall not be less than the maximum fault current the oil-filled cutout is required to interrupt, including contributions from all connected sources of energy.

(3) Voltage Rating. The maximum voltage rating of oil-filled cutouts shall not be less than the maximum circuit voltage.

(4) Fault Closing Rating. Oil-filled cutouts shall have a fault closing rating not less than the maximum asymmetrical fault current that can occur at the cutout location, unless suitable interlocks or operating procedures preclude the possibility of closing into a fault.

(5) Identification. Oil-filled cutouts shall have a permanent and legible nameplate showing the rated continuous current, rated maximum voltage, and rated interrupting current.

(6) Fuse Links. Fuse links shall have a permanent and legible identification showing the rated continuous current.

(7) Location. Cutouts shall be located so that they are readily and safely accessible for re-fusing, with the top of the cutout not over 1 500 mm above the floor or platform.

(8) Enclosure. Suitable barriers or enclosures shall be provided to prevent contact with nonshielded cables or energized parts of oil-filled cutouts.

(e) Load Interrupters. Load-interrupter switches shall be permitted if suitable fuses or circuit breakers are used in conjunction with these devices to interrupt fault currents. Where these devices are used in combination, they shall be coordinated electrically so that they will safely withstand the effects of closing, carrying, or interrupting all possible currents up to the assigned maximum short-circuit rating.

Where more than one switch is installed with interconnected load terminals to provide for alternate connection to different supply conductors, each switch shall be provided with a conspicuous sign identifying this hazard.

(1) Continuous Current Rating. The continuous current rating of interrupter switches shall equal or exceed the maximum continuous

current at the point of installation.

(2) **Voltage Rating.** The maximum voltage rating of interrupter switches shall equal or exceed the maximum circuit voltage.

(3) **Identification.** Interrupter switches shall have a permanent and legible nameplate including the following information: manufacturer's type or designation, continuous current rating, interrupting current rating, fault closing rating, maximum voltage rating.

(4) **Switching of Conductors.** The switching mechanism shall be arranged to be operated from a location where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be arranged to be locked in the open position. Metal-enclosed switches shall be operable from outside the enclosure.

(5) **Stored Energy for Opening.** The stored-energy operator shall be permitted to be left in the uncharged position after the switch has been closed if a single movement of the operating handle charges the operator and opens the switch.

(6) **Supply Terminals.** The supply terminals of fused interrupter switches shall be installed at the top of the switch enclosure, or, if the terminals are located elsewhere, the equipment shall have barriers installed so as to prevent persons from accidentally contacting energized parts or dropping tools or fuses into energized parts.

4.90.2.2 Isolating Means. Means shall be provided to completely isolate an item of equipment. The use of isolating switches shall not be required where there are other ways of de-energizing the equipment for inspection and repairs, such as draw-out-type metal-enclosed switchgear units and removable truck panels.

Isolating switches not interlocked with an approved circuit-interrupting device shall be provided with a sign warning against opening them under load.

A fuseholder and fuse, designed for the purpose, shall be permitted as an isolating switch.

4.90.2.3 Voltage Regulators. Proper switching sequence for regulators shall be ensured by use of one of the following:

- (1) Mechanically sequenced regulator bypass switch(es)

- (2) Mechanical interlocks

- (3) Switching procedure prominently displayed at the switching location

4.90.2.4 Minimum Space Separation. In field-fabricated installations, the minimum air separation between bare live conductors and between such conductors and adjacent grounded surfaces shall not be less than the values given in Table 4.90.2.4. These values shall not apply to interior portions or exterior terminals of equipment designed, manufactured, and tested in accordance with accepted national standards.

4.90.3 Equipment — Metal-Enclosed Power Switchgear and Industrial Control Assemblies

4.90.3.1 General. This part covers assemblies of metal-enclosed power switchgear and industrial control, including but not limited to switches, interrupting devices and their control, metering, protection and regulating equipment, where an integral part of the assembly, with associated interconnections and supporting structures. This part also includes metal-enclosed power switchgear assemblies that form a part of unit substations, power centers, or similar equipment.

4.90.3.2 Arrangement of Devices in Assemblies. Arrangement of devices in assemblies shall be such that individual components can safely perform their intended function without adversely affecting the safe operation of other components in the assembly.

4.90.3.3 Guarding of High-Voltage Energized Parts Within a Compartment.

Where access for other than visual inspection is required to a compartment that contains energized high-voltage parts, barriers shall be provided to prevent accidental contact by persons, tools, or other equipment with energized parts. Exposed live parts shall only be permitted in compartments accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. Fuses and fuseholders designed to enable future replacement without de-energizing the fuse holder shall only be permitted for use by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

Table 4.90.2.4 Minimum Clearance of Live Parts*

Nominal Voltage Rating (kV)	Impulse Withstand, B.I.L (kV)		Minimum Clearance of Live Parts			
			Phase-to-Phase		Phase-to-Ground	
	Indoors	Outdoors	Indoors (mm)	Outdoors (mm)	Indoors (mm)	Outdoors (mm)
2.4-4.16	60	95	115	180	80	155
7.2	75	95	140	180	105	155
13.8	95	110	195	305	130	180
14.4	110	110	230	305	170	180
23	125	150	270	385	190	255
34.5	150	150	320	385	245	255
	200	200	460	460	335	335
46	—	20	—	460	—	335
	—	250	—	535	—	435
69	—	250	—	535	—	435
	—	350	—	790	—	635
115	—	550	—	1350	—	1070
138	—	550	—	1350	—	1070
	—	650	—	1605	—	1270
161	—	650	—	1605	—	1270
	—	750	—	1830	—	1475
230	—	750	—	1830	—	1475
	—	900	—	2265	—	1805
	—	1050	—	2670	—	2110

*The values given are the minimum clearance for rigid parts and bare conductors under favorable service conditions. They shall be increased for conductor movement or under unfavorable service conditions or wherever space limitations permit. The selection of the associated impulse withstand voltage for a particular system voltage is determined by the characteristics of the surge protective equipment.

4.90.3.4 Guarding of Low-Voltage Energized Parts Within a Compartment. Energized bare parts mounted on doors shall be guarded where the door must be opened for maintenance of equipment or removal of draw-out equipment.

4.90.3.5 Clearance for Cable Conductors Entering Enclosure. The unobstructed space opposite terminals or opposite raceways or cables entering a switchgear or control assembly shall be adequate for the type of conductor and method of termination.

4.90.3.6 Accessibility of Energized Parts.

(a) **High-Voltage Equipment.** Doors that would provide unqualified persons access to high-voltage energized parts shall be locked.

(b) **Low-Voltage Control Equipment.** Low-voltage control equipment, relays, motors, and the like shall not be installed in compartments with exposed high-voltage energized parts or high-voltage wiring unless either of the following conditions is met:

(1) The access means is interlocked with the high-voltage switch or disconnecting means to prevent the access means from being opened or removed.

(2) The high-voltage switch or disconnecting means is in the isolating position.

(c) **High-Voltage Instruments or Control Transformers and Space Heaters.** High-voltage instrument or control transformers and space heaters shall be permitted to be installed in the high-voltage compartment without access restrictions beyond those that apply to the high-voltage compartment generally.

4.90.3.7 Grounding. Frames of switchgear and control assemblies shall be grounded.

4.90.3.8 Grounding of Devices. Devices with metal cases or frames, or both, such as instruments, relays, meters, and instrument and control transformers, located in or on switchgear or control, shall have the frame or case grounded.

4.90.3.9 Door Stops and Cover Plates. External hinged doors or covers shall be provided with stops to hold them in the open position. Cover plates intended to be removed for inspection of energized parts or wiring shall be equipped with lifting handles and shall not exceed 1.1 m² (12 ft²) in area or 27 kg (60 lb) in weight, unless they are hinged and bolted or locked.

4.90.3.10 Gas Discharge from Interrupting Devices. Gas discharged during operating of interrupting devices shall be directed so as not to endanger personnel.

4.90.3.11 Inspection Windows. Windows intended for inspection of disconnecting switches or other devices shall be of suitable transparent material.

4.90.3.12 Location of Devices.

(a) **Control and Instrument Transfer Switch Handles or Pushbuttons.** Control and instrument transfer switch handles or pushbuttons other than those covered in 4.90.3.12(b) shall be in a readily accessible location at an elevation of not over 2 000 mm.

Exception: Operating handles requiring more than 23 kg (50 lb) of force shall be located no higher than 1 700 mm in either the open or closed position.

(b) **Infrequently Operated Devices.** Operating handles for infrequently operated devices, such as drawout fuses, fused potential or control transformers and their primary disconnects, and bus transfer switches, shall be permitted to be located where they are safely operable and serviceable from a portable platform.

4.90.3.13 Interlocks — Interrupter Switches. Interrupter switches equipped with stored energy mechanisms shall have mechanical interlocks to prevent access to the switch compartment unless the stored energy mechanism is in the discharged or blocked position.

4.90.3.14 Stored Energy for Opening. The stored energy operator shall be permitted to be left in the uncharged position after the switch has been closed if a single movement of the operating handle charges

the operator and opens the switch.

4.90.3.15 Fused Interrupter Switches.

(a) **Supply Terminals.** The supply terminals of fused interrupter switches shall be installed at the top of the switch enclosure or, if the terminals are located elsewhere, the equipment shall have barriers installed so as to prevent persons from accidentally contacting energized parts or dropping tools or fuses into energized parts.

(b) **Backfeed.** Where fuses can be energized by backfeed, a sign shall be placed on the enclosure door identifying this hazard.

(c) **Switching Mechanism.** The switching mechanism shall be arranged to be operated from a location outside the enclosure where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be capable of being locked in the open position.

4.90.3.16 Circuit Breakers — Interlocks.

(a) **Circuit Breakers.** Circuit breakers equipped with stored energy mechanisms shall be designed to prevent the release of the stored energy unless the mechanism has been fully charged.

(b) **Mechanical Interlocks.** Mechanical interlocks shall be provided in the housing to prevent the complete withdrawal of the circuit breaker from the housing when the stored energy mechanism is in the fully charged position, unless a suitable device is provided to block the closing function of the circuit breaker before complete withdrawal.

4.90.3.17 Metal Enclosed and Metal Clad Service Equipment.

Metal enclosed and metal clad switchgear installed as high-voltage service equipment shall include a ground bus for the connection of service cable shields and to facilitate the attachment of safety grounds for personnel protection. This bus shall be extended into the compartment where the service conductors are terminated.

4.90.4 Mobile and Portable Equipment

4.90.4.1 General.

(a) **Covered.** The provisions of this part shall apply to installations and use of high-voltage power distribution and utilization equipment that is portable, mobile, or both, such as substations and switch houses mounted on skids, trailers, or cars; mobile shovels; draglines; cranes; hoists; drills; dredges; compressors; pumps; conveyors; underground excavators; and the like.

(b) **Other Requirements.** The requirements of this part shall be additional to, or amendatory of, those prescribed in Articles 1.1 through 7.25 of this Code. Special attention shall be paid to Article 2.50.

(c) **Protection.** Adequate enclosures, guarding, or both, shall be provided to protect portable and mobile equipment from physical damage.

(d) **Disconnecting Means.** Disconnecting means shall be installed for mobile and portable high-voltage equipment according to the requirements of Part 2.30.8 and shall disconnect all ungrounded conductors.

4.90.4.2 Overcurrent Protection. Motors driving single or multiple dc generators supplying a system operating on a cyclic load basis do not require overload protection, provided that the thermal rating of the ac drive motor cannot be exceeded under any operating condition. The branch-circuit protective device(s) shall provide short-circuit and locked-rotor protection and shall be permitted to be external to the equipment.

4.90.4.3 Enclosures. All energized switching and control parts shall be enclosed in effectively grounded metal cabinets or enclosures. These cabinets or enclosures shall be marked “DANGER — HIGH VOLTAGE — KEEP OUT” and shall be locked so that only authorized and licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner can enter. Circuit breakers and protective equipment shall have the operating means projecting through the metal cabinet or

enclosure so these units can be reset without opening locked doors. With doors closed, reasonable safe access for normal operation of these units shall be provided.

4.90.4.4 Collector Rings. The collector ring assemblies on revolving-type machines (shovels, draglines, etc.) shall be guarded to prevent accidental contact with energized parts by personnel on or off the machine.

4.90.4.5 Power Cable Connections to Mobile Machines. A metallic enclosure shall be provided on the mobile machine for enclosing the terminals of the power cable. The enclosure shall include provisions for a solid connection for the ground wire(s) terminal to effectively ground the machine frame. Ungrounded conductors shall be attached to insulators or be terminated in approved high-voltage cable couplers (which include ground wire connectors) of proper voltage and ampere rating. The method of cable termination used shall prevent any strain or pull on the cable from stressing the electrical connections. The enclosure shall have provision for locking so only authorized and licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner may open it and shall be marked

DANGER — HIGH VOLTAGE — KEEP OUT.

4.90.4.6 High-Voltage Portable Cable for Main Power Supply. Flexible high-voltage cable supplying power to portable or mobile equipment shall comply with Article 2.50 and Part 4.0.3.

4.90.5 Electrode-Type Boilers

4.90.5.1 General. The provisions of this part shall apply to boilers operating over 600 volts, nominal, in which heat is generated by the passage of current between electrodes through the liquid being heated.

4.90.5.2 Electric Supply System. Electrode-type boilers shall be supplied only from a 3-phase, 4-wire solidly grounded wye system, or from isolating transformers arranged to provide such a system. Control circuit voltages shall not exceed 150 volts, shall be supplied from a grounded system, and shall have the controls in the ungrounded conductor.

4.90.5.3 Branch-Circuit Requirements.

(a) **Rating.** Each boiler shall be supplied from an individual branch circuit rated not less than 100 percent of the total load.

(b) **Common-Trip Fault-Interrupting Device.** The circuit shall be protected by a 3-phase, common-trip fault-interrupting device, which shall be permitted to automatically reclose the circuit upon removal of an overload condition but shall not reclose after a fault condition.

(c) **Phase-Fault Protection.** Phase-fault protection shall be provided in each phase, consisting of a separate phase-overcurrent relay connected to a separate current transformer in the phase.

(d) **Ground Current Detection.** Means shall be provided for detection of the sum of the neutral and ground currents and shall trip the circuit-interrupting device if the sum of those currents exceeds the greater of 5 amperes or 7½ percent of the boiler full-load current for 10 seconds or exceeds an instantaneous value of 25 percent of the boiler full-load current.

(e) **Grounded Neutral Conductor.** The grounded neutral conductor shall be as follows:

- (1) Connected to the pressure vessel containing the electrodes
- (2) Insulated for not less than 600 volts
- (3) Have not less than the ampacity of the largest ungrounded branch-circuit conductor
- (4) Installed with the ungrounded conductors in the same raceway, cable, or cable tray, or, where installed as open conductors, in close proximity to the ungrounded conductors
- (5) Not used for any other circuit

4.90.5.4 Pressure and Temperature Limit Control. Each boiler shall be equipped with a means to limit the maximum temperature, pressure, or both, by directly or indirectly interrupting all current flow through the electrodes. Such means shall be in addition to the temperature, pressure, or both, regulating systems and pressure relief or safety valves.

4.90.5.5 Grounding. All exposed non-current-carrying metal parts of the boiler and associated exposed grounded structures or equipment shall be bonded to the pressure vessel or to the neutral conductor to which the vessel is connected in accordance with 2.50.5.13, except the ampacity of the bonding jumper shall not be less than the ampacity of the neutral conductor.

Chapter 5. Special Occupancies

ARTICLE 5.0 — HAZARDOUS (CLASSIFIED) LOCATIONS, CLASSES I, II, AND III, DIVISIONS 1 AND 2

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, 2004 edition, and NFPA 499, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installation in Chemical Process Areas, 2004 edition. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.0.1.1 Scope — Articles 5.0 Through 5.4. Articles 5.0 through 5.4 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers or flyings.

FPN No. 1: The unique hazards associated with explosives, pyrotechnics, and blasting agents are not addressed in this article.

FPN No. 2: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids, refer to Article 5.5.

FPN No. 3: For the requirements for electrical and electronic equipment and wiring for all voltages in Zone 20, Zone 21, and Zone 22 hazardous (classified) locations where fire or explosion hazards may exist due to combustible dusts or ignitable fibers or flyings, refer to Article 5.6.

5.0.1.2 Definitions. For purposes of Articles 5.0 through 5.4 and Articles 5.10 through 5.16, the following definitions apply.

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

(a) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location.

(b) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location.

FPN: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments.

Control Drawing. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus.

Dust-Ignitionproof. Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-1991, Enclosures for Electrical Equipment, and ANSI/UL 1203-1994, Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.

FPN: See ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, and UL 1604-1994, Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations.

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. See ISA-RP12.12.03-2002, Portable Electronic Products Suitable for Use in Class I and II, Division 2, Class I Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.

Explosionproof Apparatus. Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

FPN: For further information, see ANSI/UL 1203-1994, Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, for example, soldering, brazing, welding, or the fusion of glass to metal.

FPN: For further information, see ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment is not capable, under specified test conditions, of igniting the flammable gas-air, vapor-air, or dust-air mixture.

FPN: Conditions are described in ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism is constructed so that the component is incapable of igniting the specified flammable gas-air or vapor-air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

FPN: For further information, see UL 1604-1994, Electrical Equipment for Use in Class I and II, Division 2, and Class III Hazardous (Classified) Locations.

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing

ignition of a specified flammable gas-air, vapor-air, or dust-air mixture due to arcing or thermal means.

FPN: For further information, see ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas-air, vapor-air, or dust-air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Field Wiring Apparatus. Apparatus intended to be connected to nonincendive field wiring.

FPN: For further information see ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: For further information, see ANSI/UL 698-1995, Industrial Control Equipment for Use in Hazardous (Classified) Locations.

Purged and Pressurized. The process of (1) purging, supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level; and (2) pressurization, supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber.

FPN: For further information, see ANSI/ NFPA 496-2003, Purged and Pressurized Enclosures for Electrical Equipment.

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

5.0.1.3 Other Articles. Except as modified in Articles 5.0 through 5.4, all other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

5.0.1.4 General.

(a) **Documentation.** All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

(b) **Reference Standards.** Important information relating to topics covered in Chapter 5 may be found in other publications.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with the standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), and the Instrumentation, Systems, and Automation Society (ISA) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see NFPA 30-2003, Flammable and Combustible Liquids Code; NFPA 32-2004, Standard for Drycleaning Plants; NFPA 33-2003, Standard for Spray Application Using Flammable or Combustible Materials; NFPA 34-2003, Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids; NFPA 35-1999, Standard for the Manufacture of Organic Coatings; NFPA 36-2004, Standard for Solvent Extraction Plants; NFPA 45-2004, Standard on Fire Protection for Laboratories Using Chemicals; NFPA 50A-1999, Standard for Gaseous Hydrogen Systems at Consumer Sites; NFPA 50B-1999, Standard for Liquefied Hydrogen Systems at Consumer Sites; NFPA 58-2004, Liquefied Petroleum Gas Code; NFPA 59-2004, Utility LP-Gas Plant Code; NFPA 497-2004, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas; NFPA 499-2004, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas; NFPA 820-2003, Standard for Fire Protection in Wastewater Treatment and Collection Facilities; ANSI/API RP500-1997, Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2; ISA 12.10-1988, Area Classification in Hazardous (Classified) Dust Locations.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2000, Recommended Practice on Static Electricity; NFPA 780-2004, Standard for the Installation of Lightning Protection Systems; and API RP 2003-1998, Protection Against Ignitions Arising Out of Static Lightning and Stray Currents.

FPN No. 4: For further information on ventilation, see NFPA 30-2003, Flammable and Combustible Liquids Code; and API RP 500-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil- and gas-producing platforms, see ANSI/API RP 14F-1999, Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations.

5.0.1.5 Classifications of Locations.

(a) **Classifications of Locations.** Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present, and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation may be classified as “unclassified” locations.

FPN: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15-1994, Safety Code for Mechanical Refrigeration, and ANSI/CGA G2.1-1989, Safety Requirements for the Storage and Handling of Anhydrous Ammonia.

(b) **Class I Locations.** Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures. Class I locations shall include those specified in 5.0.1.5(b)(1) and (b)(2).

(1) Class I, Division 1. A Class I, Division 1 location is a location

a. In which ignitable concentrations of flammable gases or vapors can exist under normal operating conditions, or

b. In which ignitable concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage, or

c. In which breakdown or faulty operation of equipment or processes might release ignitable concentrations of flammable gases or vapors and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

FPN No. 1: This classification usually includes the following locations:

- (1) Where volatile flammable liquids or liquefied flammable gases are transferred from one container to another
- (2) Interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used
- (3) Locations containing open tanks or vats of volatile flammable liquids
- (4) Drying rooms or compartments for the evaporation of flammable solvents
- (5) Locations containing fat- and oil-extraction equipment using volatile flammable solvents
- (6) Portions of cleaning and dyeing plants where flammable liquids are used
- (7) Gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape
- (8) Inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids
- (9) The interiors of refrigerators and freezers in which volatile flammable materials are stored in open, lightly stoppered, or easily ruptured containers
- (10) All other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operations

FPN No. 2: In some Division 1 locations, ignitable concentrations of flammable gases or vapors may be present continuously or for long periods of time. Examples include the following:

- (1) The inside of inadequately vented enclosures containing instruments normally venting flammable gases or vapors to the interior of the enclosure
- (2) The inside of vented tanks containing volatile flammable liquids
- (3) The area between the inner and outer roof sections of a floating roof tank containing volatile flammable fluids
- (4) Inadequately ventilated areas within spraying or coating operations using volatile flammable fluids
- (5) The interior of an exhaust duct that is used to vent ignitable concentrations of gases or vapors

Experience has demonstrated the prudence of avoiding the installation of instrumentation or other electric equipment in these particular areas altogether or where it cannot be avoided because it is essential to the process and other locations are not feasible [see 5.0.1.5(a), FPN] using electric equipment or instrumentation approved for the specific application or consisting of intrinsically safe systems as described in Article 5.4.

(2) Class I, Division 2. A Class I, Division 2 location is a location

a. In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

b. In which ignitable concentrations of gases or vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or

c. That is adjacent to a Class I, Division 1 location, and to which ignitable concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

FPN No. 2: Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Depending on factors such as the quantity and size of the containers and ventilation, locations used for the storage of flammable liquids or liquefied or compressed gases in sealed containers may be considered either hazardous (classified) or unclassified locations. See NFPA 30-2003, Flammable and Combustible Liquids Code, and NFPA 58-2004, Liquefied Petroleum Gas Code.

(c) Class II Locations. Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations shall include those specified in 5.0.1.5(c)(1) and (c)(2).

(1) Class II, Division 1. A Class II, Division 1 location is a location

a. In which combustible dust is in the air under normal operating conditions in quantities sufficient to produce explosive or ignitable mixtures, or

b. Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitable mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, through operation of protection devices, or from other causes, or

c. In which Group E combustible dusts may be present in quantities sufficient to be hazardous.

FPN: Dusts containing magnesium or aluminum are particularly hazardous, and the use of extreme precaution is necessary to avoid ignition and explosion.

(2) Class II, Division 2. A Class II, Division 2 location is a location

a. In which combustible dust due to abnormal operations may be present in the air in quantities sufficient to produce explosive or ignitable mixtures; or

b. Where combustible dust accumulations are present but are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus, but could as a result of infrequent malfunctioning of handling or processing equipment become suspended in the air; or

c. In which combustible dust accumulations on, in, or in the vicinity of the electrical equipment could be sufficient to interfere with the safe dissipation of heat from electrical equipment, or could be ignitable by abnormal operation or failure of electrical equipment.

FPN No. 1: The quantity of combustible dust that may be present and the adequacy of dust removal systems are factors that merit consideration in determining the classification and may result in an unclassified area.

FPN No. 2: Where products such as seed are handled in a manner that produces low quantities of dust, the amount of dust deposited may not warrant classification.

(d) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitable fibers or flyings, but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitable mixtures. Class III locations shall include those specified in 5.0.1.5(d)(1) and (d)(2).

(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitable fibers or materials producing combustible flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fiber manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitable fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitable fibers are stored or handled other than in the process of manufacture.

5.0.1.6 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen-enriched) shall be grouped in accordance with 5.0.1.6(a) and 5.0.1.6(b).

Exception: Equipment identified for a specific gas, vapor, or dust.

FPN: This grouping is based on the characteristics of the materials. Facilities are available for testing and identifying equipment for use in the various atmospheric groups.

(a) Class I Group Classifications. Class I groups shall be according to 5.0.1.6(a)(1) through (a)(4).

FPN No. 1: FPN Nos. 2 and 3 apply to 5.0.1.6(a).

FPN No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classification involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that equipment be identified not only for class but also for the specific group of the gas or vapor that will be present.

FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the Class I groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [100°C (212°F)] and the small joint clearance permitted to arrest its flame.

(1) Group A. Acetylene. [NFPA 497:3.3]

(2) Group B. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.45 mm or a minimum igniting current ratio (MIC ratio) less than or equal to 0.40. [NFPA 497:3.3]

FPN: A typical Class I, Group B material is hydrogen.

Exception No. 1: Group D equipment shall be permitted to be used for atmospheres containing butadiene, provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm of the enclosure.

Exception No. 2: Group C equipment shall be permitted to be used for atmospheres containing allyl glycidyl ether, n-butyl glycidyl ether, ethylene oxide, propylene oxide, and acrolein, provided all conduit runs into explosionproof equipment are provided with explosionproof seals installed within 450 mm of the enclosure.

(3) Group C. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.45 mm and less than or equal to 0.75 mm, or a minimum igniting current ratio (MIC ratio) greater than 0.40 and less than or equal to 0.80. [NFPA 497:3.3]

FPN: A typical Class I, Group C material is ethylene.

(4) Group D. Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current ratio (MIC ratio) greater than 0.80. [NFPA 497:3.3]

FPN No. 1: A typical Class I, Group D material is propane.

FPN No. 2: For classification of areas involving ammonia atmospheres, see ANSI/ASHRAE 15-1994, Safety Code for Mechanical Refrigeration, and ANSI/CGA G2.1-1989, Safety Requirements for the Storage and Handling of Anhydrous Ammonia.

(b) Class II Group Classifications. Class II groups shall be in accordance with 5.0.1.6(b)(1) through (b)(3).

(1) Group E. Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment. [NFPA 499:3.3]

FPN: Certain metal dusts may have characteristics that require safeguards beyond those required for atmospheres containing the dusts of aluminum, magnesium, and their commercial alloys. For example, zirconium, thorium, and uranium dusts have extremely low ignition temperatures (as low as 20°C) and minimum ignition energies lower than any material classified in any of the Class I or Class II groups.

(2) Group F. Atmospheres containing combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see ASTM D 3175-89, Standard Test Method for Volatile Material in the Analysis Sample for Coal and Coke, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts. [NFPA 499:3.3]

(3) Group G. Atmospheres containing combustible dusts not included in Group E or F, including flour, grain, wood, plastic, and chemicals.

FPN No. 1: For additional information on group classification of Class II materials, see NFPA 499-2004, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas.

FPN No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be identified not only for the class, but also for the specific group of dust that will be present.

FPN No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitable gases. See the latest edition of the Philippine Electrical Code, Part 2, Coal Handling Areas.

5.0.1.7 Protection Techniques. Section 5.0.1.7(a) through 5.0.1.7(l) shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

(a) **Explosionproof Apparatus.** This protection technique shall be permitted for equipment in Class I, Division 1 or 2 locations.

(b) **Dust Ignitionproof.** This protection technique shall be permitted for equipment in Class II, Division 1 or 2 locations.

(c) **Dusttight.** This protection technique shall be permitted for equipment in Class II, Division 2 or Class III, Division 1 or 2 locations.

(d) **Purged and Pressurized.** This protection technique shall be permitted for equipment in any hazardous (classified) location for which it is identified.

(e) **Intrinsic Safety.** This protection technique shall be permitted for equipment in Class I, Division 1 or 2; or Class II, Division 1 or 2; or Class III, Division 1 or 2 locations. The provisions of Articles 5.1 through 5.3 and Articles 5.10 through 5.16 shall not be considered applicable to such installations, except as required by Article 5.4, and installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 5.4.

(f) **Nonincendive Circuit.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

(g) **Nonincendive Equipment.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

(h) **Nonincendive Component.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

(i) **Oil Immersion.** This protection technique shall be permitted for current-interrupting contacts in Class I, Division 2 locations as described in 5.1.3.16(b)(1)b.

(j) **Hermetically Sealed.** This protection technique shall be permitted for equipment in Class I, Division 2; Class II, Division 2; or Class III, Division 1 or 2 locations.

(k) **Combustible Gas Detection System.** A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in 5.0.1.7(k)(1), (k)(2), or (k)(3) shall be permitted.

The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.

FPN No. 2: For further information, see ANSI/API RP 500, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2.

FPN No. 3: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

(1) **Inadequate Ventilation.** In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

(2) **Interior of a Building.** In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.

(3) **Interior of a Control Panel.** In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted.

(l) **Other Protection Techniques.** Other protection techniques used in equipment identified for use in hazardous (classified) locations.

5.0.1.8 Equipment. Articles 5.0 through 5.4 require equipment construction and installation that ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance.

FPN No. 2: Since there is no consistent relationship between explosion properties and ignition temperature, the two are independent requirements.

FPN No. 3: Low ambient conditions require special consideration. Explosionproof or dust-ignitionproof equipment may not be suitable for use at temperatures lower than -25°C (-13°F) unless they are identified for low-temperature service. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified as Class I, Division 1 at normal ambient temperature.

(a) Approval for Class and Properties.

(1) Equipment shall be identified not only for the class of location but also for the explosive, combustible, or ignitable properties of the specific gas, vapor, dust, fiber, or flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in 5.0.1.8(c)(2). Class III equipment shall not exceed the maximum surface temperatures specified in 5.3.1.5.

FPN: Luminaires (lighting fixtures) and other heat-producing apparatus, switches, circuit breakers, and plugs and receptacles are potential sources of ignition and are investigated for suitability in classified locations. Such types of equipment, as well as cable terminations for entry into explosionproof enclosures, are available as listed for Class I, Division 2 locations. Fixed wiring, however, may utilize wiring methods that are not evaluated with respect to classified locations. Wiring products such as cable, raceways, boxes, and fittings, therefore, are not marked as being suitable for Class I, Division 2 locations. Also see 5.0.1.8(b)(6)(a).

Suitability of identified equipment shall be determined by any of the following:

a. Equipment listing or labeling

b. Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation

c. Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment

(2) Equipment that has been identified for a Division 1 location shall be permitted in a Division 2 location of the same class, group, and temperature class and shall comply with (a) or (b) as applicable.

a. Intrinsically safe apparatus having a control drawing requiring the installation of associated apparatus for a Division 1 installation shall be permitted to be installed in a Division 2 location if the same associated apparatus is used for the Division 2 installation.

b. Equipment that is required to be explosionproof shall incorporate seals per 5.1.2.6(a) or 5.1.2.6(d) when the wiring methods of 5.1.2.1(b) are employed.

(3) Where specifically permitted in Articles 5.1 through 5.3, general-purpose equipment or equipment in general-purpose enclosures shall be permitted to be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

(4) Equipment that depends on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the equipment shall be identified for a Class I, Division 2 location even if installed in an unclassified location. Equipment installed in a Class I, Division 1 location shall be identified for the Class I, Division 1 location.

FPN: Equipment used for flow measurement is an example of equipment having a single compression seal, diaphragm, or tube.

(5) Unless otherwise specified, normal operating conditions for motors shall be assumed to be rated full-load steady conditions.

(6) Where flammable gases or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

FPN: The characteristics of various atmospheric mixtures of gases, vapors, and dusts depend on the specific material involved.

(b) Marking. Equipment shall be marked to show the environment for which it has been evaluated. Unless otherwise specified or allowed in

(b)(6), the marking shall include the information specified in (b)(1) through (b)(5).

(1) Class. The marking shall specify the class(es) for which the equipment is suitable.

(2) Division. The marking shall specify the division if the equipment is suitable for Division 2 only. Equipment suitable for Division 1 shall be permitted to omit the division marking.

FPN: Equipment not marked to indicate a division, or marked "Division 1" or "Div. 1," is suitable for both Division 1 and 2 locations; see 5.0.1.8(a)(2). Equipment marked "Division 2" or "Div. 2" is suitable for Division 2 locations only.

(3) Material Classification Group. The marking shall specify the applicable material classification group(s) in accordance with 5.0.1.6.

Exception: Fixed luminaires (lighting fixtures) marked for use only in Class I, Division 2 or Class II, Division 2 locations shall not be required to indicate the group.

(4) Equipment Temperature. The marking shall specify the temperature class or operating temperature at a 40°C ambient temperature, or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature of greater than 40°C. The temperature class, if provided, shall be indicated using the temperature class (T Codes) shown in Table 5.0.1.8(b). Equipment for Class I and Class II shall be marked with the maximum safe operating temperature, as determined by simultaneous exposure to the combinations of Class I and Class II conditions.

Exception: Equipment of the non-heat-producing type, such as junction boxes, conduit, and fittings, and equipment of the heat-producing type having a maximum temperature not more than 100°C shall not be required to have a marked operating temperature or temperature class.

FPN: More than one marked temperature class or operating temperature, for gases and vapors, dusts, and different ambient temperatures, may appear.

(5) Ambient Temperature Range. For equipment rated for a temperature range other than -25°C to +40°C, the marking shall specify

the special range of ambient temperatures. The marking shall include either the symbol "Ta" or "Tamb."

FPN: As an example, such a marking might be "-30°C Ta +40°C."

Table 5.0.1.8(b) Classification of Maximum Surface Temperature

Maximum Temperature °C	Temperature Class (T Code)
450	T1
300	T2
280	T2A
260	T2B
230	T2C
215	T2D
200	T3
180	T3A
165	T3B
160	T3C
135	T4
120	T4A
100	T5
85	T6

(6) Special Allowances.

a. General Purpose Equipment. Fixed general-purpose equipment in Class I locations, other than fixed luminaires (lighting fixtures), that is acceptable for use in Class I, Division 2 locations shall not be required to be marked with the class, division, group, temperature class, or ambient temperature range.

b. Dusttight Equipment. Fixed dusttight equipment, other than fixed luminaires (lighting fixtures), that is acceptable for use in Class II, Division 2 and Class III locations shall not be required to be marked with the class, division, group, temperature class, or ambient temperature range.

c. Associated Apparatus. Associated intrinsically safe apparatus and associated nonincendive field wiring apparatus that are not protected

by an alternative type of protection shall not be marked with the class, division, group, or temperature class. Associated intrinsically safe apparatus and associated nonincendive field wiring apparatus shall be marked with the class, division, and group of the apparatus to which it is to be connected.

d. Simple Apparatus. "Simple apparatus" as defined in Article 5.4, shall not be required to be marked with class, division, group, temperature class, or ambient temperature range.

(c) Temperature.

(1) Class I Temperature. The temperature marking specified in 5.0.1.8(b) shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see NFPA 497-2004, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors, and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas.

(2) Class II Temperature. The temperature marking specified in 5.0.1.8(b) shall be less than the ignition temperature of the specific dust to be encountered. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165°C.

FPN: See NFPA 499-2004, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, for minimum ignition temperatures of specific dusts.

The ignition temperature for which equipment was approved prior to this requirement shall be assumed to be as shown in Table 5.0.1.8(c)(2).

(d) Threading. All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (19 mm taper per 300 mm). Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 5.0.1.8(d)(1) or (d)(2). Threaded

entries into explosionproof equipment shall be made up with at least five threads fully engaged.

Exception: For listed explosionproof equipment, factory threaded NPT entries shall be made up with at least 4½ threads fully engaged.

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Thread form specifications for NPT threads are located in ANSI/ASME B1.20.1-1983, Pipe Threads, General Purpose (Inch).

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in ISO 965/1-1980, Metric Screw Threads, and ISO 965/3-1980, Metric Screw Threads.

Table 5.0.1.8(c)(2) Class II Temperatures

Class II Group	Equipment Not Subject to Overloading °C	Equipment (Such as Motors or Power Transformer) that May Be Overloaded	
		Normal Operation °C	Abnormal Operation °C
E	200	200	200
F	200	150	200
G	165	120	165

(e) **Fiber Optic Cable Assembly.** Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Articles 5.0, 5.1, 5.2, or 5.3, as applicable.

5.0.1.9 Specific Occupancies. Articles 5.10 through 5.17 cover garages, aircraft hangars, motor fuel dispensing facilities, bulk storage plants, spray application, dipping and coating processes, and health care facilities.

ARTICLE 5.1 — CLASS I LOCATIONS

5.1.1 General

5.1.1.1 Scope. Article 5.1 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 and 2 locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, or Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids, refer to Article 5.5.

5.1.1.5 General. The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class I in 5.0.1.5.

Exception: As modified by this article.

Equipment listed and marked in accordance with 5.5.1.9(c)(2) for use in Class I, Zone 0, 1, or 2 locations shall be permitted in Class I, Division 2 locations for the same gas and with a suitable temperature class. Equipment listed and marked in accordance with 5.5.1.9(c)(2) for use in Class I, Zone 0 locations shall be permitted in Class I, Division 1 or Division 2 locations for the same gas and with a suitable temperature class.

5.1.2 Wiring

5.1.2.1 Wiring Methods. Wiring methods shall comply with 5.1.2.1(a) or 5.1.2.1(b).

(a) Class I, Division 1.

(1) General. In Class I, Division 1 locations, the wiring methods in (a) through (d) shall be permitted.

a. Threaded rigid metal conduit or threaded steel intermediate metal conduit.

Exception: Rigid nonmetallic conduit complying with Article 352 shall be permitted where encased in a concrete envelope a minimum of 50 mm thick and provided with not less than 600 mm of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 5.14.1.8, Exception No. 2; and 5.15.1.8(a). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

b. Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

c. In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 2.50.6.13, and provided with termination fittings listed for the application.

FPN: See 330.12 for restrictions on use of Type MC cable.

d. In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation,

Type ITC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(2) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, flexible fittings listed for Class I, Division 1 locations or flexible cord in accordance with the provisions of 5.1.3.41 shall be permitted.

(3) Boxes and Fittings. All boxes and fittings shall be approved for Class I, Division 1.

(b) Class I, Division 2.

(1) General. In Class I, Division 2 locations, the following wiring methods shall be permitted:

- a. All wiring methods permitted in Article 5.1.2.1(a).
- b. Threaded rigid metal conduit, threaded steel intermediate metal conduit.
- c. Enclosed gasketed busways, enclosed gasketed wireways.
- d. Type PLTC cable in accordance with the provisions of Article 7.25, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.
- e. Type ITC cable as permitted in 7.27.1.4.
- f. Type MI, MC, MV, or TC cable with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings. Single conductor Type MV cables shall be shielded or metallic armored.

(2) Flexible Connections. Where provision must be made for limited flexibility, one or more of the following shall also be permitted:

- a. Flexible metal fittings

- b. Flexible metal conduit with listed fittings
- c. Liquidtight flexible metal conduit with listed fittings
- d. Liquidtight flexible nonmetallic conduit with listed fittings

e. Flexible cord listed for extra-hard usage and provided with listed bushed fittings. An additional conductor for grounding shall be included in the flexible cord.

FPN: See 5.1.2.21(b) for grounding requirements where flexible conduit is used.

(3) Nonincendive Field Wiring. Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 5.4.1.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

- a. In separate cables
- b. In multiconductor cables where the conductors of each circuit are within a grounded metal shield
- c. In multiconductor cables, where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm
- d. Boxes and Fittings. Boxes and fittings shall not be required to be explosionproof except as required by 5.1.3.6(b)(1), 5.1.3.16(b)(1), and 5.1.3.51(b)(1).

5.1.2.6 Sealing and Drainage. Seals in conduit and cable systems shall comply with 5.1.2.6(a) through 5.1.2.6(f). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. See 5.1.2.6(e)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See 5.1.2.6(c)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than 30 mm². Special conductor constructions, for example, compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located in accordance with 5.1.2.6(a)(1) through (a)(4).

(1) Entering Enclosures. In each conduit entry into an explosionproof enclosure where either of the following apply:

a. The enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation.

b. The entry is metric designator 50 mm diameter or larger and the enclosure contains terminals, splices, or taps.

For the purposes of this section, high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception to 5.1.2.6(a)(1)a: Seals shall not be required for conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following:

(1) *Are enclosed within a chamber hermetically sealed against the entrance of gases or vapors*

(2) *Are immersed in oil in accordance with 5.1.3.16(b)(1)b.*

(3) *Are enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified for the location, and marked "factory sealed" or equivalent, unless the enclosure entry is metric designator 50 mm diameter or larger*

(4) *Are in nonincendive circuits*

Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

Conduit seals shall be installed within 460 mm from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

(2) Pressurized Enclosures. In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 460 mm from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see NFPA 496-2003, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

(3) Two or More Explosionproof Enclosures. Where two or more explosionproof enclosures for which conduit seals are required under 5.1.2.6(a)(1) are connected by nipples or by runs of conduit not more than 900 mm long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 460 mm from either enclosure.

(4) Class I, Division 1 Boundary. In each conduit run leaving a Class I, Division 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 3 000 mm of the boundary and shall be designed and installed so as to minimize the amount of gas or vapor within the Division 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed

explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.

Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, and passes completely through a Class I, Division 1 location with no fittings less than 300 mm beyond each boundary, shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: For underground conduit installed in accordance with 3.0.1.5 where the boundary is beneath the ground, the sealing fitting shall be permitted to be installed after the conduit leaves the ground, but there shall be no union, coupling, box, or fitting, other than listed explosionproof reducers at the sealing fitting, in the conduit between the sealing fitting and the point at which the conduit leaves the ground.

(b) Conduit Seals, Class I, Division 2. In Class I, Division 2 locations, conduit seals shall be located in accordance with 5.1.2.6(b)(1) and (b)(2).

(1) Entering Enclosures. For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with 5.1.2.6(a)(1) and (a)(3). All portions of the conduit run or nipple between the seal and such enclosure shall comply with 5.1.2.1(a).

(2) Class I, Division 2 Boundary. In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3 000 mm of the boundary. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location. Conduits shall be sealed to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal. Such seals shall not be required to be explosionproof but shall be identified for the purpose of

minimizing passage of gases under normal operating conditions and shall be accessible.

Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, and passes completely through a Class I, Division 2 location with no fittings less than 300 mm beyond each boundary, shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or cable not installed in any cable tray or raceway system, shall not be required to be sealed where passing from the Class I, Division 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

FPN: For further information, refer to NFPA 496-2003, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Division 2 location into an unclassified location if all of the following conditions are met:

(1) No part of the conduit system segment passes through a Class I, Division 1 location where the conduit contains unions, couplings, boxes, or fittings within 300 mm of the Class I, Division 1 location.

(2) The conduit system segment is located entirely in outdoor locations.

(3) The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system.

(4) *The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location.*

(5) *The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Division 2 locations.*

(c) Class I, Divisions 1 and 2. Seals installed in Class I, Division 1 and Division 2 locations shall comply with 5.1.2.6(c)(1) through (c)(6).

Exception: Seals not required to be explosionproof by 5.1.2.6(b)(2) or 5.4.1.70.

(1) **Fittings.** Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings listed for the location shall be used. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) **Compound.** The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93°C.

(3) **Thickness of Compounds.** Except for listed cable sealing fittings, the thickness of the sealing compound in a completed seal shall not be less than the metric designator (trade size) of the sealing fitting expressed in the units of measurement employed, and in no case less than 16 mm.

(4) **Splices and Taps.** Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) **Assemblies.** In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be identified for the location. Seals in conduit connections to the compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by 5.1.2.6(a)(1)b.

(6) **Conductor Fill.** The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically identified for a higher percentage of fill.

(d) Cable Seals, Class I, Division 1. In Class I, Division 1 locations, cable seals shall be located according to 5.1.2.6(d)(1) through (d)(3).

(1) **At Terminations.** Cable shall be sealed at all terminations. The sealing fitting shall comply with 5.1.2.6(c). Multiconductor Type MC-HL cables with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material shall be sealed with a listed fitting after removing the jacket and any other covering so that the sealing compound surrounds each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.

Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(2) **Cables Capable of Transmitting Gases or Vapors.** Cables in conduit with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Division 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 460 mm of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(3) **Cables Incapable of Transmitting Gases or Vapors.** Each multiconductor cable in conduit shall be considered as a single conductor

if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with 5.1.2.6(a).

(e) Cable Seals, Class I, Division 2. In Class I, Division 2 locations, cable seals shall be located in accordance with 5.1.2.6(e)(1) through (e)(4).

(1) Terminations. Cables entering enclosures that are required to be explosionproof shall be sealed at the point of entrance. The sealing fitting shall comply with 5.1.2.6(b)(1). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in a listed fitting in the Division 2 location after removing the jacket and any other coverings so that the sealing compound surrounds each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in 5.1.2.6(d).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Division 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(2) Cables That Do Not Transmit Gases or Vapors. Cables that have a gas/vaportight continuous sheath and do not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 5.1.2.6(e)(1). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [(200 cm³/hr) of air at a pressure of 1 500 pascals (150 mm of water)].

FPN No. 1: See ANSI/UL 886-1994, Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(3) Cables Capable of Transmitting Gases or Vapors. Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in 5.1.2.6(e)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1 500 pascals (150 mm of water) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified location.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.

(4) Cables Without Gas/Vaportight Sheath. Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

(f) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize the entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process, or Service Connections, etc. For canned pumps, process, or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical raceway or cable system capable of transmitting fluids, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the

raceway or cable system capable of transmitting fluids beyond the additional devices or means, if the primary seal fails. The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish this purpose. Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

FPN: See also the fine print notes to 5.1.2.6.

Process-connected equipment that is listed and marked “Dual Seal” shall not require additional process sealing when used within the manufacturer’s ratings.

FPN: For construction and testing requirements for dual seal process connected equipment, refer to ISA 12.27.01, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.

5.1.2.11 Conductor Insulation, Class I, Divisions 1 and 2. Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means.

5.1.2.16 Uninsulated Exposed Parts, Class I, Divisions 1 and 2. There shall be no uninsulated exposed parts, such as electric conductors, buses, terminals, or components, that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by a protection technique according to 5.0.1.7(e), 5.0.1.7(f), or 5.0.1.7(g) that is suitable for the location.

5.1.2.21 Grounding and Bonding, Class I, Divisions 1 and 2. Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 2.50 and with the requirements in 5.1.2.21(a) and 5.1.2.21(b).

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth between Class I locations and the

point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 2.50.2.13(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See 2.50.5.11 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in 5.1.2.1(b) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with 2.50.5.13.

Exception: In Class I, Division 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:

- (1) Listed liquidtight flexible metal conduit 1 800 mm or less in length, with fittings listed for grounding, is used.*
- (2) Overcurrent protection in the circuit is limited to 10 amperes or less.*
- (3) The load is not a power utilization load.*

5.1.2.26 Surge Protection.

(a) Class I, Division 1. Surge arresters, transient voltage surge suppressors (TVSS), and capacitors shall be installed in enclosures identified for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

(b) Class I, Division 2. Surge arresters and TVSS shall be nonarcing, such as metal-oxide varistor (MOV) sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Enclosures shall be permitted to be of the general-purpose type. Surge protection of types other than described in this paragraph shall be installed in enclosures identified for Class I, Division 1 locations.

5.1.2.31 Multiwire Branch Circuits. In a Class I, Division 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

5.1.3 Equipment

5.1.3.1 Transformers and Capacitors.

(a) Class I, Division 1. In Class I, Division 1 locations, transformers and capacitors shall comply with 5.1.3.1(a)(1) and (a)(2).

(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in vaults that comply with 4.50.3.1 through 4.50.3.8 and with (1) through (4) as follows:

a. There shall be no door or other communicating opening between the vault and the Division 1 location.

b. Ample ventilation shall be provided for the continuous removal of flammable gases or vapors.

c. Vent openings or ducts shall lead to a safe location outside of buildings.

d. Vent ducts and openings shall be of sufficient area to relieve explosion pressures within the vault, and all portions of vent ducts within the buildings shall be of reinforced concrete construction.

(2) Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 5.1.3.1(a)(1) or be approved for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, transformers and capacitors shall comply with 4.50.2.1 through 4.50.2.7.

5.1.3.6 Meters, Instruments, and Relays.

(a) Class I, Division 1. In Class I, Division 1 locations, meters, instruments, and relays, including kilowatt-hour meters, instrument transformers, resistors, rectifiers, and thermionic tubes, shall be provided with enclosures identified for Class I, Division 1 locations. Enclosures

for Class I, Division 1 locations include explosionproof enclosures and purged and pressurized enclosures.

FPN: See NFPA 496-2003, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

(b) Class I, Division 2. In Class I, Division 2 locations, meters, instruments, and relays shall comply with 5.1.3.6(b)(1) through (b)(6).

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified for Class I, Division 1 locations in accordance with 5.1.3.6(a).

Exception: General-purpose enclosures shall be permitted if current-interrupting contacts comply with one of the following:

- (1) *Are immersed in oil*
- (2) *Are enclosed within a chamber that is hermetically sealed against the entrance of gases or vapors*
- (3) *Are in nonincendive circuits*
- (4) *Are listed for Division 2*

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment that are used in or in connection with meters, instruments, and relays shall comply with 5.1.3.6(a).

Exception: General-purpose-type enclosures shall be permitted if such equipment is without make-and-break or sliding contacts [other than as provided in 5.1.3.6(b)(1)] and if the maximum operating temperature of any exposed surface will not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor. This exception shall not apply to thermionic tubes.

(3) Without Make-or-Break Contacts. Transformer windings, impedance coils, solenoids, and other windings that do not incorporate sliding or make-or-break contacts shall be provided with enclosures. General-purpose-type enclosures shall be permitted.

(4) **General-Purpose Assemblies.** Where an assembly is made up of components for which general-purpose enclosures are acceptable as provided in 5.1.3.6(b)(1), (b)(2), and (b)(3), a single general-purpose enclosure shall be acceptable for the assembly. Where such an assembly includes any of the equipment described in 5.1.3.6(b)(2), the maximum obtainable surface temperature of any component of the assembly shall be clearly and permanently indicated on the outside of the enclosure. Alternatively, equipment shall be permitted to be marked to indicate the temperature class for which it is suitable, using the temperature class (T Code) of Table 5.0.1.8(b).

(5) **Fuses.** Where general-purpose enclosures are permitted in 5.1.3.6(b)(1) through (b)(4), fuses for overcurrent protection of instrument circuits not subject to overloading in normal use shall be permitted to be mounted in general-purpose enclosures if each such fuse is preceded by a switch complying with 5.1.3.6(b)(1).

(6) **Connections.** To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided all of the following conditions apply:

- a. A switch complying with 5.1.3.6(b)(1) is provided so that the attachment plug is not depended on to interrupt current.
- b. The current does not exceed 3 amperes at 115 volts, nominal.
- c. The power-supply cord does not exceed 900 mm, is of a type listed for extra-hard usage or for hard usage if protected by location, and is supplied through an attachment plug and receptacle of the locking and grounding type.
- d. Only necessary receptacles are provided.
- e. The receptacle carries a label warning against unplugging under load.

5.1.3.16 Switches, Circuit Breakers, Motor Controllers, and Fuses.

(a) Class I, Division 1. In Class I, Division 1 locations, switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with enclosures, and the enclosure in each case, together with the enclosed apparatus, shall be identified as a complete assembly for use in Class I locations.

(b) Class I, Division 2. Switches, circuit breakers, motor controllers, and fuses in Class I, Division 2 locations shall comply with 5.1.3.16(b)(1) through (b)(4).

(1) **Type Required.** Circuit breakers, motor controllers, and switches intended to interrupt current in the normal performance of the function for which they are installed shall be provided with enclosures identified for Class I, Division 1 locations in accordance with 5.1.3.6(a), unless general-purpose enclosures are provided and any of the following apply:

- a. The interruption of current occurs within a chamber hermetically sealed against the entrance of gases and vapors.
- b. The current make-and-break contacts are oil-immersed and of the general-purpose type having a 50 mm minimum immersion for power contacts and a 25 mm minimum immersion for control contacts.
- c. The interruption of current occurs within a factory-sealed explosionproof chamber.
- d. The device is a solid state, switching control without contacts, where the surface temperature does not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved.

(2) **Isolating Switches.** Fused or unfused disconnect and isolating switches for transformers or capacitor banks that are not intended to interrupt current in the normal performance of the function for which they are installed shall be permitted to be installed in general-purpose enclosures.

(3) **Fuses.** For the protection of motors, appliances, and lamps, other than as provided in 5.1.3.16(b)(4), standard plug or cartridge fuses shall be permitted, provided they are placed within enclosures identified for the location; or fuses shall be permitted if they are within general-purpose enclosures, and if they are of a type in which the operating element is immersed in oil or other approved liquid, or the operating element is enclosed within a chamber hermetically sealed against the entrance of gases and vapors, or the fuse is a nonindicating, filled, current-limiting type.

(4) **Fuses Internal to Luminaires (Lighting Fixtures).** Listed cartridge fuses shall be permitted as supplementary protection within luminaires (lighting fixtures).

5.1.3.21 Control Transformers and Resistors. Transformers, impedance coils, and resistors used as, or in conjunction with, control equipment for motors, generators, and appliances shall comply with 5.1.3.21(a) and 5.1.3.21(b).

(a) Class I, Division 1. In Class I, Division 1 locations, transformers, impedance coils, and resistors, together with any switching mechanism associated with them, shall be provided with enclosures identified for Class I, Division 1 locations in accordance with 5.1.3.6(a).

(b) Class I, Division 2. In Class I, Division 2 locations, control transformers and resistors shall comply with 5.1.3.21(b)(1) through (b)(3).

(1) Switching Mechanisms. Switching mechanisms used in conjunction with transformers, impedance coils, and resistors shall comply with 5.1.3.16(b).

(2) Coils and Windings. Enclosures for windings of transformers, solenoids, or impedance coils shall be permitted to be of the general-purpose type.

(3) Resistors. Resistors shall be provided with enclosures; and the assembly shall be identified for Class I locations, unless resistance is nonvariable and maximum operating temperature, in degrees Celsius, will not exceed 80 percent of the ignition temperature of the gas or vapor involved or has been tested and found incapable of igniting the gas or vapor.

5.1.3.26 Motors and Generators.

(a) Class I, Division 1. In Class I, Division 1 locations, motors, generators, and other rotating electric machinery shall be one of the following:

(1) Identified for Class I, Division 1 locations

(2) Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, so arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes

of air, and also arranged to automatically de-energize the equipment when the air supply fails

(3) Of the totally enclosed inert gas-filled type supplied with a suitable reliable source of inert gas for pressurizing the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically de-energize the equipment when the gas supply fails

(4) Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric and that is flammable only when mixed with air; and the machine is arranged so to prevent energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically de-energize the equipment when the supply of liquid or gas or vapor fails or the pressure is reduced to atmospheric

Totally enclosed motors of the types specified in 5.1.3.26(a)(2) or 5.1.3.26(a)(3) shall have no external surface with an operating temperature in degrees Celsius in excess of 80 percent of the ignition temperature of the gas or vapor involved. Appropriate devices shall be provided to detect and automatically de-energize the motor or provide an adequate alarm if there is any increase in temperature of the motor beyond designed limits. Auxiliary equipment shall be of a type identified for the location in which it is installed.

FPN: See D 2155-69, ASTM Test Procedure.

(b) Class I, Division 2. In Class I, Division 2 locations, motors, generators, and other rotating electric machinery in which are employed sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, shall be identified for Class I, Division 1 locations, unless such sliding contacts, switching mechanisms, and resistance devices are provided with enclosures identified for Class I, Division 2 locations in accordance with 5.1.3.6(b). The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum surface temperature (based on a 40°C ambient) shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified for Class I, Division 2 locations. In Class I,

Division 2 locations, the installation of open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location, shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

FPN No. 3: For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE Std. 1349-2001, IEEE Guide for the Application of Electric Motors in Class I, Division 2 Hazardous (Classified) Locations.

5.1.3.31 Luminaires (Lighting Fixtures). Luminaires (lighting fixtures) shall comply with 5.1.3.31(a) or (b).

(a) Class I, Division 1. In Class I, Division 1 locations, luminaires (lighting fixtures) shall comply with 5.1.3.31(a)(1) through (a)(4).

(1) Luminaires (Lighting Fixtures). Each luminaire (lighting fixture) shall be identified as a complete assembly for the Class I, Division 1 location and shall be clearly marked to indicate the maximum wattage of lamps for which it is identified. Luminaires (lighting fixtures) intended for portable use shall be specifically listed as a complete assembly for that use.

(2) Physical Damage. Each luminaire (lighting fixture) shall be protected against physical damage by a suitable guard or by location.

(3) Pendant Luminaires (Lighting Fixtures). Pendant luminaires (lighting fixtures) shall be suspended by and supplied through threaded rigid metal conduit stems or threaded steel intermediate conduit stems, and threaded joints shall be provided with set-screws or other effective means to prevent loosening. For stems longer than 300 mm, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm above the lower end of the stem, or flexibility in the form of a fitting or flexible connector identified for the

Class I, Division 1 location shall be provided not more than 300 mm from the point of attachment to the supporting box or fitting.

(4) Supports. Boxes, box assemblies, or fittings used for the support of luminaires (lighting fixtures) shall be identified for Class I locations.

(b) Class I, Division 2. In Class I, Division 2 locations, luminaires (lighting fixtures) shall comply with 5.1.3.31(b)(1) through 5.1.3.31(b)(6).

(1) Luminaires (Lighting Fixtures). Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved, fixtures shall comply with 5.1.3.31(a)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class (T Code).

(2) Physical Damage. Luminaires (lighting fixtures) shall be protected from physical damage by suitable guards or by location. Where there is danger that falling sparks or hot metal from lamps or fixtures might ignite localized concentrations of flammable vapors or gases, suitable enclosures or other effective protective means shall be provided.

(3) Pendant Luminaires (Fixtures). Pendant luminaires (lighting fixtures) shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, or other approved means. For rigid stems longer than 300 mm, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm above the lower end of the stem, or flexibility in the form of an identified fitting or flexible connector shall be provided not more than 300 mm from the point of attachment to the supporting box or fitting.

(4) Portable Lighting Equipment. Portable lighting equipment shall comply with 5.1.3.31(a)(1).

Exception: Where portable lighting equipment is mounted on movable stands and is connected by flexible cords, as covered in 5.1.3.41, it shall be permitted, where mounted in any position, if it conforms to 5.1.3.31(b)(2).

(5) Switches. Switches that are a part of an assembled fixture or of an individual lampholder shall comply with 5.1.3.16(b)(1).

(6) Starting Equipment. Starting and control equipment for electric-discharge lamps shall comply with 5.1.3.21(b).

Exception: A thermal protector potted into a thermally protected fluorescent lamp ballast if the luminaire (lighting fixture) is identified for the location.

5.1.3.36 Utilization Equipment.

(a) Class I, Division 1. In Class I, Division 1 locations, all utilization equipment shall be identified for Class I, Division 1 locations.

(b) Class I, Division 2. In Class I, Division 2 locations, all utilization equipment shall comply with 5.1.3.36(b)(1) through (b)(3).

(1) Heaters. Electrically heated utilization equipment shall conform with either item (1) or (2):

a. The heater shall not exceed 80 percent of the ignition temperature in degrees Celsius of the gas or vapor involved on any surface that is exposed to the gas or vapor when continuously energized at the maximum rated ambient temperature. If a temperature controller is not provided, these conditions shall apply when the heater is operated at 120 percent of rated voltage.

Exception No. 1: For motor-mounted anticondensation space heaters, see 5.1.3.26.

Exception No. 2: Where a current-limiting device is applied to the circuit serving the heater to limit the current in the heater to a value less than that required to raise the heater surface temperature to 80 percent of the ignition temperature.

b. The heater shall be identified for Class I, Division 1 locations.

Exception: Electrical resistance heat tracing identified for Class I, Division 2 locations.

(2) Motors. Motors of motor-driven utilization equipment shall comply with 5.1.3.26(b).

(3) Switches, Circuit Breakers, and Fuses. Switches, circuit breakers, and fuses shall comply with 5.1.3.16(b).

5.1.3.41 Flexible Cords, Class I, Divisions 1 and 2.

(a) Permitted Uses. Flexible cord shall be permitted:

(1) For connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit.

(2) For that portion of the circuit where the fixed wiring methods of 5.1.2.1(a) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, and the flexible cord is protected by location or by a suitable guard from damage and only in an industrial establishment where conditions of maintenance and engineering supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner install and service the installation.

(3) For electric submersible pumps with means for removal without entering the wet-pit. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.

(4) For electric mixers intended for travel into and out of open-type mixing tanks or vats.

(b) Installation. Where flexible cords are used, the cords shall comply with all of the following:

(1) Be of a type listed for extra-hard usage

(2) Contain, in addition to the conductors of the circuit, a grounding conductor complying with 4.0.2.4

(3) Be connected to terminals or to supply conductors in an approved manner

(4) Be supported by clamps or by other suitable means in such a manner that there is no tension on the terminal connections

(5) Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures of the explosionproof type

Exception to (5): Seals shall not be required as provided in 5.1.2.1(b) and 5.1.3.6(b)(6).

(6) Be of continuous length.

FPN: See 5.1.2.11 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

5.1.3.46 Receptacles and Attachment Plugs, Class I, Divisions 1 and 2. Receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of a flexible cord and shall be identified for the location.

Exception: As provided in 5.1.3.6(b)(6).

5.1.3.51 Signaling, Alarm, Remote-Control, and Communications Systems.

(a) **Class I, Division 1.** In Class I, Division 1 locations, all apparatus and equipment of signaling, alarm, remote-control, and communications systems, regardless of voltage, shall be identified for Class I, Division 1 locations, and all wiring shall comply with 5.1.2.1(a), 5.1.2.6(a), and 5.1.2.6(c).

(b) **Class I, Division 2.** In Class I, Division 2 locations, signaling, alarm, remote-control, and communications systems shall comply with 5.1.3.51(b)(1) through (b)(4).

(1) Contacts. Switches, circuit breakers, and make-and-break contacts of pushbuttons, relays, alarm bells, and horns shall have enclosures identified for Class I, Division 1 locations in accordance with 5.1.3.6(a).

Exception: General-purpose enclosures shall be permitted if current-interrupting contacts are one of the following:

- (1) Immersed in oil
- (2) Enclosed within a chamber hermetically sealed against the entrance of gases or vapors

- (3) *In nonincendive circuits*
- (4) *Part of a listed nonincendive component*

(2) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 5.1.3.6(b)(2).

(3) Protectors. Enclosures shall be provided for lightning protective devices and for fuses. Such enclosures shall be permitted to be of the general-purpose type.

(4) Wiring and Sealing. All wiring shall comply with 5.1.2.1(b), 5.1.2.6(b), and 5.1.2.6(c).

ARTICLE 5.2 — CLASS II LOCATIONS

5.2.1 General

5.2.1.1 Scope. Article 5.2 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class II, Division 1 and 2 locations where fire or explosion hazards may exist due to combustible dust.

5.2.1.5 General. The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class II locations in 5.0.1.5(c).

Exception: As modified by this Article.

Equipment installed in Class II locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of any organic dust deposits that may occur.

FPN: Dust that is carbonized or excessively dry is highly susceptible to spontaneous ignition.

Explosionproof equipment and wiring shall not be required and shall not be acceptable in Class II locations unless identified for such locations.

5.2.2 Wiring

5.2.2.1 Wiring Methods. Wiring methods shall comply with 5.2.2.1(a) or 5.2.2.1(b).

(a) Class II, Division 1.

(1) General. In Class II, Division 1 locations, the wiring methods in (1) through (4) shall be permitted.

a. Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

b. Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

c. In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 2.50.6.13, and provided with termination fittings listed for the application, shall be permitted.

d. Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dusttight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E locations, shall be identified for Class II locations.

(2) Flexible Connections. Where necessary to employ flexible connections, one or more of the following shall also be permitted:

a. Dusttight flexible connectors

b. Liquidtight flexible metal conduit with listed fittings

c. Liquidtight flexible nonmetallic conduit with listed fittings

d. Interlocked armor Type MC cable having an overall jacket of suitable polymeric material and provided with termination fittings listed for Class II, Division 1 locations.

e. Flexible cord listed for extra-hard usage and provided with bushed fittings. Where flexible cords are used, they shall comply with

5.2.3.41.

FPN: See 5.2.2.21(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2.

(1) General. In Class II, Division 2 locations, the following wiring methods shall be permitted:

a. All wiring methods permitted in 5.2.2.1(a).

b. Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.

c. Type MC or MI cable with listed termination fittings.

d. Type PLTC in cable trays.

e. Type ITC in cable trays.

f. Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception to (6): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (6).

(2) Flexible Connections. Where provision must be made for flexibility, 5.2.2.1(a)(2) shall apply.

(3) Nonincendive Field Wiring. Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 5.4.1.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

a. In separate cables

b. In multiconductor cables where the conductors of each circuit are within a grounded metal shield

c. In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm.

d. Boxes and Fittings. All boxes and fittings shall be dusttight.

5.2.2.6 Sealing, Class II, Divisions 1 and 2. Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and one that is not, suitable means shall be provided to prevent the entrance of dust into the dust-ignitionproof enclosure through the raceway. One of the following means shall be permitted:

- (a) A permanent and effective seal
- (b) A horizontal raceway not less than 3 000 mm long
- (c) A vertical raceway not less than 1 500 mm long and extending downward from the dust-ignitionproof enclosure
- (d) A raceway installed in a manner equivalent to (2) or (3) that extends only horizontally and downward from the dust-ignition proof enclosures.

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and an enclosure in an unclassified location, seals shall not be required.

Sealing fittings shall be accessible.

Seals shall not be required to be explosionproof.

FPN: Electrical sealing putty is a method of sealing.

5.2.2.16 Uninsulated Exposed Parts, Class II, Divisions 1 and 2. There shall be no uninsulated exposed parts, such as electric conductors, buses, terminals, or components, that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by a protection technique according to 5.0.1.7(e), 5.0.1.7(f), or 5.0.1.7(g) that is suitable for the location.

5.2.2.21 Grounding and Bonding, Class II, Divisions 1 and 2. Wiring and equipment in Class II, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the requirements in 5.2.2.21(a) and 5.2.2.21(b).

(a) Bonding. The locknut-bushing and double-locknut types of contact shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 2.50.2.13(a), (b), and (c), if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See 2.50.5.11 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible conduit is used as permitted in 5.2.2.1, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with 2.50.5.13.

Exception: In Class II, Division 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:

- (1) *Listed liquidtight flexible metal conduit 1 800 mm or less in length, with fittings listed for grounding, is used.*
- (2) *Overcurrent protection in the circuit is limited to 10 amperes or less.*
- (3) *The load is not a power utilization load.*

5.2.2.26 Surge Protection — Class II, Divisions 1 and 2. Surge arresters and transient voltage surge suppressors (TVSS) installed in a Class II, Division 1 location shall be in suitable enclosures. Surge-protective capacitors shall be of a type designed for specific duty.

5.2.2.31 Multiwire Branch Circuits. In a Class II, Division 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

5.2.3 Equipment

5.2.3.1 Transformers and Capacitors.

(a) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with 5.2.3.1(a)(1) through (a)(3).

(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in vaults complying with 4.50.3.1 through 4.50.3.8, and, in addition, (1), (2), and (3) shall apply.

a. Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.

b. Vent openings and ducts shall communicate only with the outside air.

c. Suitable pressure-relief openings communicating with the outside air shall be provided.

(2) Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 4.50.3.1 through 4.50.3.8 or be identified as a complete assembly, including terminal connections for Class II locations.

(3) Metal Dusts. No transformer or capacitor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with 5.2.3.1(b)(1) through (b)(3).

(1) Containing Liquid That Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with 4.50.3.1 through 4.50.3.8.

(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

a. Provided with pressure-relief vents

b. Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building

c. Have an airspace of not less than 150 mm between the transformer cases and any adjacent combustible material

(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

5.2.3.16 Switches, Circuit Breakers, Motor Controllers, and Fuses.

(a) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with 5.2.3.16(a)(1) through (a)(3).

(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified dust-ignitionproof enclosures.

(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited.

(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.

(b) **Class II, Division 2.** In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight.

5.2.3.21 Control Transformers and Resistors.

(a) **Class II, Division 1.** In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall have dust-ignitionproof enclosures identified for Class II locations. No control transformer, impedance coil, or resistor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure identified for the specific location.

(b) **Class II, Division 2.** In Class II, Division 2 locations, transformers and resistors shall comply with 5.2.3.21(b)(1) through (b)(3).

(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with dusttight enclosures.

(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings.

(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures identified for Class II locations.

Exception: Where the maximum normal operating temperature of the resistor will not exceed 120°C, nonadjustable resistors or resistors that

are part of an automatically timed starting sequence shall be permitted to have enclosures complying with 5.2.3.21(b)(2).

5.2.3.26 Motors and Generators.

(a) **Class II, Division 1.** In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be in conformance with either of the following:

- (1) Identified for Class II, Division 1 locations
- (2) Totally enclosed pipe-ventilated, meeting temperature limitations in 5.2.1.5

(b) **Class II, Division 2.** In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water-air-cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with 5.0.1.8(c)(2) for normal operation when operating in free air (not dust blanketed) and shall have no external openings.

Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:

- (1) *Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices*
- (2) *Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings*
- (3) *Self-cleaning textile motors of the squirrel-cage type*

5.2.3.29 Ventilating Piping. Ventilating pipes for motors, generators, or other rotating electric machinery, or for enclosures for electric equipment, shall be of metal not less than 0.50 mm in thickness or of equally substantial noncombustible material and shall comply with all of the following:

- (1) Lead directly to a source of clean air outside of buildings

(2) Be screened at the outer ends to prevent the entrance of small animals or birds

(3) Be protected against physical damage and against rusting or other corrosive influences

Ventilating pipes shall also comply with 5.2.3.29(a) and 5.2.3.29(b).

(a) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:

- (1) Be riveted and soldered
- (2) Be bolted and soldered
- (3) Be welded
- (4) Be rendered dusttight by some other equally effective means

(b) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

5.2.3.31 Luminaires (Lighting Fixtures). Luminaires (lighting fixtures) shall comply with 5.2.3.31(a) and 5.2.3.31(b).

(a) Class II, Division 1. In Class II, Division 1 locations, luminaires (lighting fixtures) for fixed and portable lighting shall comply with 5.2.3.31(a)(1) through (a)(4).

(1) Fixtures. Each luminaire (fixture) shall be identified for Class II locations and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, luminaires (fixtures) for fixed or portable lighting and all auxiliary equipment shall be identified for the specific location.

(2) Physical Damage. Each luminaire (fixture) shall be protected against physical damage by a suitable guard or by location.

(3) Pendant Luminaires (Fixtures). Pendant luminaires (fixtures) shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed for the location shall be provided not more than 300 mm from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set-screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant luminaire (fixture) is not enclosed in conduit, flexible cord listed for hard usage shall be used, and suitable seals shall be provided where the cord enters the luminaire (fixture) and the outlet box or fitting. Flexible cord shall not serve as the supporting means for a fixture.

(4) Supports. Boxes, box assemblies, or fittings used for the support of luminaires (lighting fixtures) shall be identified for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, luminaires (lighting fixtures) shall comply with 5.2.3.31(b)(1) through (b)(5).

(1) Portable Lighting Equipment. Portable lighting equipment shall be identified for Class II locations. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed.

(2) Fixed Lighting. Luminaires (lighting fixtures) for fixed lighting, where not of a type identified for Class II locations, shall provide enclosures for lamps and lampholders that shall be designed to minimize the deposit of dust on lamps and to prevent the escape of sparks, burning material, or hot metal. Each fixture shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with 5.0.1.8(c)(2) under normal conditions of use.

(3) Physical Damage. Luminaires (lighting fixtures) for fixed lighting shall be protected from physical damage by suitable guards or by location.

(4) Pendant Luminaires (Fixtures). Pendant luminaires (fixtures) shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 300 mm, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm above the lower end of the stem, or flexibility in the form of an identified fitting or a flexible connector shall be provided not more than 300 mm from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant luminaire (fixture) is not enclosed in conduit, flexible cord listed for hard usage shall be used. Flexible cord shall not serve as the supporting means for a fixture.

(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of 5.2.3.21(b).

5.2.3.36 Utilization Equipment.

(a) **Class II, Division 1.** In Class II, Division 1 locations, all utilization equipment shall be identified for Class II locations. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such equipment shall be identified for the specific location.

(b) **Class II, Division 2.** In Class II, Division 2 locations, all utilization equipment shall comply with 5.2.3.36(b)(1) through (b)(4).

(1) Heaters. Electrically heated utilization equipment shall be identified for Class II locations.

Exception: Metal-enclosed radiant heating panel equipment shall be dusttight and marked in accordance with 5.0.1.8(b).

(2) Motors. Motors of motor-driven utilization equipment shall comply with 5.2.3.26(b).

(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall be dusttight.

(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with 5.2.3.21(b).

5.2.3.41 Flexible Cords — Class II, Divisions 1 and 2. Flexible cords used in Class II locations shall comply with all of the following:

(a) Be of a type listed for extra-hard usage

Exception: Flexible cord listed for hard usage as permitted by 5.2.3.31(a)(3) and (b)(4).

(b) Contain, in addition to the conductors of the circuit, a grounding conductor complying with 4.0.2.4

(c) Be connected to terminals or to supply conductors in an approved manner

(d) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections

(e) Be provided with suitable seals to prevent the entrance of dust where the flexible cord enters boxes or fittings that are required to be dust-ignitionproof

5.2.3.46 Receptacles and Attachment Plugs.

(a) **Class II, Division 1.** In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of the flexible cord and shall be identified for Class II locations.

(b) **Class II, Division 2.** In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provides for connection to the grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

5.2.3.51 Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays.

FPN: See Article 8.0 for rules governing the installation of communications circuits.

(a) **Class II, Division 1.** In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 5.2.3.51(a)(1) through (a)(6).

(1) Wiring Methods. The wiring method shall comply with 5.2.3.1(a).

(2) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified for a Class II location.

Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(3) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified for Class II locations.

Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with 5.2.3.26(a).

(5) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified for Class II locations.

(6) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, all apparatus and equipment shall be identified for the specific conditions.

(b) **Class II, Division 2.** In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 5.2.3.51(b)(1) through (b)(5).

(1) Contacts. Enclosures shall comply with 5.2.3.51(a)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with tight metal enclosures without ventilating openings.

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 5.2.3.31(a)(3).

Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general-purpose type.

(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with 5.2.3.26(b).

(5) Wiring Methods. The wiring method shall comply with 5.2.2.1(b).

ARTICLE 5.3 — CLASS III LOCATIONS

5.3.1 General

5.3.1.1 Scope. Article 5.3 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class III, Division 1 and 2 locations where fire or explosion hazards may exist due to ignitable fibers or flyings.

5.3.1.5 General. The general rules of this Code shall apply to electric wiring and equipment in locations classified as Class III locations in 5.0.1.5(d).

Exception: As modified by this Article.

Equipment installed in Class III locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of accumulated fibers or flyings. Organic material that is carbonized or excessively dry is highly susceptible to spontaneous ignition. The maximum surface temperatures under operating conditions shall not exceed 165°C for equipment that is not subject to overloading, and 120°C for equipment (such as motors or power transformers) that may be overloaded.

FPN: For electric trucks, see NFPA 505-2002, Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operation.

5.3.2 Wiring

5.3.2.1 Wiring Methods. Wiring methods shall comply with 5.3.2.1(a) or 5.3.2.1(b).

(a) Class III, Division 1. In Class III, Division 1 locations, the wiring method shall be rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, or Type MC or MI cable with listed termination fittings.

(1) Boxes and Fittings. All boxes and fittings shall be dusttight.

(2) Flexible Connections. Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in conformance with 5.3.3.41 shall be used.

FPN: See 5.3.2.21(b) for grounding requirements where flexible conduit is used.

(3) Nonincendive Field Wiring. Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified

locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 5.4.1.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

- a. In separate cables
- b. In multiconductor cables where the conductors of each circuit are within a grounded metal shield
- c. In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm

(b) Class III, Division 2. In Class III, Division 2 locations, the wiring method shall comply with 5.3.2.1(a).

Exception: In sections, compartments, or areas used solely for storage and containing no machinery, open wiring on insulators shall be permitted where installed in accordance with Article 3.98, but only on condition that protection as required by 3.98.2.6(c) be provided where conductors are not run in roof spaces and are well out of reach of sources of physical damage.

5.3.2.16 Uninsulated Exposed Parts, Class III, Divisions 1 and 2. There shall be no uninsulated exposed parts, such as electric conductors, buses, terminals, or components, that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by a protection technique according to 5.0.1.7(e), 5.0.1.7(f), or 5.0.1.7(g) that is suitable for the location.

Exception: As provided in 5.3.3.56.

5.3.2.21 Grounding and Bonding — Class III, Divisions 1 and 2. Wiring and equipment in Class III, Division 1 and 2 locations shall be grounded as specified in Article 2.50 and with the following additional requirements in 5.3.2.21(a) and 5.3.2.21(b).

(a) **Bonding.** The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class III locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 2.50.2.13(a), (b), and (c), if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See 2.50.5.11 for additional bonding requirements in hazardous (classified) locations.

(b) **Types of Equipment Grounding Conductors.** Where flexible conduit is used as permitted in 5.3.2.1, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with 2.50.5.13.

Exception: In Class III, Division 1 and 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:

- (1) *Listed liquidtight flexible metal 1 800 mm or less in length, with fittings listed for grounding, is used.*
- (2) *Overcurrent protection in the circuit is limited to 10 amperes or less.*
- (3) *The load is not a power utilization load.*

5.3.3 Equipment

5.3.3.1 Transformers and Capacitors — Class III, Divisions 1 and 2. Transformers and capacitors shall comply with 5.2.3.1(b).

5.3.3.16 Switches, Circuit Breakers, Motor Controllers, and Fuses — Class III, Divisions 1 and 2. Switches, circuit breakers, motor

controllers, and fuses, including pushbuttons, relays, and similar devices, shall be provided with dusttight enclosures.

5.3.3.21 Control Transformers and Resistors — Class III, Divisions 1 and 2. Transformers, impedance coils, and resistors used as or in conjunction with control equipment for motors, generators, and appliances shall be provided with dusttight enclosures complying with the temperature limitations in 5.3.1.5.

5.3.3.26 Motors and Generators — Class III, Divisions 1 and 2. In Class III, Divisions 1 and 2 locations, motors, generators, and other rotating machinery shall be totally enclosed nonventilated, totally enclosed pipe ventilated, or totally enclosed fan cooled.

Exception: In locations where, in the judgment of the authority having jurisdiction, only moderate accumulations of lint or flyings are likely to collect on, in, or in the vicinity of a rotating electric machine and where such machine is readily accessible for routine cleaning and maintenance, one of the following shall be permitted:

- (1) *Self-cleaning textile motors of the squirrel-cage type*
- (2) *Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanisms, including motor overload devices*
- (3) *Standard open-type machines having such contacts, switching mechanisms, or resistance devices enclosed within tight housings without ventilating or other openings*

5.3.3.29 Ventilating Piping — Class III, Divisions 1 and 2. Ventilating pipes for motors, generators, or other rotating electric machinery, or for enclosures for electric equipment, shall be of metal not less than 0.50 mm in thickness, or of equally substantial noncombustible material, and shall comply with the following:

- (1) *Lead directly to a source of clean air outside of buildings*
- (2) *Be screened at the outer ends to prevent the entrance of small animals or birds*
- (3) *Be protected against physical damage and against rusting or other corrosive influences*

Ventilating pipes shall be sufficiently tight, including their connections, to prevent the entrance of appreciable quantities of fibers or flyings into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite accumulations of fibers or flyings or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

5.3.3.31 Luminaires (Lighting Fixtures) — Class III, Divisions 1 and 2.

(a) **Fixed Lighting.** Luminaires (lighting fixtures) for fixed lighting shall provide enclosures for lamps and lampholders that are designed to minimize entrance of fibers and flyings and to prevent the escape of sparks, burning material, or hot metal. Each luminaire (fixture) shall be clearly marked to show the maximum wattage of the lamps that shall be permitted without exceeding an exposed surface temperature of 165°C under normal conditions of use.

(b) **Physical Damage.** A luminaire (fixture) that may be exposed to physical damage shall be protected by a suitable guard.

(c) **Pendant Luminaires (Fixtures).** Pendant luminaires (fixtures) shall be suspended by stems of threaded rigid metal conduit, threaded intermediate metal conduit, threaded metal tubing of equivalent thickness, or by chains with approved fittings. For stems longer than 300 mm, permanent and effective bracing against lateral displacement shall be provided at a level not more than 300 mm above the lower end of the stem, or flexibility in the form of an identified fitting or a flexible connector shall be provided not more than 300 mm from the point of attachment to the supporting box or fitting.

(d) **Portable Lighting Equipment.** Portable lighting equipment shall be equipped with handles and protected with substantial guards. Lampholders shall be of the unswitched type with no provision for receiving attachment plugs. There shall be no exposed current-carrying metal parts, and all exposed non-current-carrying metal parts shall be grounded. In all other respects, portable lighting equipment shall comply with 5.3.3.31(a).

5.3.3.36 Utilization Equipment — Class III, Divisions 1 and 2.

(a) **Heaters.** Electrically heated utilization equipment shall be identified for Class III locations.

(b) **Motors.** Motors of motor-driven utilization equipment shall comply with 5.3.3.26.

(c) **Switches, Circuit Breakers, Motor Controllers, and Fuses.** Switches, circuit breakers, motor controllers, and fuses shall comply with 5.3.3.16.

5.3.3.41 Flexible Cords — Class III, Divisions 1 and 2. Flexible cords shall comply with the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, a grounding conductor complying with 4.0.2.4
- (3) Be connected to terminals or to supply conductors in an approved manner
- (4) Be supported by clamps or other suitable means in such a manner that there will be no tension on the terminal connections
- (5) Be provided with suitable means to prevent the entrance of fibers or flyings where the cord enters boxes or fittings

5.3.3.46 Receptacles and Attachment Plugs — Class III, Divisions 1 and 2. Receptacles and attachment plugs shall be of the grounding type and shall be designed so as to minimize the accumulation or the entry of fibers or flyings, and shall prevent the escape of sparks or molten particles.

Exception: In locations where, in the judgment of the authority having jurisdiction, only moderate accumulations of lint or flyings will be likely to collect in the vicinity of a receptacle, and where such receptacle is readily accessible for routine cleaning, general-purpose grounding-type receptacles mounted so as to minimize the entry of fibers or flyings shall be permitted.

5.3.3.51 Signaling, Alarm, Remote-Control, and Local Loudspeaker Intercommunications Systems — Class III, Divisions 1 and 2. Signaling, alarm, remote-control, and local loudspeaker

intercommunications systems shall comply with the requirements of Article 5.3 regarding wiring methods, switches, transformers, resistors, motors, luminaires (lighting fixtures), and related components.

5.3.3.56 Electric Cranes, Hoists, and Similar Equipment — Class III, Divisions 1 and 2. Where installed for operation over combustible fibers or accumulations of flyings, traveling cranes and hoists for material handling, traveling cleaners for textile machinery, and similar equipment shall comply with 5.3.3.56(a) through (d).

(a) Power Supply. Power supply to contact conductors shall be electrically isolated from all other systems, ungrounded, and shall be equipped with an acceptable ground detector that gives an alarm and automatically de-energizes the contact conductors in case of a fault to ground or gives a visual and audible alarm as long as power is supplied to the contact conductors and the ground fault remains.

(b) Contact Conductors. Contact conductors shall be located or guarded so as to be inaccessible to other than authorized persons and shall be protected against accidental contact with foreign objects.

(c) Current Collectors. Current collectors shall be arranged or guarded so as to confine normal sparking and prevent escape of sparks or hot particles. To reduce sparking, two or more separate surfaces of contact shall be provided for each contact conductor. Reliable means shall be provided to keep contact conductors and current collectors free of accumulations of lint or flyings.

(d) Control Equipment. Control equipment shall comply with 5.3.3.16 and 5.3.3.21.

5.3.3.61 Storage Battery Charging Equipment — Class III, Divisions 1 and 2. Storage battery charging equipment shall be located in separate rooms built or lined with substantial noncombustible materials. The rooms shall be constructed to prevent the entrance of ignitable amounts of flyings or lint and shall be well ventilated.

ARTICLE 5.4 — INTRINSICALLY SAFE SYSTEMS

5.4.1.1 Scope. This article covers the installation of intrinsically safe

(I.S.) apparatus, wiring, and systems for Class I, II, and III locations.

FPN: For further information, see ANSI/ISA RP 12.06.01-2002, Wiring Methods for Hazardous (Classified) Locations Instrumentation — Part 1: Intrinsic Safety.

5.4.1.2 Definitions.

Associated Apparatus. Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Associated apparatus may be either of the following:

- (1) Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location

FPN No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.

FPN No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.

Control Drawing. See definition in 5.0.1.2.

Different Intrinsically Safe Circuits. Intrinsically safe circuits in which the possible interconnections have not been evaluated and identified as intrinsically safe.

Intrinsically Safe Apparatus. Apparatus in which all the circuits are intrinsically safe.

Intrinsically Safe Circuit. A circuit in which any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN: Test conditions are described in ANSI/UL 913-1997, Standard for Safety, Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous (Classified) Locations.

Intrinsically Safe System. An assembly of interconnected intrinsically safe apparatus, associated apparatus, and interconnecting cables in that

those parts of the system that may be used in hazardous (classified) locations are intrinsically safe circuits.

FPN: An intrinsically safe system may include more than one intrinsically safe circuit.

Simple Apparatus. An electrical component or combination of components of simple construction with well-defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.

FPN: The following apparatus are examples of simple apparatus:

(a) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs

(b) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW

5.4.1.3 Application of Other Articles. Except as modified by this article, all applicable articles of this Code shall apply.

5.4.1.4 Equipment. All intrinsically safe apparatus and associated apparatus shall be listed.

Exception: Simple apparatus, as described on the control drawing, shall not be required to be listed.

5.4.1.10 Equipment Installation.

(a) **Control Drawing.** Intrinsically safe apparatus, associated apparatus, and other equipment shall be installed in accordance with the control drawing(s).

Exception: A simple apparatus that does not interconnect intrinsically safe circuits.

FPN: The control drawing identification is marked on the apparatus.

(b) **Location.** Intrinsically safe apparatus shall be permitted to be installed in any hazardous (classified) location for which it has been identified. General-purpose enclosures shall be permitted for intrinsically safe apparatus.

Associated apparatus shall be permitted to be installed in any hazardous (classified) location for which it has been identified or, if protected by other means, permitted by Articles 5.1 through 5.3 and Article 5.5.

Simple apparatus shall be permitted to be installed in any hazardous (classified) location in which the maximum surface temperature of the simple apparatus does not exceed the ignition temperature of the flammable gases or vapors, flammable liquids, combustible dusts, or ignitable fibers or flyings present.

For simple apparatus, the maximum surface temperature can be determined from the values of the output power from the associated apparatus or apparatus to which it is connected to obtain the temperature class. The temperature class can be determined by:

(1) Reference to Table 5.4.1.10(b)

(2) Calculation using the formula:

$$T = P_o R_{th} + T_{amb}$$

where:

T is the surface temperature

P_o is the output power marked on the associated apparatus or intrinsically safe apparatus

R_{th} is the thermal resistance of the simple apparatus

T_{amb} is the ambient temperature (normally 40°C) and reference Table 5.0.1.8(b)

In addition, components with a surface area smaller than 10 cm² (excluding lead wires) may be classified as T5 if their surface temperature does not exceed 150°C.

Table 5.4.1.10 Assessment for T4 Classification According to Component Size and Temperature

Total Surface Area Excluding Lead Wires	Requirement for T4 Classification (Based on 40°C Ambient Temperature)
< 20 mm ²	Surface temperature ≤ 275°C
≥ 20 mm ² ≤ 10 cm ²	Surface temperature ≤ 200°C
≥ 20 mm ²	Power not exceeding 1.3 W*

* Reduce to 1.2 W with an ambient of 60°C or 1.0 W with 80°C ambient temperature.

FPN: The following apparatus are examples of simple apparatus:

- (1) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
- (2) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW

5.4.1.20 Wiring Methods. Intrinsically safe apparatus and wiring shall be permitted to be installed using any of the wiring methods suitable for unclassified locations, including Chapter 7 and Chapter 8. Sealing shall be as provided in

5.4.1.70, and separation shall be as provided in 5.4.1.30.

5.4.1.30 Separation of Intrinsically Safe Conductors.

(a) From Nonintrinsically Safe Circuit Conductors.

(1) In Raceways, Cable Trays, and Cables. Conductors of intrinsically safe circuits shall not be placed in any raceway, cable tray, or cable with conductors of any nonintrinsically safe circuit.

Exception No. 1: Where conductors of intrinsically safe circuits are separated from conductors of nonintrinsically safe circuits by a distance of at least 50 mm and secured, or by a grounded metal partition or an approved insulating partition.

FPN: Sheet metal partitions 0.90 mm or thicker are generally considered acceptable.

Exception No. 2: Where either (1) all of the intrinsically safe circuit conductors or (2) all of the nonintrinsically safe circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.

FPN: Cables meeting the requirements of Articles 3.30 and 3.32 are typical of those considered acceptable.

(2) Within Enclosures.

a. Conductors of intrinsically safe circuits shall be separated at least 50 mm from conductors of any nonintrinsically safe circuits, or as specified in 5.4.1.30(a)(2).

b. All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.

FPN No. 1: The use of separate wiring compartments for the intrinsically safe and nonintrinsically safe terminals is the preferred method of complying with this requirement.

FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least 19 mm can be used to help ensure the required separation of the wiring.

(3) Other (Not in Raceway or Cable Tray Systems). Conductors and cables of intrinsically safe circuits run in other than raceway or cable tray systems shall be separated by at least 50 mm and secured from conductors and cables of any nonintrinsically safe circuits.

Exception: Where either (1) all of the intrinsically safe circuit conductors are in Type MI or MC cables or (2) all of the nonintrinsically safe circuit conductors are in raceways or Type MI or MC cables where the sheathing or cladding is capable of carrying fault current to ground.

(b) From Different Intrinsically Safe Circuit Conductors. Different intrinsically safe circuits shall be in separate cables or shall be separated from each other by one of the following means:

(1) The conductors of each circuit are within a grounded metal shield.

(2) The conductors of each circuit have insulation with a minimum thickness of 0.25 mm.

Exception: Unless otherwise identified.

(3) The clearance between two terminals for connection of field wiring of different intrinsically safe circuits shall be at least 6 mm unless this clearance is permitted to be reduced by the control drawing.

5.4.1.50 Grounding.

(a) Intrinsically Safe Apparatus, Associated Apparatus, and Raceways. Intrinsically safe apparatus, associated apparatus, cable shields, enclosures, and raceways, if of metal, shall be grounded.

FPN: Supplementary bonding to the grounding electrode may be needed for some associated apparatus, for example, zener diode barriers, if specified in the control drawing. See ANSI/ISA RP 12.06.01-2002, Wiring Methods for Hazardous (Classified) Locations Instrumentation Part 1: Intrinsic Safety.

(b) Connection to Grounding Electrodes. Where connection to a grounding electrode is required, the grounding electrode shall be as specified in 2.50.3.3(a)(1), (a)(2), (a)(3), and (a)(4) and shall comply with 2.50.2.11(a)(7). Section 2.50.3.3(a)(5), (a)(6), and (a)(7) shall not be used if electrodes specified in 2.50.3.3(a)(1), (a)(2), (a)(3), or (a)(4) are available.

(c) Shields. Where shielded conductors or cables are used, shields shall be grounded.

Exception: Where a shield is part of an intrinsically safe circuit.

5.4.1.60 Bonding.

(a) Hazardous Locations. In hazardous (classified) locations, intrinsically safe apparatus shall be bonded in the hazardous (classified) location in accordance with 2.50.5.11.

(b) Unclassified. In unclassified or nonhazardous locations, where metal raceways are used for intrinsically safe system wiring in hazardous

(classified) locations, associated apparatus shall be bonded in accordance with 5.1.2.21(a), 5.2.2.21(a), 5.3.2.21(a), or 5.5.1.25, as applicable.

5.4.1.70 Sealing. Conduits and cables that are required to be sealed by 5.1.2.6, 5.2.2.6, and 5.5.1.16 shall be sealed to minimize the passage of gases, vapors, or dusts. Such seals shall not be required to be explosionproof or flameproof.

Exception: Seals shall not be required for enclosures that contain only intrinsically safe apparatus, except as required by 5.1.2.6(f)(3).

5.4.1.80 Identification. Labels required by this section shall be suitable for the environment where they are installed with consideration given to exposure to chemicals and sunlight.

(a) Terminals. Intrinsically safe circuits shall be identified at terminal and junction locations in a manner that will prevent unintentional interference with the circuits during testing and servicing.

(b) Wiring. Raceways, cable trays, and other wiring methods for intrinsically safe system wiring shall be identified with permanently affixed labels with the wording “Intrinsic Safety Wiring” or equivalent. The labels shall be located so as to be visible after installation and placed so that they may be readily traced through the entire length of the installation. Intrinsic safety circuit labels shall appear in every section of the wiring system that is separated by enclosures, walls, partitions, or floors. Spacing between labels shall not be more than 7 600 mm.

Exception: Circuits run underground shall be permitted to be identified where they become accessible after emergence from the ground.

FPN No. 1: Wiring methods permitted in unclassified locations may be used for intrinsically safe systems in hazardous (classified) locations. Without labels to identify the application of the wiring, enforcement authorities cannot determine that an installation is in compliance with this Code.

FPN No. 2: In unclassified locations, identification is necessary to ensure that nonintrinsically safe wire will not be inadvertently added to existing raceways at a later date.

(c) Color Coding. Color coding shall be permitted to identify intrinsically safe conductors where they are colored light blue and where no other conductors colored light blue are used. Likewise, color coding

shall be permitted to identify raceways, cable trays, and junction boxes where they are colored light blue and contain only intrinsically safe wiring.

ARTICLE 5.5 — CLASS I, ZONE 0, 1, AND 2 LOCATIONS

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 497-2004, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.5.1.1 Scope. This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 5.0 for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 5.0 through 5.4.

5.5.1.2 Definitions. For purposes of this article, the following definitions apply.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments.

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations.

Encapsulation “m.” Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See ANSI/ISA 12.23.01-2002, Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Encapsulation “m”; and ANSI/UL 60079-18, Electrical apparatus for explosive gas atmospheres — Part 18: Encapsulation “m.”

Flameproof “d.” Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See ANSI/ISA 12.22.01-2002, Electrical Apparatus for Use in Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof “d”; and ANSI/UL 60079-1, Electrical apparatus for explosive gas atmospheres — Part 1: Flameproof enclosures “d.”

Increased Safety “e.” Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See ANSI/ISA — 12.16.01-2002, Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety “e”; and ANSI/UL 60079-7, Electrical apparatus for explosive gas atmospheres — Part 7: Increased Safety “e.”

Intrinsic Safety “i.” Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See ANSI/UL 913-1997, Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations; ISA 12.02.01-1999, Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations — Intrinsic Safety “i”; and ANSI/UL 60079-11, Electrical apparatus for explosive gas atmospheres — Part II: Intrinsic safety “i.”

FPN No. 2: Intrinsic safety is designated type of protection “ia” for use in Zone 0 locations. Intrinsic safety is designated type of protection “ib” for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe apparatus (“ia” or “ib,” respectively) but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Oil Immersion “o.” Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See ISA 12.26.01-1998, Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion “o”; and ANSI/UL 60079-6, Electrical apparatus for explosive gas atmospheres — Part 6: Oil-immersion “o.”

Powder Filling “q.” Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

FPN: See ANSI/ISA-12.25.01-2002, Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling “q”; and ANSI/UL 60079-5, Electrical apparatus for explosive gas atmospheres — Part 5: Powder filling “q.”

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See NFPA 496-2003, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

FPN No. 2: See IEC 60079-2-2000, Electrical Apparatus for Explosive Gas Atmospheres — Part 2: Electrical Apparatus, Type of Protection “p”; and IEC 60079-13-1982, Electrical Apparatus for Explosive Gas Atmospheres — Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization.

Type of Protection “n.” Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: See ANSI/UL 60079-15-2002, Electrical apparatus for explosive gas atmospheres — Part 15: Type of protection “n”; and ANSI/ISA 12.12.02-2003, Electrical apparatus for use in Class I, Zone 2 Hazardous (Classified) Locations: Type of protection “n.”

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I,

Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

5.5.1.3 Other Articles. All other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

Exception: As modified by Article 5.4 and this Article.

5.5.1.4 General.

(a) Documentation for Industrial Occupancies. All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2; ISA RP12.24.01-1998, Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) Reference Standards. Important information relating to topics covered in Chapter 5 may be found in other publications.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the Instrumentation, Systems, and Automation Society (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2; ISA RP 12.24.01-1998, Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2000, Recommended Practice on Static Electricity; NFPA 780-2004, Standard for the Installation of Lightning Protection Systems; and API RP 2003-1998, Protection Against Ignitions Arising Out of Static Lightning and Stray Currents.

FPN No. 4: For further information on ventilation, see NFPA 30-2003, Flammable and Combustible Liquids Code, and ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see ANSI/API RP 14FZ-2000, Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Zone 0, Zone 1, and Zone 2 Locations.

FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see IEC 60079-14-1996, Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other Than Mines), and IEC 60079-16-1990, Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses.

FPN No. 7: For further information on application of electrical equipment in hazardous (classified) locations in general, see ANSI/ISA 12.00.01-2002, Electrical Apparatus for Use in Class I, Zones 0 and 1, Hazardous (Classified) Locations: General Requirements; ISA 12.01.01-1999, Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations; and ANSI/UL 60079-0, Electrical apparatus for explosive gas atmospheres — Part 0: General requirements.

5.5.1.5 Classifications of Locations.

(a) Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See 5.5.1.7 for restrictions on area classification.

FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation may be classified as “unclassified” locations.

FPN: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15-1994, Safety Code for Mechanical Refrigeration; and ANSI/CGA G2.1-1989 (14-39), Safety Requirements for the Storage and Handling of Anhydrous Ammonia.

(b) Class I, Zone 0, 1, and 2 Locations. Class I, Zone 0, 1, and 2 locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures. Class I, Zone 0, 1, and 2 locations shall include those specified in 5.5.1.5(b)(1), (b)(2), and (b)(3).

(1) Class I, Zone 0. A Class I, Zone 0 location is a location in which

a. Ignitable concentrations of flammable gases or vapors are present continuously, or

b. Ignitable concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2; ISA 12.24.01-1998, Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum.

FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitable concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See 5.5.1.5(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 5.4.

(2) Class I, Zone 1. A Class I, Zone 1 location is a location

a. In which ignitable concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or

b. In which ignitable concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or

c. In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or

d. That is adjacent to a Class I, Zone 0 location from which ignitable concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operation is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seals and flange gaskets, and spillage caused by accidents) are not considered normal operation.

FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or in easily ruptured containers; and other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operation but not classified Zone 0.

(3) Class I, Zone 2. A Class I, Zone 2 location is a location

a. In which ignitable concentrations of flammable gases or vapors are not likely to occur in normal operation and, if they do occur, will exist only for a short period; or

b. In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a

result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or

c. In which ignitable concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or

d. That is adjacent to a Class I, Zone 1 location, from which ignitable concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but which would become hazardous only in case of an accident or of some unusual operating condition.

5.5.1.6 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in 5.5.1.6(a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See 90.2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in 5.5.1.6(a), (b), and (c), according to the nature of the gas or vapor, for protection techniques “d,” “ia,” “ib,” “[ia],” and “[ib],” and, where applicable, “n” and “o.”

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in IEC 60079-1A-1975, Amendment No. 1 (1993), Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus; and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in IEC 60079-11-1999, Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety “i.” The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in IEC 60079-12-1978, Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents.

FPN No. 2: Verification of electrical equipment utilizing protection techniques “e,” “m,” “p,” and “q,” due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

Class I, Zone 0, 1, and 2, groups shall be as follows:

(a) Group IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45. [NFPA 497:3.3]

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in 5.0.1.6(a)(1) and 5.0.1.6(a)(2).

(b) Group IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80. [NFPA 497:3.3]

FPN: Group IIB is equivalent to Class I, Group C, as described in 5.0.1.6(a)(3).

(c) Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80. [NFPA 497:3.3]

FPN: Group IIA is equivalent to Class I, Group D as described in 5.0.1.6(a)(4).

5.5.1.7 Special Precaution. Article 5.5 requires equipment construction and installation that ensures safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by 5.5.1.8(a) may not be suitable for use at temperatures lower than -20°C unless they are identified for use at lower temperatures. However, at low ambient temperatures, flammable

concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

(a) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a licensed electrical practitioner.

(b) Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location, provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

(d) Solid Obstacles. Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table 5.5.1.7(d) to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation.

Table 5.5.1.7(d) Minimum Distance of Obstructions From Flameproof “d” Flange Openings

Gas Group	Minimum Distance (mm)
IIC	40
IIB	30
IIA	10

5.5.1.8 Protection Techniques. Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 5.5.1.8(a) through 5.5.1.8(i).

FPN: For additional information, see ANSI/ISA 12.00.01-2002, Electrical Apparatus for Use in Class I, Zones 0 and 1 Hazardous (Classified) Locations, General

Requirements; ANSI/ISA 12.01.01-2002, Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations; and ANSI/UL 60079-0, Electrical apparatus for explosive gas atmospheres — Part 0: General requirements.

(a) Flameproof “d”. This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(b) Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is identified.

(c) Intrinsic Safety. This protection technique shall be permitted for apparatus and associated apparatus in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is listed.

(d) Type of Protection “n”. This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection “n” is further subdivided into nA, nC, and nR.

FPN: See Table 5.5.1.9(c)(2)d for the descriptions of subdivisions for type of protection “n”.

(e) Oil Immersion “o”. This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(f) Increased Safety “e”. This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(g) Encapsulation “m”. This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(h) Powder Filling “q”. This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(i) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in

5.5.1.8(i)(1), i(2), or i(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.

FPN No. 2: For further information, see ANSI/API RP 505, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, and Zone 2.

FPN No. 3: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.

(1) Inadequate Ventilation. In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.

(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.

(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.

5.5.1.9 Equipment.

(a) Suitability. Suitability of identified equipment shall be determined by one of the following:

- (1) Equipment listing or labeling
- (2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
- (3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment

(b) Listing.

- (1) Equipment that is listed for a Zone 0 location shall be permitted

in a Zone 1 or Zone 2 location of the same gas or vapor, provided that it is installed in accordance with the requirements for the marked type of protection. Equipment that is listed of a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor, provided that it is installed in accordance with the requirements for the marked type of protection.

(2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB. + H2."

(c) Marking. Equipment shall be marked in accordance with 5.5.1.9(c)(1) or (c)(2).

(1) Division Equipment. Equipment identified for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with 5.0.1.8(b), be permitted to be marked with all of the following:

- a. Class I, Zone 1 or Class I, Zone 2 (as applicable)
- b. Applicable gas classification group(s) in accordance with Table 5.5.1.9(c)
- c. Temperature classification in accordance with 5.5.1.9(d)(1)

Table 5.5.1.9(c) Gas Classification Groups

Gas Group	Comment
IIC	See 5.5.1.6(a)(1)
IIB	See 5.5.1.6(a)(2)
IIA	See 5.5.1.6(a)(3)

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in 5.5.1.8 shall be marked with all of the following in the order shown:

- a. Class
- b. Zone
- c. Symbol "AEx"
- d. Protection technique(s) in accordance with Table 5.5.1.9(c)(2)(4)

e. Applicable gas classification group(s) in accordance with Table 5.5.1.9(c)

f. Temperature classification in accordance with 5.5.1.9(d)(1)

Exception No. 1: Associated apparatus NOT suitable for installation in a hazardous (classified) locations shall be required to be marked only with (3), (4), and (5), but BOTH the symbol AEx (3) and the symbol for the type of protection (4) shall be enclosed within the same square brackets, for example, [AEx ia] IIC.

Exception No. 2: Simple apparatus as defined in 5.4.1.2 shall not be required to have a marked operating temperature or temperature class.

Electrical equipment of types of protection "e," "m," "p," or "q" shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 1: An example of the required marking for intrinsically safe apparatus for installation in Class I, Zone 0 is "Class I, Zone 0, AEx ia IIC T6." An explanation of the marking that is required is shown in FPN Figure 5.5.1.9(c)(2).

FPN No. 2: An example of the required marking for intrinsically safe associated apparatus mounted in a flameproof enclosure for installation in Class I, Zone 1 is "Class I, Zone 1 AEx d[ia] IIC T4."

FPN No. 3: An example of the required marking for intrinsically safe associated apparatus NOT for installation in a hazardous (classified) location is "[AEx ia] IIC."

(d) Class I Temperature. The temperature marking specified below shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see NFPA 497-2004, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas; and IEC 60079-20-1996, Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus.

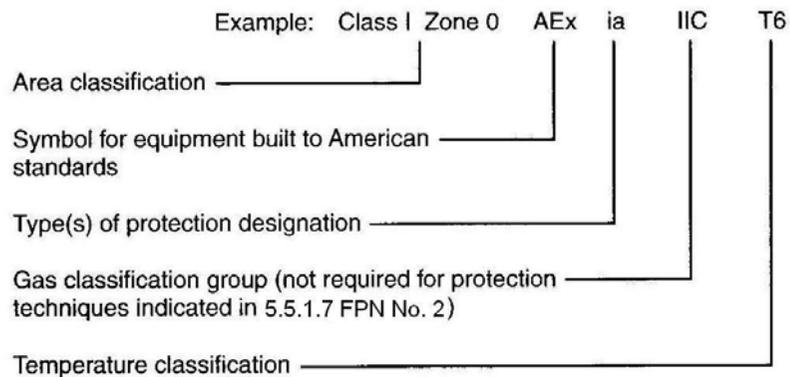

Figure 5.5.1.9(c)(2) Zone Equipment Marking

Table 5.5.1.9(c)(2)d Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Associated apparatus	Unclassified
[ib]	Associated apparatus	Unclassified
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

(1) Temperature Classifications. Equipment shall be marked to show the operating temperature or temperature class referenced to a 40°C (104°F) ambient. The temperature class, if provided, shall be indicated using the temperature class (T Code) shown in Table 5.5.1.9(d)(1).

Electrical equipment designed for use in the ambient temperature range between -20°C and +40°C shall require no additional ambient temperature marking.

Electrical equipment that is designed for use in a range of ambient temperatures other than -20°C and +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures. As an example, such a marking might be “-30°C Ta + 40°C.”

Electrical equipment suitable for ambient temperatures exceeding 40°C shall be marked with both the maximum ambient temperature and the operating temperature or temperature class at that ambient temperature.

Exception No. 1: Equipment of the non-heat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100°C shall not be required to have a marked operating temperature or temperature class.

Exception No. 2: Equipment identified for Class I, Division 1 or Division 2 locations as permitted by 5.5.1.20(b) and 5.5.1.20(d) shall be permitted to be marked in accordance with 5.0.1.8(b) and Table 5.0.1.8(b).

Table 5.5.1.9(d)(1) Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class (T Code)	Maximum Surface Temperature (°C)
T1	≤ 450
T2	≤ 300
T3	≤ 200
T4	≤ 135
T5	≤ 100
T6	≤ 85

(e) Threading. All NPT threaded conduit and fittings referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (19mm taper per 300 mm). Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 5.5.1.9(e)(1) or 5.5.1.9(e)(2). Threaded entries into explosionproof or flameproof equipment shall be made up with at least five threads fully engaged.

Exception: For listed explosionproof or flameproof equipment, factory threaded NPT entries shall be made up with at least 4½ threads fully engaged.

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit fittings or cable fittings shall be used.

FPN: Thread form specifications for NPT threads are located in ANSI/ASME B1.20.1-1983, Pipe Threads, General Purpose (Inch).

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in ISO 965/1-1980, Metric Screw Threads; and ISO 965/3-1980, Metric Screw Threads.

5.5.1.15 Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with 5.5.1.15(a) through 5.5.1.15(c).

(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 5.4 shall be permitted.

FPN: Article 5.4 only includes protection technique "ia."

(b) Class I, Zone 1.

(1) General. In Class I, Zone 1 locations, the wiring methods in (b)(1)a through (b)(1)f shall be permitted.

a. All wiring methods permitted by 5.5.1.15(a).

b. In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 2.50.6.13, and provided with termination fittings listed for the application.

FPN: See 330.12 for restrictions on use of Type MC cable.

c. In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

d. Type MI cable with termination fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

e. Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

f. Rigid nonmetallic conduit complying with Article 352 shall be permitted where encased in a concrete envelope a minimum of 50 mm

thick and provided with not less than 600 mm of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

(2) Flexible Connections. Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of 5.5.1.17 shall be permitted.

(c) Class I, Zone 2.

(1) General. In Class I, Zone 2 locations, the wiring methods in (c)(1)(a) through (c)(1)(g) shall be permitted.

a. All wiring methods permitted by 5.5.1.15(b).

b. Types MI, MC, MV, or TC cable with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings. Single conductor Type MV cables shall be shielded or metallic-armored.

c. Type ITC cable as permitted in 7.27.1.4.

d. Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.

e. Enclosed gasketed busways, enclosed gasketed wireways.

f. Threaded rigid metal conduit, threaded steel intermediate metal conduit.

g. Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple

apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 5.4.1.2.

Separate nonincendive field wiring circuits shall be installed in accordance with one of the following:

1. In separate cables

2. In multiconductor cables where the conductors of each circuit are within a grounded metal shield

3. In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm.

(2) Flexible Connections. Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in accordance with the provisions of 5.5.1.17 shall be permitted.

FPN: See 5.5.1.25(b) for grounding requirements where flexible conduit is used.

5.5.1.16 Sealing and Drainage. Seals in conduit and cable systems shall comply with 5.5.1.16(a) through 5.5.1.16(e). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. See 5.5.1.16(c)(2)b. Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See 5.5.1.16(d)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than 30 mm². Special conductor constructions, for example, compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Zone 0. In Class I, Zone 0 locations, seals shall be located according to 5.5.1.16(a)(1), (a)(2), and (a)(3).

(1) Conduit Seals. Seals shall be provided within 3 000 mm of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except listed reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 300 mm beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

(2) Cable Seals. Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

(3) Not Required to Be Explosionproof or Flameproof. Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, seals shall be located in accordance with 5.5.1.16(b)(1) through (b)(8).

(1) Type of Protection “d” or “e” Enclosures. Conduit seals shall be provided within 50 mm for each conduit entering enclosures having type of protection “d” or “e.”

Exception No. 1: Where the enclosure having type of protection “d” is marked to indicate that a seal is not required.

Exception No. 2: For type of protection “e,” conduit and fittings employing only NPT to NPT raceway joints or fittings listed for type of protection “e” shall be permitted between the enclosure and the seal, and the seal shall not be required to be within 50 mm of the entry.

FPN: Examples of fittings employing other than NPT threads include conduit couplings, capped elbows, unions, and breather drains.

Exception No. 3: For conduit installed between type of protection “e” enclosures employing only NPT to NPT raceway joints or conduit fittings listed for type of protection “e,” a seal shall not be required.

(2) Explosionproof Equipment. Conduit seals shall be provided for each conduit entering explosionproof equipment according to (b)(2)a, (b)(2)b, and (b)(2)c.

a. In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is metric designator 50 mm diameter or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section, high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following:

(1) *Are enclosed within a chamber hermetically sealed against the entrance of gases or vapors.*

(2) *Are immersed in oil.*

(3) *Are enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified for the location, and marked “factory sealed” or equivalent, unless the entry is metric designator 50 mm diameter or larger. Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.*

b. Conduit seals shall be installed within 460 mm from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

c. Where two or more explosionproof enclosures for which conduit seals are required under 5.5.1.16(b)(2) are connected by nipples or by runs of conduit not more than 900 mm long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 460 mm from either enclosure.

(3) Pressurized Enclosures. Conduit seals shall be provided in each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 460 mm from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure reduces problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see NFPA 496-2003, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

(4) Class I, Zone 1 Boundary. Conduit seals shall be provided in each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 3 000 mm of the boundary and shall be designed and installed so as to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.

Exception: Metal conduit containing no unions, couplings, boxes, or fittings and passing completely through a Class I, Zone 1 location with no fittings less than 300 mm beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(5) Cables Capable of Transmitting Gases or Vapors. Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound surrounds each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 460 mm of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or

separate the twisted pair.

(6) Cables Incapable of Transmitting Gases or Vapors. Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with 5.5.1.16(d).

(7) Cables Entering Enclosures. Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with 5.5.1.16(d).

(8) Class I, Zone 1 Boundary. Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) **Zone 2.** In Class I, Zone 2 locations, seals shall be located in accordance with 5.5.1.16(c)(1) and (c)(2).

(1) Conduit Seals. Conduit seals shall be located in accordance with (c)(1)a and (c)(1)b.

a. For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with 5.5.1.16(b)(1) and 5.5.1.16(b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with 5.5.1.16(b).

b. In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3 000 mm of the boundary and shall be designed and installed so as to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes, or fittings and passing completely through a Class I, Zone 2 location with no fittings less than 300 mm beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or cable that is not installed in a raceway or cable tray system shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to NFPA 496-2003, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if all the following conditions are met:

(1) No part of the conduit system segment passes through a Class I, Zone 0 or Class I, Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 300 mm of the Class I, Zone 0 or Class I, Zone 1 location.

(2) The conduit system segment is located entirely in outdoor locations.

(3) The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system.

(4) The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location.

(5) The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Zone 2 locations.

(2) Cable Seals. Cable seals shall be located in accordance with (c)(2)a, (c)(2)b, and (c)(2)c.

a. Explosionproof and Flameproof Enclosures. Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with 5.5.1.16(d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound surrounds each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in 5.5.1.16(b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

b. Cables That Will Not Transmit Gases or Vapors. Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 5.5.1.16(c)(2)a. The minimum length of such cable run shall not be less than the length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [200 cm³/hr of air at a pressure of 1500 pascals (150 mm of water)].

FPN No. 1: See ANSI/UL 886-1994, Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

c. Cables Capable of Transmitting Gases or Vapors. Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in 5.5.1.16(c)(2)a, unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1500 pascals (150 mm of water) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.

d. Cables Without Gas/Vaportight Continuous Sheath. Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

(d) Class I, Zones 0, 1, and 2. Where required, seals in Class I, Zones 0, 1, and 2 locations shall comply with 5.5.1.16(d)(1) through (d)(5).

(1) Fittings. Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings listed for the location shall be used. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point less than 93°C.

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 16 mm.

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process, or Service Connections, and So Forth. For canned pumps, process, or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means if the primary seal fails.

The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other

approved means are provided to accomplish the purpose in the preceding paragraph.

Drains, vents, or other devices shall be provided so that primary seal leakage is obvious.

FPN: See also the fine print notes to 5.5.1.16.

Process-connected equipment that is listed and marked “Dual Seal” shall not require additional process sealing when used within the manufacturer’s ratings.

FPN: For construction and testing requirements for dual seal process, connected equipment, refer to ISA 12.27.01, Requirements for Process Sealing Between Electrical Systems and Potentially Flammable or Combustible Process Fluids.

5.5.1.17 Flexible Cords, Class I, Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of 5.5.1.15(b) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall comply with all of the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, a grounding conductor complying with 4.0.2.4
- (3) Be connected to terminals or to supply conductors in an approved manner
- (4) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections
- (5) Be provided with listed seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof

Exception: As provided in 5.5.1.16.

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.

Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.

FPN: See 5.5.1.18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

5.5.1.18 Conductors and Conductor Insulation.

(a) Conductors. For type of protection “e,” field wiring conductors shall be copper. Every conductor (including spares) that enters Type “e” equipment shall be terminated at a Type “e” terminal.

(b) Conductor Insulation. Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type identified for use under such conditions, or the insulation shall be protected by a sheath of lead or by other approved means.

5.5.1.19 Uninsulated Exposed Parts. There shall be no uninsulated exposed parts, such as electric conductors, buses, terminals, or components that operate at more than 30 volts (15 volts in wet locations). These parts shall additionally be protected by type of protection ia, ib, or nA that is suitable for the location.

5.5.1.20 Equipment Requirements.

(a) Zone 0. In Class I, Zone 0 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception: Intrinsically safe apparatus listed for use in Class I, Division 1 locations for the same gas, or as permitted by 5.5.1.9(b)(2), and with a suitable temperature class shall be permitted.

(b) Zone 1. In Class I, Zone 1 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception No. 1: Equipment identified for use in Class I, Division 1 or listed for use in Class I, Zone 0 locations for the same gas, or as permitted by 5.5.1.9(b)(2), and with a suitable temperature class shall be permitted.

Exception No. 2: Equipment identified for Class I, Zone 1, or Zone 2 type of protection “p” shall be permitted.

(c) Zone 2. In Class I, Zone 2 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception No. 1: Equipment listed for use in Class I, Zone 0 or Zone 1 locations for the same gas, or as permitted by 5.5.1.9(b)(2), and with a suitable temperature class, shall be permitted.

Exception No. 2: Equipment identified for Class I, Zone 1 or Zone 2 type of protection “p” shall be permitted.

Exception No. 3: Equipment identified for use in Class I, Division 1 or Division 2 locations for the same gas, or as permitted by 5.5.1.9(b)(2), and with a suitable temperature class shall be permitted.

Exception No. 4: In Class I, Zone 2 locations, the installation of open or nonexplosionproof or nonflameproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Zone 2 location shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean air purging may be needed immediately prior to and during start-up periods.

(d) Manufacturer’s Instructions. Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the

instructions (if any) provided by the manufacturer.

5.5.1.21 Multiwire Branch Circuits. In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

5.5.1.22 Increased Safety “e” Motors and Generators. In Class I, Zone 1 locations, Increased Safety “e” motors and generators of all voltage ratings shall be listed for Class I, Zone 1 locations, and shall comply with all of the following:

- (1) Motors shall be marked with the current ratio, IA/IN, and time, tE.
- (2) Motors shall have controllers marked with the model or identification number, output rating (horsepower or kilowatt), full-load amperes, starting current ratio (IA/IN), and time (tE) of the motors that they are intended to protect; the controller marking shall also include the specific overload protection type (and setting, if applicable) that is listed with the motor or generator.
- (3) Connections shall be made with the specific terminals listed with the motor or generator.
- (4) Terminal housings shall be permitted to be of substantial, nonmetallic, nonburning material, provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing.
- (5) The provisions of Part 4.30.3 shall apply regardless of the voltage rating of the motor.
- (6) The motors shall be protected against overload by a separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated in accordance with the listing of the motor and its overload protection.
- (7) Sections 4.30.3.2(c) and 4.30.3.14 shall not apply to such motors.
- (8) The motor overload protection shall not be shunted or cut out during the starting period.

5.5.1.25 Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the requirements in 5.5.1.25(a) and 5.5.1.25(b).

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding

jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 2.50.2.13(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See 2.50.5.11 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in 5.5.1.15(c) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with 2.50.5.13.

Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:

- (a) Listed liquidtight flexible metal conduit 1 800 mm or less in length, with fittings listed for grounding, is used.*
- (b) Overcurrent protection in the circuit is limited to 10 amperes or less.*
- (c) The load is not a power utilization load.*

ARTICLE 5.6 — ZONE 20, 21, AND 22 LOCATIONS FOR COMBUSTIBLE DUSTS, FIBERS, AND FLYINGS

5.6.1.1 Scope. This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 5.0, Article 5.2, and Article 5.3 for electrical and electronic equipment and wiring for all voltages in Zone 20, Zone 21, and Zone 22 hazardous (classified) locations where fire and explosion hazards may exist due to combustible dusts, or ignitable fibers or flyings. Combustible metallic dusts are not covered by the

requirements of this article.

FPN No. 1: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; Class III, Division 1 or Division 2; and Class I, Zone 0 or Zone 1 or Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 5.0 through 5.5.

FPN No. 2: Zone 20, Zone 21, and Zone 22 area classifications are based on the modified IEC area classification system as defined in ISA 12.10.05, Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations (IEC61241-10 Mod).

FPN No. 3: The unique hazards associated with explosives, pyrotechnics, and blasting agents are not addressed in this article.

5.6.1.2 Definitions. For purposes of this article, the following definitions apply.

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

- (1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location
- (2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location

FPN: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Dust-Ignitionproof. Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-1991, Enclosures for Electrical Equipment, and ANSI/UL 1203-1994, Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations.

Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.

FPN: See ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, and UL 1604-1994, Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment is not capable, under specified test conditions, of igniting the flammable gas-air, vapor-air, or dust-air mixture.

FPN: Conditions are described in ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas-air, vapor-air, or dust-air mixture due to arcing or thermal means.

FPN: Conditions are described in ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas-air, vapor-air, or dust-air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Field Wiring Apparatus. Apparatus intended to be connected to nonincendive field wiring.

FPN: Conditions are described in ANSI/ISA 12.12.01-2000, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Pressurized. The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of combustible dust, or an ignitable fiber or flying.

FPN: For further information, see ANSI/ NFPA 496-2003, Purged and Pressurized Enclosures for Electrical Equipment.

Zone 20 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers and flyings are present continuously or for long periods of time in quantities sufficient to be hazardous, as classified by 5.6.1.5(b)(1).

Zone 21 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers and flyings are likely to exist occasionally under normal operation in quantities sufficient to be hazardous, as classified by 5.6.1.5(b)(2).

Zone 22 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers and flyings are not likely to occur under normal operation in quantities sufficient to be hazardous, as classified by 5.6.1.5(b)(3).

5.6.1.4 General.

(a) Documentation for Industrial Occupancies. Areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain or operate electrical equipment.

(b) Reference Standards. Important information relating to topics covered in Chapter 5 are found in other publications.

FPN: It is important that the authority having jurisdiction be familiar with the recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the ISA, International Society for Measurement and Control, and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

5.6.1.5 Classification of Locations.

(a) Classifications of Locations. Locations shall be classified on the basis of the properties of the combustible dust, ignitable fibers or flyings that may be present, and the likelihood that a combustible or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where

pyrophoric materials are the only materials used or handled, these locations are outside of the scope of this article.

(b) Zone 20, Zone 21, and Zone 22 Locations. Zone 20, Zone 21, and Zone 22 locations are those in which combustible dust, ignitable fibers, or flyings are or may be present in the air or in layers, in quantities sufficient to produce explosive or ignitable mixtures. Zone 20, Zone 21, and Zone 22 locations shall include those specified in 5.6.1.5(b)(1), (b)(2), and (b)(3).

FPN: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification, and, thus, to reduce the amount of special equipment required.

(1) Zone 20. A Zone 20 location is a location in which

a. Ignitable concentrations of combustible dust or ignitable fibers or flyings are present continuously.

b. Ignitable concentrations of combustible dust or ignitable fibers or flyings are present for long periods of time.

FPN No. 1: As a guide to classification of Zone 20 locations, refer to ISA 12.10.05, Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations (IEC61241-10 Mod).

FPN No. 2: Zone 20 classification includes locations inside dust containment systems; hoppers, silos, etc., cyclones and filters, dust transport systems, except some parts of belt and chain conveyors, etc.; blenders, mills, dryers, bagging equipment, etc.

(2) Zone 21. A Zone 21 location is a location

a. In which ignitable concentrations of combustible dust or ignitable fibers or flyings are likely to exist occasionally under normal operating conditions; or

b. In which ignitable concentrations of combustible dust or ignitable fibers or flyings may exist frequently because of repair or maintenance operations or because of leakage; or

c. In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result

in the release of ignitable concentrations of combustible dust, or ignitable fibers or flyings and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or

d. That is adjacent to a Zone 20 location from which ignitable concentrations of dust or ignitable fibers or flyings could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: As a guide to classification of Zone 21 locations, refer to ISA 12.10.05, Electrical Apparatus for Use In Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations (IEC61241-10 Mod).

FPN No. 2: This classification usually includes locations outside dust containment and in the immediate vicinity of access doors subject to frequent removal or opening for operation purposes when internal combustible mixtures are present; locations outside dust containment in the proximity of filling and emptying points, feed belts, sampling points, truck dump stations, belt dump over points, etc. where no measures are employed to prevent the formation of combustible mixtures; locations outside dust containment where dust accumulates and where due to process operations the dust layer is likely to be disturbed and form combustible mixtures; locations inside dust containment where explosive dust clouds are likely to occur (but neither continuously, nor for long periods, nor frequently) as, for example, silos (if filled and/or emptied only occasionally) and the dirty side of filters if large self-cleaning intervals are occurring.

(3) Zone 22. A Zone 22 location is a location

a. In which ignitable concentrations of combustible dust or ignitable fibers or flyings are not likely to occur in normal operation, and if they do occur, will only persist for a short period; or

b. In which combustible dust, or fibers, or flyings are handled, processed, or used but in which the dust, fibers, or flyings are normally confined within closed containers of closed systems from which they can escape only as a result of the abnormal operation of the equipment with which the dust, or fibers, or flyings are handled, processed, or used; or

c. That is adjacent to a Zone 21 location, from which ignitable concentrations of dust or fibers or flyings could be communicated, unless such communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: As a guide to classification of Zone 22 locations, refer to ISA 12.10.05, Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations — Classification of Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations (IEC61241-10 Mod).

FPN No. 2: Zone 22 locations usually include outlets from bag filter vents, because in the event of a malfunction there can be emission of combustible mixtures; locations near equipment that has to be opened at infrequent intervals or equipment that from experience can easily form leaks where, due to pressure above atmospheric, dust will blow out; pneumatic equipment, flexible connections that can become damaged, etc.; storage locations for bags containing dusty product, since failure of bags can occur during handling, causing dust leakage; and locations where controllable dust layers are formed that are likely to be raised into explosive dust/air mixtures. Only if the layer is removed by cleaning before hazardous dust-air mixtures can be formed is the area designated non-hazardous.

FPN No. 3: Locations that normally are classified as Zone 21 can fall into Zone 22 when measures are employed to prevent the formation of explosive dust-air mixtures. Such measures include exhaust ventilation. The measures should be used in the vicinity of (bag) filling and emptying points, feed belts, sampling points, truck dump stations, belt dump over points, etc.

5.6.1.6 Special Precaution. Article 5.6 requires equipment construction and installation that ensures safe performance under conditions of proper use and maintenance.

FPN: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

(a) Implementation of Zone Classification System. Classification of areas, engineering and design, selection of equipment and wiring methods, installation, and inspection shall be performed by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

(b) Dual Classification. In instances of areas within the same facility classified separately, Zone 22 locations shall be permitted to abut, but not overlap, Class II or Class III, Division 2 locations. Zone 20 or Zone 21 locations shall not abut Class II or Class III, Division 1 or Division 2 locations.

(c) Reclassification Permitted. A Class II or Class III, Division 1 or Division 2 location shall be permitted to be reclassified as a Zone 20, Zone 21, or Zone 22 location, provided that all of the space that is

classified because of a single combustible dust or ignitable fiber or flying source is reclassified under the requirements of this article.

(d) Simultaneous Presence of Flammable Gases and Combustible Dusts, Fibers, or Flyings. Where flammable gases or combustible dusts, fibers, or flyings are or may be present at the same time, the simultaneous presence shall be considered during the selection and installation of the electrical equipment and the wiring methods, including the determination of the safe operating temperature of the electrical equipment.

5.6.1.8 Protection Techniques. Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 5.6.1.8(a) through 5.6.1.8(f).

(a) Dust Ignitionproof. This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is identified.

(b) Pressurized. This protection technique shall be permitted for equipment in Zone 21, and Zone 22 locations for which it is identified.

(c) Intrinsic Safety. This protection technique shall be permitted for equipment in Zone 20, Zone 21, and Zone 22 locations for which it is identified. Installation of intrinsically safe apparatus and wiring shall be in accordance with the requirements of Article 5.4.

(d) Dusttight. This protection technique shall be permitted for equipment in Zone 22 locations for which it is identified.

(e) Nonincendive Circuit. This protection technique shall be permitted for equipment in Zone 22 locations for which it is identified.

(f) Nonincendive Equipment. This protection technique shall be permitted for equipment in Zone 22 locations for which it is identified.

5.6.1.9 Equipment Requirements.

(a) Suitability. Suitability of identified equipment shall be determined by one of the following:

- (1) Equipment listing or labeling
- (2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
- (3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment

(b) Listing.

(1) Equipment that is listed for Zone 20 shall be permitted in a Zone 21 or Zone 22 location of the same dust, or ignitable fiber, or flying. Equipment that is listed for Zone 21 may be used in a Zone 22 location of the same dust, fiber, or flying.

(2) Equipment shall be permitted to be listed for a specific dust, or ignitable fiber or flying, or any specific combination of dusts, fibers, or flyings.

(c) Marking. Equipment identified for Class II, Division 1 or Class II, Division 2 shall, in addition to being marked in accordance with 5.0.1.8(b), be permitted to be marked with both of the following:

- (1) Zone 20, 21, or 22 (as applicable)
- (2) Temperature classification in accordance with 5.6.1.9(d)

(d) Temperature Classifications. Equipment shall be marked to show the operating temperature referenced to a 40°C ambient. Electrical equipment designed for use in the ambient temperature range between -20°C and +40°C shall require no additional ambient temperature marking. Electrical equipment that is designed for use in a range of ambient temperatures other than -20°C and +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures. As an example, such a marking might be “-30°C Ta +40°C.” Electrical equipment suitable for ambient temperatures exceeding 40°C shall be marked with both the maximum ambient temperature and the operating temperature at that ambient temperature.

Exception No. 1: Equipment of the non-heat-producing type, such as conduit fittings, shall not be required to have a marked operating temperature.

Exception No. 2: Equipment identified for Class II, Division 1 or Class II, Division 2 locations as permitted by 5.6.1.20(b) and 5.6.1.20(c) shall be permitted to be marked in accordance with 5.0.1.6(d) and Table 5.0.1.6(d).

(e) Threading. All NPT threads referred to herein shall be threaded with a National (American) Standard Pipe Taper (NPT) thread that provides a taper of 1 in 16 (19 mm taper per 300mm). Conduit and fittings shall be made wrenchtight to prevent sparking when the fault current flows through the conduit system, and to ensure the integrity of the conduit system. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 5.6.1.9(e)(1) or (e)(2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit fittings, or cable fittings shall be used.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

5.6.1.15 Wiring Methods. Wiring methods shall maintain the integrity of the protection techniques and shall comply with 5.6.1.15(a), (b), or (c).

(a) Zone 20. In Zone 20 locations, the wiring methods in (1) through (5) shall be permitted.

(1) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(2) Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

Exception: MI cable and fittings listed for Class II, Division 1 locations are permitted to be used.

(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, Type MC cable, listed for continuous use in Zone 20 locations, with a gas/vaportight continuous corrugated metallic sheath, and overall jacket of suitable polymeric material, separate grounding conductors in accordance with 2.50.6.13, and provided with termination fittings listed for the application, shall be permitted.

Exception: MC cable and fittings listed for Class II, Division 1 locations are permitted to be used.

(4) Fittings and boxes shall be identified for use in Zone 20 locations.

Exception: Boxes and fittings listed for Class II, Division 1 locations are permitted to be used.

(5) Where necessary to employ flexible connections, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed fittings shall be used. Where flexible cords are used, they shall also comply with 5.6.1.17. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath.

Exception: Flexible conduit and flexible conduit and cord fittings listed for Class II, Division 1 locations are permitted to be used.

FPN: See 5.6.1.25 for grounding requirements where flexible conduit is used.

(b) Zone 21. In Zone 21 locations, the wiring methods in (b)(1) and (b)(2) shall be permitted.

(1) All wiring methods permitted in 5.6.1.15(a)

(2) Fittings and boxes that are dusttight, provided with threaded bosses for connection to conduit, in which taps, joints, or terminal connections are not made, and are not used in locations where metal dust is present, may be used

(c) Zone 22. In Zone 22 locations, the wiring methods in (1) through (8) shall be permitted.

(1) All wiring methods permitted in 5.6.1.15(b).

(2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.

(3) Type MC or MI cable with listed termination fittings.

(4) Type PLTC in cable trays.

(5) Type ITC in cable trays.

(6) Type MC, MI, MV, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between two adjacent cables, shall be the wiring method employed. Single conductor Type MV cables shall be shielded or metallic armored.

(7) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s).

Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring circuit, provided the simple apparatus does not interconnect the nonincendive field wiring circuit to any other circuit.

FPN: Simple apparatus is defined in 5.4.1.2.

Separation of nonincendive field wiring circuits shall be in accordance with one of the following:

a. Be in separate cables

b. Be in multiconductor cables where the conductors of each circuit are within a grounded metal shield

c. Be in multiconductor cables where the conductors have insulation with a minimum thickness of 0.25 mm

(8) Boxes and fittings shall be dusttight.

5.6.1.16 Sealing. Where necessary to protect the ingress of combustible dust, or ignitable fibers, or flyings, or to maintain the type of protection, seals shall be provided. The seal shall be identified as capable of preventing the ingress of combustible dust or ignitable fibers or flyings and maintaining the type of protection but need not be explosionproof or flameproof.

5.6.1.17 Flexible Cords. Flexible cords used in Zone 20, Zone 21, and Zone 22 locations shall comply with all of the following:

- (1) Be of a type listed for extra-hard usage
- (2) Contain, in addition to the conductors of the circuit, a grounding conductor in complying with 4.0.2.4
- (3) Be connected to terminals or to supply conductors in an approved manner
- (4) Be supported by clamps or by other suitable means in such a manner to minimize tension on the terminal connections
- (5) Be provided with suitable seals to prevent the entrance of combustible dust, or ignitable fibers, or flyings where the flexible cord enters boxes or fittings

5.6.1.20 Equipment Installation.

(a) Zone 20. In Zone 20 locations, only equipment listed and marked as suitable for the location shall be permitted.

Exception: Intrinsically safe apparatus listed for use in Class II, Division 1 locations with a suitable temperature class shall be permitted.

(b) Zone 21. In Zone 21 locations, only equipment listed and marked as suitable for the location shall be permitted.

Exception No. 1: Apparatus listed for use in Class II, Division 1 locations with a suitable temperature class shall be permitted.

Exception No. 2: Pressurized equipment identified for Class II, Division 1 shall be permitted.

(c) Zone 22. In Zone 22 locations, only equipment listed and marked as suitable for the location shall be permitted.

Exception No. 1: Apparatus listed for use in Class II, Division 1 or Class II, Division 2 locations with a suitable temperature class shall be permitted.

Exception No. 2: Pressurized equipment identified for Class II, Division 1 or Division 2 shall be permitted.

(d) Manufacturer's Instructions. Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the instructions (if any) provided by the manufacturer.

(e) Temperature. The temperature marking specified in 5.6.1.9(c)(2)e shall comply with (e)(1) or (e)(2).

(1) For combustible dusts, less than the lower of either the layer or cloud ignition temperature of the specific combustible dust. For organic dusts that may dehydrate or carbonize, the temperature marking shall not exceed the lower of either the ignition temperature or 165°C.

(2) For ignitable fibers or flyings, less than 165°C for equipment that is not subject to overloading, or 120°C for equipment (such as motors or power transformers) that may be overloaded.

FPN: See NFPA 499-2004, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Processing Areas, for minimum ignition temperatures of specific dusts.

5.6.1.21 Multiwire Branch Circuits. In Zone 20 and Zone 21 locations, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

5.6.1.25 Grounding and Bonding. Grounding and bonding shall comply with Article 2.50 and the requirements in 5.6.1.25(a) and 5.6.1.25(b).

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Zone 20, Zone 21, and

Zone 22 locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 2.50.2.13(a), (b), and (c), if the branch side overcurrent protection is located on the load side of the disconnecting means.

FPN: See 2.50.5.11 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible conduit is used as permitted in 5.6.1.15, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with 2.50.5.13.

Exception: In Zone 22 locations, the bonding jumper shall be permitted to be deleted where all of the following conditions are met:

- (1) Listed liquidtight flexible metal conduit 1 800 mm or less in length, with fittings listed for grounding, is used.*
- (2) Overcurrent protection in the circuit is limited to 10 amperes or less.*
- (3) The load is not a power utilization load.*

ARTICLE 5.10 — HAZARDOUS (CLASSIFIED) LOCATIONS — SPECIFIC

5.10.1.1 Scope. Articles 5.11 through 5.17 cover occupancies or parts of occupancies that are or may be hazardous because of atmospheric concentrations of flammable liquids, gases, or vapors, or because of deposits or accumulations of materials that may be readily ignitable.

5.10.1.2 General. The general rules of this Code and the provisions of Articles 5.0 through 5.4 shall apply to electric wiring and equipment in occupancies within the scope of Articles 5.11 through 5.17, except as

such rules are modified in Articles 5.11 through 5.17. Where unusual conditions exist in a specific occupancy, the authority having jurisdiction shall judge with respect to the application of specific rules.

ARTICLE 5.11 — COMMERCIAL GARAGES, REPAIR AND STORAGE

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.11.1.1 Scope. These occupancies shall include locations used for service and repair operations in connection with self-propelled vehicles (including, but not limited to, passenger automobiles, buses, trucks, and tractors) in which volatile flammable liquids or flammable gases are used for fuel or power.

5.11.1.3 Classifications of Locations.

(a) Unclassified Locations.

(1) Parking and Repair Garages. Parking garages used for parking or storage shall be permitted to be unclassified. Repair garages shall be permitted to be unclassified when designed in accordance with 5.11.1.3(a)(2) through 5.11.1.3(a)(7).

FPN: For further information, see NFPA 88A-2002, Standard for Parking Structures, and NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.

(2) Alcohol-Based Windshield Washer Fluid. The storage, handling, or dispensing into motor vehicles of alcohol-based windshield washer fluid in areas used for the service and repair operations of the vehicles shall not cause such areas to be classified as hazardous (classified) locations.

FPN: For further information, see 8.3.5, Exception, of NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.

(3) Specific Areas Adjacent to Classified Locations. Areas adjacent to classified locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar

locations, shall not be classified where mechanically ventilated at a rate of four or more air changes per hour, or designed with positive air pressure, or where effectively cut off by walls or partitions.

(4) Pits in Lubrication or Service Room Where Class I Liquids Are Not Transferred. Any pit, belowgrade work area, or subfloor work area that is provided with exhaust ventilation at a rate of not less than 0.3 m³/min/m² of floor area at all times that the building is occupied or when vehicles are parked in or over this area and where exhaust air is taken from a point within 300 mm of the floor of the pit, belowgrade work area, or subfloor work area is unclassified. [NFPA 30A:7.4.5.4 and Table 8.3.1]

(5) Up to a Level of 460 mm Above the Floor in Lubrication or Service Rooms Where Class I Liquids Are Transferred. For each floor, the entire area up to a level of 460 mm above the floor shall be considered unclassified where there is mechanical ventilation providing a minimum of four air changes per hour or 0.3 cubic meter per minute of exchanged air for each square meter of floor area. Ventilation shall provide for air exchange across the entire floor area, and exhaust air shall be taken at a point within 300 mm of the floor.

(6) Flammable Liquids Having Flash Points Below 38°C. Where flammable liquids having a flash point below 38°C (such as gasoline) or gaseous fuels (such as natural gas, hydrogen, or LPG) will not be transferred, such location shall be considered to be unclassified. unless the location is required to be classified in accordance with 5.11.1.3(b)(2) or (b)(4).

(7) Within 460 mm of the Ceiling. In major repair garages, where lighter-than-air gaseous fuels (such as natural gas or hydrogen) vehicles are repaired or stored, the area within 460 mm of the ceiling shall be considered unclassified where ventilation of at least 0.3 m³/min/m² of ceiling area taken from a point within 460 mm of the highest point in the ceiling is provided.

FPN: For further information on the definition of major repair garage, see 3.3.12.1 of NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.

(b) Classified Locations.

(1) Flammable Fuel Dispensing Areas. Areas in which flammable fuel is dispensed into vehicle fuel tanks shall conform to Article 5.14.

(2) Lubrication or Service Room Where Class I Liquids or Gaseous Fuels (Such as Natural Gas, Hydrogen, or LPG) Are Not Transferred. The following spaces that are not designed in accordance with 5.11.1.3(a)(4) shall be classified as Class I, Division 2:

a. Entire area within any unventilated pit, belowgrade work area, or subfloor area.

b. Area up to 460 mm above any such unventilated pit, belowgrade work area, or subfloor work area and extending a distance of 900 mm horizontally from the edge of any such pit, belowgrade work area, or subfloor work area.

(3) Lubrication or Service Room Where Class I Liquids or Gaseous Fuels (Such as Natural Gas, Hydrogen, or LPG) Are Transferred. The following spaces that are not designed in accordance with 5.11.1.3(a)(5) shall be classified as follows:

a. Up to a Level of 460 mm Above the Floor. For each floor, the entire area up to a level of 460 mm above the floor shall be a Class I, Division 2 location.

b. Any Unventilated Pit or Depression Below Floor Level. Any unventilated pit or depression below floor level shall be a Class I, Division 1 location and shall extend up to said floor level.

c. Any Ventilated Pit or Depression Below Floor Level. Any ventilated pit or depression in which six air changes per hour are exhausted from a point within 300 mm of the floor level of the pit shall be a Class I, Division 2 location.

d. Space Above an Unventilated Pit or Depression Below Floor Level. Above a pit, or depression below floor level, the space up to 460 mm above the floor or grade level and 900 mm horizontally from a lubrication pit shall be a Class I, Division 2 location.

e. Dispenser for Class I Liquids, Other Than Fuels. Within 900 mm of any fill or dispensing point, extending in all directions shall be a Class I, Division 2 location. See also 5.11.1.3(b)(1).

(4) Within 460 mm of the Ceiling. In major repair garages where lighter-than-air gaseous fuel (such as natural gas or hydrogen) vehicles are repaired or stored, ceiling spaces that are not designed in accordance with 5.11.1.3(a)(7) shall be classified as Class I, Division 2.

FPN: For further information on the definition of major repair garage, see 3.3.12.1 of NFPA 30A, 2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.

5.11.1.4 Wiring and Equipment in Class I Locations.

(a) Wiring Located in Class I Locations. Within Class I locations as classified in 5.11.1.3, wiring shall conform to applicable provisions of Article 5.1.

(b) Equipment Located in Class I Locations. Within Class I locations as defined in 5.11.1.3, equipment shall conform to applicable provisions of Article 5.1.

(1) Fuel-Dispensing Units. Where fuel-dispensing units (other than liquid petroleum gas, which is prohibited) are located within buildings, the requirements of Article 5.14 shall govern.

Where mechanical ventilation is provided in the dispensing area, the control shall be interlocked so that the dispenser cannot operate without ventilation, as prescribed in 5.0.1.5(b)(2).

(2) Portable Lighting Equipment. Portable lighting equipment shall be equipped with handle, lampholder, hook, and substantial guard attached to the lampholder or handle. All exterior surfaces that might come in contact with battery terminals, wiring terminals, or other objects shall be of nonconducting material or shall be effectively protected with insulation. Lampholders shall be of an unswitched type and shall not provide means for plug-in of attachment plugs. The outer shell shall be of molded composition or other suitable material. Unless the lamp and its cord are supported or arranged in such a manner that they cannot be used in the locations classified in 5.11.1.3, they shall be of a type identified for Class I, Division 1 locations.

5.11.1.7 Wiring and Equipment Installed Above Class I Locations.

(a) Wiring in Spaces Above Class I Locations.

(1) Fixed Wiring Above Class I Locations. All fixed wiring above Class I locations shall be in metal raceways, rigid nonmetallic conduit, electrical nonmetallic tubing, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, or shall be Type MC, AC, MI, manufactured wiring systems, or PLTC cable in accordance with Article 7.25, or Type TC cable or Type ITC cable in accordance with Article 7.27. Cellular metal floor raceways or cellular concrete floor raceways shall be permitted to be used only for supplying ceiling outlets or extensions to the area below the floor, but such raceways shall have no connections leading into or through any Class I location above the floor.

(2) Pendant. For pendants, flexible cord suitable for the type of service and listed for hard usage shall be used.

(b) Electrical Equipment Installed Above Class I Locations.

(1) Fixed Electrical Equipment. Electrical equipment in a fixed position shall be located above the level of any defined Class I location or shall be identified for the location.

a. Arcing Equipment. Equipment that is less than 3 600 mm above the floor level and that may produce arcs, sparks, or particles of hot metal, such as cutouts, switches, charging panels, generators, motors, or other equipment (excluding receptacles, lamps, and lampholders) having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

b. Fixed Lighting. Lamps and lampholders for fixed lighting that is located over lanes through which vehicles are commonly driven or that may otherwise be exposed to physical damage shall be located not less than 3 600 mm above floor level, unless of the totally enclosed type or constructed so as to prevent escape of sparks or hot metal particles.

5.11.1.9 Sealing. Seals conforming to the requirements of 5.1.2.6 and 5.1.2.6(b)(2) shall be provided and shall apply to horizontal as well as vertical boundaries of the defined Class I locations.

5.11.1.10 Special Equipment.

(a) **Battery Charging Equipment.** Battery chargers and their control equipment, and batteries being charged, shall not be located within locations classified in 5.11.1.3.

(b) Electric Vehicle Charging Equipment.

(1) General. All electrical equipment and wiring shall be installed in accordance with Article 6.25, except as noted in 5.11.1.10(b)(2) and (b)(3). Flexible cords shall be of a type identified for extra-hard usage.

(2) Connector Location. No connector shall be located within a Class I location as defined in 5.11.1.3.

(3) Plug Connections to Vehicles. Where the cord is suspended from overhead, it shall be arranged so that the lowest point of sag is at least 150 mm above the floor. Where an automatic arrangement is provided to pull both cord and plug beyond the range of physical damage, no additional connector shall be required in the cable or at the outlet.

5.11.1.12 Ground-Fault Circuit-Interrupter Protection for Personnel. All 125-volt and/or 250-volt, single-phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ground-fault circuit-interrupter protection for personnel.

5.11.1.16 Grounded and Grounding Requirements.

(a) **General Grounding Requirements.** All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 2.50.

(b) **Supplying Circuits with Grounded and Grounding Conductors in Class I Locations.** Grounding in Class I locations shall comply with 5.1.2.21.

(1) Circuits Supplying Portable Equipment or Pendants. Where a circuit supplies portables or pendants and includes a grounded conductor

as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied.

(2) Approved Means. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the non-current-carrying metal portions of pendant luminaires (fixtures), portable lamps, and portable utilization equipment.

ARTICLE 5.13 — AIRCRAFT HANGARS

5.13.1.1 Scope. This article shall apply to buildings or structures in any part of which aircraft containing Class I (flammable) liquids or Class II (combustible) liquids whose temperatures are above their flash points are housed or stored and in which aircraft might undergo service, repairs, or alterations. It shall not apply to locations used exclusively for aircraft that have never contained fuel or unfueled aircraft.

FPN No. 1: For definitions of aircraft hangar and unfueled aircraft, see NFPA 409-2004, Standard on Aircraft Hangars.

FPN No. 2: For further information on fuel classification see NFPA 30-2003, Flammable and Combustible Liquids Code.

5.13.1.2 Definitions. For the purpose of this article, the following definitions shall apply.

Mobile Equipment. Equipment with electric components suitable to be moved only with mechanical aids or is provided with wheels for movement by person(s) or powered devices.

Portable Equipment. Equipment with electric components suitable to be moved by a single person without mechanical aids.

5.13.1.3 Classification of Locations.

(a) **Below Floor Level.** Any pit or depression below the level of the hangar floor shall be classified as a Class I, Division 1 or Zone 1 location that shall extend up to said floor level.

(b) Areas Not Cut Off or Ventilated. The entire area of the hangar, including any adjacent and communicating areas not suitably cut off from the hangar, shall be classified as a Class I, Division 2 or Zone 2 location up to a level 460 mm above the floor.

(c) Vicinity of Aircraft. The area within 1 500 mm horizontally from aircraft power plants or aircraft fuel tanks shall be classified as a Class I, Division 2 or Zone 2 location that shall extend upward from the floor to a level 1 500 mm above the upper surface of wings and of engine enclosures.

(d) Areas Suitably Cut Off and Ventilated. Adjacent areas in which flammable liquids or vapors are not likely to be released, such as stock rooms, electrical control rooms, and other similar locations, shall not be classified where adequately ventilated and where effectively cut off from the hangar itself by walls or partitions.

5.13.1.4 Wiring and Equipment in Class I Locations.

(a) General. All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in 5.13.1.3 shall comply with the applicable provisions of Article 5.1 or Article 5.5 for the division or zone in which they are used.

Attachment plugs and receptacles in Class I locations shall be identified for Class I locations or shall be designed such that they cannot be energized while the connections are being made or broken.

(b) Stanchions, Rostrums, and Docks. Electric wiring, outlets, and equipment (including lamps) on or attached to stanchions, rostrums, or docks that are located or likely to be located in a Class I location, as defined in 5.13.1.3(c), shall comply with the applicable provisions of Article 5.1 or Article 5.5 for the division or zone in which they are used.

5.13.1.7 Wiring and Equipment Not Installed in Class I Locations.

(a) Fixed Wiring. All fixed wiring in a hangar but not installed in a Class I location as classified in 5.13.1.3 shall be installed in metal raceways or shall be Type MI, TC, or MC cable.

Exception: Wiring in unclassified locations, as described in 5.13.1.3(d),

shall be permitted to be any suitable type wiring method recognized in Chapter 3.

(b) Pendants. For pendants, flexible cord suitable for the type of service and identified for hard usage or extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(c) Arcing Equipment. In locations above those described in 5.13.1.3, equipment that is less than 3 000 mm above wings and engine enclosures of aircraft and that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, charging panels, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

Exception: Equipment in areas described in 5.13.1.3(d) shall be permitted to be of the general-purpose type.

(d) Lampholders. Lampholders of metal-shell, fiber-lined types shall not be used for fixed incandescent lighting.

(e) Stanchions, Rostrums, or Docks. Where stanchions, rostrums, or docks are not located or likely to be located in a Class I location, as defined in 5.13.1.3(c), wiring and equipment shall comply with 5.13.1.7, except that such wiring and equipment not more than 450 mm above the floor in any position shall comply with 5.13.1.4(b). Receptacles and attachment plugs shall be of a locking type that will not readily disconnect.

(f) Mobile Stanchions. Mobile stanchions with electric equipment complying with 5.13.1.7(e) shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING — KEEP 1.5 METERS CLEAR OF
AIRCRAFT ENGINES AND FUEL TANK AREAS

5.13.1.8 Underground Wiring.

(a) Wiring and Equipment Embedded, Under Slab, or Under Ground. All wiring installed in or under the hangar floor shall comply

with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided.

(b) Uninterrupted Raceways, Embedded, Under Slab, or Underground. Uninterrupted raceways that are embedded in a hangar floor or buried beneath the hangar floor shall be considered to be within the Class I location above the floor, regardless of the point at which the raceway descends below or rises above the floor.

5.13.1.9 Sealing. Seals shall be provided in accordance with 5.1.2.6 or 5.5.1.16, as applicable. Sealing requirements specified shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

5.13.1.10 Special Equipment.

(a) Aircraft Electrical Systems.

(1) De-energizing Aircraft Electrical Systems. Aircraft electrical systems shall be de-energized when the aircraft is stored in a hangar and, whenever possible, while the aircraft is undergoing maintenance.

(2) Aircraft Batteries. Aircraft batteries shall not be charged where installed in an aircraft located inside or partially inside a hangar.

(b) Aircraft Battery Charging and Equipment. Battery chargers and their control equipment shall not be located or operated within any of the Class I locations defined in 5.13.1.3 and shall preferably be located in a separate building or in an area such as defined in 5.13.1.3(d). Mobile chargers shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING — KEEP 1.5 METERS CLEAR OF
AIRCRAFT ENGINES AND FUEL TANK AREAS

Tables, racks, trays, and wiring shall not be located within a Class I location and, in addition, shall comply with Article 4.80.

(c) External Power Sources for Energizing Aircraft.

(1) Not Less Than 460 mm Above Floor. Aircraft energizers shall be designed and mounted such that all electric equipment and fixed wiring will be at least 460 mm above floor level and shall not be operated in a Class I location as defined in 5.13.1.3(c).

(2) Marking for Mobile Units. Mobile energizers shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING — KEEP 1.5 METERS CLEAR OF
AIRCRAFT ENGINES AND FUEL TANK AREAS

(3) Cords. Flexible cords for aircraft energizers and ground support equipment shall be identified for the type of service and extra-hard usage and shall include an equipment grounding conductor.

(d) Mobile Servicing Equipment with Electric Components.

(1) General. Mobile servicing equipment (such as vacuum cleaners, air compressors, air movers) having electric wiring and equipment not suitable for Class I, Division 2 or Zone 2 locations shall be so designed and mounted that all such fixed wiring and equipment will be at least 460 mm above the floor. Such mobile equipment shall not be operated within the Class I location defined in 5.13.1.3(c) and shall carry at least one permanently affixed warning sign with the following words or equivalent:

WARNING — KEEP 1.5 METERS CLEAR OF
AIRCRAFT ENGINES AND FUEL TANK AREAS

(2) Cords and Connectors. Flexible cords for mobile equipment shall be suitable for the type of service and identified for extra-hard usage and shall include an equipment grounding conductor. Attachment plugs and receptacles shall be identified for the location in which they are installed and shall provide for connection of the equipment grounding conductor.

(3) Restricted Use. Equipment that is not identified as suitable for Class I, Division 2 locations shall not be operated in locations where

maintenance operations likely to release flammable liquids or vapors are in progress.

(e) Portable Equipment.

(1) Portable Lighting Equipment. Portable lighting equipment that is used within a hangar shall be identified for the location in which they are used. For portable lamps, flexible cord suitable for the type of service and identified for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(2) Portable Utilization Equipment. Portable utilization equipment that is or may be used within a hangar shall be of a type suitable for use in Class I, Division 2 or Zone 2 locations. For portable utilization equipment, flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

5.13.1.12 Ground-Fault Circuit-Interrupter Protection for Personnel. All 125-volt and/or 250-volt, 50/60 Hz, single phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ground-fault circuit-interrupter protection for personnel.

5.13.1.16 Grounded and Grounding Requirements.

(a) General Grounding Requirements. All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 2.50. Grounding in Class I locations shall comply with 5.1.2.21 for Class I, Division 1 and 2 locations and 5.5.1.25 for Class I, Zone 0, 1, and 2 locations.

(b) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations.

(1) Circuits Supplying Portable Equipment or Pendants. Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 2.0, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of

any lampholder or to the grounded terminal of any utilization equipment supplied.

(2) Approved Means. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the non-current-carrying metal portions of pendant luminaires (fixtures), portable lamps, and portable utilization equipment.

ARTICLE 5.14 — MOTOR FUEL DISPENSING FACILITIES

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.14.1.1 Scope. This article shall apply to motor fuel dispensing facilities, marine/motor fuel dispensing facilities, motor fuel dispensing facilities located inside buildings, and fleet vehicle motor fuel dispensing facilities.

FPN: For further information regarding safeguards for motor fuel dispensing facilities, see NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.

5.14.1.2 Definition.

Motor Fuel Dispensing Facility. That portion of a property where motor fuels are stored and dispensed from fixed equipment into the fuel tanks of motor vehicles or marine craft or into approved containers, including all equipment used in connection therewith. [NFPA 30A:3.3.11]

FPN: Refer to Articles 5.10 and 5.11 with respect to electric wiring and equipment for other areas used as lubricatoriums, service rooms, repair rooms, offices, salesrooms, compressor rooms, and similar locations.

5.14.1.3 Classification of Locations.

(a) Unclassified Locations. Where the authority having jurisdiction can satisfactorily determine that flammable liquids having a flash point below 38°C, such as gasoline, will not be handled, such location shall not be required to be classified.

(b) Classified Locations.

(1) Class I Locations. Table 5.14.1.3(b)(1) shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify motor fuel dispensing facilities and commercial garages as defined in Article 5.11. Table 5.15.1.3 shall be used for the purpose of delineating and classifying aboveground tanks. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition. [NFPA 30A:8.1, 8.3]

(2) Compressed Natural Gas, Liquefied Natural Gas, and Liquefied Petroleum Gas Areas. Table 5.14.1.3(b)(2) shall be used to delineate and classify areas where compressed natural gas (CNG), liquefied natural gas (LNG), or liquefied petroleum gas (LPG) are stored, handled, or dispensed. Where CNG or LNG dispensers are installed beneath a canopy or enclosure, either the canopy or the enclosure shall be designed to prevent accumulation or entrapment of ignitable vapors, or all electrical equipment installed beneath the canopy or enclosure shall be suitable for Class I, Division 2 hazardous (classified) locations. Dispensing devices for liquefied petroleum gas shall be located not less than 1 500 mm from any dispensing device for Class I liquids. [NFPA 30A:12.1, 12.4, 12.5]

FPN No. 1: For information on area classification where liquefied petroleum gases are dispensed, see NFPA 58-2004, Liquefied Petroleum Gas Code.

FPN No. 2: For information on classified areas pertaining to LP-Gas systems other than residential or commercial, see NFPA 58-2004, Liquefied Petroleum Gas Code, and NFPA 59-2004, Utility LP-Gas Plant Code.

FPN No. 3: See 5.55.1.21 for motor fuel dispensing stations in marinas and boatyards.

5.14.1.4 Wiring and Equipment Installed in Class I Locations. All electrical equipment and wiring installed in Class I locations as classified in 5.14.1.3 shall comply with the applicable provisions of Article 5.1.

Exception: As permitted in 5.14.1.8.

FPN: For special requirements for conductor insulation, see 5.1.2.11.

Table 5.14.1.3(b)(1). Class I Locations — Motor Fuel Dispensing Facilities

Location	Class I, Group D Division	Extent of Classified Location
Underground Tank Fill Opening Vent-Discharging Upward	1	Any pit, box, or space below grade level, any part of which is within the Division 1 or 2 classified location.
	2	Up to 450 mm above grade level within a horizontal radius of 3 000 mm from a loose fill connection and within a horizontal radius of 1 500 mm from tight fill connection.
	1	Within 900 mm of open end of vent, extending in all directions.
	2	Space between 900 mm and 1 500 mm of open end of vent, extending in all directions
Dispensing Device ⁴ (except overhead type) ² Pits Dispenser Outdoor Indoor With Mechanical Ventilation With Gravity Ventilation	1	Any pit, box, or space below grade level, any part of which is within the Division 1 or 2 classified location. FPN: Space classification inside the dispenser enclosure is covered in <i>Power Operated dispensing Device for Petroleum Products</i> , ANSI/UL 87-1995.
	2	Within 450 mm horizontally in all directions extending to grade from the dispenser enclosure or that portion of the dispenser enclosure containing liquid handling components. FPN: Space classification inside the dispenser enclosure is covered in <i>Power Operated dispensing Device for Petroleum Products</i> , ANSI/UL 87-1995.
	2	Up to 450 mm above grade level within 6 000 mm horizontally of any edge of enclosure.
	2	Up to 450 mm above grade or floor level within 6 000 mm horizontally of any edge of enclosure.
	2	Up to 450 mm above grade or floor level within 7 600 mm horizontally of any edge of enclosure.

Table 5.14.1.3(b)(1) (Continued)

Location	Class I, Group D Division	Extent of Classified Location
Dispensing Device⁴ Overhead Type ²	1	The space within the dispenser enclosure, and all electrical equipment integral with the dispenser hose or nozzle.
	2	A space extending 450 mm horizontally in all directions beyond the enclosure and extending to grade.
	2	Up to 450 mm above grade level within 6 000 mm horizontally measured from a point vertically below the edge of any dispenser enclosure.
Remote Pump — Outdoor	1	Any pit, box, or space below grade level if any part is within a horizontal distance of 3 000 mm from any edge of pump.
	2	Within 900 mm of any edge of pump, extending in all directions. Also up to 450 mm above grade level within 3 000 mm horizontally from any edge of pump.
Remote Pump—Indoor	1	Entire space within any pit.
	2	Within 1 500 mm of any edge of pump, extending in all direction. Also up to 900 mm above grade level within 7 600 mm horizontally from any edge of pump.
Lubrication or Service Room — Without Dispensing	2	Entire area within any pit used for lubrication or similar service where Class I liquids may be released.
	2	Area up to 460 mm above any such pit, and extending a distance of 900 mm horizontally from the edge of the pit.
	2	Entire unventilated area within any pit, below grade area, or subfloor area.
	2	Area up to 460 mm above any such unventilated pit, below grade work area, or subfloor work area and extending a distance of 900 mm horizontally from the edge of any such pit, below grade work area, subfloor work area.
	Unclassified	Any pit, below grade work area, or subfloor work area that is provided with exhaust ventilation at a rate of not less than 0.3 m ³ /minute/m ² of floor area at all times that the building is occupied or when vehicles are parked in or over this area and where exhaust air is taken from a point within 300 mm of the floor of the pit, below grade work area, or subfloor work area.

Table 5.14.1.3(b)(1) (Continued)

Location	Class I, Group D Division	Extent of Classified Location
Special Enclosure Inside Building³	1	Entire enclosure.
Sales, Storage, and Rest Rooms	Unclassified	If there is any opening to these rooms within the extent of a Division 1 location, the entire room shall be classified as Division 1.
Vapor Processing System Pits	1	Any pit, box, or space below grade level, any part of which is within a Division 1 or 2 classified location or that houses any equipment used to transport or process vapors.
Vapor Processing Equipment Located Within Protective Enclosures FPN: See <i>Automotive and Marine Service Station Code</i> , NFPA 30A-1996, Section 4-5.7	2	Within any protective enclosure housing vapor processing equipment.
Vapor Processing Equipment Not Within Protective Enclosures (excluding piping and combustion devices)	2	The space within 450 mm in all directions of equipment containing flammable vapor or liquid extending to grade level. Up to 450 mm above grade level within 3 000 mm horizontally of the vapor processing equipment.
Equipment Enclosures	1	Any space within the enclosure where vapor or liquid is present under normal operating conditions.
Vacuum-Assist Blowers	2	The space within 450 mm in all directions extending to grade level. Up to 450 mm. above grade level within 3 000 mm horizontally.

¹Refer to Figure 5.14.1.2 for an illustration of classified location around dispensing devices.

²Ceiling mounted hose reel.

³FPN: See *Automotive and Marine Service Station Code*, NFPA 30A-1996, Section 2-2.

⁴FPN: Area classification inside the dispenser enclosure is covered in *Power-Operated Dispensing Devices for Petroleum Products*, ANSI/UL 87-1995.

Table 5.14.1.3(b)(2). Electrical Equipment Classified Areas for Dispensing Devices

Dispensing Device	Extent of Classified Area	
	Class I, Division 1	Class I, Division 2
Compressed natural gas	Entire space within the dispenser enclosure	1 500 mm in all directions from dispenser enclosure
Liquefied natural gas	Entire space within the dispenser enclosure and 1 500 mm in all directions from the dispenser enclosure	From 1 500 mm to 3 000 mm in all directions from the dispenser enclosure
Liquefied petroleum gas	Entire space within the dispenser enclosure; 450 mm from the exterior surface of the dispenser enclosure to an elevation of 1 200 mm above the base of the dispenser; the entire pit or open space beneath the dispenser and within 6 000 mm horizontally from any edge of the dispenser when the pit or trench is not mechanically ventilated.	Up to 450 mm aboveground and within 6 000 mm horizontally from any edge of the dispenser enclosure, including pits or trenches within this area when provided with adequate mechanical ventilation

[NFPA 30A: Table 12.6.2]

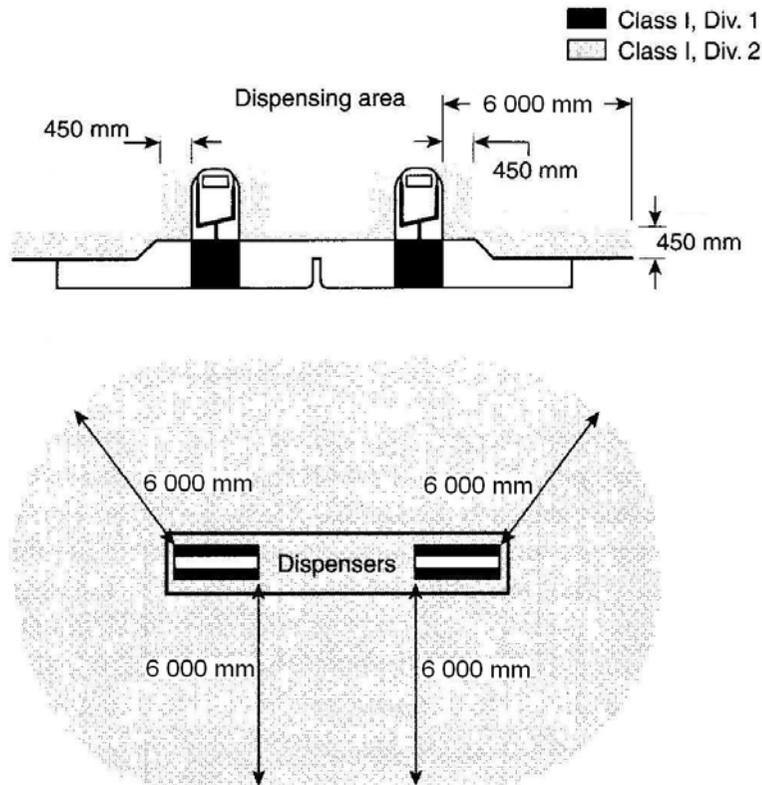

Figure 5.14.1.3 Classified locations adjacent to dispensers as detailed in Table 5.14.1.3(b)(1)

5.14.1.4 Wiring and Equipment Installed in Class I Locations. All electrical equipment and wiring installed in Class I locations as classified in 5.14.1.3 shall comply with the applicable provisions of Article 5.1.

Exception: As permitted in 5.14.1.8.

FPN: For special requirements for conductor insulation, see 5.1.2.11.

5.14.1.7 Wiring and Equipment Above Class I Locations. Wiring and equipment above the Class I locations as classified in 5.14.1.3 shall comply with 5.11.1.7.

5.14.1.8 Underground Wiring. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring that is below the surface of a Class I, Division 1, or a Class I, Division 2, location [as classified in Table 5.14.1.3(b)(1) and Table 5.14.1.3(b)(2)] shall be sealed within 3 000 mm of the point of emergence above grade. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point of emergence above grade. Refer to Table 3.0.1.5.

Exception No. 1: Type MI cable shall be permitted where it is installed in accordance with Article 3.32.

Exception No. 2: Rigid nonmetallic conduit shall be permitted where buried under not less than 600 mm cover. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm of the underground run to emergence or to the point of connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

5.14.1.9 Sealing.

(a) At Dispenser. A listed seal shall be provided in each conduit run entering or leaving a dispenser or any cavities or enclosures in direct communication therewith. The sealing fitting shall be the first fitting after the conduit emerges from the earth or concrete.

(b) At Boundary. Additional seals shall be provided in accordance with 5.1.2.6. Sections 5.1.2.6(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

5.14.1.11 Circuit Disconnects.

(a) General. Each circuit leading to or through dispensing equipment, including equipment for remote pumping systems, shall be

provided with a clearly identified and readily accessible switch or other acceptable means, located remote from the dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuits, including the grounded conductor, if any.

Single-pole breakers utilizing handle ties shall not be permitted.

(b) Attended Self-Service Motor Fuel Dispensing Facilities.

Emergency controls as specified in 5.14.1.11(a) shall be installed at a location acceptable to the authority having jurisdiction, but controls shall not be more than 30 m from dispensers. [NFPA 30A:6.7.1]

(c) Unattended Self-Service Motor Fuel Dispensing Facilities.

Emergency controls as specified in 5.14.1.11(a) shall be installed at a location acceptable to the authority having jurisdiction, but the control shall be more than 6 000 mm but less than 30 m from the dispensers. Additional emergency controls shall be installed on each group of dispensers or the outdoor equipment used to control the dispensers. Emergency controls shall shut off all power to all dispensing equipment at the station. Controls shall be manually reset only in a manner approved by the authority having jurisdiction. [NFPA 30A:6.7.2]

FPN: For additional information, see 6.7.1 and 6.7.2 of NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.

5.14.1.13 Provisions for Maintenance and Service of Dispensing Equipment. Each dispensing device shall be provided with a means to remove all external voltage sources, including feedback, during periods of maintenance and service of the dispensing equipment. The location of this means shall be permitted to be other than inside or adjacent to the dispensing device. The means shall be capable of being locked in the open position.

5.14.1.16 Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 2.50. Grounding in Class I locations shall comply with 5.1.3.31.

ARTICLE 5.15 — BULK STORAGE PLANTS

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 30-2003, Flammable and Combustible Liquids Code. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.15.1.1 Scope. This article covers a property or portion of a property where flammable liquids are received by tank vessel, pipelines, tank car, or tank vehicle and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container.

5.15.1.2 Definition.

Bulk Plant or Terminal. That portion of a property where liquids are received by tank vessel, pipelines, tank car, or tank vehicle and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container. [NFPA 30:3.3.32.1]

FPN: For further information, see NFPA 30-2003, Flammable and Combustible Liquids Code.

5.15.1.3 Class I Locations. Table 5.15.1.3 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify bulk storage plants. The class location shall not extend beyond a floor, wall, roof, or other solid partition that has no communicating openings. [NFPA 30:8.1, 8.2.2]

FPN No. 1: The area classifications listed in Table 5.15.1.3 are based on the premise that the installation meets the applicable requirements of NFPA 30-2003, Flammable and Combustible Liquids Code, Chapter 5, in all respects. Should this not be the case, the authority having jurisdiction has the authority to classify the extent of the classified space.

FPN No. 2: See 5.55.1.21 for gasoline dispensing stations in marinas and boatyards.

5.15.1.4 Wiring and Equipment Located in Class I Locations. All electrical wiring and equipment within the Class I locations defined in 5.15.1.3 shall comply with the applicable provisions of Article 5.1 or Article 5.5 for the division or zone in which they are used.

Exception: As permitted in 5.15.1.8.

Table 5.15.1.3 Electrical Area Classifications

Location	Class I, Division	Zone	Extent of Classified Location	
Indoor equipment installed in accordance with Section 5.3 of NFPA 30 where flammable vapor-air mixtures can exist under normal operation	1	0	The entire area associated with such equipment where flammable gases or vapors are present continuously or for long periods of time	
	1	1	Area within 1 500 mm of any edge of such equipment, extending in all directions.	
	2	2	Area between 1 500 mm and 2 400 mm of any edge of such equipment, extending in all directions; also space up to 900 mm above floor or grade level within 1 500 mm to 7 600 mm horizontally from any edge of such equipment	
Outdoor equipment of the type covered in Section 5.3 of NFPA 30 where flammable vapor-air mixtures may exist under normal operation	1	0	The entire area associated with such equipment where flammable gases or vapors are present continuously or for long periods of time.	
	1	1	Area within 900 mm of any edge of such equipment, extending in all directions.	
	2	2	Area between 900 mm and 2 400 mm of any edge of such equipment, extending in all directions; also, space up to 900 mm above floor or grade level within 900 mm to 3 000 mm horizontally from any edge of such equipment	
Tank storage installations inside buildings	1	1	All equipment located below grade level	
	2	2	Any equipment located at or above grade level	
Tank – Aboveground ²	1	0	Inside fixed roof tank.	
	1	1	Area inside dike where dike height is greater than the distance from the tank to the dike for more than 50 percent of the tank circumference.	
	2	2	Within 3 000 mm from shell, ends, or roof of tank; also, area inside dike to level of top of tank	
			Area inside of vent piping or opening.	
	Vent	1	0	Within 1 500 mm of open end of vent, extending in all directions.
	Floating Roof with fixed outer roof	1	1	
Floating Roof with no fixed outer roof	1	1	Area above the floating roof and within the shell.	

Table 5.15.1.3 (Continued)

Location	Class I, Division	Zone	Extent of Classified Location
Underground tank fill opening	1	1	Any pit, or space below grade level, if any part is within a Division 1 or 2, or Zone 1 or 2, classified location.
	2	2	Up to 450 mm above grade level within a horizontal radius of 3 000 mm from a loose fill connection, and within a horizontal radius of 1 500 mm from a tight fill connection.
Vent – discharging upward	1	0	Area inside of vent piping or opening.
	1	1	Within 900 mm of open end of vent, extending in all directions.
	2	2	Area between 900 mm and 1 500 mm of open end of vent, extending in all directions.
Drum and container filling – outdoors or indoors	1	0	Area inside the drum or container .
	1	1	Within 900 mm of vent and fill openings, extending in all directions.
	2	2	Area between 900 mm and 1 500 mm from vent or fill opening, extending in all directions; also, up to 450 mm above floor or grade level within a horizontal radius of 3 000 mm from vent or fill opening.
Pumps, bleeders, withdrawal fittings, Indoors	2	2	Within 1 500 mm of any edge of such devices, extending in all directions; also, up to 900 mm above floor or grade level within 7 600 mm horizontally from any edge of such devices.
	2	2	Within 900 mm of any edge of such devices, extending in all directions. Also, up to 450 mm above grade level within 3 000 mm horizontally from any edge of such devices.
Pits and sumps Without mechanical ventilation	1	1	Entire area within a pit or sump if any part is within a Division 1 or 2, or Zone 1 or 2, classified location.
	2	2	Entire area within a pit or sump if any part is within a Division 1 or 2, or Zone 1 or 2, classified location .
	2	2	Entire pit or sump
With adequate mechanical ventilation	2	2	Entire pit or sump
Containing valves, fittings, or piping, and not within a Division 1 or 2, or Zone 1 or 2, classified location	2	2	Entire pit or sump

Table 5.15.1.3 (Continued)

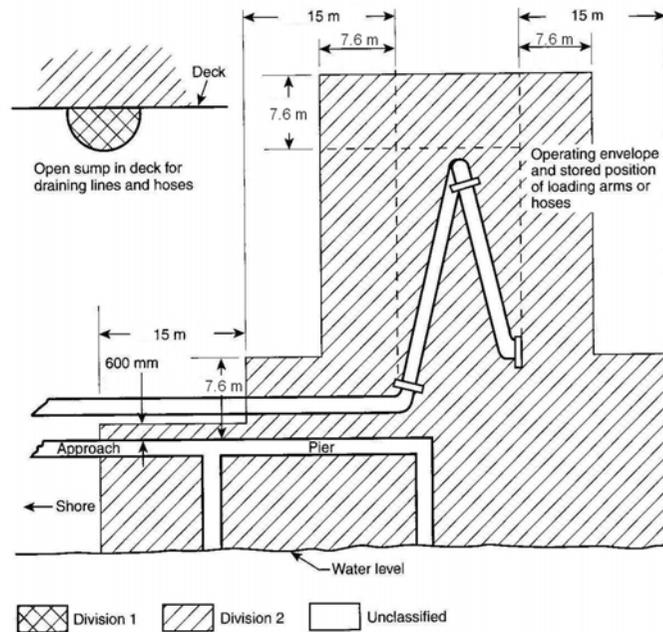

Location	Class I, Division	Zone	Extent of Classified Location
Drainage ditches, separators, impounding basins Outdoors	2	2	Area up to 450 mm above ditch, separator, or basin; also, area up to 450 mm above grade within 4 500 mm horizontally from any edge
Indoors			Same classified area as pits.
Tank vehicle and tank car ² loading through open dome	1	0	Area inside of the tank.
	1	1	Within 900 mm of edge of dome, extending in all directions.
	2	2	Area between 900 mm and 4 500 mm from edge of dome, extending in all directions.
Loading through bottom connections with atmospheric venting	1	0	Area inside of the tank.
	1	1	Within 900 mm of point of venting to atmosphere, extending in all directions.
	2	2	Area between 900 mm and 4 500 mm from point of venting to atmosphere, extending in all directions; also up to 450 mm above grade within a horizontal radius of 3 000 mm from point of loading connection.
Office and rest rooms	Ordinary	Ordinary	If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.
Loading through closed dome with atmospheric venting	1	1	Within 900 mm of open end of vent, extending in all directions.
	2	2	Area between 900 mm and 4 500 mm from open end of vent, extending in all directions; also, within 900 mm of edge of dome, extending in all directions.
Loading through closed dome with vapor control	2	2	Within 900 mm of point of connection of both fill and vapor lines extending in all directions
Bottom loading with vapor control or any bottom unloading	2	2	Within 900 mm of point of connections, extending in all directions; also up to 450 mm above grade within a horizontal radius of 3 000 mm from point of connections.
Storage and repair garage for tank vehicles.	1	1	All pits or spaces below floor level.
	2	2	Area up to 450 mm above floor or grade level for entire storage or repair garage.
Garages for other than tank vehicles.	Ordinary	Ordinary	If there is any opening to these rooms within the extent of an outdoor classified location, the entire room shall be classified the same as the area classification at the point of the opening.

Table 5.15.1.3 (Continued)

Location	Class I, Division	Zone	Extent of Classified Location
Outdoor drum storage	Ordinary	Ordinary	
Inside rooms or storage lockers used for the storage of Class I liquids	2	2	Entire room
Indoor warehousing where there is no flammable liquid transfer	Ordinary	Ordinary	If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.
Piers and wharves			See Figure 5.15.1.3.

¹The release of Class I liquids may generate vapors to the extent that the entire building, and possibly an area surrounding it, should be considered a Class I, Division 2 or Zone 2 location.

²When classifying extent of area, consideration shall be given to fact that tank cars or tank vehicles may be spotted at varying points. Therefore, the extremities of the loading or unloading positions shall be used. [NFPA 30:Table 8.2.2]

Notes:

- (1) The "source of vapor" shall be the operating envelope and stored position of the outboard flange connection of the loading arm (or hose).
- (2) The berth area adjacent to tanker and barge cargo tanks is to be Division 2 to the following extent:
 - a. 7 600 mm horizontally in all directions on the pier side from that portion of the hull containing cargo tanks.
 - b. From the water level 7 600 mm above the cargo tanks at their highest position.
- (3) Additional locations may have to be classified as required by the presence of other sources of flammable liquids on the berth, or by Coast Guard or other regulations.

Figure 5.15.1.3 Marine Terminal Handling Flammable Liquids. [NFPA 30:Figure 7.7.16]

5.15.1.4 Wiring and Equipment Located in Class I Locations. All electrical wiring and equipment within the Class I locations defined in 5.15.1.3 shall comply with the applicable provisions of Article 5.1 or Article 5.5 for the division or zone in which they are used.

Exception: As permitted in 5.15.1.8.

5.15.1.7 Wiring and Equipment Above Class I Locations.

(a) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways or PVC Schedule 80 rigid nonmetallic conduit, or equivalent, or be Type MI, TC, or MC cable.

(b) Fixed Equipment. Fixed equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

(c) Portable Lamps or Other Utilization Equipment. Portable lamps or other utilization equipment and their flexible cords shall comply with the provisions of Article 5.1 or Article 5.5 for the class of location above which they are connected or used.

5.15.1.8 Underground Wiring.

(a) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 600 mm of cover, shall be permitted in rigid nonmetallic conduit or a listed cable. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm of the conduit run to emergence or to the point of connection to the aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.

(b) Insulation. Conductor insulation shall comply with 5.1.2.11.

(c) Nonmetallic Wiring. Where rigid nonmetallic conduit or cable with a nonmetallic sheath is used, an equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

5.15.1.9 Sealing. Sealing requirements shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways and cables under defined Class I locations shall be considered to be within a Class I, Division 1 or Zone 1 location.

5.15.1.10 Special Equipment — Gasoline Dispensers. Where gasoline or other volatile flammable liquids or liquefied flammable gases are dispensed at bulk stations, the applicable provisions of Article 5.14 shall apply.

5.15.1.16 Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with 5.1.2.21 for Class I, Division 1 and 2 locations and 5.5.1.25 for Class I, Zone 0, 1, and 2 locations.

FPN: For information on grounding for static protection, see 4.5.3.4 and 4.5.3.5 of NFPA 30-2003, Flammable and Combustible Liquids Code.

ARTICLE 5.16 — SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 33-2003, Standard for Spray Application Using Flammable and Combustible Materials, or NFPA 34-2003, Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.16.1.1 Scope. This article covers the regular or frequent application of flammable liquids, combustible liquids, and combustible powders by spray operations and the application of flammable liquids, or combustible liquids at temperatures above their flashpoint, by dipping, coating, or other means.

FPN: For further information regarding safeguards for these processes, such as fire protection, posting of warning signs, and maintenance, see NFPA 33-2003, Standard for Spray Application Using Flammable and Combustible Materials, and NFPA 34-2003, Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids. For additional information regarding ventilation, see NFPA 91-2004, Standard for Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids.

5.16.1.2 Definitions. For the purpose of this article, the following definitions shall apply.

Spray Area. Normally, locations outside of buildings or localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits shall be the maximum area in the direct path of spray operations. In manual operations, the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.

Spray Booth. An enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust but may draw supply air from the larger room or have a dedicated air supply.

Spray Room. A purposefully enclosed room built for spray/coating/dipping applications provided with dedicated ventilation supply and exhaust. Normally the room is configured to house the item to be painted, providing reasonable access around the item/process. Depending on the size of the item being painted, such rooms may actually be the entire building or the major portion thereof.

5.16.1.3 Classification of Locations. Classification is based on dangerous quantities of flammable vapors, combustible mists, residues, dusts, or deposits.

(a) Class I, Division 1 or Class I, Zone 0 Locations. The following spaces shall be considered Class I, Division 1, or Class I, Zone 0, as applicable:

- (1) The interior of any open or closed container of a flammable liquid
- (2) The interior of any dip tank or coating tank

FPN: For additional guidance and explanatory diagrams, see 4.3.5 of NFPA 33-2003, Standard for Spray Application Using Flammable or Combustible Materials, and Sections 4.2, 4.3, and 4.4 of NFPA 34-2003, Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids.

(b) Class I or Class II, Division 1 Locations. The following spaces shall be considered Class I, Division 1, or Class I, Zone 1, or Class II, Division 1 locations, as applicable:

(1) The interior of spray booths and rooms except as specifically provided in 5.16.1.3(d).

(2) The interior of exhaust ducts.

(3) Any area in the direct path of spray operations.

(4) For open dipping and coating operations, all space within a 1 500-mm radial distance from the vapor sources extending from these surfaces to the floor. The vapor source shall be the liquid exposed in the process and the drainboard, and any dipped or coated object from which it is possible to measure vapor concentrations exceeding 25 percent of the lower flammable limit at a distance of 300 mm, in any direction, from the object.

(5) Sumps, pits, or belowgrade channels within 7 600 mm horizontally of a vapor source. If the sump, pit, or channel extends beyond 7 600 mm from the vapor source, it shall be provided with a vapor stop or it shall be classified as Class I, Division 1 for its entire length.

(6) All space in all directions outside of but within 900 mm of open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids.

(c) Class I or Class II, Division 2 Locations. The following spaces shall be considered Class I, Division 2 or Class I, Zone 2, or Class II, Division 2 as applicable.

(1) Open Spraying. For open spraying, all space outside of but within 6 000 mm horizontally and 3 000 mm vertically of the Class I, Division 1 or Class I, Zone 1 location as defined in 5.16.1.3(a), and not separated from it by partitions. See Figure 5.16.1.3(b)(1). [NFPA 33:6.5.1]

(2) Closed-Top, Open-Face, and Open-Front Spraying. If spray application operations are conducted within a closed-top, open-face, or open-front booth or room, any electrical wiring or utilization equipment located outside of the booth or room but within the boundaries designated as Division 2 or Zone 2 in Figure 5.16.1.3(b)(2) shall be suitable for Class I, Division 2, Class I, Zone 2, or Class II, Division 2 locations, whichever is applicable. The Class I, Division 2, Class I, Zone

2, or Class II, Division 2 locations shown in Figure 5.16.1.3(b)(2) shall extend from the edges of the open face or open front of the booth or room in accordance with the following:

a. If the exhaust ventilation system is interlocked with the spray application equipment, the Division 2 or Zone 2 location shall extend 1 500 mm horizontally and 900 mm vertically from the open face or open front of the booth or room, as shown in Figure 5.16.1.3(b)(2), top.

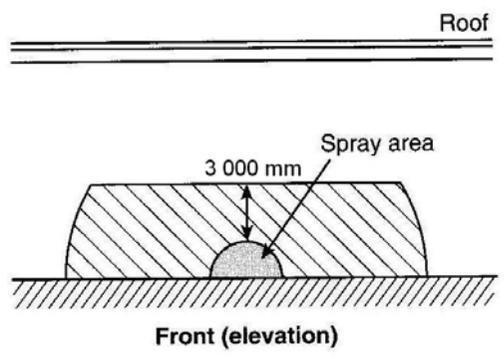

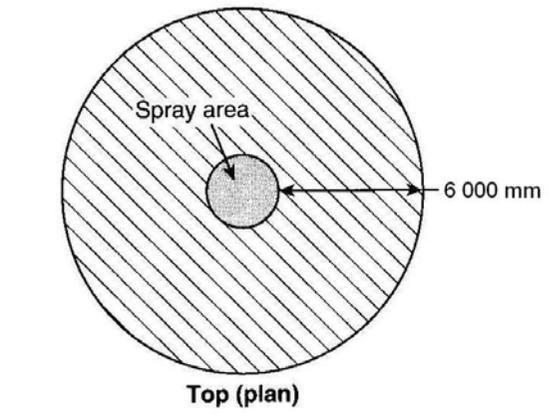

b. If the exhaust ventilation system is not interlocked with the spray application equipment, the Division 2 or Zone 2 location shall extend 3 000 mm horizontally and 900 mm vertically from the open face or open front of the booth or room, as shown in Figure 5.16.1.3(b)(2), bottom.

For the purposes of this subsection, interlocked shall mean that the spray application equipment cannot be operated unless the exhaust ventilation system is operating and functioning properly and spray application is automatically stopped if the exhaust ventilation system fails. [NFPA 33:6.5.2]

(3) Open-Top Spraying. For spraying operations conducted within an open top spray booth, the space 900 mm vertically above the booth and within 900 mm of other booth openings shall be considered Class I, Division 2, Class I, Zone 2, or Class II, Division 2. [NFPA 33:6.5.3]

(4) Enclosed Booths and Rooms. For spraying operations confined to an enclosed spray booth or room, the space within 900 mm in all directions from any openings shall be considered Class I, Division 2, Class I, or Zone 2, or Class II, Division 2 as shown in Figure 5.16.1.3(b)(4). [NFPA 33:6.5.4]

(5) Dip Tanks and Drain Boards — Surrounding Space. For dip tanks and drain boards, the 900-mm space surrounding the Class I, Division 1 or Class I, Zone 1 location as defined in 5.16.1.3(a)(4) and as shown in Figure 5.16.1.3(b)(5). [NFPA 34:6.4.3]

- Class I, Division 1, Class I, Zone 1, or Class II, Division 1
- Class I, Division 2, Class I, Zone 2, or Class II, Division 2

Figure 5.16.1.3(c)(1) Electrical Area Classification for Open Spray Areas. [NFPA 33:Figure 6.5.1]

 [NFPA 33:Figure 6.5.4]

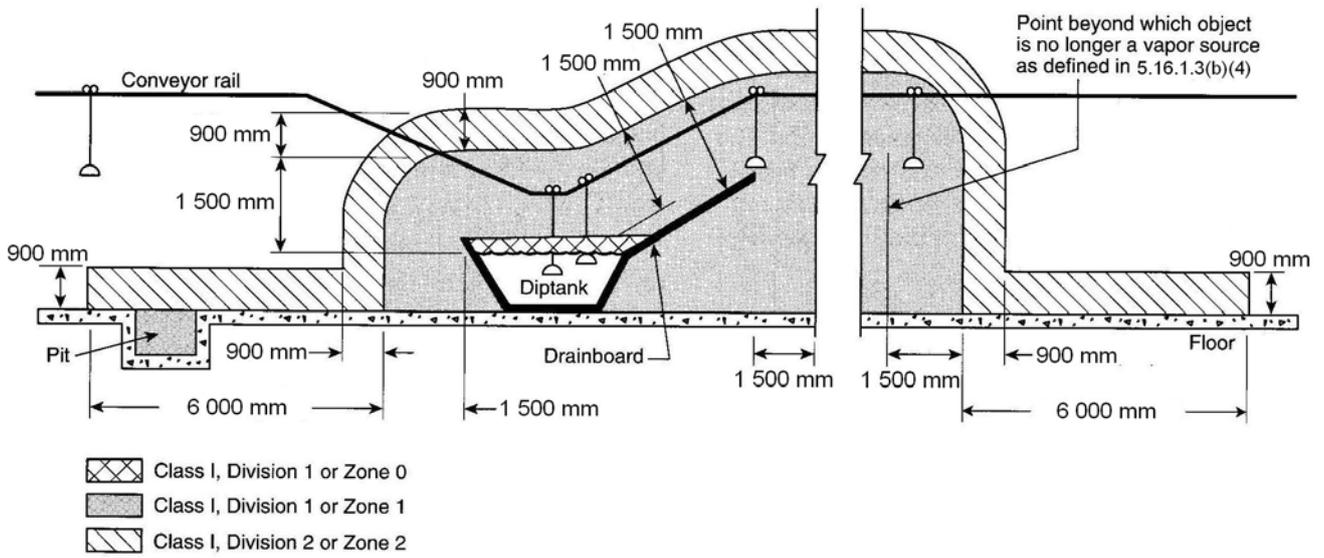

Figure 5.16.1.3(c)(5) Electrical Area Classification for Open Processes Without Vapor Containment or Ventilation. [NFPA 33:Figure 6.4(b)]

(6) Dip Tanks and Drain Boards — Space Above Floor. For dip tanks and drain boards, the space 900 mm above the floor and extending 6 000 mm horizontally in all directions from the Class I, Division 1 or Class I, Zone 1 location.

Exception: This space shall not be required to be considered a hazardous (classified) location where the vapor source area is 0.46 m² or less and where the contents of the open tank trough or container do not exceed 19 L. In addition, the vapor concentration during operation and shutdown periods shall not exceed 25 percent of the lower flammable limit outside the Class I location specified in 5.16.1.3(a)(4). [NFPA 34:6.4.4]

(7) Open Containers. All space in all directions within 600 mm of the Division 1 or Zone 1 area surrounding open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids, as well as the area extending 1 500 mm beyond the Division 1 or Zone 1 area up to a height of 460 mm above the floor or grade level. [NFPA 33:6.5.5.1(2)]

(d) Enclosed Coating and Dipping Operations. The space adjacent to an enclosed dipping or coating process or apparatus shall be considered unclassified. [NFPA 34:6.5.2]

Exception: The space within 900 mm in all directions from any opening in the enclosures shall be classified as Class I, Division 2 or Class I, Zone 2, as applicable. [NFPA 34:6.5.3]

(e) Adjacent Locations. Adjacent locations that are cut off from the defined Class I or Class II locations by tight partitions without communicating openings, and within which flammable vapors or combustible powders are not likely to be released, shall be unclassified.

(f) Unclassified Locations. Locations using drying, curing, or fusion apparatus and provided with positive mechanical ventilation adequate to prevent accumulation of flammable concentrations of vapors, and provided with effective interlocks to de-energize all electrical equipment (other than equipment identified for Class I locations) in case the ventilating equipment is inoperative, shall be permitted to be unclassified where the authority having jurisdiction so judges.

FPN: For further information regarding safeguards, see NFPA 86-2003, Standard for Ovens and Furnaces.

5.16.1.4 Wiring and Equipment in Class I Locations.

(a) Wiring and Equipment — Vapors. All electric wiring and equipment within the Class I location (containing vapor only — not residues) defined in 5.16.1.3 shall comply with the applicable provisions of Article 5.1 or Article 5.5, as applicable.

(b) Wiring and Equipment — Vapors and Residues. Unless specifically listed for locations containing deposits of dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits (as applicable), there shall be no electrical equipment in any spray area as herein defined whereon deposits of combustible residue may readily accumulate, except wiring in rigid metal conduit, intermediate metal conduit, Type MI cable, or in metal boxes or fittings containing no taps, splices, or terminal connections. [NFPA 33:6.4.2]

(c) Illumination. Illumination of readily ignitable areas through panels of glass or other transparent or translucent material shall be permitted only if it complies with the following:

- (1) Fixed lighting units are used as the source of illumination.
- (2) The panel effectively isolates the Class I location from the area in which the lighting unit is located.
- (3) The lighting unit is identified for its specific location.
- (4) The panel is of a material or is protected so that breakage is unlikely.
- (5) The arrangement is such that normal accumulations of hazardous residue on the surface of the panel will not be raised to a dangerous temperature by radiation or conduction from the source of illumination.

(d) Portable Equipment. Portable electric lamps or other utilization equipment shall not be used in a spray area during spray operations.

Exception No. 1: Where portable electric lamps are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type identified for Class I, Division 1 or Class 1, Zone 1 locations where readily ignitable residues may be present. [NFPA 33:6.9]

Exception No. 2: Where portable electric drying apparatus is used in automobile refinishing spray booths and the following requirements are met.

(a) *The apparatus and its electrical connections are not located within the spray enclosure during spray operations.*

(b) *Electrical equipment within 460 mm of the floor is identified for Class I, Division 2 or Class I, Zone 2 locations.*

(c) *All metallic parts of the drying apparatus are electrically bonded and grounded.*

(d) *Interlocks are provided to prevent the operation of spray equipment while drying apparatus is within the spray enclosure, to allow for a 3-minute purge of the enclosure before energizing the drying apparatus and to shut off drying apparatus on failure of ventilation system.*

(e) Electrostatic Equipment. Electrostatic spraying or detearing equipment shall be installed and used only as provided in 5.16.1.10.

FPN: For further information, see NFPA 33-2003, Standard for Spray Application Using Flammable or Combustible Materials.

5.16.1.7 Wiring and Equipment Not Within Class I and II Locations.

(a) Wiring. All fixed wiring above the Class I and II locations shall be in metal raceways, rigid nonmetallic conduit, or electrical nonmetallic tubing, or shall be Type MI, TC, or MC cable. Cellular metal floor raceways shall be permitted only for supplying ceiling outlets or extensions to the area below the floor of a Class I or II location, but such raceways shall have no connections leading into or through the Class I or II location above the floor unless suitable seals are provided.

(b) Equipment. Equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, where installed above a Class I or II location or above a location where freshly finished goods are handled, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

5.16.1.10 Special Equipment.

(a) Fixed Electrostatic Equipment. This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of hazardous materials for coatings on articles or for other similar purposes in which the charging or atomizing device is attached to a mechanical support or manipulator. This shall include robotic devices. This section shall not apply to devices that are held or manipulated by hand. Where robot or programming procedures involve manual manipulation of the robot arm while spraying with the high voltage on, the provisions of 5.16.1.10(b) shall apply. The installation of electrostatic spraying equipment shall comply with 5.16.1.10(a)(1) through (a)(10). Spray equipment shall be listed. All automatic electrostatic equipment systems shall comply with 5.16.1.4(a)(1) through (a)(9).

(1) Power and Control Equipment. Transformers, high-voltage supplies, control apparatus, and all other electric portions of the equipment shall be installed outside of the Class I location as defined in 5.16.1.3 or be of a type identified for the location.

Exception: High-voltage grids, electrodes, electrostatic atomizing heads, and their connections shall be permitted within the Class I location.

(2) Electrostatic Equipment. Electrodes and electrostatic atomizing heads shall be adequately supported in permanent locations and shall be effectively insulated from ground. Electrodes and electrostatic atomizing heads that are permanently attached to their bases, supports, reciprocators, or robots shall be deemed to comply with this section.

(3) High-Voltage Leads. High-voltage leads shall be properly insulated and protected from mechanical damage or exposure to destructive chemicals. Any exposed element at high voltage shall be effectively and permanently supported on suitable insulators and shall be effectively guarded against accidental contact or grounding.

(4) Support of Goods. Goods being coated using this process shall be supported on conveyors or hangers. The conveyors or hangers shall be arranged (1) to ensure that the parts being coated are electrically

connected to ground with a resistance of 1 megohm or less and (2) to prevent parts from swinging.

(5) Automatic Controls. Electrostatic apparatus shall be equipped with automatic means that will rapidly de-energize the high-voltage elements under any of the following conditions:

- a. Stoppage of ventilating fans or failure of ventilating equipment from any cause
- b. Stoppage of the conveyor carrying goods through the high-voltage field unless stoppage is required by the spray process
- c. Occurrence of excessive current leakage at any point in the high-voltage system
- d. De-energizing the primary voltage input to the power supply

(6) Grounding. All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be adequately grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

(7) Isolation. Safeguards such as adequate booths, fencing, railings, interlocks, or other means shall be placed about the equipment or incorporated therein so that they, either by their location, character, or both, ensure that a safe separation of the process is maintained.

(8) Signs. Signs shall be conspicuously posted to convey the following:

- a. Designate the process zone as dangerous with regard to fire and accident
- b. Identify the grounding requirements for all electrically conductive objects in the spray area
- c. Restrict access to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner only

(9) Insulators. All insulators shall be kept clean and dry.

(10) Other Than Nonincendive Equipment. Spray equipment that cannot be classified as nonincendive shall comply with (a)(10)a and

(a)(10)b.

a. Conveyors or hangers shall be arranged so as to maintain a safe distance of at least twice the sparking distance between goods being painted and electrodes, electrostatic atomizing heads, or charged conductors. Warnings defining this safe distance shall be posted.

b. The equipment shall provide an automatic means of rapidly de-energizing the high-voltage elements in the event the distance between the goods being painted and the electrodes or electrostatic atomizing heads falls below that specified in (a). [NFPA 33:Chapter 11]

(b) Electrostatic Hand-Spraying Equipment. This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of materials for coatings on articles, or for other similar purposes in which the atomizing device is hand-held or manipulated during the spraying operation. Electrostatic hand-spraying equipment and devices used in connection with paint-spraying operations shall be of listed types and shall comply with 5.16.1.10(b)(1) through (b)(5).

(1) General. The high-voltage circuits shall be designed so as not to produce a spark of sufficient intensity to ignite the most readily ignitable of those vapor-air mixtures likely to be encountered, or result in appreciable shock hazard upon coming in contact with a grounded object under all normal operating conditions. The electrostatically charged exposed elements of the handgun shall be capable of being energized only by an actuator that also controls the coating material supply.

(2) Power Equipment. Transformers, power packs, control apparatus, and all other electric portions of the equipment shall be located outside of the Class I location or be identified for the location.

Exception: The handgun itself and its connections to the power supply shall be permitted within the Class I location.

(3) Handle. The handle of the spraying gun shall be electrically connected to ground by a metallic connection and be constructed so that the operator in normal operating position is in intimate electrical contact with the grounded handle to prevent buildup of a static charge on the operator's body. Signs indicating the necessity for grounding other persons entering the spray area shall be conspicuously posted.

(4) Electrostatic Equipment. All electrically conductive objects in the spraying area shall be adequately grounded. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.

(5) Support of Objects. Objects being painted shall be maintained in metallic contact with the conveyor or other grounded support. Hooks shall be regularly cleaned to ensure adequate grounding of 1 megohm or less. Areas of contact shall be sharp points or knife edges where possible. Points of support of the object shall be concealed from random spray where feasible; and, where the objects being sprayed are supported from a conveyor, the point of attachment to the conveyor shall be located so as to not collect spray material during normal operation. [NFPA 33:Chapter 12]

(c) Powder Coating. This section shall apply to processes in which combustible dry powders are applied. The hazards associated with combustible dusts are present in such a process to a degree, depending on the chemical composition of the material, particle size, shape, and distribution.

(1) Electric Equipment and Sources of Ignition. Electric equipment and other sources of ignition shall comply with the requirements of Article 5.2. Portable electric lamps and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such lamps or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be effectively grounded.

Exception: Where portable electric lamps are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type listed for Class II, Division 1 locations where readily ignitable residues may be present.

(2) Fixed Electrostatic Spraying Equipment. The provisions of 5.16.1.10(a) and 5.16.1.10(c)(1) shall apply to fixed electrostatic spraying equipment.

(3) Electrostatic Hand-Spraying Equipment. The provisions of 5.16.1.10(b) and 5.16.1.10(c)(1) shall apply to electrostatic hand-spraying equipment.

(4) Electrostatic Fluidized Beds. Electrostatic fluidized beds and associated equipment shall be of identified types. The high-voltage circuits shall be designed so that any discharge produced when the charging electrodes of the bed are approached or contacted by a grounded object shall not be of sufficient intensity to ignite any powder-air mixture likely to be encountered or to result in an appreciable shock hazard.

a. Transformers, power packs, control apparatus, and all other electric portions of the equipment shall be located outside the powder-coating area or shall otherwise comply with the requirements of 5.16.1.10(c)(1).

Exception: The charging electrodes and their connections to the power supply shall be permitted within the powder-coating area.

b. All electrically conductive objects within the powder-coating area shall be adequately grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

c. Objects being coated shall be maintained in electrical contact (less than 1 megohm) with the conveyor or other support in order to ensure proper grounding. Hangers shall be regularly cleaned to ensure effective electrical contact. Areas of electrical contact shall be sharp points or knife edges where possible.

d. The electric equipment and compressed air supplies shall be interlocked with a ventilation system so that the equipment cannot be operated unless the ventilating fans are in operation. [NFPA 33:Chapter 15]

5.16.1.16 Grounding. All metal raceways, the metal armors or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 2.50. Grounding shall comply with 5.1.2.21, 5.2.2.21, or 5.5.1.25, as applicable.

ARTICLE 5.17 — HEALTH CARE FACILITIES

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 99-2002, Standard for Health Care Facilities. Only editorial changes were made to the extracted text to make it consistent with this Code.

5.17.1 General

5.17.1.1 Scope. The provisions of this article shall apply to electrical construction and installation criteria in health care facilities that provide services to human beings.

The requirements in Parts 5.17.2 and 5.17.3 not only apply to single-function buildings but are also intended to be individually applied to their respective forms of occupancy within a multifunction building (e.g., a doctor's examining room located within a limited care facility would be required to meet the provisions of 5.17.2.1).

FPN: For information concerning performance, maintenance, and testing criteria, refer to the appropriate health care facilities documents.

5.17.1.2 Definitions.

Alternate Power Source. One or more generator sets, or battery systems where permitted, intended to provide power during the interruption of the normal electrical services or the public utility electrical service intended to provide power during interruption of service normally provided by the generating facilities on the premises.

Ambulatory Health Care Facility. A building or part thereof used to provide services or treatment to four or more patients at the same time and meeting either (1) or (2).

(1) Those facilities that provide, on an outpatient basis, treatment for patients that would render them incapable of taking action for self-preservation under emergency conditions without assistance from others, such as hemodialysis units or freestanding emergency medical units.

(2) Those facilities that provide, on an outpatient basis, surgical treatment requiring general anesthesia.

Anesthetizing Location. Any area of a facility that has been

designated to be used for the administration of any flammable or nonflammable inhalation anesthetic agent in the course of examination or treatment, including the use of such agents for relative analgesia.

Critical Branch. A subsystem of the emergency system consisting of feeders and branch circuits supplying energy to task illumination, special power circuits, and selected receptacles serving areas and functions related to patient care, and which are connected to alternate power sources by one or more transfer switches during interruption of the normal power source.

Electrical Life-Support Equipment. Electrically powered equipment whose continuous operation is necessary to maintain a patient's life.

Emergency System. A system of circuits and equipment intended to supply alternate power to a limited number of prescribed functions vital to the protection of life and safety.

Equipment System. A system of circuits and equipment arranged for delayed, automatic, or manual connection to the alternate power source and that serves primarily 3-phase power equipment.

Essential Electrical System. A system comprised of alternate sources of power and all connected distribution systems and ancillary equipment, designed to ensure continuity of electrical power to designated areas and functions of a health care facility during disruption of normal power sources, and also designed to minimize disruption within the internal wiring system.

Exposed Conductive Surfaces. Those surfaces that are capable of carrying electric current and that are unprotected, unenclosed, or unguarded, permitting personal contact. Paint, anodizing, and similar coatings are not considered suitable insulation, unless they are listed for such use.

Fault Hazard Current. See Hazard Current.

Flammable Anesthetics. Gases or vapors, such as fluroxene, cyclopropane, divinyl ether, ethyl chloride, ethyl ether, and ethylene, which may form flammable or explosive mixtures with air, oxygen, or reducing gases such as nitrous oxide.

Flammable Anesthetizing Location. Any area of the facility that has been designated to be used for the administration of any flammable inhalation anesthetic agents in the normal course of examination or treatment.

Hazard Current. For a given set of connections in an isolated power system, the total current that would flow through a low impedance if it were connected between either isolated conductor and ground.

Fault Hazard Current. The hazard current of a given isolated system with all devices connected except the line isolation monitor.

Monitor Hazard Current. The hazard current of the line isolation monitor alone.

Total Hazard Current. The hazard current of a given isolated system with all devices, including the line isolation monitor, connected.

Health Care Facilities. Buildings or portions of buildings in which medical, dental, psychiatric, nursing, obstetrical, or surgical care are provided. Health care facilities include, but are not limited to, hospitals, nursing homes, limited care facilities, clinics, medical and dental offices, and ambulatory care centers, whether permanent or movable.

Hospital. A building or part thereof used for the medical, psychiatric, obstetrical, or surgical care, on a 24-hour basis, of four or more inpatients. Hospital, wherever used in this Code, shall include general hospitals, mental hospitals, tuberculosis hospitals, children's hospitals, and any such facilities providing inpatient care.

Isolated Power System. A system comprising an isolating transformer or its equivalent, a line isolation monitor, and its ungrounded circuit conductors.

Isolation Transformer. A transformer of the multiple-winding type, with the primary and secondary windings physically separated, which inductively couples its secondary winding to the grounded feeder systems that energize its primary winding.

Life Safety Branch. A subsystem of the emergency system consisting

of feeders and branch circuits, meeting the requirements of Article 7.0 and intended to provide adequate power needs to ensure safety to patients and personnel, and which are automatically connected to alternate power sources during interruption of the normal power source.

Limited Care Facility. A building or part thereof used on a 24-hour basis for the housing of four or more persons who are incapable of self-preservation because of age, physical limitation due to accident or illness, or mental limitations, such as mental retardation/developmental disability, mental illness, or chemical dependency.

Line Isolation Monitor. A test instrument designed to continually check the balanced and unbalanced impedance from each line of an isolated circuit to ground and equipped with a built-in test circuit to exercise the alarm without adding to the leakage current hazard.

Monitor Hazard Current. See Hazard Current.

Nurses' Stations. Areas intended to provide a center of nursing activity for a group of nurses serving bed patients, where the patient calls are received, nurses are dispatched, nurses' notes written, inpatient charts prepared, and medications prepared for distribution to patients. Where such activities are carried on in more than one location within a nursing unit, all such separate areas are considered a part of the nurses' station.

Nursing Home. A building or part thereof used for the lodging, boarding, and nursing care, on a 24-hour basis, of four or more persons who, because of mental or physical incapacity, may be unable to provide for their own needs and safety without the assistance of another person. Nursing home, wherever used in this Code, shall include nursing and convalescent homes, skilled nursing facilities, intermediate care facilities, and infirmaries of homes for the aged.

Patient Bed Location. The location of an inpatient sleeping bed; or the bed or procedure table used in a critical patient care area.

Patient Care Area. Any portion of a health care facility wherein patients are intended to be examined or treated. Areas of a health care facility in which patient care is administered are classified as general care areas or critical care areas, either of which may be classified as a wet location. The governing body of the facility designates these areas in

accordance with the type of patient care anticipated and with the following definitions of the area classification.

FPN: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care areas.

General Care Areas. Patient bedrooms, examining rooms, treatment rooms, clinics, and similar areas in which it is intended that the patient will come in contact with ordinary appliances such as a nurse call system, electrical beds, examining lamps, telephone, and entertainment devices. In such areas, it may also be intended that patients be connected to electromedical devices (such as heating pads, electrocardiographs, drainage pumps, monitors, otoscopes, ophthalmoscopes, intravenous lines, etc.).

Critical Care Areas. Those special care units, intensive care units, coronary care units, angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, and similar areas in which patients are intended to be subjected to invasive procedures and connected to line-operated, electromedical devices.

Wet Locations. Those patient care areas that are normally subject to wet conditions while patients are present. These include standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. Routine housekeeping procedures and incidental spillage of liquids do not define a wet location.

Patient Equipment Grounding Point. A jack or terminal bus that serves as the collection point for redundant grounding of electric appliances serving a patient vicinity or for grounding other items in order to eliminate electromagnetic interference problems.

Patient Vicinity. In an area in which patients are normally cared for, the patient vicinity is the space with surfaces likely to be contacted by the patient or an attendant who can touch the patient. Typically in a patient room, this encloses a space within the room not less than 1 800 mm beyond the perimeter of the bed in its nominal location, and extending vertically not less than 2 300 mm above the floor.

Psychiatric Hospital. A building used exclusively for the psychiatric care, on a 24-hour basis, of four or more inpatients.

Reference Grounding Point. The ground bus of the panelboard or isolated power system panel supplying the patient care area.

Relative Analgesia. A state of sedation and partial block of pain perception produced in a patient by the inhalation of concentrations of nitrous oxide insufficient to produce loss of consciousness (conscious sedation).

Selected Receptacles. A minimum number of electric receptacles to accommodate appliances ordinarily required for local tasks or likely to be used in patient care emergencies.

Task Illumination. Provision for the minimum lighting required to carry out necessary tasks in the described areas, including safe access to supplies and equipment, and access to exits.

Therapeutic High Frequency Diathermy Equipment. Therapeutic high-frequency diathermy equipment is therapeutic induction and dielectric heating equipment.

Total Hazard Current. See Hazard Current.

X-Ray Installations, Long-Time Rating. A rating based on an operating interval of 5 minutes or longer.

X-Ray Installations, Mobile. X-ray equipment mounted on a permanent base with wheels, casters, or a combination of both to facilitate moving the equipment while completely assembled.

X-Ray Installations, Momentary Rating. A rating based on an operating interval that does not exceed 5 seconds.

X-Ray Installations, Portable. X-ray equipment designed to be hand carried.

X-Ray Installations, Transportable. X-ray equipment to be installed in a vehicle or that may be readily disassembled for transport in a vehicle.

5.17.2 Wiring and Protection

5.17.2.1 Applicability.

(a) **Applicability.** Part II shall apply to patient care areas of all health care facilities.

(b) **Not Covered.** Part II shall not apply to the following:

(1) Business offices, corridors, waiting rooms, and the like in clinics, medical and dental offices, and outpatient facilities

(2) Areas of nursing homes and limited care facilities wired in accordance with Chapters 1 through 4 of this Code where these areas are used exclusively as patient sleeping rooms

FPN: See NFPA 101@-2003, Life Safety Code@.

5.17.2.2 General Installation — Construction Criteria. The purpose of this article is to specify the installation criteria and wiring methods that minimize electrical hazards by the maintenance of adequately low potential differences only between exposed conductive surfaces that are likely to become energized and could be contacted by a patient.

FPN: In a health care facility, it is difficult to prevent the occurrence of a conductive or capacitive path from the patient's body to some grounded object, because that path may be established accidentally or through instrumentation directly connected to the patient. Other electrically conductive surfaces that may make an additional contact with the patient, or instruments that may be connected to the patient, then become possible sources of electric currents that can traverse the patient's body. The hazard is increased as more apparatus is associated with the patient, and, therefore, more intensive precautions are needed. Control of electric shock hazard requires the limitation of electric current that might flow in an electric circuit involving the patient's body by raising the resistance of the conductive circuit that includes the patient, or by insulating exposed surfaces that might become energized, in addition to reducing the potential difference that can appear between exposed conductive surfaces in the patient vicinity, or by combinations of these methods. A special problem is presented by the patient with an externalized direct conductive path to the heart muscle. The patient may be electrocuted at current levels so low that additional protection in the design of appliances, insulation of the catheter, and control of medical practice is required.

5.17.2.3 Wiring Methods. Except as modified in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this Code.

5.17.2.4 Grounding of Receptacles and Fixed Electric Equipment in Patient Care Areas. Wiring in patient care areas shall comply with 5.17.2.4(a) and 5.17.2.4(b).

(a) **Wiring Methods.** All branch circuits serving patient care areas shall be provided with a ground path for fault current by installation in a metal raceway system, or a cable having a metallic armor or sheath assembly. The metal raceway system, or metallic cable armor, or sheath assembly shall itself qualify as an equipment grounding return path in accordance with 2.50.6.9.

(b) **Insulated Equipment Grounding Conductor.** The grounding terminals of all receptacles and all non-current-carrying conductive surfaces of fixed electric equipment likely to become energized that are subject to personal contact, operating at over 100 volts, shall be grounded by an insulated copper conductor. The equipment grounding conductor shall be sized in accordance with Table 2.50.6.13 and installed in metal raceways or as a part of listed cables having a metallic armor or sheath assembly with the branch-circuit conductors supplying these receptacles or fixed equipment.

Exception No. 1: Metal faceplates shall be permitted to be grounded by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 2: Luminaires (light fixtures) more than 2 300 mm above the floor and switches located outside of the patient vicinity shall not be required to be grounded by an insulated equipment grounding conductor.

5.17.2.5 Panelboard Bonding. The equipment grounding terminal buses of the normal and essential branch-circuit panelboards serving the same individual patient vicinity shall be bonded together with an insulated continuous copper conductor not smaller than 5.5 mm² (2.6 mm dia.). Where two or more panelboards serving the same individual patient vicinity are served from separate transfer switches on the emergency system, the equipment grounding terminal buses of those panelboards shall be bonded together with an insulated continuous copper conductor not smaller than 5.5 mm² (2.6 mm dia.). This conductor shall be permitted to be broken in order to terminate on the equipment grounding terminal bus in each panelboard.

5.17.2.7 Receptacles with Insulated Grounding Terminals.

Receptacles with insulated grounding terminals, as permitted in 2.50.7.17(d), shall be identified; such identification shall be visible after installation.

FPN: Caution is important in specifying such a system with receptacles having insulated grounding terminals, since the grounding impedance is controlled only by the equipment grounding conductors and does not benefit functionally from any parallel grounding paths. This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary and parallel grounding paths are to be avoided.

5.17.2.8 Ground-Fault Protection.

(a) Applicability. The requirements of 5.17.2.8 shall apply to hospitals and other buildings (including multiple occupancy buildings) with critical care areas or utilizing electrical life support equipment, and buildings that provide the required essential utilities or services for the operation of critical care areas or electrical life support equipment.

(b) Feeders. Where ground-fault protection is provided for operation of the service disconnecting means or feeder disconnecting means as specified by 2.30.7.6 or 2.15.1.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the feeder disconnecting means to open.

The additional levels of ground-fault protection shall not be installed as follows:

- (1) On the load side of an essential electrical system transfer switch
- (2) Between the on-site generating unit(s) described in 5.17.3.11(b) and the essential electrical system transfer switch(es)
- (3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase

(c) Selectivity. Ground-fault protection for operation of the service and feeder disconnecting means shall be fully selective such that the feeder device, but not the service device, shall open on ground faults on the load side of the feeder device. A six-cycle minimum separation between the service and feeder ground-fault tripping bands shall be provided.

Operating time of the disconnecting devices shall be considered in selecting the time spread between these two bands to achieve 100 percent selectivity.

FPN: See 2.30.7.6, fine print note, for transfer of alternate source where ground-fault protection is applied.

(d) Testing. When equipment ground-fault protection is first installed, each level shall be performance tested to ensure compliance with 5.17.2.8(c).

5.17.2.9 General Care Areas.

(a) Patient Bed Location. Each patient bed location shall be supplied by at least two branch circuits, one from the emergency system and one from the normal system. All branch circuits from the normal system shall originate in the same panelboard.

Exception No. 1: Branch circuits serving only special-purpose outlets or receptacles, such as portable X-ray outlets, shall not be required to be served from the same distribution panel or panels.

Exception No. 2: Requirements of 5.17.2.9(a) shall not apply to patient bed locations in clinics, medical and dental offices, and outpatient facilities; psychiatric, substance abuse, and rehabilitation hospitals; sleeping rooms of nursing homes and limited care facilities meeting the requirements of 5.17.2.1(b)(2).

Exception No. 3: A general care patient bed location served from two separate transfer switches on the emergency system shall not be required to have circuits from the normal system.

(b) Patient Bed Location Receptacles. Each patient bed location shall be provided with a minimum of four receptacles. They shall be permitted to be of the single or duplex types or a combination of both. All receptacles, whether four or more, shall be listed "hospital grade" and so identified. Each receptacle shall be grounded by means of an insulated copper conductor sized in accordance with Table 2.50.6.13.

Exception No. 1: Requirements of 5.17.2.9(b) shall not apply to psychiatric, substance abuse, and rehabilitation hospitals meeting the

requirements of 5.17.2.1(b)(2).

Exception No. 2: Psychiatric security rooms shall not be required to have receptacle outlets installed in the room.

FPN: It is not intended that there be a total, immediate replacement of existing non-hospital grade receptacles. It is intended, however, that non-hospital grade receptacles be replaced with hospital grade receptacles upon modification of use, renovation, or as existing receptacles need replacement.

(c) Pediatric Locations. Receptacles located within the rooms, bathrooms, playrooms, activity rooms, and patient care areas of pediatric wards shall be listed tamper resistant or shall employ a listed tamper resistant cover.

5.17.2.10 Critical Care Areas.

(a) Patient Bed Location Branch Circuits. Each patient bed location shall be supplied by at least two branch circuits, one or more from the emergency system and one or more circuits from the normal system. At least one branch circuit from the emergency system shall supply an outlet(s) only at that bed location. All branch circuits from the normal system shall be from a single panelboard. Emergency system receptacles shall be identified and shall also indicate the panelboard and circuit number supplying them.

Exception No. 1: Branch circuits serving only special-purpose receptacles or equipment in critical care areas shall be permitted to be served by other panelboards.

Exception No. 2: Critical care locations served from two separate transfer switches on the emergency system shall not be required to have circuits from the normal system.

(b) Patient Bed Location Receptacles.

(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of six receptacles, at least one of which shall be connected to either of the following:

- a. The normal system branch circuit required in 5.17.2.10(a)

b. An emergency system branch circuit supplied by a different transfer switch than the other receptacles at the same location

(2) Receptacle Requirements. The receptacles required in 5.17.2.10(b)(1) shall be permitted to be of the single or duplex types or a combination of both. All receptacles, whether six or more, shall be listed “hospital grade” and so identified. Each receptacle shall be grounded to the reference grounding point by means of an insulated copper equipment grounding conductor.

(c) Patient Vicinity Grounding and Bonding (Optional). A patient vicinity shall be permitted to have a patient equipment grounding point. The patient equipment grounding point, where supplied, shall be permitted to contain one or more listed grounding and bonding jacks. An equipment bonding jumper not smaller than 5.5 mm² (2.6 mm dia.) shall be used to connect the grounding terminal of all grounding-type receptacles to the patient equipment grounding point. The bonding conductor shall be permitted to be arranged centrally or looped as convenient.

FPN: Where there is no patient equipment grounding point, it is important that the distance between the reference grounding point and the patient vicinity be as short as possible to minimize any potential differences.

(d) Panelboard Grounding. Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable is installed, grounding of a panelboard or switchboard shall be ensured by one of the following means at each termination or junction point of the raceway or Type MC or MI cable:

(1) A grounding bushing and a continuous copper bonding jumper, sized in accordance with 2.50.6.13, with the bonding jumper connected to the junction enclosure or the ground bus of the panel

(2) Connection of feeder raceways or Type MC or MI cable to threaded hubs or bosses on terminating enclosures

(3) Other approved devices such as bonding-type locknuts or bushings

(e) Additional Protective Techniques in Critical Care Areas (Optional). Isolated power systems shall be permitted to be used for critical care areas, and, if used, the isolated power system equipment

shall be listed as isolated power equipment. The isolated power system shall be designed and installed in accordance with 5.17.7.1.

Exception: The audible and visual indicators of the line isolation monitor shall be permitted to be located at the nursing station for the area being served.

(f) Isolated Power System Grounding. Where an isolated ungrounded power source is used and limits the first-fault current to a low magnitude, the grounding conductor associated with the secondary circuit shall be permitted to be run outside of the enclosure of the power conductors in the same circuit.

FPN: Although it is permitted to run the grounding conductor outside of the conduit, it is safer to run it with the power conductors to provide better protection in case of a second ground fault.

(g) Special-Purpose Receptacle Grounding. The equipment grounding conductor for special-purpose receptacles, such as the operation of mobile X-ray equipment, shall be extended to the reference grounding points of branch circuits for all locations likely to be served from such receptacles. Where such a circuit is served from an isolated ungrounded system, the grounding conductor shall not be required to be run with the power conductors; however, the equipment grounding terminal of the special-purpose receptacle shall be connected to the reference grounding point.

5.17.2.11 Wet Locations.

(a) Receptacles and Fixed Equipment. All receptacles and fixed equipment within the area of the wet location shall have ground-fault circuit-interrupter protection for personnel if interruption of power under fault conditions can be tolerated, or be served by an isolated power system if such interruption cannot be tolerated.

Exception: Branch circuits supplying only listed, fixed, therapeutic and diagnostic equipment shall be permitted to be supplied from a normal grounded service, single- or 3-phase system, provided that

- (a) Wiring for grounded and isolated circuits does not occupy the same raceway, and*
- (b) All conductive surfaces of the equipment are grounded.*

(b) Isolated Power Systems. Where an isolated power system is utilized, the isolated power equipment shall be listed as isolated power equipment, and the isolated power system shall be designed and installed in accordance with 5.17.7.1.

FPN: For requirements for installation of therapeutic pools and tubs, see Part 6.80.6.

5.17.2.12 Ground-Fault Circuit-Interrupter Protection for Personnel. Ground-fault circuit-interrupter protection for personnel shall not be required for receptacles installed in those critical care areas where the toilet and basin are installed within the patient room.

5.17.3 Essential Electrical System

5.17.3.1 Scope. The essential electrical system for these facilities shall comprise a system capable of supplying a limited amount of lighting and power service, which is considered essential for life safety and orderly cessation of procedures during the time normal electrical service is interrupted for any reason. This includes clinics, medical and dental offices, outpatient facilities, nursing homes, limited care facilities, hospitals, and other health care facilities serving patients.

FPN: For information on the need for an essential electrical system, see NFPA 99-2002, Standard for Health Care Facilities.

5.17.3.2 Application of Other Articles. The essential electrical system shall meet the requirements of Article 7.0, except as amended by Article 5.17.

5.17.3.6 Essential Electrical Systems for Hospitals.

(a) Applicability. The requirements of Part 5.17.3, 5.17.3.6 through 5.17.3.11, shall apply to hospitals where an essential electrical system is required.

FPN No. 1: For performance, maintenance, and testing requirements of essential electrical systems in hospitals, see NFPA 99-2002, Standard for Health Care Facilities. For installation of centrifugal fire pumps, see NFPA 20-2002, Standard for the Installation of Stationary Fire Pumps for Fire Protection.

FPN No. 2: For additional information, see NFPA 99-2002, Standard for Health Care Facilities.

(b) General.

(1) Separate Systems. Essential electrical systems for hospitals shall be comprised of two separate systems capable of supplying a limited amount of lighting and power service, which is considered essential for life safety and effective hospital operation during the time the normal electrical service is interrupted for any reason. These two systems shall be the emergency system and the equipment system.

(2) Emergency Systems. The emergency system shall be limited to circuits essential to life safety and critical patient care. These are designated the life safety branch and the critical branch.

(3) Equipment System. The equipment system shall supply major electrical equipment necessary for patient care and basic hospital operation.

(4) Transfer Switches. The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the emergency system and each equipment system shall have one or more transfer switches. One transfer switch shall be permitted to serve one or more branches or systems in a facility with a maximum demand on the essential electrical system of 150 kVA.

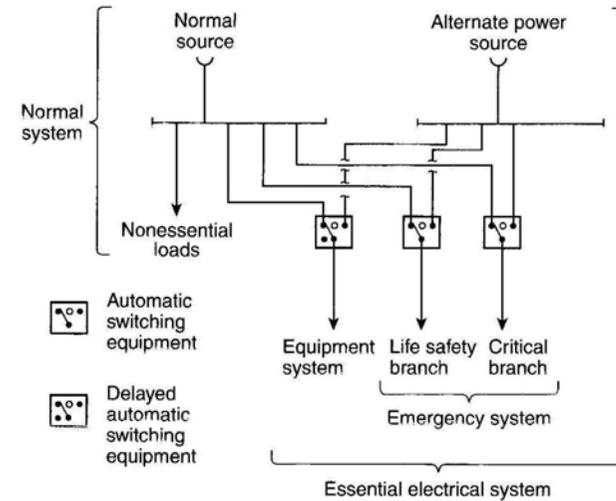

FPN No. 1: See NFPA 99-2002, Standard for Health Care Facilities: 4.4.3.2, Transfer Switch Operation Type I; 4.4.2.1.4, Automatic Transfer Switch Features; and 4.4.2.1.6, Nonautomatic Transfer Device Features.

FPN No. 2: See FPN Figure 5.17.3.6, No. 1.

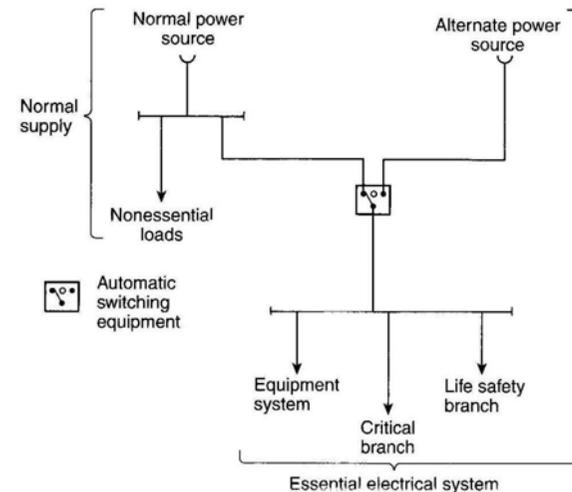

FPN No. 3: See FPN Figure 5.17.3.6, No. 2.

(5) Other Loads. Loads served by the generating equipment not specifically named in Article 5.17 shall be served by their own transfer switches such that the following conditions apply:

- a. These loads shall not be transferred if the transfer will overload the generating equipment.
- b. These loads shall be automatically shed upon generating equipment overloading.

FPN Figure 5.17.3.6, No. 1 Hospital — Minimum Requirement for Transfer Switch Arrangement.

FPN Figure 5.17.3.6, No. 2 Hospital — Minimum Requirement (150 kVA or less) for Transfer Switch Arrangement.

(6) Contiguous Facilities. Hospital power sources and alternate power sources shall be permitted to serve the essential electrical systems of contiguous or same site facilities. [NFPA 99:13.3.4.3]

(c) Wiring Requirements.

(1) Separation from Other Circuits. The life safety branch and critical branch of the emergency system shall be kept entirely independent of all other wiring and equipment and shall not enter the same raceways, boxes, or cabinets with each other or other wiring.

Wiring of the life safety branch and the critical branch shall be permitted to occupy the same raceways, boxes, or cabinets of other circuits not part of the branch where such wiring complies with one of the following:

- a. Is in transfer equipment enclosures
- b. Is in exit or emergency luminaires (lighting fixtures) supplied from two sources
- c. Is in a common junction box attached to exit or emergency luminaires (lighting fixtures) supplied from two sources
- d. Is for two or more emergency circuits supplied from the same branch

The wiring of the equipment system shall be permitted to occupy the same raceways, boxes, or cabinets of other circuits that are not part of the emergency system.

(2) Isolated Power Systems. Where isolated power systems are installed in any of the areas in 5.17.3.9(a)(1) and (a)(2), each system shall be supplied by an individual circuit serving no other load.

(3) Mechanical Protection of the Emergency System. The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 5.17.2.4(a) and 5.17.2.4(b). The following wiring methods shall be permitted:

- a. Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid nonmetallic conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

b. Where encased in not less than 50 mm of concrete, Schedule 40 rigid nonmetallic conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

c. Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:

1. Where used in listed prefabricated medical headwalls
2. In listed office furnishings
3. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage
4. Where necessary for flexible connection to equipment

(4) Flexible power cords of appliances or other utilization equipment connected to the emergency system.

(5) Secondary circuits of Class 2 or Class 3 communication or signaling systems

FPN: See 5.17.2.4 for additional grounding requirements in patient care areas.

(d) Capacity of Systems. The essential electrical system shall have adequate capacity to meet the demand for the operation of all functions and equipment to be served by each system and branch.

Feeders shall be sized in accordance with Articles 2.15 and 2.20. The generator set(s) shall have sufficient capacity and proper rating to meet the demand produced by the load of the essential electrical system(s) at any given time.

Demand calculations for sizing of the generator set(s) shall be based on any of the following:

- (1) Prudent demand factors and historical data
- (2) Connected load
- (3) Feeder calculation procedures described in Article 2.20
- (4) Any combination of the above

The sizing requirements in 7.0.1.5 and 7.1.1.6 shall not apply to hospital generator set(s).

(e) Receptacle Identification. The cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the emergency system shall have a distinctive color or marking so as to be readily identifiable. [NFPA 99:4.4.2.2.4.2(b)]

5.17.3.7 Emergency System. Those functions of patient care depending on lighting or appliances that are connected to the emergency system shall be divided into two mandatory branches: the life safety branch and the critical branch, described in 5.17.3.8 and 5.17.3.9.

The branches of the emergency system shall be installed and connected to the alternate power source so that all functions specified herein for the emergency system shall be automatically restored to operation within 10 seconds after interruption of the normal source. [NFPA 99:4.4.2.2.2.1, 4.4.3.1]

5.17.3.8 Life Safety Branch. No function other than those listed in 5.17.3.8(a) through 5.17.3.8(g) shall be connected to the life safety branch. The life safety branch of the emergency system shall supply power for the following lighting, receptacles, and equipment.

(a) Illumination of Means of Egress. Illumination of means of egress, such as lighting required for corridors, passageways, stairways, and landings at exit doors, and all necessary ways of approach to exits. Switching arrangements to transfer patient corridor lighting in hospitals from general illumination circuits to night illumination circuits shall be permitted, provided only one of two circuits can be selected and both circuits cannot be extinguished at the same time.

FPN: See NFPA 101-2003, Life Safety Code, Sections 7.8 and 7.9.

(b) Exit Signs. Exit signs and exit directional signs.

FPN: See NFPA 101-2003, Life Safety Code, Section 7.10.

(c) Alarm and Alerting Systems. Alarm and alerting systems including the following:

(1) Fire alarms

FPN: See NFPA 101-2003, Life Safety Code, Section 9.6 and 18.3.4.

(2) Alarms required for systems used for the piping of nonflammable medical gases

FPN: See NFPA 99-2002, Standard for Health Care Facilities, 4.4.2.2.2(3).

(d) Communications Systems. Hospital communications systems, where used for issuing instructions during emergency conditions.

(e) Generator Set Location. Task illumination battery charger for emergency battery-powered lighting unit(s) and selected receptacles at the generator set location.

(f) Elevators. Elevator cab lighting, control, communications, and signal systems.

(g) Automatic Doors. Automatically operated doors used for building egress. [NFPA 99:4.4.2.2.2.2]

5.17.3.9 Critical Branch.

(a) Task Illumination and Selected Receptacles. The critical branch of the emergency system shall supply power for task illumination, fixed equipment, selected receptacles, and special power circuits serving the following areas and functions related to patient care:

(1) Critical care areas that utilize anesthetizing gases — task illumination, selected receptacles, and fixed equipment

(2) The isolated power systems in special environments

(3) Patient care areas — task illumination and selected receptacles in the following:

a. Infant nurseries

b. Medication preparation areas

c. Pharmacy dispensing areas

d. Selected acute nursing areas

e. Psychiatric bed areas (omit receptacles)

f. Ward treatment rooms

g. Nurses' stations (unless adequately lighted by corridor luminaires)

(4) Additional specialized patient care task illumination and receptacles, where needed

(5) Nurse call systems

(6) Blood, bone, and tissue banks

(7) Telephone equipment rooms and closets

(8) Task illumination, selected receptacles, and selected power circuits for the following:

a. General care beds (at least one duplex receptacle per patient bedroom)

b. Angiographic labs

c. Cardiac catheterization labs

d. Coronary care units

e. Hemodialysis rooms or areas

f. Emergency room treatment areas (selected)

g. Human physiology labs

h. Intensive care units

i. Postoperative recovery rooms (selected)

(9) Additional task illumination, receptacles, and selected power circuits needed for effective hospital operation. Single-phase fractional horsepower motors shall be permitted to be connected to the critical branch. [NFPA 99:4.4.2.2.3(9)]

(b) Subdivision of the Critical Branch. It shall be permitted to subdivide the critical branch into two or more branches.

FPN: It is important to analyze the consequences of supplying an area with only critical care branch power when failure occurs between the area and the transfer switch. Some proportion of normal and critical power or critical power from separate transfer switches may be appropriate.

5.17.3.10 Equipment System Connection to Alternate Power Source.

The equipment system shall be installed and connected to the alternate power source such that the equipment described in 5.17.3.10(a) is automatically restored to operation at appropriate time-lag intervals following the energizing of the emergency system. Its arrangement shall also provide for the subsequent connection of equipment described in 5.17.3.10(b). [NFPA 99:4.4.2.2.3.2]

Exception: For essential electrical systems under 150 kVA, deletion of the time-lag intervals feature for delayed automatic connection to the

equipment system shall be permitted.

(a) Equipment for Delayed Automatic Connection. The following equipment shall be arranged for delayed automatic connection to the alternate power source:

(1) Central suction systems serving medical and surgical functions, including controls. Such suction systems shall be permitted on the critical branch.

(2) Sump pumps and other equipment required to operate for the safety of major apparatus, including associated control systems and alarms.

(3) Compressed air systems serving medical and surgical functions, including controls. Such air systems shall be permitted on the critical branch.

(4) Smoke control and stair pressurization systems, or both.

(5) Kitchen hood supply or exhaust systems, or both, if required to operate during a fire in or under the hood. [NFPA 99:4.4.2.2.3.4(5)]

(6) Supply, return, and exhaust ventilating systems for airborne infectious/isolation rooms, protective environment rooms, exhaust fans for laboratory fume hoods, nuclear medicine areas where radioactive material is used, ethylene oxide evacuation and anesthesia evacuation. Where delayed automatic connection is not appropriate, such ventilation systems shall be permitted to be placed on the critical branch. [NFPA 99:4.4.2.2.3.4(6)]

Exception: Sequential delayed automatic connection to the alternate power source to prevent overloading the generator shall be permitted where engineering studies indicate it is necessary.

(b) Equipment for Delayed Automatic or Manual Connection. The following equipment shall be arranged for either delayed automatic or manual connection to the alternate power source:

(1) Heating equipment to provide heating for operating, delivery, labor, recovery, intensive care, coronary care, nurseries, infection/isolation rooms, emergency treatment spaces, and general patient rooms and pressure maintenance (jockey or make-up) pump(s) for water-based fire protection systems.

Exception: Heating of general patient rooms and infection/isolation rooms during disruption of the normal source shall not be required under any of the following conditions:

- (1) *The outside design temperature is higher than -6.7°C.*
- (2) *The outside design temperature is lower than -6.7°C, and where a selected room(s) is provided for the needs of all confined patients, only such room(s) need be heated.*
- (3) *The facility is served by a dual source of normal power.*

FPN No. 1: The design temperature is based on the 97½ percent design value as shown in Chapter 24 of the ASHRAE Handbook of Fundamentals (1997).

FPN No. 2: For a description of a dual source of normal power, see 5.17.3.11(c), FPN.

(2) An elevator(s) selected to provide service to patient, surgical, obstetrical, and ground floors during interruption of normal power. In instances where interruption of normal power would result in other elevators stopping between floors, throw-over facilities shall be provided to allow the temporary operation of any elevator for the release of patients or other persons who may be confined between floors.

- (3) Hyperbaric facilities.
- (4) Hypobaric facilities.
- (5) Automatically operated doors.

(6) Minimal electrically heated autoclaving equipment shall be permitted to be arranged for either automatic or manual connection to the alternate source.

(7) Controls for equipment listed in 5.17.3.10.

(8) Other selected equipment shall be permitted to be served by the equipment system. [NFPA 99:4.4.2.2.3.5(9)]

(c) AC Equipment for Nondelayed Automatic Connection. Generator accessories, including but not limited to, the transfer fuel pump, electrically operated louvers, and other generator accessories essential for generator operation, shall be arranged for automatic connection to the alternate power source. [NFPA 99:4.4.2.2.3.3]

5.17.3.11 Sources of Power.

(a) Two Independent Sources of Power. Essential electrical systems shall have a minimum of two independent sources of power: a normal source generally supplying the entire electrical system and one or more

alternate sources for use when the normal source is interrupted. [NFPA 99:4.4.1.1.4]

(b) Alternate Source of Power. The alternate source of power shall be one of the following:

(1) Generator(s) driven by some form of prime mover(s) and located on the premises

(2) Another generating unit(s) where the normal source consists of a generating unit(s) located on the premises

(3) An external utility service when the normal source consists of a generating unit(s) located on the premises

(4) A battery system located on the premises [NFPA 99:4.4.1.2]

(c) Location of Essential Electrical System Components. Careful consideration shall be given to the location of the spaces housing the components of the essential electrical system to minimize interruptions caused by natural forces common to the area (e.g., storms, floods, earthquakes, or hazards created by adjoining structures or activities). Consideration shall also be given to the possible interruption of normal electrical services resulting from similar causes as well as possible disruption of normal electrical service due to internal wiring and equipment failures.

FPN: Facilities in which the normal source of power is supplied by two or more separate central station-fed services experience greater than normal electrical service reliability than those with only a single feed. Such a dual source of normal power consists of two or more electrical services fed from separate generator sets or a utility distribution network that has multiple power input sources and is arranged to provide mechanical and electrical separation so that a fault between the facility and the generating sources is not likely to cause an interruption of more than one of the facility service feeders.

5.17.3.16 Essential Electrical Systems for Nursing Homes and Limited Care Facilities.

(a) Applicability. The requirements of Part 5.17.3, 5.17.3.16(c) through 5.17.3.20, shall apply to nursing homes and limited care facilities.

Exception: The requirements of Part 5.17.3, 5.17.3.16(c) through 5.17.3.20, shall not apply to freestanding buildings used as nursing homes and limited care facilities, provided that the following apply:

(a) Admitting and discharge policies are maintained that preclude the provision of care for any patient or resident who may need to be sustained by electrical life-support equipment.

(b) No surgical treatment requiring general anesthesia is offered.

(c) An automatic battery-operated system(s) or equipment is provided that shall be effective for at least 1½ hours and is otherwise in accordance with 7.0.3.1 and that shall be capable of supplying lighting for exit lights, exit corridors, stairways, nursing stations, medical preparation areas, boiler rooms, and communications areas. This system shall also supply power to operate all alarm systems. [NFPA 99:17.3.4.1.2(3), 18.3.4.1.2(3)]

FPN: See NFPA 101-2003, Life Safety Code.

(b) Inpatient Hospital Care Facilities. Nursing homes and limited care facilities that provide inpatient hospital care shall comply with the requirements of Part 5.17.3, 5.17.3.6 through 5.17.3.11.

(c) Facilities Contiguous or Located on the Same Site with Hospitals. Nursing homes and limited care facilities that are contiguous or located on the same site with a hospital shall be permitted to have their essential electrical systems supplied by that of the hospital.

FPN: For performance, maintenance, and testing requirements of essential electrical systems in nursing homes and limited care facilities, see NFPA 99-2002, Standard for Health Care Facilities.

5.17.3.17 Essential Electrical Systems.

(a) General. Essential electrical systems for nursing homes and limited care facilities shall be comprised of two separate branches capable of supplying a limited amount of lighting and power service, which is considered essential for the protection of life safety and effective operation of the institution during the time normal electrical service is interrupted for any reason. These two separate branches shall be the life safety branch and the critical branch. [NFPA 99:Annex A, 4.5.2.2.1]

(b) Transfer Switches. The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the essential electrical system shall be served by one or more transfer switches. One transfer switch shall be permitted to serve one or

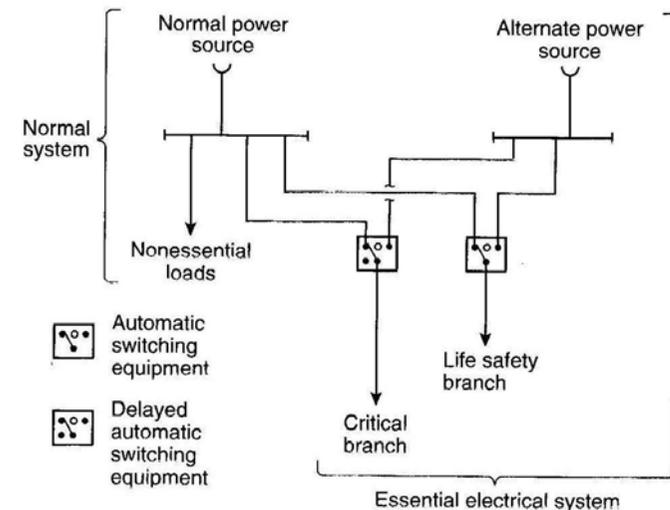

more branches or systems in a facility with a maximum demand on the essential electrical system of 150 kVA. [NFPA 99:4.5.2.2.1]

FPN No. 1: See NFPA 99-2002, Standard for Health Care Facilities, 4.5.3.2, Transfer Switch Operation Type II; 4.4.2.1.4, Automatic Transfer Switch Features; and 4.4.2.1.6, Nonautomatic Transfer Device Features.

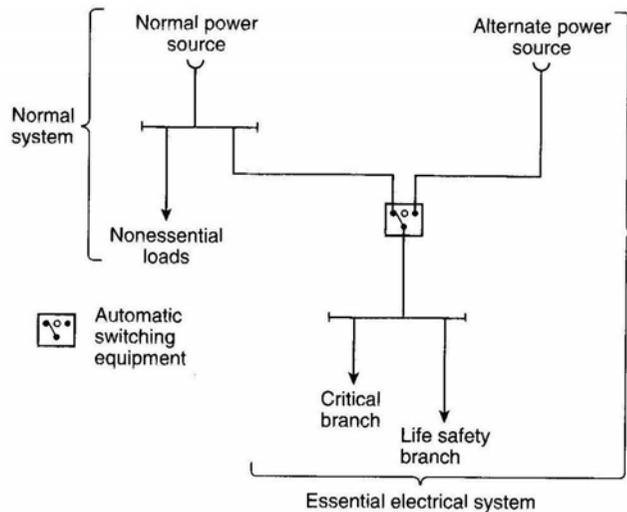

FPN No. 2: See FPN Figure 5.17.3.17, No. 1.

FPN No. 3: See FPN Figure 5.17.3.17, No. 2.

(c) Capacity of System. The essential electrical system shall have adequate capacity to meet the demand for the operation of all functions and equipment to be served by each branch at one time.

FPN Figure 5.17.3.17, No. 1 Nursing Home and Limited Health Care Facilities — Minimum Requirement for Transfer Switch Arrangement.

FPN Figure 5.17.3.17, No. 2 Nursing Home and Limited Health Care Facilities — Minimum Requirement (150 kVA or less) for Transfer Switch Arrangement.

(d) Separation from Other Circuits. The life safety branch shall be kept entirely independent of all other wiring and equipment and shall not enter the same raceways, boxes, or cabinets with other wiring except as follows:

- (1) In transfer switches
- (2) In exit or emergency luminaires (lighting fixtures) supplied from two sources
- (3) In a common junction box attached to exit or emergency luminaires (lighting fixtures) supplied from two sources

The wiring of the critical branch shall be permitted to occupy the same raceways, boxes, or cabinets of other circuits that are not part of the life safety branch.

(e) Receptacle Identification. The cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the emergency system shall have a distinctive color or marking so as to be readily identifiable. [NFPA 99: 4.5.2.2.4.2]

5.17.3.18 Automatic Connection to Life Safety Branch. The life safety branch shall be installed and connected to the alternate source of power so that all functions specified herein shall be automatically restored to operation within 10 seconds after the interruption of the normal source. No functions other than those listed in 5.17.3.18(a) through 5.17.3.18(g) shall be connected to the life safety branch. The life safety branch shall supply power for the following lighting, receptacles, and equipment.

FPN: The life safety branch is called the emergency system in NFPA 99-2002, Standard for Health Care Facilities.

(a) Illumination of Means of Egress. Illumination of means of egress as is necessary for corridors, passageways, stairways, landings, and exit doors and all ways of approach to exits. Switching arrangement to transfer patient corridor lighting from general illumination circuits shall be permitted, providing only one of two circuits can be selected and both circuits cannot be extinguished at the same time.

FPN: See NFPA 101-2003, Life Safety Code, Sections 7.8 and 7.9.

(b) Exit Signs. Exit signs and exit directional signs.

FPN: See NFPA 101-2003, Life Safety Code, Section 7.10.

(c) Alarm and Alerting Systems. Alarm and alerting systems, including the following:

- (1) Fire alarms

FPN: See NFPA 101-2003, Life Safety Code, Sections 9.6 and 18.3.4.

(2) Alarms required for systems used for the piping of nonflammable medical gases

FPN: See NFPA 99-2002, Standard for Health Care Facilities, 4.4.2.2.2(3).

(d) Communications Systems. Communications systems, where used for issuing instructions during emergency conditions.

(e) **Dining and Recreation Areas.** Sufficient lighting in dining and recreation areas to provide illumination to exit ways.

(f) **Generator Set Location.** Task illumination and selected receptacles in the generator set location.

(g) **Elevators.** Elevator cab lighting, control, communications, and signal systems. [NFPA 99:4.4.2.2.2.2(6), 4.5.2.2.2(7)]

5.17.3.19 Connection to Critical Branch. The critical branch shall be installed and connected to the alternate power source so that the equipment listed in 5.17.3.19(a) shall be automatically restored to operation at appropriate time-lag intervals following the restoration of the life safety branch to operation. Its arrangement shall also provide for the additional connection of equipment listed in 5.17.3.19(b) by either delayed automatic or manual operation.

Exception: For essential electrical systems under 150 kVA, deletion of the time-lag intervals feature for delayed automatic connection to the equipment system shall be permitted.

(a) **Delayed Automatic Connection.** The following equipment shall be connected to the critical branch and shall be arranged for delayed automatic connection to the alternate power source:

(1) Patient care areas — task illumination and selected receptacles in the following:

- a. Medication preparation areas
- b. Pharmacy dispensing areas
- c. Nurses' stations (unless adequately lighted by corridor luminaires)

(2) Sump pumps and other equipment required to operate for the safety of major apparatus and associated control systems and alarms

(3) Smoke control and stair pressurization systems

(4) Kitchen hood supply and/or exhaust systems, if required to operate during a fire in or under the hood

(5) Supply, return, and exhaust ventilating systems for airborne infectious isolation rooms

(b) **Delayed Automatic or Manual Connection.** The following equipment shall be connected to the critical branch and shall be arranged for either delayed automatic or manual connection to the alternate power source.

(1) Heating equipment to provide heating for patient rooms.

Exception: Heating of general patient rooms during disruption of the normal source shall not be required under any of the following conditions:

(1) *The outside design temperature is higher than -6.7°C.*

(2) *The outside design temperature is lower than -6.7°C and where a selected room(s) is provided for the needs of all confined patients, only such room(s) need be heated.*

(3) *The facility is served by a dual source of normal power as described in 5.17.3.20(c), FPN.*

FPN: The outside design temperature is based on the 97½ percent design values as shown in Chapter 24 of the ASHRAE Handbook of Fundamentals (1997).

(2) Elevator service — in instances where disruption of power would result in elevators stopping between floors, throw-over facilities shall be provided to allow the temporary operation of any elevator for the release of passengers. For elevator cab lighting, control, and signal system requirements, see 5.17.3.18(g).

(3) Additional illumination, receptacles, and equipment shall be permitted to be connected only to the critical branch. [NFPA 99:4.5.2.2.3.3(c)]

5.17.3.20 Sources of Power.

(a) **Two Independent Sources of Power.** Essential electrical systems shall have a minimum of two independent sources of power: a normal source generally supplying the entire electrical system and one or more alternate sources for use when the normal source is interrupted. [NFPA 99:4.4.1.1.4]

(b) Alternate Source of Power. The alternate source of power shall be a generator(s) driven by some form of prime mover(s) and located on the premises.

Exception No. 1: Where the normal source consists of generating units on the premises, the alternate source shall be either another generator set or an external utility service.

Exception No. 2: Nursing homes or limited care facilities meeting the requirements of 5.17.3.16(a), Exception, shall be permitted to use a battery system or self-contained battery integral with the equipment. [NFPA 99:17.3.4.1.3, 18.3.4.1.1]

(c) Location of Essential Electrical System Components. Careful consideration shall be given to the location of the spaces housing the components of the essential electrical system to minimize interruptions caused by natural forces common to the area (e.g., storms, floods, earthquakes, or hazards created by adjoining structures or activities). Consideration shall also be given to the possible interruption of normal electrical services resulting from similar causes as well as possible disruption of normal electrical service due to internal wiring and equipment failures.

FPN: Facilities in which the normal source of power is supplied by two or more separate central station-fed services experience greater than normal electrical service reliability than those with only a single feed. Such a dual source of normal power consists of two or more electrical services fed from separate generator sets or a utility distribution network that has multiple power input sources and is arranged to provide mechanical and electrical separation so that a fault between the facility and the generating sources will not likely cause an interruption of more than one of the facility service feeders.

5.17.3.21 Essential Electrical Systems for Other Health Care Facilities.

(a) Essential Electrical Distribution. The essential electrical distribution system shall be a battery or generator system.

FPN: See NFPA 99–2002, Standard for Health Care Facilities.

(b) Electrical Life Support Equipment. Where electrical life support equipment is required, the essential electrical distribution system shall be as described in 5.17.3.6 through 5.17.3.11. [NFPA 99:14.3.4.2.1]

(c) Critical Care Areas. Where critical care areas are present, the essential electrical distribution system shall be as described in 5.17.3.6 through 5.17.3.11. [NFPA 99:14.3.4.2.2]

(d) Power Systems. Battery systems shall be installed in accordance with the requirements of Article 700, and generator systems shall be as described in 5.17.3.6 through 5.17.3.11.

5.17.4 Inhalation Anesthetizing Locations

FPN: For further information regarding safeguards for anesthetizing locations, see NFPA 99-2002, Standard for Health Care Facilities.

5.17.4.1 Anesthetizing Location Classification.

FPN: If either of the anesthetizing locations in 5.17.4.1(a) or 5.17.4.1(b) is designated a wet location, refer to 5.17.2.11.

(a) Hazardous (Classified) Location.

(1) Use Location. In a location where flammable anesthetics are employed, the entire area shall be considered to be a Class I, Division 1 location that extends upward to a level 1 500 mm above the floor. The remaining volume up to the structural ceiling is considered to be above a hazardous (classified) location. [NFPA 99:Annex E, E.1, and E.2]

(2) Storage Location. Any room or location in which flammable anesthetics or volatile flammable disinfecting agents are stored shall be considered to be a Class I, Division 1 location from floor to ceiling.

(b) Other-Than-Hazardous (Classified) Location. Any inhalation anesthetizing location designated for the exclusive use of nonflammable anesthetizing agents shall be considered to be an other-than-hazardous (classified) location.

5.17.4.2 Wiring and Equipment.

(a) Within Hazardous (Classified) Anesthetizing Locations.

(1) Isolation. Except as permitted in 5.17.7.1, each power circuit within, or partially within, a flammable anesthetizing location as referred

to in 5.17.4.1 shall be isolated from any distribution system by the use of an isolated power system. [NFPA 99:Annex E, E.6.6.2]

(2) Design and Installation. Where an isolated power system is utilized, the isolated power equipment shall be listed as isolated power equipment, and the isolated power system shall be designed and installed in accordance with 5.17.7.1.

(3) Equipment Operating at More Than 10 Volts. In hazardous (classified) locations referred to in 5.17.4.1, all fixed wiring and equipment and all portable equipment, including lamps and other utilization equipment, operating at more than 10 volts between conductors shall comply with the requirements of 5.1.1.1 through 5.1.2.16, and 5.1.3.1 through 5.1.3.51, and 5.1.2.21(a) and 5.1.2.21(b) for Class I, Division 1 locations. All such equipment shall be specifically approved for the hazardous atmospheres involved. [NFPA 99: Annex E, E.2.1, E.4.5, E.4.6, and E.4.7]

(4) Extent of Location. Where a box, fitting, or enclosure is partially, but not entirely, within a hazardous (classified) location(s), the hazardous (classified) location(s) shall be considered to be extended to include the entire box, fitting, or enclosure.

(5) Receptacles and Attachment Plugs. Receptacles and attachment plugs in a hazardous (classified) location(s) shall be listed for use in Class I, Group C hazardous (classified) locations and shall have provision for the connection of a grounding conductor.

(6) Flexible Cord Type. Flexible cords used in hazardous (classified) locations for connection to portable utilization equipment, including lamps operating at more than 8 volts between conductors, shall be of a type approved for extra-hard usage in accordance with Table 4.0.1.4 and shall include an additional conductor for grounding.

(7) Flexible Cord Storage. A storage device for the flexible cord shall be provided and shall not subject the cord to bending at a radius of less than 75 mm.

(b) Above Hazardous (Classified) Anesthetizing Locations.

(1) Wiring Methods. Wiring above a hazardous (classified) location

referred to in 5.17.4.1 shall be installed in rigid metal conduit, electrical metallic tubing, intermediate metal conduit, Type MI cable, or Type MC cable that employs a continuous, gas/vaportight metal sheath.

(2) Equipment Enclosure. Installed equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent escape of sparks or hot metal particles.

Exception: Wall-mounted receptacles installed above the hazardous (classified) location in flammable anesthetizing locations shall not be required to be totally enclosed or have openings guarded or screened to prevent dispersion of particles.

(3) Luminaires (Lighting Fixtures). Surgical and other luminaires (lighting fixtures) shall conform to 5.1.3.31(b).

Exception No. 1: The surface temperature limitations set forth in 5.1.3.31(b)(1) shall not apply.

Exception No. 2: Integral or pendant switches that are located above and cannot be lowered into the hazardous (classified) location(s) shall not be required to be explosionproof.

(4) Seals. Approved seals shall be provided in conformance with 5.1.2.6, and 5.1.2.6(a)(4) shall apply to horizontal as well as to vertical boundaries of the defined hazardous (classified) locations.

(5) Receptacles and Attachment Plugs. Receptacles and attachment plugs located above hazardous (classified) anesthetizing locations shall be listed for hospital use for services of prescribed voltage, frequency, rating, and number of conductors with provision for the connection of the grounding conductor. This requirement shall apply to attachment plugs and receptacles of the 2-pole, 3-wire grounding type for single-phase, 230-volt and/or 115-volt, nominal, ac service.

(6) 250-Volt Receptacles and Attachment Plugs Rated 50 and 60 Amperes. Receptacles and attachment plugs rated 250 volts, for connection of 50-ampere and 60-ampere ac medical equipment for use

above hazardous (classified) locations, shall be arranged so that the 60-ampere receptacle will accept either the 50-ampere or the 60-ampere plug. Fifty-ampere receptacles shall be designed so as not to accept the 60-ampere attachment plug. The attachment plugs shall be of the 2-pole, 3-wire design with a third contact connecting to the insulated (green or green with yellow stripe) equipment grounding conductor of the electrical system.

(c) Other-Than-Hazardous (Classified) Anesthetizing Locations.

(1) Wiring Methods. Wiring serving other-than-hazardous (classified) locations, as defined in 5.17.4.1, shall be installed in a metal raceway system or cable assembly. The metal raceway system or cable armor or sheath assembly shall qualify as an equipment grounding return path in accordance with 2.50.6.9. Type MC and Type MI cable shall have an outer metal armor or sheath that is identified as an acceptable grounding return path.

Exception: Pendant receptacle constructions that employ at least Type SJO or equivalent flexible cords suspended not less than 1 800 mm from the floor shall not be required to be installed in a metal raceway or cable assembly.

(2) Receptacles and Attachment Plugs. Receptacles and attachment plugs installed and used in other-than-hazardous (classified) locations shall be listed for hospital use for services of prescribed voltage, frequency, rating, and number of conductors with provision for connection of the grounding conductor. This requirement shall apply to 2-pole, 3-wire grounding type for single-phase, 230-volt and/or 115-volt, nominal, ac service.

(3) 250-Volt Receptacles and Attachment Plugs Rated 50 Amperes and 60 Amperes. Receptacles and attachment plugs rated 250 volts, for connection of 50-ampere and 60-ampere ac medical equipment for use in other-than-hazardous (classified) locations, shall be arranged so that the 60-ampere receptacle will accept either the 50-ampere or the 60-ampere plug. Fifty-ampere receptacles shall be designed so as not to accept the 60-ampere attachment plug. The attachment plugs shall be of the 2-pole, 3-wire design with a third contact connecting to the insulated (green or green with yellow stripe) equipment grounding conductor of the electrical system.

5.17.4.3 Grounding. In any anesthetizing area, all metal raceways and metal-sheathed cables and all non-current-carrying conductive portions of fixed electric equipment shall be grounded. Grounding in Class I locations shall comply with 5.1.2.21.

Exception: Equipment operating at not more than 10 volts between conductors shall not be required to be grounded.

5.17.4.4 Grounded Power Systems in Anesthetizing Locations.

(a) Battery-Powered Emergency Lighting Units. One or more battery-powered emergency lighting units shall be provided in accordance with 7.0.3.1(f).

(b) Branch-Circuit Wiring. Branch circuits supplying only listed, fixed, therapeutic and diagnostic equipment, permanently installed above the hazardous (classified) location and in other-than-hazardous (classified) locations, shall be permitted to be supplied from a normal grounded service, single- or three-phase system, provided the following apply:

(1) Wiring for grounded and isolated circuits does not occupy the same raceway or cable.

(2) All conductive surfaces of the equipment are grounded.

(3) Equipment (except enclosed X-ray tubes and the leads to the tubes) are located at least 2 400 mm above the floor or outside the anesthetizing location.

(4) Switches for the grounded branch circuit are located outside the hazardous (classified) location.

Exception: Sections 5.17.4.4(b)(3) and (b)(4) shall not apply in other-than-hazardous (classified) locations.

(c) Fixed Lighting Branch Circuits. Branch circuits supplying only fixed lighting shall be permitted to be supplied by a normal grounded service, provided the following apply:

(1) Such luminaires (fixtures) are located at least 2 400 mm above the floor.

(2) All conductive surfaces of luminaires (fixtures) are grounded.

(3) Wiring for circuits supplying power to luminaires (fixtures) does not occupy the same raceway or cable for circuits supplying isolated power.

(4) Switches are wall-mounted and located above hazardous (classified) locations.

Exception: Sections 5.17.4.4(c)(1) and (c)(4) shall not apply in other-than-hazardous (classified) locations.

(d) Remote-Control Stations. Wall-mounted remote-control stations for remote-control switches operating at 24 volts or less shall be permitted to be installed in any anesthetizing location.

(e) Location of Isolated Power Systems. Where an isolated power system is utilized, the isolated power equipment shall be listed as isolated power equipment. Isolated power equipment and its grounded primary feeder shall be permitted to be located in an anesthetizing location, provided it is installed above a hazardous (classified) location or in an other-than-hazardous (classified) location.

(f) Circuits in Anesthetizing Locations. Except as permitted above, each power circuit within, or partially within, a flammable anesthetizing location as referred to in 5.17.4.1 shall be isolated from any distribution system supplying other-than-anesthetizing locations.

5.17.4.5 Low-Voltage Equipment and Instruments.

(a) Equipment Requirements. Low-voltage equipment that is frequently in contact with the bodies of persons or has exposed current-carrying elements shall comply with one of the following:

- (1) Operate on an electrical potential of 10 volts or less
- (2) Approved as intrinsically safe or double-insulated equipment
- (3) Be moisture resistant

(b) Power Supplies. Power shall be supplied to low-voltage equipment from one of the following:

(1) An individual portable isolating transformer (autotransformers shall not be used) connected to an isolated power circuit receptacle by means of an appropriate cord and attachment plug

(2) A common low-voltage isolating transformer installed in an other-than-hazardous (classified) location

(3) Individual dry-cell batteries

(4) Common batteries made up of storage cells located in an other-than-hazardous (classified) location

(c) Isolated Circuits. Isolating-type transformers for supplying low-voltage circuits shall have both of the following:

(1) Approved means for insulating the secondary circuit from the primary circuit

(2) The core and case grounded

(d) Controls. Resistance or impedance devices shall be permitted to control low-voltage equipment but shall not be used to limit the maximum available voltage to the equipment.

(e) Battery-Powered Appliances. Battery-powered appliances shall not be capable of being charged while in operation unless their charging circuitry incorporates an integral isolating-type transformer.

(f) Receptacles or Attachment Plugs. Any receptacle or attachment plug used on low-voltage circuits shall be of a type that does not permit interchangeable connection with circuits of higher voltage.

FPN: Any interruption of the circuit, even circuits as low as 10 volts, either by any switch or loose or defective connections anywhere in the circuit, may produce a spark that is sufficient to ignite flammable anesthetic agents.

5.17.5 X-Ray Installations

Nothing in this part shall be construed as specifying safeguards against the useful beam or stray X-ray radiation.

FPN No. 1: Radiation safety and performance requirements of several classes of X-ray equipment are regulated under Public Law 90-602 and are enforced by the Department of Health and Human Services.

FPN No. 2: In addition, information on radiation protection by the National Council on Radiation Protection and Measurements is published as Reports of the National Council on Radiation Protection and Measurement. These reports are obtainable from NCRP Publications, P.O. Box 30175, Washington, DC 20014.

5.17.5.1 Connection to Supply Circuit.

(a) **Fixed and Stationary Equipment.** Fixed and stationary X-ray equipment shall be connected to the power supply by means of a wiring method that meets the general requirements of this Code.

Exception: Equipment properly supplied by a branch circuit rated at not over 30 amperes shall be permitted to be supplied through a suitable attachment plug and hard-service cable or cord.

(b) **Portable, Mobile, and Transportable Equipment.** Individual branch circuits shall not be required for portable, mobile, and transportable medical X-ray equipment requiring a capacity of not over 60 amperes.

(c) **Over 600-Volt Supply.** Circuits and equipment operated on a supply circuit of over 600 volts shall comply with Article 4.90.

5.17.5.2 Disconnecting Means.

(a) **Capacity.** A disconnecting means of adequate capacity for at least 50 percent of the input required for the momentary rating or 100 percent of the input required for the long-time rating of the X-ray equipment, whichever is greater, shall be provided in the supply circuit.

(b) **Location.** The disconnecting means shall be operable from a location readily accessible from the X-ray control.

(c) **Portable Equipment.** For equipment connected to a 230-volt and/or 115-volt branch circuit of 30 amperes or less, a grounding-type attachment plug and receptacle of proper rating shall be permitted to serve as a disconnecting means.

5.17.5.3 Rating of Supply Conductors and Overcurrent Protection.

(a) Diagnostic Equipment.

(1) Branch Circuits. The ampacity of supply branch-circuit conductors and the current rating of overcurrent protective devices shall not be less than 50 percent of the momentary rating or 100 percent of the long-time rating, whichever is greater.

(2) Feeders. The ampacity of supply feeders and the current rating of overcurrent protective devices supplying two or more branch circuits supplying X-ray units shall not be less than 50 percent of the momentary demand rating of the largest unit plus 25 percent of the momentary demand rating of the next largest unit plus 10 percent of the momentary demand rating of each additional unit. Where simultaneous biplane examinations are undertaken with the X-ray units, the supply conductors and overcurrent protective devices shall be 100 percent of the momentary demand rating of each X-ray unit.

FPN: The minimum conductor size for branch and feeder circuits is also governed by voltage regulation requirements. For a specific installation, the manufacturer usually specifies minimum distribution transformer and conductor sizes, rating of disconnecting means, and overcurrent protection.

(b) **Therapeutic Equipment.** The ampacity of conductors and rating of overcurrent protective devices shall not be less than 100 percent of the current rating of medical X-ray therapy equipment.

FPN: The ampacity of the branch-circuit conductors and the ratings of disconnecting means and overcurrent protection for X-ray equipment are usually designated by the manufacturer for the specific installation.

5.17.5.4 Control Circuit Conductors.

(a) **Number of Conductors in Raceway.** The number of control circuit conductors installed in a raceway shall be determined in accordance with 3.0.1.17.

(b) **Minimum Size of Conductors.** Size 0.75 mm² (1.0 mm dia.) or 1.25 mm² (1.2 mm dia.) fixture wires as specified in 7.25.2.7 and flexible cords shall be permitted for the control and operating circuits of X-ray and auxiliary equipment where protected by not larger than 20-ampere overcurrent devices.

5.17.5.5 Equipment Installations. All equipment for new X-ray installations and all used or reconditioned X-ray equipment moved to and reinstalled at a new location shall be of an approved type.

5.17.5.6 Transformers and Capacitors. Transformers and capacitors that are part of X-ray equipment shall not be required to comply with Articles 4.50 and 4.60.

Capacitors shall be mounted within enclosures of insulating material or grounded metal.

5.17.5.7 Installation of High-Tension X-Ray Cables. Cables with grounded shields connecting X-ray tubes and image intensifiers shall be permitted to be installed in cable trays or cable troughs along with X-ray equipment control and power supply conductors without the need for barriers to separate the wiring.

5.17.5.8 Guarding and Grounding.

(a) High-Voltage Parts. All high-voltage parts, including X-ray tubes, shall be mounted within grounded enclosures. Air, oil, gas, or other suitable insulating media shall be used to insulate the high-voltage from the grounded enclosure. The connection from the high-voltage equipment to X-ray tubes and other high-voltage components shall be made with high-voltage shielded cables.

(b) Low-Voltage Cables. Low-voltage cables connecting to oil-filled units that are not completely sealed, such as transformers, condensers, oil coolers, and high-voltage switches, shall have insulation of the oil-resistant type.

(c) Noncurrent-Carrying Metal Parts. Noncurrent-carrying metal parts of X-ray and associated equipment (controls, tables, X-ray tube supports, transformer tanks, shielded cables, X-ray tube heads, etc.) shall be grounded in the manner specified in Article 2.50, as modified by 5.17.2.4(a) and 5.17.2.4(b).

5.17.6 Communications, Signaling Systems, Data Systems, Fire Alarm Systems, and Systems Less Than 230 Volts, Nominal

5.17.6.1 Patient Care Areas. Equivalent insulation and isolation to that required for the electrical distribution systems in patient care areas shall be provided for communications, signaling systems, data system circuits, fire alarm systems, and systems less than 120 volts, nominal.

FPN: An acceptable alternate means of providing isolation for patient/nurse call systems is by the use of nonelectrified signaling, communications, or control devices held by the patient or within reach of the patient.

5.17.6.2 Other-Than-Patient-Care Areas. In other-than-patient-care areas, installations shall be in accordance with the appropriate provisions of Articles 6.40, 7.25, 7.60, and 8.0.

5.17.6.3 Signal Transmission Between Appliances.

(a) General. Permanently installed signal cabling from an appliance in a patient location to remote appliances shall employ a signal transmission system that prevents hazardous grounding interconnection of the appliances.

FPN: See 5.17.2.4(a) for additional grounding requirements in patient care areas.

(b) Common Signal Grounding Wire. Common signal grounding wires (i.e., the chassis ground for single-ended transmission) shall be permitted to be used between appliances all located within the patient vicinity, provided the appliances are served from the same reference grounding point.

5.17.7 Isolated Power Systems

5.17.7.1 Isolated Power Systems.

(a) Installations.

(1) Isolated Power Circuits. Each isolated power circuit shall be controlled by a switch that has a disconnecting pole in each isolated circuit conductor to simultaneously disconnect all power. Such isolation shall be accomplished by means of one or more transformers having no electrical connection between primary and secondary windings, by means of motor generator sets, or by means of suitably isolated batteries.

(2) Circuit Characteristics. Circuits supplying primaries of isolating transformers shall operate at not more than 600 volts between conductors and shall be provided with proper overcurrent protection. The secondary voltage of such transformers shall not exceed 600 volts between conductors of each circuit. All circuits supplied from such secondaries shall be ungrounded and shall have an approved overcurrent device of proper ratings in each conductor. Circuits supplied directly from batteries or from motor generator sets shall be ungrounded and shall be protected against overcurrent in the same manner as transformer-fed secondary

circuits. If an electrostatic shield is present, it shall be connected to the reference grounding point. [NFPA 99:4.3.2.6.1]

(3) Equipment Location. The isolating transformers, motor generator sets, batteries and battery chargers, and associated primary or secondary overcurrent devices shall not be installed in hazardous (classified) locations. The isolated secondary circuit wiring extending into a hazardous anesthetizing location shall be installed in accordance with 5.1.2.1.

(4) Isolation Transformers. An isolation transformer shall not serve more than one operating room except as covered in (a)(4)a and (a)(4)b.

For purposes of this section, anesthetic induction rooms are considered part of the operating room or rooms served by the induction rooms.

a. Induction Rooms. Where an induction room serves more than one operating room, the isolated circuits of the induction room shall be permitted to be supplied from the isolation transformer of any one of the operating rooms served by that induction room.

b. Higher Voltages. Isolation transformers shall be permitted to serve single receptacles in several patient areas where the following apply:

1. The receptacles are reserved for supplying power to equipment requiring 150 volts or higher, such as portable X-ray units.

2. The receptacles and mating plugs are not interchangeable with the receptacles on the local isolated power system. [NFPA 99:13.4.1.2.6.6]

(5) Conductor Identification. The isolated circuit conductors shall be identified as follows:

- a. Isolated Conductor No. 1 — Orange
- b. Isolated Conductor No. 2 — Brown

For 3-phase systems, the third conductor shall be identified as yellow. Where isolated circuit conductors supply 125-volt and/or 250-volt, single-phase, 15- and 20-ampere receptacles, the orange conductor(s) shall be connected to the terminal(s) on the receptacles that

are identified in accordance with 2.0.1.10(b) for connection to the grounded circuit conductor.

(6) Wire-Pulling Compounds. Wire-pulling compounds that increase the dielectric constant shall not be used on the secondary conductors of the isolated power supply.

FPN No. 1: It is desirable to limit the size of the isolation transformer to 10 kVA or less and to use conductor insulation with low leakage to meet impedance requirements.

FPN No. 2: Minimizing the length of branch-circuit conductors and using conductor insulations with a dielectric constant less than 3.5 and insulation resistance constant greater than 6100 megohm-meters at 16°C reduces leakage from line to ground, reducing the hazard current.

(b) Line Isolation Monitor.

(1) Characteristics. In addition to the usual control and overcurrent protective devices, each isolated power system shall be provided with a continually operating line isolation monitor that indicates total hazard current. The monitor shall be designed such that a green signal lamp, conspicuously visible to persons in each area served by the isolated power system, remains lighted when the system is adequately isolated from ground. An adjacent red signal lamp and an audible warning signal (remote if desired) shall be energized when the total hazard current (consisting of possible resistive and capacitive leakage currents) from either isolated conductor to ground reaches a threshold value of 5 mA under nominal line voltage conditions. The line monitor shall not alarm for a fault hazard of less than 3.7 mA or for a total hazard current of less than 5 mA.

Exception: A system shall be permitted to be designed to operate at a lower threshold value of total hazard current. A line isolation monitor for such a system shall be permitted to be approved with the provision that the fault hazard current shall be permitted to be reduced but not to less than 35 percent of the corresponding threshold value of the total hazard current, and the monitor hazard current is to be correspondingly reduced to not more than 50 percent of the alarm threshold value of the total hazard current.

(2) Impedance. The line isolation monitor shall be designed to have sufficient internal impedance such that, when properly connected to the isolated system, the maximum internal current that can flow through the

line isolation monitor, when any point of the isolated system is grounded, shall be 1 mA.

Exception: The line isolation monitor shall be permitted to be of the low-impedance type such that the current through the line isolation monitor, when any point of the isolated system is grounded, will not exceed twice the alarm threshold value for a period not exceeding 5 milliseconds.

FPN: Reduction of the monitor hazard current, provided this reduction results in an increased "not alarm" threshold value for the fault hazard current, will increase circuit capacity.

(3) Ammeter. An ammeter calibrated in the total hazard current of the system (contribution of the fault hazard current plus monitor hazard current) shall be mounted in a plainly visible place on the line isolation monitor with the "alarm on" zone at approximately the center of the scale.

Exception: The line isolation monitor shall be permitted to be a composite unit, with a sensing section cabled to a separate display panel section on which the alarm or test functions are located.

FPN: It is desirable to locate the ammeter so that it is conspicuously visible to persons in the anesthetizing location.

ARTICLE 5.18 — ASSEMBLY OCCUPANCIES

5.18.1.1 Scope. Except for the assembly occupancies explicitly covered by 5.20.1.1, this article covers all buildings or portions of buildings or structures designed or intended for the gathering together of 100 or more persons for such purposes as deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation, or similar purposes.

5.18.1.2 General Classification.

(a) **Examples.** Assembly occupancies shall include, but not be limited to, the following:

Armories	Exhibition halls
Assembly halls	Gymnasiums

Auditoriums	Mortuary chapels
Bowling lanes	Multipurpose rooms
Club rooms	Museums
Conference rooms	Places of awaiting transportation
Courtrooms	Places of religious worship
Dance halls	Pool rooms
Dining and drinking facilities	Restaurants
	Skating rinks

(b) **Multiple Occupancies.** Where an assembly occupancy forms a portion of a building containing other occupancies, Article 5.18 applies only to that portion of the building considered an assembly occupancy. Occupancy of any room or space for assembly purposes by less than 100 persons in a building of other occupancy, and incidental to such other occupancy, shall be classified as part of the other occupancy and subject to the provisions applicable thereto.

(c) **Theatrical Areas.** Where any such building structure, or portion thereof, contains a projection booth or stage platform or area for the presentation of theatrical or musical productions, either fixed or portable, the wiring for that area, including associated audience seating areas, and all equipment that is used in the referenced area, and portable equipment and wiring for use in the production that will not be connected to permanently installed wiring, shall comply with Article 5.20.

FPN: For methods of determining population capacity, see local building code or, in its absence, NFPA 101-2003, Life Safety Code.

5.18.1.3 Other Articles.

(a) **Hazardous (Classified) Areas.** Electrical installations in hazardous (classified) areas located in assembly occupancies shall comply with Article 5.0.

(b) **Temporary Wiring.** In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be installed in accordance with Article 5.90. Flexible cables and cords approved for hard or extra-hard usage shall be permitted to be laid on floors where protected from contact by the general public. The ground-fault circuit-interrupter requirements of 5.90.1.6 shall not apply.

Exception: Where conditions of supervision and maintenance ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner will service the installation, flexible cords or cables identified in Table 4.0.1.4 for hard usage or extra-hard usage shall be permitted in cable trays used only for temporary wiring. All cords or cables shall be installed in a single layer. A permanent sign shall be attached to the cable tray at intervals not to exceed 7 600 mm. The sign shall read

CABLE TRAY FOR TEMPORARY WIRING ONLY

(c) Emergency Systems. Control of emergency systems shall comply with Article 7.0.

5.18.1.4 Wiring Methods.

(a) General. The fixed wiring methods shall be metal raceways, flexible metal raceways, nonmetallic raceways encased in not less than 50 mm of concrete, Type MI, MC, or AC cable containing an insulated equipment grounding conductor sized in accordance with Table 2.50.6.13.

Exception: Fixed wiring methods shall be as provided in

(a) Audio signal processing, amplification, and reproduction equipment — Article 6.40

(b) Communications circuits — Article 8.0

(c) Class 2 and Class 3 remote-control and signaling circuits — Article 7.25

(d) Fire alarm circuits — Article 7.60

(b) Nonrated Construction. In addition to the wiring methods of 5.18.1.4(a), nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.

FPN: Fire-rated construction is the fire-resistive classification used in building codes.

(c) Spaces with Finish Rating. Electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed in club rooms,

conference and meeting rooms in hotels or motels, courtrooms, dining facilities, restaurants, mortuary chapels, museums, libraries, and places of religious worship where the following apply:

(1) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(2) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

Electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with 3.0.1.22(c).

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C or an individual temperature rise of 163°C as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

5.18.1.5 Supply. Portable switchboards and portable power distribution equipment shall be supplied only from listed power outlets of sufficient voltage and ampere rating. Such power outlets shall be protected by overcurrent devices. Such overcurrent devices and power outlets shall not be accessible to the general public. Provisions for connection of an equipment grounding conductor shall be provided. The neutral of feeders supplying solid-state, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor.

ARTICLE 5.20 — THEATERS, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, PERFORMANCE AREAS, AND SIMILAR LOCATIONS

5.20.1 General

5.20.1.1 Scope. This article covers all buildings or that part of a building or structure, indoor or outdoor, designed or used for presentation, dramatic, musical, motion picture projection, or similar purposes and to specific audience seating areas within motion picture or television

| studios.

5.20.1.2 Definitions.

Border Light. A permanently installed overhead strip light.

Breakout Assembly. An adapter used to connect a multipole connector containing two or more branch circuits to multiple individual branch-circuit connectors.

Bundled. Cables or conductors that are physically tied, wrapped, taped or otherwise periodically bound together.

Connector Strip. A metal wireway containing pendant or flush receptacles.

Drop Box. A box containing pendant- or flush-mounted receptacles attached to a multiconductor cable via strain relief or a multipole connector.

Footlight. A border light installed on or in the stage.

Grouped. Cables or conductors positioned adjacent to one another but not in continuous contact with each other.

Performance Area. The stage and audience seating area associated with a temporary stage structure, whether indoors or outdoors, constructed of scaffolding, truss, platforms, or similar devices, that is used for the presentation of theatrical or musical productions or for public presentations.

Portable Equipment. Equipment fed with portable cords or cables intended to be moved from one place to another.

Portable Power Distribution Unit. A power distribution box containing receptacles and overcurrent devices.

Proscenium. The wall and arch that separates the stage from the auditorium (house).

Stand Lamp (Work Light). A portable stand that contains a general-purpose luminaire (lighting fixture) or lampholder with guard for the purpose of providing general illumination on the stage or in the auditorium.

Strip Light. A luminaire (lighting fixture) with multiple lamps arranged in a row.

Two-Fer. An adapter cable containing one male plug and two female cord connectors used to connect two loads to one branch circuit.

5.20.1.3 Motion Picture Projectors. Motion picture equipment and its installation and use shall comply with Article 5.40.

5.20.1.4 Audio Signal Processing, Amplification, and Reproduction Equipment. Audio signal processing, amplification, and reproduction equipment and its installation shall comply with Article 6.40.

5.20.1.5 Wiring Methods.

(a) General. The fixed wiring method shall be metal raceways, nonmetallic raceways encased in at least 50 mm of concrete, Type MI cable, MC cable, or AC cable containing an insulated equipment grounding conductor sized in accordance with Table 2.50.6.13.

Exception: Fixed wiring methods shall be as provided in Article 6.40 for audio signal processing, amplification, and reproduction equipment, in Article 8.0 for communication circuits, in Article 7.25 for Class 2 and Class 3 remote-control and signaling circuits, and in Article 7.60 for fire alarm circuits.

(b) Portable Equipment. The wiring for portable switchboards, stage set lighting, stage effects, and other wiring not fixed as to location shall be permitted with approved flexible cords and cables as provided elsewhere in Article 5.20. Fastening such cables and cords by uninsulated staples or nailing shall not be permitted.

(c) Nonrated Construction. Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are

not required to be of fire-rated construction by the applicable building code.

5.20.1.6 Number of Conductors in Raceway. The number of conductors permitted in any metal conduit, rigid nonmetallic conduit as permitted in this article, or electrical metallic tubing for border or stage pocket circuits or for remote-control conductors shall not exceed the percentage fill shown in Table 1 of Chapter 9. Where contained within an auxiliary gutter or a wireway, the sum of the cross-sectional areas of all contained conductors at any cross section shall not exceed 20 percent of the interior cross-sectional area of the auxiliary gutter or wireway. The 30-conductor limitation of 3.66.2.13 and 3.76.2.13 shall not apply.

5.20.1.7 Enclosing and Guarding Live Parts. Live parts shall be enclosed or guarded to prevent accidental contact by persons and objects. All switches shall be of the externally operable type. Dimmers, including rheostats, shall be placed in cases or cabinets that enclose all live parts.

5.20.1.8 Emergency Systems. Control of emergency systems shall comply with Article 7.0.

5.20.1.9 Branch Circuits. A branch circuit of any size supplying one or more receptacles shall be permitted to supply stage set lighting. The voltage rating of the receptacles shall not be less than the circuit voltage. Receptacle ampere ratings and branch-circuit conductor ampacity shall not be less than the branch-circuit overcurrent device ampere rating. Table 2.10.2.3(b)(2) shall not apply.

5.20.1.10 Portable Equipment. Portable stage and studio lighting equipment and portable power distribution equipment shall be permitted for temporary use outdoors, provided the equipment is supervised by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner while energized and barriered from the general public.

5.20.2 Fixed Stage Switchboards

5.20.2.1 Dead Front. Stage switchboards shall be of the dead-front type and shall comply with Part 4.8.4 unless approved based on suitability as a stage switchboard as determined by a qualified testing laboratory and recognized test standards and principles.

5.20.2.2 Guarding Back of Switchboard. Stage switchboards having exposed live parts on the back of such boards shall be enclosed by the building walls, wire mesh grilles, or by other approved methods. The entrance to this enclosure shall be by means of a self-closing door.

5.20.2.3 Control and Overcurrent Protection of Receptacle Circuits. Means shall be provided at a stage-lighting switchboard to which load circuits are connected for overcurrent protection of stage-lighting branch circuits, including branch circuits supplying stage and auditorium receptacles used for cord- and plug-connected stage equipment. Where the stage switchboard contains dimmers to control nonstage lighting, the locating of the overcurrent protective devices for these branch circuits at the stage switchboard shall be permitted.

5.20.2.4 Metal Hood. A stage switchboard that is not completely enclosed dead-front and dead-rear or recessed into a wall shall be provided with a metal hood extending the full length of the board to protect all equipment on the board from falling objects.

5.20.2.5 Dimmers. Dimmers shall comply with 5.20.2.5(a) through (d).

(a) Disconnection and Overcurrent Protection. Where dimmers are installed in ungrounded conductors, each dimmer shall have overcurrent protection not greater than 125 percent of the dimmer rating and shall be disconnected from all ungrounded conductors when the master or individual switch or circuit breaker supplying such dimmer is in the open position.

(b) Resistance- or Reactor-Type Dimmers. Resistance- or series reactor-type dimmers shall be permitted to be placed in either the grounded or the ungrounded conductor of the circuit. Where designed to open either the supply circuit to the dimmer or the circuit controlled by it, the dimmer shall then comply with 4.4.1.2(b). Resistance- or reactor-type dimmers placed in the grounded neutral conductor of the circuit shall not open the circuit.

(c) Autotransformer-Type Dimmers. The circuit supplying an autotransformer-type dimmer shall not exceed 250 volts between conductors. The grounded conductor shall be common to the input and output circuits.

FPN: See 210.9 for circuits derived from autotransformers.

(d) Solid-State-Type Dimmers. The circuit supplying a solid-state dimmer shall not exceed 250 volts between conductors unless the dimmer is listed specifically for higher voltage operation. Where a grounded conductor supplies a dimmer, it shall be common to the input and output circuits. Dimmer chassis shall be connected to the equipment grounding conductor.

5.20.2.6 Type of Switchboard. A stage switchboard shall be either one or a combination of the types specified in 5.20.2.6(a), (b), and (c).

(a) Manual. Dimmers and switches are operated by handles mechanically linked to the control devices.

(b) Remotely Controlled. Devices are operated electrically from a pilot-type control console or panel. Pilot control panels either shall be part of the switchboard or shall be permitted to be at another location.

(c) Intermediate. A stage switchboard with circuit interconnections is a secondary switchboard (patch panel) or panelboard remote to the primary stage switchboard. It shall contain overcurrent protection. Where the required branch-circuit overcurrent protection is provided in the dimmer panel, it shall be permitted to be omitted from the intermediate switchboard.

5.20.2.7 Stage Switchboard Feeders.

(a) Type of Feeder. Feeders supplying stage switchboards shall be one of the types in 5.20.2.7(a)(1) through (a)(3).

(1) Single Feeder. A single feeder disconnected by a single disconnect device.

(2) Multiple Feeders to Intermediate Stage Switchboard (Patch Panel). Multiple feeders of unlimited quantity shall be permitted, provided that all multiple feeders are part of a single system. Where combined, neutral conductors in a given raceway shall be of sufficient ampacity to carry the maximum unbalanced current supplied by multiple feeder conductors in the same raceway, but they need not be greater than

the ampacity of the neutral supplying the primary stage switchboard. Parallel neutral conductors shall comply with 3.10.1.4.

(3) Separate Feeders to Single Primary Stage Switchboard (Dimmer Bank). Installations with separate feeders to a single primary stage switchboard shall have a disconnecting means for each feeder. The primary stage switchboard shall have a permanent and obvious label stating the number and location of disconnecting means. If the disconnecting means are located in more than one distribution switchboard, the primary stage switchboard shall be provided with barriers to correspond with these multiple locations.

(b) Neutral. The neutral of feeders supplying solid-state, 3-phase, 4-wire dimming systems shall be considered a current-carrying conductor.

(c) Supply Capacity. For the purposes of calculating supply capacity to switchboards, it shall be permissible to consider the maximum load that the switchboard is intended to control in a given installation, provided that the following apply:

(1) All feeders supplying the switchboard shall be protected by an overcurrent device with a rating not greater than the ampacity of the feeder.

(2) The opening of the overcurrent device shall not affect the proper operation of the egress or emergency lighting systems.

FPN: For calculation of stage switchboard feeder loads, see 2.20.3.1.

5.20.3 Fixed Stage Equipment Other Than Switchboards

5.20.3.1 Circuit Loads.

(a) Circuits Rated 20 Amperes or Less. Footlights, border lights, and proscenium sidelights shall be arranged so that no branch circuit supplying such equipment carries a load exceeding 20 amperes.

(b) Circuits Rated Greater Than 20 Amperes. Where only heavy-duty lampholders are used, such circuits shall be permitted to comply with Article 2.10 for circuits supplying heavy-duty lampholders.

5.20.3.2 Conductor Insulation. Foot, border, proscenium, or portable strip lights and connector strips shall be wired with conductors that have insulation suitable for the temperature at which the conductors are operated, but not less than 125°C. The ampacity of the 125°C conductors shall be that of 60°C conductors. All drops from connector strips shall be 90°C wire sized to the ampacity of 60°C cords and cables with no more than 150 mm of conductor extending into the connector strip. Section 3.10.1.15(b)(2)a shall not apply.

FPN: See Table 3.10.1.13 for conductor types.

5.20.3.3 Footlights.

(a) Metal Trough Construction. Where metal trough construction is employed for footlights, the trough containing the circuit conductors shall be made of sheet metal not lighter than 0.8 mm and treated to prevent oxidation. Lampholder terminals shall be kept at least 12 mm from the metal of the trough. The circuit conductors shall be soldered to the lampholder terminals.

(b) Other-Than-Metal Trough Construction. Where the metal trough construction specified in 5.20.3.3(a) is not used, footlights shall consist of individual outlets with lampholders wired with rigid metal conduit, intermediate metal conduit, or flexible metal conduit, Type MC cable, or mineral-insulated, metal-sheathed cable. The circuit conductors shall be soldered to the lampholder terminals.

(c) Disappearing Footlights. Disappearing footlights shall be arranged so that the current supply is automatically disconnected when the footlights are replaced in the storage recesses designed for them.

5.20.3.4 Borders and Proscenium Sidelights.

(a) General. Borders and proscenium sidelights shall be as follows:

- (1) Constructed as specified in 5.20.3.3
- (2) Suitably stayed and supported
- (3) Designed so that the flanges of the reflectors or other adequate guards protect the lamps from mechanical damage and from accidental contact with scenery or other combustible material

(b) Cords and Cables for Border Lights.

(1) General. Cords and cables for supply to border lights shall be listed for extra-hard usage. The cords and cables shall be suitably supported. Such cords and cables shall be employed only where flexible conductors are necessary. Ampacity of the conductors shall be as provided in 4.0.1.5.

(2) Cords and Cables Not in Contact with Heat-Producing Equipment. Listed multiconductor extra-hard-usage-type cords and cables not in direct contact with equipment containing heat-producing elements shall be permitted to have their ampacity determined by Table 5.20.3.4. Maximum load current in any conductor with an ampacity determined by Table 5.20.3.4 shall not exceed the values in Table 5.20.3.4.

Table 5.20.3.4 Ampacity of Listed Extra-Hard-Usage Cords and Cables with Temperature Ratings of 75°C and 90°C*
[Based on Ambient Temperature of 30°C]

Conductor Size [mm ² (mm dia.)]	Temperature Rating of Cords and Cable		Maximum Rating of Overcurrent Device
	75°C	90°C	
2.0 (1.6)	24	28	15
3.5 (2.0)	32	35	20
5.5 (2.6)	41	47	25
8.0 (3.2)	57	65	35
14	77	87	45
22	101	114	60
30	133	152	80

*Ampacity shown is the ampacity for multiconductor cords and cables where only three copper conductors are current-carrying. If the number of current-carrying conductors in a cord or cable exceeds three and the load diversity factor is a minimum of 50 percent, the ampacity of each conductor shall be reduced as shown in the following table.

Number of Conductors	Percent of Ampacity
4-6	80
7-24	70
25-42	60
43 and above	50

Note: Ultimate insulation temperature. In no case shall conductors be associated together in such a way with respect to the kind of circuit, the wiring method used, or the number of conductors such that the temperature limit of the conductors will be exceeded.

A neutral conductor that carries only the unbalanced current from other conductors of the same circuit need not be considered as a current-carrying conductor.

In a 3-wire circuit consisting of two phase wires and the neutral of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.

On a 4-wire, 3-phase, wye circuit where the major portion of the load consists of nonlinear loads such as electric-discharge lighting, electronic computer/data processing, or similar equipment, there are harmonic currents present in the neutral conductor, and the neutral shall be considered to be a current-carrying conductor.

5.20.3.5 Receptacles. Receptacles for electrical equipment on stages shall be rated in amperes. Conductors supplying receptacles shall be in accordance with Articles 3.10 and 4.0.

5.20.3.6 Connector Strips, Drop Boxes, Floor Pockets, and Other Outlet Enclosures. Receptacles for the connection of portable stage-lighting equipment shall be pendant or mounted in suitable pockets or enclosures and shall comply with 5.20.3.5. Supply cables for connector strips and drop boxes shall be as specified in 5.20.3.4(b).

5.20.3.7 Backstage Lamps (Bare Bulbs). Lamps (bare bulbs) installed in backstage and ancillary areas where they can come in contact with scenery shall be located and guarded so as to be free from physical damage and shall provide an air space of not less than 50 mm between such lamps and any combustible material.

Exception: Decorative lamps installed in scenery shall not be considered to be backstage lamps for the purpose of this section.

5.20.3.8 Curtain Machines. Curtain machines shall be listed.

5.20.3.9 Smoke Ventilator Control. Where stage smoke ventilators are released by an electrical device, the circuit operating the device shall be normally closed and shall be controlled by at least two externally

operable switches, one switch being placed at a readily accessible location on stage and the other where designated by the authority having jurisdiction. The device shall be designed for the full voltage of the circuit to which it is connected, no resistance being inserted. The device shall be located in the loft above the scenery and shall be enclosed in a suitable metal box having a tight, self-closing door.

5.20.4 Portable Switchboards on Stage

5.20.4.1 Road Show Connection Panel (A Type of Patch Panel). A panel designed to allow for road show connection of portable stage switchboards to fixed lighting outlets by means of permanently installed supplementary circuits. The panel, supplementary circuits, and outlets shall comply with 5.20.4.1(a) through (d).

(a) Load Circuits. Circuits shall terminate in grounding-type polarized inlets of current and voltage rating that match the fixed-load receptacle.

(b) Circuit Transfer. Circuits that are transferred between fixed and portable switchboards shall have all circuit conductors transferred simultaneously.

(c) Overcurrent Protection. The supply devices of these supplementary circuits shall be protected by branch-circuit overcurrent protective devices. The individual supplementary circuit, within the road show connection panel and theater, shall be protected by branch-circuit overcurrent protective devices of suitable ampacity installed within the road show connection panel.

(d) Enclosure. Panel construction shall be in accordance with Article 4.8.

5.20.4.2 Supply. Portable switchboards shall be supplied only from power outlets of sufficient voltage and ampere rating. Such power outlets shall include only externally operable, enclosed fused switches or circuit breakers mounted on stage or at the permanent switchboard in locations readily accessible from the stage floor. Provisions for connection of an equipment grounding conductor shall be provided. The neutral of feeders supplying solid-state, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor.

5.20.4.3 Overcurrent Protection. Circuits from portable switchboards directly supplying equipment containing incandescent lamps of not over 300 watts shall be protected by overcurrent protective devices having a rating or setting of not over 20 amperes. Circuits for lampholders over 300 watts shall be permitted where overcurrent protection complies with Article 2.10.

5.20.4.4 Construction and Feeders. Portable switchboards and feeders for use on stages shall comply with 5.20.4.4(a) through (p).

(a) **Enclosure.** Portable switchboards shall be placed within an enclosure of substantial construction, which shall be permitted to be arranged so that the enclosure is open during operation. Enclosures of wood shall be completely lined with sheet metal of not less than 0.50 mm and shall be well galvanized, enameled, or otherwise properly coated to prevent corrosion or be of a corrosion-resistant material.

(b) **Energized Parts.** There shall not be exposed energized parts within the enclosure.

(c) **Switches and Circuit Breakers.** All switches and circuit breakers shall be of the externally operable, enclosed type.

(d) **Circuit Protection.** Overcurrent devices shall be provided in each ungrounded conductor of every circuit supplied through the switchboard. Enclosures shall be provided for all overcurrent devices in addition to the switchboard enclosure.

(e) **Dimmers.** The terminals of dimmers shall be provided with enclosures, and dimmer faceplates shall be arranged so that accidental contact cannot be readily made with the faceplate contacts.

(f) Interior Conductors.

(1) Type. All conductors other than busbars within the switchboard enclosure shall be stranded. Conductors shall be approved for an operating temperature at least equal to the approved operating temperature of the dimming devices used in the switchboard and in no case less than the following:

a. Resistance-type dimmers — 200°C; or

b. Reactor-type, autotransformer, and solid-state dimmers — 125°C

All control wiring shall comply with Article 7.25.

(2) Protection. Each conductor shall have an ampacity not less than the rating of the circuit breaker, switch, or fuse that it supplies. Circuit interrupting and bus bracing shall be in accordance with 1.10.1.9 and 1.10.1.10. The short-circuit current rating shall be marked on the switchboard.

Conductors shall be enclosed in metal wireways or shall be securely fastened in position and shall be bushed where they pass through metal.

(g) **Pilot Light.** A pilot light shall be provided within the enclosure and shall be connected to the circuit supplying the board so that the opening of the master switch does not cut off the supply to the lamp. This lamp shall be on an individual branch circuit having overcurrent protection rated or set at not over 15 amperes.

(h) Supply Conductors.

(1) General. The supply to a portable switchboard shall be by means of listed extra-hard usage cords or cables. The supply cords or cable shall terminate within the switchboard enclosure, in an externally operable fused master switch or circuit breaker or in a connector assembly identified for the purpose. The supply cords or cable (and connector assembly) shall have sufficient ampacity to carry the total load connected to the switchboard and shall be protected by overcurrent devices.

(2) Single-Conductor Cables. Single-conductor portable supply cable sets shall not be smaller than 30 mm² conductors. The equipment grounding conductor shall not be smaller than 14 mm² conductor. Single-conductor grounded neutral cables for a supply shall be sized in accordance with 5.20.4.4(o)(2). Where single conductors are paralleled for increased ampacity, the paralleled conductors shall be of the same length and size. Single-conductor supply cables shall be grouped together but not bundled. The equipment grounding conductor shall be permitted to be of a different type, provided it meets the other requirements of this section, and it shall be permitted to be reduced in size as permitted by 2.50.6.13. Grounded (neutral) and equipment grounding conductors shall be identified in accordance with 2.0.1.6, 2.50.6.10, and 3.10.1.12.

Grounded conductors shall be permitted to be identified by marking at least the first 150 mm from both ends of each length of conductor with white or gray. Equipment grounding conductors shall be permitted to be identified by marking at least the first 150 mm from both ends of each length of conductor with green or green with yellow stripes. Where more than one nominal voltage exists within the same premises, each ungrounded conductor shall be identified by system.

(3) Supply Conductors Not Over 3 000 mm Long. Where supply conductors do not exceed 3 000 mm in length between supply and switchboard or supply and a subsequent overcurrent device, the supply conductors shall be permitted to be reduced in size where all of the following conditions are met:

- a. The ampacity of the supply conductors shall be at least one-quarter of the ampacity of the supply overcurrent protection device.
- b. The supply conductors shall terminate in a single overcurrent protection device that will limit the load to the ampacity of the supply conductors. This single overcurrent device shall be permitted to supply additional overcurrent devices on its load side.
- c. The supply conductors shall not penetrate walls, floors, or ceilings or be run through doors or traffic areas. The supply conductors shall be adequately protected from physical damage.
- d. The supply conductors shall be suitably terminated in an approved manner.
- e. Conductors shall be continuous without splices or connectors.
- f. Conductors shall not be bundled.
- g. Conductors shall be supported above the floor in an approved manner.

(4) Supply Conductors Not Over 6 000 mm Long. Where supply conductors do not exceed 6 000 mm in length between supply and switchboard or supply and a subsequent overcurrent protection device, the supply conductors shall be permitted to be reduced in size where all of the following conditions are met:

- a. The ampacity of the supply conductors shall be at least one-half of the ampacity of the supply overcurrent protection device.
- b. The supply conductors shall terminate in a single overcurrent protection device that limits the load to the ampacity of the supply conductors. This single overcurrent device shall be permitted to supply

additional overcurrent devices on its load side.

c. The supply conductors shall not penetrate walls, floors, or ceilings or be run through doors or traffic areas. The supply conductors shall be adequately protected from physical damage.

d. The supply conductors shall be suitably terminated in an approved manner.

e. The supply conductors shall be supported in an approved manner at least 2 100 mm above the floor except at terminations.

f. The supply conductors shall not be bundled.

g. Tap conductors shall be in unbroken lengths.

(5) Supply Conductors Not Reduced in Size. Supply conductors not reduced in size under provisions of 5.20.4.4(h)(3) or 5.20.4.4(h)(4) shall be permitted to pass through holes in walls specifically designed for the purpose. If penetration is through the fire-resistant-rated wall, it shall be in accordance with 3.0.1.21.

(i) Cable Arrangement. Cables shall be protected by bushings where they pass through enclosures and shall be arranged so that tension on the cable is not transmitted to the connections. Where power conductors pass through metal, the requirements of 3.0.1.20 shall apply.

(j) Number of Supply Interconnections. Where connectors are used in a supply conductor, there shall be a maximum number of three interconnections (mated connector pairs) where the total length from supply to switchboard does not exceed 30 m. In cases where the total length from supply to switchboard exceeds 30 m, one additional interconnection shall be permitted for each additional 30 m of supply conductor.

(k) Single-Pole Separable Connectors. Where single-pole portable cable connectors are used, they shall be listed and of the locking type. Sections 4.0.1.10, 4.6.1.6, and 4.6.1.7 shall not apply to listed single-pole separable connectors and single-conductor cable assemblies utilizing listed single-pole separable connectors. Where paralleled sets of current-carrying, single-pole separable connectors are provided as input devices, they shall be prominently labeled with a warning indicating the presence of internal parallel connections. The use of single-pole separable connectors shall comply with at least one of the following conditions:

- (1) Connection and disconnection of connectors are only possible

where the supply connectors are interlocked to the source, and it is not possible to connect or disconnect connectors when the supply is energized.

(2) Line connectors are of the listed sequential-interlocking type so that load connectors shall be connected in the following sequence:

- a. Equipment grounding conductor connection
- b. Grounded circuit conductor connection, if provided
- c. Ungrounded conductor connection, and that disconnection shall be in the reverse order

(3) A caution notice shall be provided adjacent to the line connectors indicating that plug connection shall be in the following order:

- a. Equipment grounding conductor connectors
- b. Grounded circuit conductor connectors, if provided
- c. Ungrounded conductor connectors, and that disconnection shall be in the reverse order

(l) Protection of Supply Conductors and Connectors. All supply conductors and connectors shall be protected against physical damage by an approved means. This protection shall not be required to be raceways.

(m) Flanged Surface Inlets. Flanged surface inlets (recessed plugs) that are used to accept the power shall be rated in amperes.

(n) Terminals. Terminals to which stage cables are connected shall be located so as to permit convenient access to the terminals.

(o) Neutral.

(1) Neutral Terminal. In portable switchboard equipment designed for use with 3-phase, 4-wire with ground supply, the supply neutral terminal, its associated busbar, or equivalent wiring, or both, shall have an ampacity equal to at least twice the ampacity of the largest ungrounded supply terminal.

Exception: Where portable switchboard equipment is specifically constructed and identified to be internally converted in the field, in an approved manner, from use with a balanced 3-phase, 4-wire with ground supply to a balanced single-phase, 3-wire with ground supply, the supply

neutral terminal and its associated busbar, equivalent wiring, or both, shall have an ampacity equal to at least that of the largest ungrounded single-phase supply terminal.

(2) Supply Neutral. The power supply conductors for portable switchboards shall be sized considering the neutral as a current-carrying conductor. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits, the grounded neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard.

(p) Licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. The routing of portable supply conductors, the making and breaking of supply connectors and other supply connections, and the energization and de-energization of supply services shall be performed by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner, and portable switchboards shall be so marked, indicating this requirement in a permanent and conspicuous manner.

Exception: A portable switchboard shall be permitted to be connected to a permanently installed supply receptacle by other than licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner, provided that the supply receptacle is protected for its rated ampacity by an overcurrent device of not greater than 150 amperes, and where the receptacle, interconnection, and switchboard comply with all of the following:

- (a) Employ listed multipole connectors suitable for the purpose for every supply interconnection*
- (b) Prevent access to all supply connections by the general public*
- (c) Employ listed extra-hard usage multiconductor cords or cables with an ampacity suitable for the type of load and not less than the ampere rating of the connectors.*

5.20.5 Portable Stage Equipment Other Than Switchboards

5.20.5.1 Arc Lamps. Arc lamps, including enclosed arc lamps and associated ballasts, shall be listed. Interconnecting cord sets and interconnecting cords and cables shall be extra-hard usage type and listed.

5.20.5.2 Portable Power Distribution Units. Portable power distribution units shall comply with 5.20.5.2(a) through (e).

(a) **Enclosure.** The construction shall be such that no current-carrying part will be exposed.

(b) **Receptacles and Overcurrent Protection.** Receptacles shall comply with 5.20.3.5 and shall have branch-circuit overcurrent protection in the box. Fuses and circuit breakers shall be protected against physical damage. Cords or cables supplying pendant receptacles shall be listed for extra-hard usage.

(c) **Busbars and Terminals.** Busbars shall have an ampacity equal to the sum of the ampere ratings of all the circuits connected to the busbar. Lugs shall be provided for the connection of the master cable.

(d) **Flanged Surface Inlets.** Flanged surface inlets (recessed plugs) that are used to accept the power shall be rated in amperes.

(e) **Cable Arrangement.** Cables shall be adequately protected where they pass through enclosures and be arranged so that tension on the cable is not transmitted to the terminations.

5.20.5.3 Bracket Fixture Wiring.

(a) **Bracket Wiring.** Brackets for use on scenery shall be wired internally, and the fixture stem shall be carried through to the back of the scenery where a bushing shall be placed on the end of the stem. Externally wired brackets or other fixtures shall be permitted where wired with cords designed for hard usage that extend through scenery and without joint or splice in canopy of fixture back and terminate in an approved-type stage connector located, where practical, within 460 mm of the fixture.

(b) **Mounting.** Fixtures shall be securely fastened in place.

5.20.5.4 Portable Strips. Portable strips shall be constructed in accordance with the requirements for border lights and proscenium sidelights in 5.20.3.4(a). The supply cable shall be protected by bushings

where it passes through metal and shall be arranged so that tension on the cable will not be transmitted to the connections.

FPN No. 1: See 5.20.3.2 for wiring of portable strips.

FPN No. 2: See 5.20.5.8(a)(3) for insulation types required on single conductors.

5.20.5.5 Festoons. Joints in festoon wiring shall be staggered. Lamps enclosed in lanterns or similar devices of combustible material shall be equipped with guards.

5.20.5.6 Special Effects. Electrical devices used for simulating lightning, waterfalls, and the like shall be constructed and located so that flames, sparks, or hot particles cannot come in contact with combustible material.

5.20.5.7 Multipole Branch-Circuit Cable Connectors. Multipole branch-circuit cable connectors, male and female, for flexible conductors shall be constructed so that tension on the cord or cable is not transmitted to the connections. The female half shall be attached to the load end of the power supply cord or cable. The connector shall be rated in amperes and designed so that differently rated devices cannot be connected together; however, a 20-ampere T-slot receptacle shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Alternating-current multipole connectors shall be polarized and comply with 4.6.1.6 and 4.6.1.9.

FPN: See 4.0.1.10 for pull at terminals.

5.20.5.8 Conductors for Portables.

(a) Conductor Type.

(1) General. Flexible conductors, including cable extensions, used to supply portable stage equipment shall be listed extra-hard usage cords or cables.

(2) Stand Lamps. Listed, hard usage cord shall be permitted to supply stand lamps where the cord is not subject to physical damage and is protected by an overcurrent device rated at not over 20 amperes.

(3) High-Temperature Applications. A special assembly of

conductors in sleeving not longer than 1 000 mm shall be permitted to be employed in lieu of flexible cord if the individual wires are stranded and rated not less than 125°C and the outer sleeve is glass fiber with a wall thickness of at least 0.635 mm.

Portable stage equipment requiring flexible supply conductors with a higher temperature rating where one end is permanently attached to the equipment shall be permitted to employ alternate, suitable conductors as determined by a qualified testing laboratory and recognized test standards.

(4) Breakouts. Listed, hard usage (junior hard service) cords shall be permitted in breakout assemblies where all of the following conditions are met:

a. The cords are utilized to connect between a single multipole connector containing two or more branch circuits and multiple 2-pole, 3-wire connectors.

b. The longest cord in the breakout assembly does not exceed 6 000 mm.

c. The breakout assembly is protected from physical damage by attachment over its entire length to a pipe, truss, tower, scaffold, or other substantial support structure.

d. All branch circuits feeding the breakout assembly are protected by overcurrent devices rated at not over 20 amperes.

(b) Conductor Ampacity. The ampacity of conductors shall be as given in 4.0.1.5, except multiconductor, listed, extra-hard usage portable cords that are not in direct contact with equipment containing heat-producing elements shall be permitted to have their ampacity determined by Table 5.20.3.4. Maximum load current in any conductor with an ampacity determined by Table 5.20.3.4 shall not exceed the values in Table 5.20.3.4.

Exception: Where alternate conductors are allowed in 5.20.5.8(a)(3), their ampacity shall be as given in the appropriate table in this Code for the types of conductors employed.

5.20.5.9 Adapters. Adapters, two-fers, and other single- and multiple-circuit outlet devices shall comply with 5.20.5.9(a), (b), and (c).

(a) No Reduction in Current Rating. Each receptacle and its corresponding cable shall have the same current and voltage rating as the plug supplying it. It shall not be utilized in a stage circuit with a greater current rating.

(b) Connectors. All connectors shall be wired in accordance with 5.20.5.7.

(c) Conductor Type. Conductors for adapters and two-fers shall be listed, extra-hard usage or listed, hard usage (junior hard service) cord. Hard usage (junior hard service) cord shall be restricted in overall length to 1 000 mm.

5.20.6 Dressing Rooms

5.20.6.1 Pendant Lampholders. Pendant lampholders shall not be installed in dressing rooms.

5.20.6.2 Lamp Guards. All exposed incandescent lamps in dressing rooms, where less than 2 400 mm from the floor, shall be equipped with open-end guards riveted to the outlet box cover or otherwise sealed or locked in place.

5.20.6.3 Switches Required. All lights and any receptacles adjacent to the mirror(s) and above the dressing table counter(s) installed in dressing rooms shall be controlled by wall switches installed in the dressing room(s). Each switch controlling receptacles adjacent to the mirror(s) and above the dressing table counter(s) shall be provided with a pilot light located outside the dressing room, adjacent to the door to indicate when the receptacles are energized. Other outlets installed in the dressing room shall not be required to be switched.

5.20.7 Grounding

5.20.7.1 Grounding. All metal raceways and metal-sheathed cables shall be grounded. The metal frames and enclosures of all equipment, including border lights and portable luminaires (lighting fixtures), shall be grounded. Grounding, where used, shall be in accordance with Article 2.50.

ARTICLE 5.25 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

5.25.1 General Requirements

5.25.1.1 Scope. This article covers the installation of portable wiring and equipment for carnivals, circuses, fairs, and similar functions, including wiring in or on all structures.

FPN: Portable as used in this Article refers to the non-permanent or transitory nature of the installations covered here, and not interpreted to mean installations (including equipment) that can be easily moved as applied elsewhere in this Code.

5.25.1.3 Other Articles.

(a) Portable Wiring and Equipment. Wherever the requirements of other articles of this Code and Article 5.25 differ, the requirements of Article 5.25 shall apply to the portable wiring and equipment.

(b) Permanent Structures. Articles 5.18 and 5.20 shall apply to wiring in permanent structures.

(c) Audio Signal Processing, Amplification, and Reproduction Equipment. Article 6.40 shall apply to the wiring and installation of audio signal processing, amplification, and reproduction equipment.

(d) Attractions Utilizing Pools, Fountains, and Similar Installations with Contained Volumes of Water. This equipment shall be installed to comply with the applicable requirements of Article 6.80.

5.25.1.5 Overhead Conductor Clearances.

(a) Vertical Clearances. Conductors shall have a vertical clearance to ground in accordance with 2.25.1.18. These clearances shall apply only to wiring installed outside of tents and concessions.

(b) Clearance to Rides and Attractions. Amusement rides and amusement attractions shall be maintained not less than 4 500 mm in any direction from overhead conductors operating at 600 volts or less, except for the conductors supplying the amusement ride or attraction. Amusement rides or attractions shall not be located under or within 4 500 mm horizontally of conductors operating in excess of 600 volts.

5.25.1.6 Protection of Electrical Equipment. Electrical equipment and wiring methods in or on rides, concessions, or other units shall be provided with mechanical protection where such equipment or wiring methods are subject to physical damage.

5.25.2 Power Sources

5.25.2.1 Services. Services shall comply with 5.25.2.1(a) and 5.25.2.1(b).

(a) Guarding. Service equipment shall not be installed in a location that is accessible to unqualified persons, unless the equipment is lockable.

(b) Mounting and Location. Service equipment shall be mounted on solid backing and be installed so as to be protected from the weather, unless of weatherproof construction.

5.25.2.2 Multiple Sources of Supply. Where multiple services or separately derived systems or both supply rides, attractions, and other structures, all sources of supply that serve rides, attractions, or other structures separated by less than 3 600 mm shall be bonded to the same grounding electrode system.

5.25.3 Wiring Methods

5.25.3.1 Wiring Methods.

(a) Type. Where flexible cords or cables are used, they shall be listed for extra hard usage. Where flexible cords or cables are used and are not subject to physical damage, they shall be permitted to be listed for hard usage. Where used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant. Extra-hard usage flexible cords or cables shall be permitted for use as permanent wiring on portable amusement rides and attractions where not subject to physical damage.

(b) Single-Conductor. Single-conductor cable shall be permitted only in sizes 30 mm² or larger.

(c) **Open Conductors.** Open conductors are prohibited except as part of a listed assembly or festoon lighting installed in accordance with Article 2.25.

(d) **Splices.** Flexible cords or cables shall be continuous without splice or tap between boxes or fittings.

(e) **Cord Connectors.** Cord connectors shall not be laid on the ground unless listed for wet locations. Connectors and cable connections shall not be placed in audience traffic paths or within areas accessible to the public unless guarded.

(f) **Support.** Wiring for an amusement ride, attraction, tent, or similar structure shall not be supported by any other ride or structure unless specifically designed for the purpose.

(g) **Protection.** Flexible cords or cables accessible to the public shall be arranged to minimize the tripping hazard and shall be permitted to be covered with nonconductive matting, provided that the matting does not constitute a greater tripping hazard than the uncovered cables. It shall be permitted to bury cables. The requirements of 3.0.1.5 shall not apply.

(h) **Boxes and Fittings.** A box or fitting shall be installed at each connection point, outlet, switchpoint, or junction point.

5.25.3.2 Rides, Tents and Concessions.

(a) **Disconnecting Means.** Each ride and concession shall be provided with a fused disconnect switch or circuit breaker located within sight and within 1 800 mm of the operator's station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type. A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operator's console is closed shall be a permissible method of opening the circuit.

(b) **Portable Wiring Inside Tents and Concessions.** Electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed and, where subject to physical damage, shall be provided with mechanical protection. All lamps for general illumination

shall be protected from accidental breakage by a suitable fixture or lampholder with a guard.

5.25.3.3 Portable Distribution or Termination Boxes. Portable distribution or termination boxes shall comply with 5.25.3.3(a) through 5.25.3.3(d).

(a) **Construction.** Boxes shall be designed so that no live parts are exposed to accidental contact. Where installed outdoors, the box shall be of weatherproof construction and mounted so that the bottom of the enclosure is not less than 150 mm above the ground.

(b) **Busbars and Terminals.** Busbars shall have an ampere rating not less than the overcurrent device supplying the feeder supplying the box. Where conductors terminate directly on busbars, busbar connectors shall be provided.

(c) **Receptacles and Overcurrent Protection.** Receptacles shall have overcurrent protection installed within the box. The overcurrent protection shall not exceed the ampere rating of the receptacle, except as permitted in Article 4.30 for motor loads.

(d) **Single-Pole Connectors.** Where single-pole connectors are used, they shall comply with 5.30.2.12.

5.25.3.4 Ground-Fault Circuit-Interrupter (GFCI) Protection.

(a) **Where GFCI Protection Is Required.** The ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug or located in the power-supply cord, within 300 mm of the attachment plug. Listed cord sets incorporating ground-fault circuit-interrupter for personnel shall be permitted.

(1) 125-volt and/or 250-volt, single-phase, 15- and 20-ampere non-locking type receptacles used for disassembly and reassembly or readily accessible to the general public.

(2) Equipment that is readily accessible to the general public and supplied from a 125-volt and/or 250-volt, single-phase, 15- or 20-ampere branch circuit.

(b) Where GFCI Protection Is Not Required. Receptacles that only facilitate quick disconnecting and reconnecting of electrical equipment shall not be required to be provided with GFCI protection. These receptacles shall be of the locking type.

(c) Where GFCI Protection Is Not Permitted. Egress lighting shall not be protected by a GFCI.

5.25.4 Grounding and Bonding

5.25.4.1 Equipment Bonding. The following equipment connected to the same source shall be bonded:

- (1) Metal raceways and metal-sheathed cable
- (2) Metal enclosures of electric equipment
- (3) Metal frames and metal parts of rides, concessions, tents, trailers, trucks, or other equipment that contain or support electrical equipment

5.25.4.2 Equipment Grounding. All equipment requiring grounding shall be grounded by an equipment grounding conductor of a type and size recognized by 2.50.6.9 and installed in accordance with Article 250. The equipment grounding conductor shall be bonded to the system grounded conductor at the service disconnecting means or, in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.

5.25.4.3 Grounding Conductor Continuity Assurance. The continuity of the grounding conductor system used to reduce electrical shock hazards as required by 2.50.6.5, 2.50.7.9, 4.6.1.3(c), and 5.90.1.4(d) shall be verified each time that portable electrical equipment is connected.

ARTICLE 5.30 — MOTION PICTURE AND TELEVISION STUDIOS AND SIMILAR LOCATIONS

5.30.1 General

5.30.1.1 Scope. The requirements of this article shall apply to television

studios and motion picture studios using either film or electronic cameras, except as provided in 5.20.1.1, and exchanges, factories, laboratories, stages, or a portion of the building in which film or tape more than 22 mm in width is exposed, developed, printed, cut, edited, rewound, repaired, or stored.

FPN: For methods of protecting against cellulose nitrate film hazards, see NFPA 40-2001, Standard for the Storage and Handling of Cellulose Nitrate Motion Picture Film.

5.30.1.2 Definitions.

Alternating-Current Power Distribution Box (Alternating-Current Plugging Box, Scatter Box). An ac distribution center or box that contains one or more grounding-type polarized receptacles that may contain overcurrent protection devices.

Bull Switch. An externally operated wall-mounted safety switch that may or may not contain overcurrent protection and is designed for the connection of portable cables and cords.

Location (Shooting Location). A place outside a motion picture studio where a production or part of it is filmed or recorded.

Location Board (Deuce Board). Portable equipment containing a lighting contactor or contactors and overcurrent protection designed for remote control of stage lighting.

Motion Picture Studio (Lot). A building or group of buildings and other structures designed, constructed, or permanently altered for use by the entertainment industry for the purpose of motion picture or television production.

Plugging Box. A dc device consisting of one or more 2-pole, 2-wire, nonpolarized, nongrounding-type receptacles intended to be used on dc circuits only.

Portable Equipment. Equipment intended to be moved from one place to another.

Single-Pole Separable Connector. A device that is installed at the ends of portable, flexible, single-conductor cable that is used to establish

connection or disconnection between two cables or one cable and a single-pole, panel-mounted separable connector.

Spider (Cable Splicing Block). A device that contains busbars that are insulated from each other for the purpose of splicing or distributing power to portable cables and cords that are terminated with single-pole busbar connectors.

Stage Effect (Special Effect). An electrical or electromechanical piece of equipment used to simulate a distinctive visual or audible effect such as wind machines, lightning simulators, sunset projectors, and the like.

Stage Property. An article or object used as a visual element in a motion picture or television production, except painted backgrounds (scenery) and costumes.

Stage Set. A specific area set up with temporary scenery and properties designed and arranged for a particular scene in a motion picture or television production.

Stand Lamp (Work Light). A portable stand that contains a general-purpose luminaire (lighting fixture) or lampholder with guard for the purpose of providing general illumination in the studio or stage.

Television Studio or Motion Picture Stage (Sound Stage). A building or portion of a building usually insulated from the outside noise and natural light for use by the entertainment industry for the purpose of motion picture, television, or commercial production.

5.30.1.6 Portable Equipment. Portable stage and studio lighting equipment and portable power distribution equipment shall be permitted for temporary use outdoors if the equipment is supervised by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner while energized and barriered from the general public.

5.30.2 Stage or Set

5.30.2.1 Permanent Wiring. The permanent wiring shall be Type MC cable, Type AC cable containing an insulated equipment grounding

conductor sized in accordance with Table 2.50.6.13, Type MI cable, or in approved raceways.

Exception: Communications circuits; audio signal processing, amplification, and reproduction circuits; Class 1, Class 2, and Class 3 remote-control or signaling circuits and power-limited fire alarm circuits shall be permitted to be wired in accordance with Articles 6.40, 7.25, 7.60, and 8.0.

5.30.2.2 Portable Wiring.

(a) Stage Set Wiring. The wiring for stage set lighting and other supply wiring not fixed as to location shall be done with listed hard usage flexible cords and cables. Where subject to physical damage, such wiring shall be listed extra-hard usage flexible cords and cables. Splices or taps in cables shall be permitted if the total connected load does not exceed the maximum ampacity of the cable.

(b) Stage Effects and Electrical Equipment Used as Stage Properties. The wiring for stage effects and electrical equipment used as stage properties shall be permitted to be wired with single- or multiconductor listed flexible cords or cables if the conductors are protected from physical damage and secured to the scenery by approved cable ties or by insulated staples. Splices or taps shall be permitted where such are made with listed devices and the circuit is protected at not more than 20 amperes.

(c) Other Electrical Equipment. Cords and cables other than extra-hard usage, where supplied as a part of a listed assembly, shall be permitted.

5.30.2.3 Stage Lighting and Effects Control. Switches used for studio stage set lighting and effects (on the stages and lots and on location) shall be of the externally operable type. Where contactors are used as the disconnecting means for fuses, an individual externally operable switch, such as a tumbler switch, for the control of each contactor shall be located at a distance of not more than 1 800 mm from the contactor, in addition to remote-control switches. A single externally operable switch shall be permitted to simultaneously disconnect all the contactors on any one location board, where located at a distance of not more than 1 800 mm from the location board.

5.30.2.4 Plugging Boxes. Each receptacle of dc plugging boxes shall be rated at not less than 30 amperes.

5.30.2.5 Enclosing and Guarding Live Parts.

(a) **Live Parts.** Live parts shall be enclosed or guarded to prevent accidental contact by persons and objects.

(b) **Switches.** All switches shall be of the externally operable type.

(c) **Rheostats.** Rheostats shall be placed in approved cases or cabinets that enclose all live parts, having only the operating handles exposed.

(d) **Current-Carrying Parts.** Current-carrying parts of bull switches, location boards, spiders, and plugging boxes shall be enclosed, guarded, or located so that persons cannot accidentally come into contact with them or bring conductive material into contact with them.

5.30.2.6 Portable Lamps. Portable lamps and work lights shall be equipped with flexible cords, composition or metal-sheathed porcelain sockets, and substantial guards.

Exception: Portable lamps used as properties in a motion picture set or television stage set, on a studio stage or lot, or on location shall not be considered to be portable lamps for the purpose of this section.

5.30.2.7 Portable Arc Lamps.

(a) **Portable Carbon Arc Lamps.** Portable carbon arc lamps shall be substantially constructed. The arc shall be provided with an enclosure designed to retain sparks and carbons and to prevent persons or materials from coming into contact with the arc or bare live parts. The enclosures shall be ventilated. All switches shall be of the externally operable type.

(b) **Portable Noncarbon Arc Electric-Discharge Lamps.** Portable noncarbon arc lamps, including enclosed arc lamps, and associated ballasts shall be listed. Interconnecting cord sets and interconnecting cords and cables shall be extra-hard usage type and listed.

5.30.2.8 Overcurrent Protection — General. Automatic overcurrent

protective devices (circuit breakers or fuses) for motion picture studio stage set lighting and the stage cables for such stage set lighting shall be as given in 5.30.2.8(a) through (g). The maximum ampacity allowed on a given conductor, cable, or cord size shall be as given in the applicable tables of Articles 3.10 and 4.0.

(a) **Stage Cables.** Stage cables for stage set lighting shall be protected by means of overcurrent devices set at not more than 400 percent of the ampacity given in the applicable tables of Articles 3.10 and 4.0.

(b) **Feeders.** In buildings used primarily for motion picture production, the feeders from the substations to the stages shall be protected by means of overcurrent devices (generally located in the substation) having a suitable ampere rating. The overcurrent devices shall be permitted to be multipole or single-pole gang operated. No pole shall be required in the neutral conductor. The overcurrent device setting for each feeder shall not exceed 400 percent of the ampacity of the feeder, as given in the applicable tables of Article 3.10.

(c) **Cable Protection.** Cables shall be protected by bushings where they pass through enclosures and shall be arranged so that tension on the cable is not transmitted to the connections. Where power conductors pass through metal, the requirements of 3.0.1.20 shall apply.

Portable feeder cables shall be permitted to temporarily penetrate fire-rated walls, floors, or ceilings provided that all of the following apply:

(1) The opening is of noncombustible material.

(2) When in use, the penetration is sealed with a temporary seal of a listed firestop material.

(3) When not in use, the opening shall be capped with a material of equivalent fire rating.

(d) **Location Boards.** Overcurrent protection (fuses or circuit breakers) shall be provided at the location boards. Fuses in the location boards shall have an ampere rating of not over 400 percent of the ampacity of the cables between the location boards and the plugging boxes.

(e) **Plugging Boxes.** Cables and cords supplied through plugging boxes shall be of copper. Cables and cords smaller than 8.0 mm² shall be attached to the plugging box by means of a plug containing two cartridge

fuses or a 2-pole circuit breaker. The rating of the fuses or the setting of the circuit breaker shall not be over 400 percent of the rated ampacity of the cables or cords as given in the applicable tables of Articles 3.10 and 4.0. Plugging boxes shall not be permitted on ac systems.

(f) Alternating-Current Power Distribution Boxes. Alternating-current power distribution boxes used on sound stages and shooting locations shall contain connection receptacles of a polarized, grounding type.

(g) Lighting. Work lights, stand lamps, and luminaires (fixtures) rated 1000 watts or less and connected to dc plugging boxes shall be by means of plugs containing two cartridge fuses not larger than 20 amperes, or they shall be permitted to be connected to special outlets on circuits protected by fuses or circuit breakers rated at not over 20 amperes. Plug fuses shall not be used unless they are on the load side of the fuse or circuit breakers on the location boards.

5.30.2.9 Sizing of Feeder Conductors for Television Studio Sets.

(a) General. It shall be permissible to apply the demand factors listed in Table 5.30.2.9(a) to that portion of the maximum possible connected load for studio or stage set lighting for all permanently installed feeders between substations and stages and to all permanently installed feeders between the main stage switchboard and stage distribution centers or location boards.

Table 5.30.2.9(a) Demand Factors for Stage Set Lighting

Portion of Stage Set Lighting Load to Which Demand Factor Applied (volt-amperes)	Feeder Demand Factor
First 50 000 or less at	100 %
From 50 001 to 100 000 at	75%
From 100 001 to 200 000 at	60%
Remaining over 200 000 at	50%

(b) Portable Feeders. A demand factor of 50 percent of maximum possible connected load shall be permitted for all portable feeders.

5.30.2.10 Grounding. Type MC cable, Type MI cable, metal raceways, and all non-current-carrying metal parts of appliances, devices, and equipment shall be grounded as specified in Article 2.50. This shall not apply to pendant and portable lamps, to stage lighting and stage sound equipment, or to other portable and special stage equipment operating at not over 150 volts dc to ground.

5.30.2.11 Plugs and Receptacles.

(a) Rating. Plugs and receptacles shall be rated in amperes. The voltage rating of the plugs and receptacles shall not be less than the circuit voltage. Plug and receptacle ampere ratings for ac circuits shall not be less than the feeder or branch-circuit overcurrent device ampere rating. Table 2.10.2.3(b)(2) shall not apply.

(b) Interchangeability. Plugs and receptacles used in portable professional motion picture and television equipment shall be permitted to be interchangeable for ac or dc use on the same premises, provided they are listed for ac/dc use and marked in a suitable manner to identify the system to which they are connected.

5.30.2.12 Single-Pole Separable Connectors.

(a) General. Where ac single-pole portable cable connectors are used, they shall be listed and of the locking type. Sections 4.0.1.10, 4.6.1.6, and 4.6.1.7 shall not apply to listed single-pole separable connections and single-conductor cable assemblies utilizing listed single-pole separable connectors. Where paralleled sets of current-carrying single-pole separable connectors are provided as input devices, they shall be prominently labeled with a warning indicating the presence of internal parallel connections. The use of single-pole separable connectors shall comply with at least one of the following conditions:

(1) Connection and disconnection of connectors are only possible where the supply connectors are interlocked to the source and it is not possible to connect or disconnect connectors when the supply is energized.

(2) Line connectors are of the listed sequential-interlocking type so that load connectors shall be connected in the following sequence:

- a. Equipment grounding conductor connection

- b. Grounded circuit conductor connection, if provided
- c. Ungrounded conductor connection, and that disconnection shall be in the reverse order

(3) A caution notice shall be provided adjacent to the line connectors, indicating that plug connection shall be in the following order:

- a. Equipment grounding conductor connectors
- b. Grounded circuit-conductor connectors, if provided
- c. Ungrounded conductor connectors, and that disconnection shall be in the reverse order

(b) Interchangeability. Single-pole separable connectors used in portable professional motion picture and television equipment shall be permitted to be interchangeable for ac or dc use or for different current ratings on the same premises, provided they are listed for ac/dc use and marked in a suitable manner to identify the system to which they are connected.

5.30.2.13 Branch Circuits. A branch circuit of any size supplying one or more receptacles shall be permitted to supply stage set lighting loads.

5.30.3 Dressing Rooms

5.30.3.1 Dressing Rooms. Fixed wiring in dressing rooms shall be installed in accordance with the wiring methods covered in Chapter 3. Wiring for portable dressing rooms shall be approved.

5.30.4 Viewing, Cutting, and Patching Tables

5.30.4.1 Lamps at Tables. Only composition or metal-sheathed, porcelain, keyless lampholders equipped with suitable means to guard lamps from physical damage and from film and film scrap shall be used at patching, viewing, and cutting tables.

5.30.5 Cellulose Nitrate Film Storage Vaults

5.30.5.1 Lamps in Cellulose Nitrate Film Storage Vaults. Lamps in cellulose nitrate film storage vaults shall be installed in rigid fixtures of the glass-enclosed and gasketed type. Lamps shall be controlled by a

switch having a pole in each ungrounded conductor. This switch shall be located outside of the vault and provided with a pilot light to indicate whether the switch is on or off. This switch shall disconnect from all sources of supply all ungrounded conductors terminating in any outlet in the vault.

5.30.5.2 Electrical Equipment in Cellulose Nitrate Film Storage Vaults. Except as permitted in 5.30.5.1, no receptacles, outlets, heaters, portable lights, or other portable electric equipment shall be located in cellulose nitrate film storage vaults. Electric motors shall be permitted, provided they are listed for the application and comply with Article 5.0, Class I, Division 2.

5.30.6 Substations

5.30.6.1 Substations. Wiring and equipment of over 600 volts, nominal, shall comply with Article 490.

5.30.6.2 Portable Substations. Wiring and equipment in portable substations shall conform to the sections applying to installations in permanently fixed substations, but, due to the limited space available, the working spaces shall be permitted to be reduced, provided that the equipment shall be arranged so that the operator can work safely and so that other persons in the vicinity cannot accidentally come into contact with current-carrying parts or bring conducting objects into contact with them while they are energized.

5.30.6.3 Overcurrent Protection of Direct-Current Generators. Three-wire generators shall have overcurrent protection in accordance with 4.45.1.12(e).

5.30.6.4 Direct-Current Switchboards.

(a) General. Switchboards of not over 250 volts dc between conductors, where located in substations or switchboard rooms accessible to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner only, shall not be required to be dead-front.

(b) Circuit Breaker Frames. Frames of dc circuit breakers installed on switchboards shall not be required to be grounded.

ARTICLE 5.40 — MOTION PICTURE PROJECTION ROOMS

5.40.1 General

5.40.1.1 Scope. The provisions of this article apply to motion picture projection rooms, motion picture projectors, and associated equipment of the professional and nonprofessional types using incandescent, carbon arc, xenon, or other light source equipment that develops hazardous gases, dust, or radiation.

FPN: For further information, see NFPA 40-2001, Standard for the Storage and Handling of Cellulose Nitrate Motion Picture Film.

5.40.1.2 Definitions.

Nonprofessional Projector. Nonprofessional projectors are those types other than as described in 5.40.1.2.

Professional Projector. A type of projector using 35- or 70-mm film that has a minimum width of 35 mm and has on each edge 212 perforations per meter, or a type using carbon arc, xenon, or other light source equipment that develops hazardous gases, dust, or radiation.

5.40.2 Equipment and Projectors of the Professional Type

5.40.2.1 Motion Picture Projection Room Required. Every professional-type projector shall be located within a projection room. Every projection room shall be of permanent construction, approved for the type of building in which the projection room is located. All projection ports, spotlight ports, viewing ports, and similar openings shall be provided with glass or other approved material so as to completely close the opening. Such rooms shall not be considered as hazardous (classified) locations as defined in Article 5.0.

FPN: For further information on protecting openings in projection rooms handling cellulose nitrate motion picture film, see NFPA 101-2003, Life Safety Code.

5.40.2.2 Location of Associated Electrical Equipment.

(a) **Motor Generator Sets, Transformers, Rectifiers, Rheostats,**

and Similar Equipment. Motor generator sets, transformers, rectifiers, rheostats, and similar equipment for the supply or control of current to projection or spotlight equipment shall, where nitrate film is used, be located in a separate room. Where placed in the projection room, they shall be located or guarded so that arcs or sparks cannot come in contact with film, and the commutator end or ends of motor generator sets shall comply with one of the conditions in 5.40.2.2(a)(1) through (a)(6).

(1) **Types.** Be of the totally enclosed, enclosed fan-cooled, or enclosed pipe-ventilated type.

(2) **Separate Rooms or Housings.** Be enclosed in separate rooms or housings built of noncombustible material constructed so as to exclude flyings or lint, and properly ventilated from a source of clean air.

(3) **Solid Metal Covers.** Have the brush or sliding-contact end of motor-generator enclosed by solid metal covers.

(4) **Tight Metal Housings.** Have brushes or sliding contacts enclosed in substantial, tight metal housings.

(5) **Upper and Lower Half Enclosures.** Have the upper half of the brush or sliding-contact end of the motor-generator enclosed by a wire screen or perforated metal and the lower half enclosed by solid metal covers.

(6) **Wire Screens or Perforated Metal.** Have wire screens or perforated metal placed at the commutator of brush ends. No dimension of any opening in the wire screen or perforated metal shall exceed 1.27 mm, regardless of the shape of the opening and of the material used.

(b) **Switches, Overcurrent Devices, or Other Equipment.** Switches, overcurrent devices, or other equipment not normally required or used for projectors, sound reproduction, flood or other special effect lamps, or other equipment shall not be installed in projection rooms.

Exception No. 1: In projection rooms approved for use only with cellulose acetate (safety) film, the installation of appurtenant electrical equipment used in conjunction with the operation of the projection equipment and the control of lights, curtains, and audio equipment, and so forth, shall be permitted. In such projection rooms, a sign reading

“Safety Film Only Permitted in This Room” shall be posted on the outside of each projection room door and within the projection room itself in a conspicuous location.

Exception No. 2: Remote-control switches for the control of auditorium lights or switches for the control of motors operating curtains and masking of the motion picture screen shall be permitted to be installed in projection rooms.

(c) Emergency Systems. Control of emergency systems shall comply with Article 7.0.

5.40.2.3 Work Space. Each motion picture projector, floodlight, spotlight, or similar equipment shall have clear working space not less than 800 mm wide on each side and at the rear thereof.

Exception: One such space shall be permitted between adjacent pieces of equipment.

5.40.2.4 Conductor Size. Conductors supplying outlets for arc and xenon projectors of the professional type shall not be smaller than 8.0 mm² and shall be of sufficient size for the projector employed. Conductors for incandescent-type projectors shall conform to normal wiring standards as provided in 2.10.2.5.

5.40.2.5 Conductors on Lamps and Hot Equipment. Insulated conductors having a rated operating temperature of not less than 200°C shall be used on all lamps or other equipment where the ambient temperature at the conductors as installed will exceed 50°C.

5.40.2.6 Flexible Cords. Cords approved for hard usage, as provided in Table 4.0.1.4, shall be used on portable equipment.

5.40.2.11 Approval. Projectors and enclosures for arc, xenon and incandescent lamps and rectifiers, transformers, rheostats, and similar equipment shall be listed.

5.40.2.12 Marking. Projectors and other equipment shall be marked with the manufacturer’s name or trademark and with the voltage and current for which they are designed in accordance with 1.10.1.21.

5.40.3 Nonprofessional Projectors

5.40.3.1 Motion Picture Projection Room Not Required. Projectors of the nonprofessional or miniature type, where employing cellulose acetate (safety) film, shall be permitted to be operated without a projection room.

5.40.3.2 Approval. Projection equipment shall be listed.

5.40.4 Audio Signal Processing, Amplification, and Reproduction Equipment

5.40.4.1 Audio Signal Processing, Amplification, and Reproduction Equipment. Audio signal processing, amplification, and reproduction equipment shall be installed as provided in Article 6.40.

ARTICLE 5.45 — MANUFACTURED BUILDINGS

5.45.1.1 Scope. This article covers requirements for a manufactured building and building components as herein defined.

5.45.1.2 Definitions.

Building Component. Any subsystem, subassembly, or other system designed for use in or integral with or as part of a structure, which can include structural, electrical, mechanical, plumbing, and fire protection systems, and other systems affecting health and safety.

Building System. Plans, specifications, and documentation for a system of manufactured building or for a type or a system of building components, which can include structural, electrical, mechanical, plumbing, and fire protection systems, and other systems affecting health and safety, and including such variations thereof as are specifically permitted by regulation, and which variations are submitted as part of the building system or amendment thereto.

Closed Construction. Any building, building component, assembly, or system manufactured in such a manner that all concealed parts of processes of manufacture cannot be inspected before installation at the building site without disassembly, damage, or destruction.

Manufactured Building. Any building that is of closed construction and is made or assembled in manufacturing facilities on or off the building site for installation, or for assembly and installation on the building site, other than manufactured homes, mobile homes, park trailers, or recreational vehicles.

5.45.1.4 Wiring Methods.

(a) **Methods Permitted.** All raceway and cable wiring methods included in this Code and such other wiring systems specifically intended and listed for use in manufactured buildings shall be permitted with listed fittings and with fittings listed and identified for manufactured buildings.

(b) **Securing Cables.** In closed construction, cables shall be permitted to be secured only at cabinets, boxes, or fittings where 5.5 mm² (2.6 mm dia.) or smaller conductors are used and protection against physical damage is provided.

● **5.45.1.5 Supply Conductors.** Provisions shall be made to route the service-entrance, service-lateral, feeder, or branch-circuit supply to the service or building disconnecting means conductors.

5.45.1.6 Installation of Service-Entrance Conductors. Service-entrance conductors shall be installed after erection at the building site.

Exception: Where point of attachment is known prior to manufacture.

5.45.1.7 Service Equipment. Service equipment shall be installed in accordance with 2.30.6.1.

5.45.1.8 Protection of Conductors and Equipment. Protection shall be provided for exposed conductors and equipment during processes of manufacturing, packaging, in transit, and erection at the building site.

5.45.1.9 Boxes.

(a) **Other Dimensions.** Boxes of dimensions other than those required in Table 3.14.2.2(a) shall be permitted to be installed where tested, identified, and listed to applicable standards.

(b) **Not Over 1640 cm³.** Any box not over 1640 cm³ in size, intended for mounting in closed construction, shall be affixed with anchors or clamps so as to provide a rigid and secure installation.

5.45.1.10 Receptacle or Switch with Integral Enclosure. A receptacle or switch with integral enclosure and mounting means, where tested, identified, and listed to applicable standards, shall be permitted to be installed.

5.45.1.11 Bonding and Grounding. Prewired panels and building components shall provide for the bonding, or bonding and grounding, of all exposed metals likely to become energized, in accordance with Parts 2.50.5, 2.50.6, and 2.50.7.

5.45.1.12 Grounding Electrode Conductor. Provisions shall be made to route a grounding electrode conductor from the service, feeder, or branch-circuit supply to the point of attachment to the grounding electrode.

5.45.1.13 Component Interconnections. Fittings and connectors that are intended to be concealed at the time of on-site assembly, where tested, identified, and listed to applicable standards, shall be permitted for on-site interconnection of modules or other building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstand and shall be capable of enduring the vibration and minor relative motions occurring in the components of manufactured building.

ARTICLE 5.47 — AGRICULTURAL BUILDINGS

5.47.1.1 Scope. The provisions of this article shall apply to the following agricultural buildings or that part of a building or adjacent areas of similar or like nature as specified in 5.47.1.1(a) and 5.47.1.1(b).

(a) **Excessive Dust and Dust with Water.** Agricultural buildings where excessive dust and dust with water may accumulate, including all areas of poultry, livestock, and fish confinement systems, where litter dust or feed dust, including mineral feed particles, may accumulate.

(b) Corrosive Atmosphere. Agricultural buildings where a corrosive atmosphere exists. Such buildings include areas where the following conditions exist:

- (1) Poultry and animal excrement may cause corrosive vapors.
- (2) Corrosive particles may combine with water.
- (3) The area is damp and wet by reason of periodic washing for cleaning and sanitizing with water and cleansing agents.
- (4) Similar conditions exist.

5.47.1.2 Definitions.

Distribution Point. An electrical supply point from which service drops, service laterals, feeders, or branch circuits to agricultural buildings, associated farm dwelling(s), and associated buildings under single management are supplied.

FPN No. 1: Distribution points are also known as the center yard pole, meterpole, or the common distribution point.

FPN No. 2: The service point as defined in Article 1.1 is typically at the distribution point.

Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.

Site-Isolating Device. A disconnecting means installed at the distribution point for the purposes of isolation, system maintenance, emergency disconnection, or connection of optional standby systems.

5.47.1.3 Other Articles. For agricultural buildings not having conditions as specified in 5.47.1.1, the electrical installations shall be made in accordance with the applicable articles in this Code.

5.47.1.4 Surface Temperatures. Electrical equipment or devices installed in accordance with the provisions of this article shall be installed in a manner such that they will function at full rating without developing surface temperatures in excess of the specified normal safe operating range of the equipment or device.

5.47.1.5 Wiring Methods.

(a) Wiring Systems. Types UF, NMC, copper SE cables, jacketed Type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed. The wiring methods of Part 5.2.2 shall be permitted for areas described in 5.47.1.1(a).

FPN: See 3.0.1.7 and 3.52.2.35 for installation of raceway systems exposed to widely different temperatures.

(b) Mounting. All cables shall be secured within 200 mm of each cabinet, box, or fitting. The 6 mm airspace required for nonmetallic boxes, fittings, conduit, and cables in 3.0.1.6(c) shall not be required in buildings covered by this article.

(c) Equipment Enclosures, Boxes, Conduit Bodies, and Fittings.

(1) Excessive Dust. Equipment enclosures, boxes, conduit bodies, and fittings installed in areas of buildings where excessive dust may be present shall be designed to minimize the entrance of dust and shall have no openings (such as holes for attachment screws) through which dust could enter the enclosure.

(2) Damp or Wet Locations. In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the enclosure, box, conduit body, or fitting. In wet locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit bodies, and fittings shall be listed for use in wet locations and equipment enclosures shall be weatherproof.

(3) Corrosive Atmosphere. Where wet dust, excessive moisture, corrosive gases or vapors, or other corrosive conditions may be present, equipment enclosures, boxes, conduit bodies, and fittings shall have corrosion resistance properties suitable for the conditions.

FPN No. 1: See Table 4.30.7.11 for appropriate enclosure type designations.

FPN No. 2: Aluminum and magnetic ferrous materials may corrode in agricultural environments.

(d) Flexible Connections. Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible conduit, or flexible cord listed and identified for hard usage shall be used. All connectors and fittings used shall be listed and identified for the purpose.

(e) Physical Protection. All electrical wiring and equipment subject to physical damage shall be protected.

(f) Separate Equipment Grounding Conductor. Non-current-carrying metal parts of equipment, raceways, and other enclosures, where required to be grounded, shall be grounded by a copper equipment grounding conductor installed between the equipment and the building disconnecting means. If installed underground, the equipment grounding conductor shall be insulated or covered.

(g) Receptacles. All 125-volt and/or 250-volt, single-phase, 15- and 20-ampere general-purpose receptacles installed in the following locations shall have ground-fault circuit-interrupter protection for personnel:

- (1) In areas having an equipotential plane
- (2) Outdoors
- (3) Damp or wet locations
- (4) Dirt confinement areas for livestock

5.47.1.6 Switches, Receptacles, Circuit Breakers, Controllers, and Fuses. Switches, including pushbuttons, relays, and similar devices, receptacles, circuit breakers, controllers, and fuses, shall be provided with enclosures as specified in 5.47.1.5(c).

5.47.1.7 Motors. Motors and other rotating electrical machinery shall be totally enclosed or designed so as to minimize the entrance of dust, moisture, or corrosive particles.

5.47.1.8 Luminaires (Lighting Fixtures). Luminaires (lighting fixtures) shall comply with 5.47.1.8(a) through 5.47.1.8(c).

(a) Minimize the Entrance of Dust. Luminaires (lighting fixtures) shall be installed to minimize the entrance of dust, foreign matter, moisture, and corrosive material.

(b) Exposed to Physical Damage. Any luminaire (lighting fixture) that may be exposed to physical damage shall be protected by a suitable guard.

(c) Exposed to Water. A luminaire (fixture) that may be exposed to water from condensation, building cleansing water, or solution shall be watertight.

5.47.1.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point. Overhead electrical supply shall comply with 5.47.1.9(a) and 5.47.1.9(b), or with 5.47.1.9(c). Underground electrical supply shall comply with 5.47.1.9(c) and 5.47.1.9(d).

(a) Site-Isolating Device. Site-isolating devices shall comply with 5.47.1.9(a)(1) through (a)(9).

(1) Where Required. A site-isolating device shall be installed at the distribution point where two or more agricultural buildings, structures, associated farm dwelling(s), or other buildings are supplied from the distribution point.

(2) Location. The site-isolating device shall be pole-mounted and shall meet the clearance requirements of 2.30.2.3(a).

(3) Operation. The site-isolating device shall simultaneously disconnect all ungrounded service conductors from the premises wiring.

(4) Bonding Provisions. The site-isolating device enclosure shall be bonded to the grounded circuit conductor and the grounding electrode system.

(5) Grounding. At the site-isolating device, the system grounded conductor shall be connected to a grounding electrode system via a grounding electrode conductor.

(6) Rating. The site-isolating device shall be rated for the calculated load as determined by Part 2.20.5.

(7) Overcurrent Protection. The site-isolating device shall not be required to provide overcurrent protection.

(8) Accessibility. Where the site-isolating device is not readily accessible, it shall be capable of being remotely operated by an operating handle installed at a readily accessible location. The operating handle of the site-isolating device, when in its highest position, shall not be more than 2 000 mm above grade or a working platform.

(9) Series Devices. An additional site-isolating device for the premises wiring system shall not be required where a site-isolating device meeting all applicable requirements of this section is provided by the serving utility as part of their service requirements.

(b) Service Disconnecting Means and Overcurrent Protection at the Building(s) or Structure(s). Where the service disconnecting means and overcurrent protection are located at the building(s) or structure(s), the requirements of 5.47.1.9(b)(1) through (b)(3) shall apply.

(1) Conductor Sizing. The supply conductors shall be sized in accordance with Part 2.20.5.

(2) Conductor Installation. The supply conductors shall be installed in accordance with the requirements of Part 2.25.2.

(3) Grounding and Bonding. For each building or structure, the conditions in either (b)(3)a or (b)(3)b shall be permitted.

a. System with grounded neutral conductor. The grounded circuit conductor shall be connected to the building disconnecting means and to the grounding electrode system of that building or structure where all the requirements of 2.50.2.13(b)(2) are met.

FPN: A system with a grounded neutral conductor is commonly referred to as a "3-wire system" in single-phase applications.

b. System with separate equipment grounding conductor. A separate equipment-grounding conductor shall be run with the supply conductors to the building(s) or structure(s), and the following conditions shall be met:

FPN: A system with a separate equipment grounding conductor is commonly referred to as a "4-wire system" in single-phase applications.

1. The equipment grounding conductor shall be the same size as the largest supply conductor if of the same material, or adjusted in size in accordance with the equivalent size columns of Table 2.50.6.13 if of different materials.

2. The equipment grounding conductor is bonded to the grounded circuit conductor and the site-isolating device at the distribution point.

3. A grounding electrode system is provided in accordance with Part 2.50.3 and connected to the equipment-grounding conductor at the building(s) or structure(s) disconnecting means.

4. The grounded circuit conductor is not connected to a grounding electrode or to any equipment-grounding conductor on the load side of the distribution point.

(c) Service Disconnecting Means and Overcurrent Protection at the Distribution Point. Where the service disconnecting means and overcurrent protection for each set of feeder conductors are located at the distribution point, feeders to building(s) or structure(s) shall meet the requirements of 2.50.2.13 and Parts 2.25.1 and 2.25.2.

FPN: Methods to reduce neutral-to-earth voltages in livestock facilities include supplying buildings or structures with 4-wire single-phase services, sizing 3-wire single-phase service and feeder conductors to limit voltage drop to 2 percent, and connecting loads line-to-line.

(d) Direct-Buried Equipment Grounding Conductors. Where livestock is housed, any portion of a direct-buried equipment grounding conductor run to the building or structure shall be insulated or covered copper.

5.47.1.10 Equipotential Planes and Bonding of Equipotential Planes. The installation and bonding of equipotential planes shall comply with 5.47.1.10(a) and 5.47.1.10(b). For the purposes of this section, the term livestock shall not include poultry.

(a) Where Required. Equipotential planes shall be installed in all concrete floor confinement areas in livestock buildings, and in all outdoor confinement areas such as feedlots, containing metallic equipment that may become energized and is accessible to livestock. The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized.

(b) Bonding. Equipotential planes shall be bonded to the electrical grounding system. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than 8.0 mm². The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

FPN No. 1: Methods to establish equipotential planes are described in American Society of Agricultural Engineers (ASAE) EP473-2001, Equipotential Planes in Animal Containment Areas.

FPN No. 2: Low grounding electrode system resistances may reduce potential differences in livestock facilities.

ARTICLE 5.50 — MOBILE HOMES, MANUFACTURED HOMES, AND MOBILE HOME PARKS

5.50.1 General

5.50.1.1 Scope. The provisions of this article cover the electrical conductors and equipment installed within or on mobile and manufactured homes, the conductors that connect mobile and manufactured homes to a supply of electricity, and the installation of electrical wiring, luminaires (fixtures), equipment, and appurtenances related to electrical installations within a mobile home park up to the mobile home service-entrance conductors or, if none, the mobile home service equipment.

FPN: For additional information on manufactured housing see NFPA 501-2003, Standard on Manufactured Housing, and Part 3280, Manufactured Home Construction and Safety Standards, of the Federal Department of Housing and Urban Development.

5.50.1.2 Definitions.

Appliance, Fixed. An appliance that is fastened or otherwise secured at a specific location.

Appliance, Portable. An appliance that is actually moved or can easily be moved from one place to another in normal use.

FPN: For the purpose of this article, the following major appliances, other than built-in, are considered portable if cord connected: refrigerators, range equipment, clothes washers, dishwashers without booster heaters, or other similar appliances.

Appliance, Stationary. An appliance that is not easily moved from one place to another in normal use.

Distribution Panelboard. See definition of panelboard in Article 100.

Feeder Assembly. The overhead or under-chassis feeder conductors, including the grounding conductor, together with the necessary fittings and equipment or a power-supply cord listed for mobile home use, designed for the purpose of delivering energy from the source of electrical supply to the distribution panelboard within the mobile home.

Laundry Area. An area containing or designed to contain a laundry tray, clothes washer, or a clothes dryer.

Manufactured Home. A structure, transportable in one or more sections, that is 2 400 mm or more in width or 12 m or more in length in the traveling mode or, when erected on site, is 30 m² or more; which is built on a chassis and designed to be used as a dwelling, with or without a permanent foundation, when connected to the required utilities, including the plumbing, heating, air conditioning, and electrical systems contained therein. Calculations used to determine the number of square meters in a structure will be based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimensions include all expandable rooms, cabinets, and other projections containing interior space but do not include inside bay windows.

For the purpose of this Code and unless otherwise indicated, the term mobile home includes manufactured homes.

FPN No. 1: See the applicable building code for definition of the term permanent foundation.

FPN No. 2: See Part 3280, Manufactured Home Construction and Safety Standards, of the Federal Department of Housing and Urban Development, for additional information on the definition.

Mobile Home. A factory-assembled structure or structures transportable in one or more sections that is built on a permanent chassis and designed to be used as a dwelling without a permanent foundation where connected to the required utilities and that includes the plumbing, heating, air-conditioning, and electric systems contained therein.

For the purpose of this Code and unless otherwise indicated, the term mobile home includes manufactured homes.

Mobile Home Accessory Building or Structure. Any awning, cabana, ramada, storage cabinet, carport, fence, windbreak, or porch established for the use of the occupant of the mobile home on a mobile home lot.

Mobile Home Lot. A designated portion of a mobile home park designed for the accommodation of one mobile home and its accessory buildings or structures for the exclusive use of its occupants.

Mobile Home Park. A contiguous parcel of land that is used for the accommodation of occupied mobile homes.

Mobile Home Service Equipment. The equipment containing the disconnecting means, overcurrent protective devices, and receptacles or other means for connecting a mobile home feeder assembly.

Park Electrical Wiring Systems. All of the electrical wiring, luminaires (fixtures), equipment, and appurtenances related to electrical installations within a mobile home park, including the mobile home service equipment.

5.50.1.4 General Requirements.

(a) Mobile Home Not Intended as a Dwelling Unit. A mobile home not intended as a dwelling unit — for example, those equipped for sleeping purposes only, contractor's on-site offices, construction job dormitories, mobile studio dressing rooms, banks, clinics, mobile stores,

or intended for the display or demonstration of merchandise or machinery — shall not be required to meet the provisions of this article pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if provided with an electrical installation intended to be energized from a 230-volt or 115/230-volt ac power supply system. Where different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.

(b) In Other Than Mobile Home Parks. Mobile homes installed in other than mobile home parks shall comply with the provisions of this article.

(c) Connection to Wiring System. The provisions of this article shall apply to mobile homes intended for connection to a wiring system rated 230 volts, nominal, 2-wire ac, with one grounded phase conductor or 115/230 volts, nominal, 3-wire ac, with grounded neutral.

(d) Listed or Labeled. All electrical materials, devices, appliances, fittings, and other equipment shall be listed or labeled by a qualified testing agency and shall be connected in an approved manner when installed.

5.50.2 Mobile and Manufactured Homes

5.50.2.1 Power Supply.

(a) Feeder. The power supply to the mobile home shall be a feeder assembly consisting of not more than one listed 50-ampere mobile home power-supply cord with an integrally molded or securely attached plug cap or a permanently installed feeder.

Exception No. 1: A mobile home that is factory equipped with gas or oil-fired central heating equipment and cooking appliances shall be permitted to be provided with a listed mobile home power-supply cord rated 40 amperes.

Exception No. 2: A feeder assembly shall not be required for manufactured homes constructed in accordance with 5.50.3.3(b).

(b) Power-Supply Cord. If the mobile home has a power-supply cord, it shall be permanently attached to the distribution panelboard or to a junction box permanently connected to the distribution panelboard, with the free end terminating in an attachment plug cap.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, or shipped with, a mobile home.

A suitable clamp or the equivalent shall be provided at the distribution panelboard knockout to afford strain relief for the cord to prevent strain from being transmitted to the terminals when the power-supply cord is handled in its intended manner.

The cord shall be a listed type with four conductors, one of which shall be identified by a continuous green color or a continuous green color with one or more yellow stripes for use as the grounding conductor.

(c) Attachment Plug Cap. The attachment plug cap shall be a 2-pole, 3-wire, grounding type, rated 50 amperes, 250 volts or 3-pole, 4-wire, grounding type, rated 50 amperes, 125/250 volts with a configuration as shown in Figure 5.50.2.1(c) and intended for use with the 50-ampere, 250-volt and 125/250-volt receptacle configurations shown in Figure 5.50.2.1(c). It shall be listed, by itself or as part of a power-supply cord assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug cap. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

FPN: Complete details of the 50-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD 6-1989, Figure 14-50.

(d) Overall Length of a Power-Supply Cord. The overall length of a power-supply cord, measured from the end of the cord, including bared leads, to the face of the attachment plug cap shall not be less than 6 400 mm and shall not exceed 11 m. The length of the cord from the face of the attachment plug cap to the point where the cord enters the mobile home shall not be less than 6 000 m.

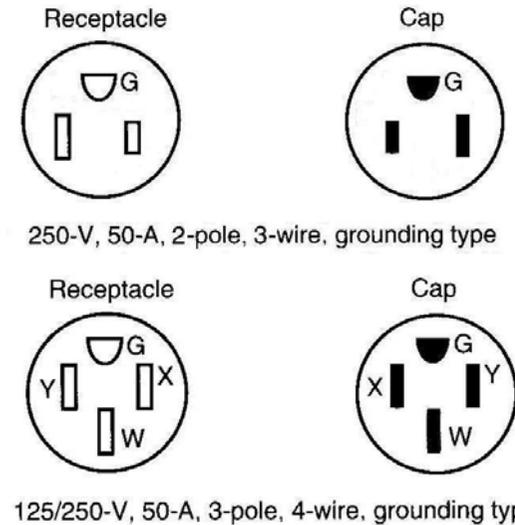

Figure 5.50.2.1(c) 50-Ampere, 250-volt and 50-Ampere, 125/250-Volt Receptacle and Attachment Plug Cap Configurations, 2-pole, 3-wire and 3-Pole, 4-Wire, respectively, Grounding-Types, Used for Mobile Home Supply Cords and Mobile Home Parks. Please see NEC 2005 page 70-447 and attached sketch on separate bond paper. Additional drawing of plug from WWY.

(e) Marking. The power-supply cord shall bear the following marking:

FOR USE WITH MOBILE HOMES — 40 AMPERES.

OR

FOR USE WITH MOBILE HOMES — 50 AMPERES.

(f) Point of Entrance. The point of entrance of the feeder assembly to the mobile home shall be in the exterior wall, floor, or roof.

(g) Protected. Where the cord passes through walls or floors, it shall be protected by means of conduits and bushings or equivalent. The cord shall be permitted to be installed within the mobile home walls, provided a continuous raceway having a maximum size of 30 mm is installed from the branch-circuit panelboard to the underside of the mobile home floor.

(h) Protection Against Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the attachment plug cap of the power-supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the mobile home is in transit.

(i) Mast Weatherhead or Raceway. Where the calculated load exceeds 50 amperes or where a permanent feeder is used, the supply shall be by means of either of the following:

(1) One mast weatherhead installation, installed in accordance with Article 230, containing four continuous, insulated, color-coded feeder conductors, one of which shall be an equipment grounding conductor

(2) A metal raceway or rigid nonmetallic conduit from the disconnecting means in the mobile home to the underside of the mobile home, with provisions for the attachment to a suitable junction box or fitting to the raceway on the underside of the mobile home [with or without conductors as in 5.50.2.1(i)(1)]. The manufacturer shall provide written installation instructions stating the proper feeder conductor sizes for the raceway and the size of the junction box to be used.

5.50.2.2 Disconnecting Means and Branch-Circuit Protective Equipment. The branch-circuit equipment shall be permitted to be combined with the disconnecting means as a single assembly. Such a combination shall be permitted to be designated as a distribution panelboard. If a fused distribution panelboard is used, the maximum fuse size for the mains shall be plainly marked with lettering at least 6 mm high and visible when fuses are changed.

Where plug fuses and fuseholders are used, they shall be tamper-resistant Type S, enclosed in dead-front fuse panelboards. Electrical distribution panelboards containing circuit breakers shall also be dead-front type.

FPN: See 1.10.1.22 concerning identification of each disconnecting means and each service, feeder, or branch circuit at the point where it originated and the type marking needed.

(a) Disconnecting Means. A single disconnecting means shall be provided in each mobile home consisting of a circuit breaker, or a switch and fuses and its accessories installed in a readily accessible location near the point of entrance of the supply cord or conductors into the mobile home. The main circuit breakers or fuses shall be plainly marked "Main." This equipment shall contain a solderless type of grounding connector or bar for the purposes of grounding, with sufficient terminals for all grounding conductors. The neutral bar termination of the grounded circuit conductors shall be insulated in accordance with 5.50.2.7(a). The disconnecting equipment shall have a rating not less than the calculated load. The distribution equipment, either circuit breaker or fused type, shall be located a minimum of 600 mm from the bottom of such equipment to the floor level of the mobile home.

FPN: See 5.50.2.11(b) for information on disconnecting means for branch circuits designed to energize heating or air-conditioning equipment, or both, located outside the mobile home, other than room air conditioners.

A distribution panelboard shall be rated not less than 50 amperes and employ a 2-pole circuit breaker rated 40 amperes for a 40-ampere supply cord, or 50 amperes for a 50-ampere supply cord. A distribution panelboard employing a disconnect switch and fuses shall be rated 60 amperes and shall employ a single 2-pole, 60-ampere fuseholder with 40- or 50-ampere main fuses for 40- or 50-ampere supply cords, respectively. The outside of the distribution panelboard shall be plainly marked with the fuse size.

The distribution panelboard shall be located in an accessible location but shall not be located in a bathroom or a clothes closet. A clear working space at least 800 mm wide and 800 mm in front of the distribution panelboard shall be provided. This space shall extend from the floor to the top of the distribution panelboard.

(b) Branch-Circuit Protective Equipment. Branch-circuit distribution equipment shall be installed in each mobile home and shall include overcurrent protection for each branch circuit consisting of either circuit breakers or fuses.

The branch-circuit overcurrent devices shall be rated as follows:

(1) Not more than the circuit conductors; and

(2) Not more than 150 percent of the rating of a single appliance rated 13.3 amperes or more that is supplied by an individual branch circuit; but

(3) Not more than the overcurrent protection size and of the type marked on the air conditioner or other motor-operated appliance.

(c) Two-Pole Circuit Breakers. Where circuit breakers are provided for branch-circuit protection, 240-volt circuits shall be protected by a 2-pole common or companion trip, or handle-tied paired circuit breakers.

(d) Electrical Nameplates. A metal nameplate on the outside adjacent to the feeder assembly entrance shall read:

THIS CONNECTION FOR 230-VOLT,
2-POLE, 3-WIRE, 60-HERTZ,
_____ AMPERE SUPPLY

or

THIS CONNECTION FOR 120/240-VOLT,
3-POLE, 4-WIRE, 60-HERTZ,
_____ AMPERE SUPPLY

The correct ampere rating shall be marked in the blank space.

Exception: For manufactured homes, the manufacturer shall provide in its written installation instructions or in the data plate the minimum ampere rating of the feeder assembly or, where provided, the service entrance conductors intended for connection to the manufactured home. The rating provided shall not be less than the minimum load calculated in accordance with 5.50.2.9.

5.50.2.3 Branch Circuits. The number of branch circuits required shall be determined in accordance with 5.50.2.3(a) through (e).

(a) Lighting. The number of branch circuits shall be based on 33 volt-amperes/m² times outside dimensions of the mobile home (coupler excluded) divided by 230 volts for 230 volts power supply and 115 volts for 115/230 volts power supply to determine the number of 15- or 20-ampere lighting area circuits, for example,

$$\frac{33 \times \text{length} \times \text{width}}{230 \times 15 \text{ (or } 20\text{)}} = \text{No. of 15- (or 20-) ampere circuits}$$

or

$$\frac{33 \times \text{length} \times \text{width}}{115 \times 15 \text{ (or } 20\text{)}} = \text{No. of 15- (or 20-) ampere circuits}$$

(b) Small Appliances. In kitchens, pantries, dining rooms, and breakfast rooms, two or more 20-ampere small-appliance circuits, in addition to the number of circuits required elsewhere in this section, shall be provided for all receptacle outlets required by 5.50.2.4(d) in these rooms. Such circuits shall have no other outlets.

Exception No. 1: Receptacle outlets installed solely for the electrical supply and support of an electric clock in any the rooms specified in 5.50.2.3(b) shall be permitted.

Exception No. 2: Receptacle outlets installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units shall be permitted.

Exception No. 3: A single receptacle for refrigeration equipment shall be permitted to be supplied from an individual branch circuit rated 15 amperes or greater.

Countertop receptacle outlets installed in the kitchen shall be supplied by not less than two small-appliance circuit branch circuits, either or both of which shall be permitted to supply receptacle outlets in the kitchen and other locations specified in 5.50.2.3(b).

(c) Laundry Area. Where a laundry area is provided, a 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s). This circuit shall have no other outlets.

(d) General Appliances. (Including furnace, water heater, range, and central or room air conditioner, etc.). There shall be one or more circuits of adequate rating in accordance with the following:

FPN: For central air conditioning, see Article 4.40.

(1) The ampere rating of fixed appliances shall not be over 50 percent of the circuit rating if lighting outlets (receptacles, other than kitchen, dining area, and laundry, considered as lighting outlets) are on the same circuit.

(2) For fixed appliances on a circuit without lighting outlets, the sum of rated amperes shall not exceed the branch-circuit rating. Motor loads or continuous loads shall not exceed 80 percent of the branch-circuit rating.

(3) The rating of a single cord-and-plug-connected appliance on a circuit having no other outlets shall not exceed 80 percent of the circuit rating.

(4) The rating of a range branch circuit shall be based on the range demand as specified for ranges in 5.50.2.9(b)(5).

(e) Bathrooms. Bathroom receptacle outlets shall be supplied by at least one 20-ampere branch circuit. Such circuits shall have no other outlets other than as provided for in 5.50.2.4(e)(2).

5.50.2.4 Receptacle Outlets.

(a) Grounding-Type Receptacle Outlets. All receptacle outlets shall comply with the following:

- (1) Be of grounding type
- (2) Be installed according to 4.6.1.3
- (3) Except where supplying specific appliances, be 15- or 20-ampere, 250-volt or 125-volt, either single or multiple type, and accept parallel-blade or tandem-blade attachment plugs, respectively

(b) Ground-Fault Circuit Interrupters (GFCI). All 250-volt and/or 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed outdoors, in compartments accessible from outside the unit, or in bathrooms, including receptacles in luminaires (light fixtures), shall have GFCI protection. GFCI protection shall be provided for receptacle outlets serving countertops in kitchens, and receptacle outlets located within 1 800 mm of a wet bar sink.

Exception: Receptacles installed for appliances in dedicated spaces,

such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment.

Feeders supplying branch circuits shall be permitted to be protected by a ground-fault circuit-interrupter in lieu of the provision for such interrupters specified herein.

(c) Cord-Connected Fixed Appliance. A grounding-type receptacle outlet shall be provided for each cord-connected fixed appliance installed.

(d) Receptacle Outlets Required. Except in the bath, closet, and hall areas, receptacle outlets shall be installed at wall spaces 600 mm wide or more so that no point along the floor line is more than 1 800 mm measured horizontally from an outlet in that space. In addition, a receptacle outlet shall be installed in the following locations:

(1) Over or adjacent to countertops in the kitchen (at least one on each side of the sink if countertops are on each side and are 300 mm or over in width).

(2) Adjacent to the refrigerator and freestanding gas-range space. A duplex receptacle shall be permitted to serve as the outlet for a countertop and a refrigerator.

(3) At countertop spaces for built-in vanities.

(4) At countertop spaces under wall-mounted cabinets.

(5) In the wall at the nearest point to where a bar-type counter attaches to the wall.

(6) In the wall at the nearest point to where a fixed room divider attaches to the wall.

(7) In laundry areas within 1 800 mm of the intended location of the laundry appliance(s).

(8) At least one receptacle outlet located outdoors and accessible at grade level and not more than 2 000 mm above grade. A receptacle outlet located in a compartment accessible from the outside of the unit shall be considered an outdoor receptacle.

(9) At least one receptacle outlet shall be installed in bathrooms within 900 mm of the outside edge of each basin. The receptacle outlet shall be located above or adjacent to the basin location. This receptacle shall be in addition to any receptacle that is a part of a luminaire (fixture) or appliance. The receptacle shall not be enclosed within a bathroom cabinet or vanity.

(e) Pipe Heating Cable(s) Outlet. For the connection of pipe heating cable(s), a receptacle outlet shall be located on the underside of the unit as follows:

- (1) Within 600 mm of the cold water inlet.
- (2) Connected to an interior branch circuit, other than a small appliance branch circuit. It shall be permitted to use a bathroom receptacle circuit for this purpose.
- (3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter.
- (4) This outlet shall not be considered as the receptacle required by 5.50.2.4(d)(8).

(f) Receptacle Outlets Not Permitted. Receptacle outlets shall not be permitted in the following locations:

- (1) Receptacle outlets shall not be installed within a bathtub or shower space.
- (2) A receptacle shall not be installed in a face-up position in any countertop.
- (3) Receptacle outlets shall not be installed above electric baseboard heaters, unless provided for in the listing or manufacturer's instructions.

(g) Receptacle Outlets Not Required. Receptacle outlets shall not be required in the following locations:

- (1) In the wall space occupied by built-in kitchen or wardrobe cabinets
- (2) In the wall space behind doors that can be opened fully against a wall surface
- (3) In room dividers of the lattice type that are less than 2 400 mm long, not solid, and within 150 mm of the floor
- (4) In the wall space afforded by bar-type counters

5.50.2.5 Luminaires (Fixtures) and Appliances.

(a) Fasten Appliances in Transit. Means shall be provided to securely fasten appliances when the mobile home is in transit. (See 5.50.2.7 for provisions on grounding.)

(b) Accessibility. Every appliance shall be accessible for inspection, service, repair, or replacement without removal of permanent construction.

(c) Pendants. Listed pendant-type luminaires (fixtures) or pendant cords shall be permitted.

(d) Bathtub and Shower Luminaires (Fixtures). Where a luminaire (lighting fixture) is installed over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type listed for wet locations.

5.50.2.6 Wiring Methods and Materials. Except as specifically limited in this section, the wiring methods and materials included in this Code shall be used in mobile homes. Aluminum conductors, aluminum alloy conductors, and aluminum core conductors such as copper-clad aluminum shall not be acceptable for use as branch-circuit wiring.

(a) Nonmetallic Boxes. Nonmetallic boxes shall be permitted only with nonmetallic cable or nonmetallic raceways.

(b) Nonmetallic Cable Protection. Nonmetallic cable located 400 mm or less above the floor, if exposed, shall be protected from physical damage by covering boards, guard strips, or raceways. Cable likely to be damaged by stowage shall be so protected in all cases.

(c) Metal-Covered and Nonmetallic Cable Protection. Metal-covered and nonmetallic cables shall be permitted to pass through the centers of the wide side of 50 mm by 100 mm studs. However, they shall be protected where they pass through 50 mm by 50 mm studs or at other studs or frames where the cable or armor would be less than 30 mm from the inside or outside surface of the studs where the wall covering materials are in contact with the studs. Steel plates on each side of the cable, or a tube, with not less than 1.3 mm wall thickness shall be required to protect the cable. These plates or tubes shall be securely held in place.

(d) Metal Faceplates. Where metal faceplates are used, they shall be effectively grounded.

(e) Installation Requirements. If a range, clothes dryer, or similar appliance is connected by metal-covered cable or flexible metal conduit,

a length of not less than 900 mm of free cable or conduit shall be provided to permit moving the appliance. The cable or flexible metal conduit shall be secured to the wall. Type NM or Type SE cable shall not be used to connect a range or dryer. This shall not prohibit the use of Type NM or Type SE cable between the branch-circuit overcurrent-protective device and a junction box or range or dryer receptacle.

(f) Raceways. Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. Rigid nonmetallic conduit, electrical nonmetallic tubing, or surface raceway shall be permitted. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

(g) Switches. Switches shall be rated as follows:

(1) For lighting circuits, switches shall be rated not less than 10 amperes, 115 to 120 volts or 230 to 250 volts, and in no case less than the connected load.

(2) Switches for motor or other loads shall comply with the provisions of 4.4.1.14.

(h) Under-Chassis Wiring (Exposed to Weather). Where outdoor or under-chassis line-voltage (115 volts, nominal, or higher) wiring is exposed to moisture or physical damage, it shall be protected by rigid metal conduit or intermediate metal conduit. The conductors shall be suitable for wet locations.

Exception: Type MI cable, electrical metallic tubing, or rigid nonmetallic conduit shall be permitted where closely routed against frames and equipment enclosures.

(i) Boxes, Fittings, and Cabinets. Boxes, fittings, and cabinets shall be securely fastened in place and shall be supported from a structural member of the home, either directly or by using a substantial brace.

Exception: Snap-in-type boxes. Boxes provided with special wall or ceiling brackets and wiring devices with integral enclosures that securely fasten to walls or ceilings and are identified for the use shall be permitted without support from a structural member or brace. The

testing and approval shall include the wall and ceiling construction systems for which the boxes and devices are intended to be used.

(j) Appliance Terminal Connections. Appliances having branch-circuit terminal connections that operate at temperatures higher than 60°C shall have circuit conductors as described in the following:

(1) Branch-circuit conductors having an insulation suitable for the temperature encountered shall be permitted to be run directly to the appliance.

(2) Conductors having an insulation suitable for the temperature encountered shall be run from the appliance terminal connection to a readily accessible outlet box placed at least 300 mm from the appliance. These conductors shall be in a suitable raceway or Type AC or MC cable of at least 460 mm but not more than 1 800 mm in length.

(k) Component Interconnections. Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding and shall be capable of enduring the vibration and shock occurring in mobile home transportation.

FPN: See 5.50.2.10 for interconnection of multiple section units.

5.50.2.7 Grounding. Grounding of both electrical and nonelectrical metal parts in a mobile home shall be through connection to a grounding bus in the mobile home distribution panelboard. The grounding bus shall be grounded through the green-colored insulated conductor in the supply cord or the feeder wiring to the service ground in the service-entrance equipment located adjacent to the mobile home location. Neither the frame of the mobile home nor the frame of any appliance shall be connected to the grounded circuit conductor in the mobile home. Where the distribution panelboard is the service equipment as permitted by 5.50.3.3(b), the grounded conductors and the equipment grounding bus shall be connected.

(a) Grounded Conductor.

(1) Insulated. The grounded circuit conductor shall be insulated from

the grounding conductors and from equipment enclosures and other grounded parts. The grounded circuit conductor terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Where the distribution panelboard is the service equipment as permitted by 5.50.3.3(b), the neutral conductors and the equipment grounding bus shall be connected.

(2) Connections of Ranges and Clothes Dryers. Connections of ranges and clothes dryers with 115/230-volt, 3-wire ratings shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plugs, with 230-volt, 2-wire ratings shall be made with 3-conductor cord and 2-pole, 3-wire, grounding-type plugs, or by Type AC cable, Type MC cable, or conductors enclosed in flexible metal conduit.

(b) Equipment Grounding Means.

(1) Supply Cord or Permanent Feeder. The green-colored insulated grounding wire in the supply cord or permanent feeder wiring shall be connected to the grounding bus in the distribution panelboard or disconnecting means.

(2) Electrical System. In the electrical system, all exposed metal parts, enclosures, frames, lamp fixture canopies, and so forth shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

(3) Cord-Connected Appliances. Cord-connected appliances, such as washing machines, clothes dryers, and refrigerators, and the electrical system of gas ranges and so forth, shall be grounded by means of a cord with grounding conductor and grounding-type attachment plug.

(c) Bonding of Non-Current-Carrying Metal Parts.

(1) Exposed Non-Current-Carrying Metal Parts. All exposed non-current-carrying metal parts that may become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard. A bonding conductor shall be connected

between the distribution panelboard and accessible terminal on the chassis.

(2) Grounding Terminals. Grounding terminals shall be of the solderless type and listed as pressure-terminal connectors recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be 8.0 mm² copper minimum, or equivalent. The bonding conductor shall be routed so as not to be exposed to physical damage.

(3) Metallic Piping and Ducts. Metallic gas, water, and waste pipes and metallic air-circulating ducts shall be considered bonded if they are connected to the terminal on the chassis [see 5.50.2.7(c)(1)] by clamps, solderless connectors, or by suitable grounding-type straps.

(4) Metallic Roof and Exterior Coverings. Any metallic roof and exterior covering shall be considered bonded if the following conditions are met:

a. The metal panels overlap one another and are securely attached to the wood or metal frame parts by metallic fasteners.

b. The lower panel of the metallic exterior covering is secured by metallic fasteners at a cross member of the chassis by two metal straps per mobile home unit or section at opposite ends.

The bonding strap material shall be a minimum of 100 mm in width of material equivalent to the skin or a material of equal or better electrical conductivity. The straps shall be fastened with paint-penetrating fittings such as screws and starwashers or equivalent.

5.50.2.8 Testing.

(a) **Dielectric Strength Test.** The wiring of each mobile home shall be subjected to a 1-minute, 900-volt, dielectric strength test (with all switches closed) between live parts (including neutral) and the mobile home ground. Alternatively, the test shall be permitted to be performed at 1 080 volts for 1 second. This test shall be performed after branch circuits are complete and after luminaires (fixtures) or appliances are installed.

Exception: Listed luminaires (fixtures) or appliances shall not be required to withstand the dielectric strength test.

(b) Continuity and Operational Tests and Polarity Checks. Each mobile home shall be subjected to all of the following:

(1) An electrical continuity test to ensure that all exposed electrically conductive parts are properly bonded

(2) An electrical operational test to demonstrate that all equipment, except water heaters and electric furnaces, is connected and in working order

(3) Electrical polarity checks of permanently wired equipment and receptacle outlets to determine that connections have been properly made

5.50.2.9 Calculations. The following method shall be employed in calculating the supply-cord and distribution-panelboard load for each feeder assembly for each mobile home in lieu of the procedure shown in Article 2.20 and shall be based on a 2-wire, 230-volt supply with 230-volt loads or on a 3-wire, 115/230-volt supply with 115-volt loads balanced between the two legs of the 3-wire system.

(a) Lighting, Small Appliance, and Laundry Load.

(1) Lighting Volt-Amperes. Length times width of mobile home floor (outside dimensions) times 33 volt-amperes/m², for example, length × width × 33 = lighting volt-amperes.

(2) Small Appliance Volt-Amperes. Number of circuits times 1 500 volt-amperes for each 20-ampere appliance receptacle circuit (see definition of Appliance, Portable, with note in 5.50.1.2), for example, number of circuits × 1 500 = small appliance volt-amperes.

(3) Laundry Area Circuit Volt-Amperes. 1 500 volt-amperes.

(4) Total Volt-Amperes. Lighting volt-amperes plus small appliance volt-amperes plus laundry area volt-amperes equals total volt-amperes.

(5) Net Volt-Amperes. First 3 000 total volt-amperes at 100 percent plus remainder at 35 percent equals volt-amperes to be divided by 230 volts to obtain current (amperes) per leg.

(b) Total Load for Determining Power Supply. Total load for determining power supply is the sum of the following:

(1) Lighting and small appliance load as calculated in 5.50.2.9(a)(5).

(2) Nameplate amperes for motors and heater loads (exhaust fans, air conditioners, electric, gas, or oil heating). Omit smaller of the heating and cooling loads, except include blower motor if used as air-conditioner evaporator motor. Where an air conditioner is not installed and a 40-ampere power-supply cord is provided, allow 15 amperes for a 230-volt supply or 15 amperes per leg for a 115/230-volt supply, for air conditioning.

(3) Twenty-five percent of current of largest motor in (2).

(4) Total of nameplate amperes for waste disposer, dishwasher, water heater, clothes dryer, wall-mounted oven, cooking units. Where the number of these appliances exceeds three, use 75 percent of total.

(5) Derive amperes for freestanding range (as distinguished from separate ovens and cooking units) by dividing the following values by 230 volts:

Nameplate Rating (watts)	Use (volt-amperes)
0 – 10 000	80 Percent of Rating
Over 10 000 – 12 500	8 000
Over 12 500 – 13 500	8 400
Over 13 500 – 14 500	8 800
Over 14 500 – 15 500	9 200
Over 15 500 – 16 500	9 600
Over 16 500 – 17 500	10 000

(6) If outlets or circuits are provided for other than factory-installed appliances, include the anticipated load.

FPN: Refer to Appendix D, Example D11, for an illustration of the application of this calculation.

(c) Optional Method of Calculation for Lighting and Appliance Load. The optional method for calculating lighting and appliance load shown in 2.20.4.3 shall be permitted.

5.50.2.10 Interconnection of Multiple-Section Mobile or Manufactured Home Units.

(a) **Wiring Methods.** Approved and listed fixed-type wiring methods shall be used to join portions of a circuit that must be electrically joined and are located in adjacent sections after the home is installed on its support foundation. The circuit's junction shall be accessible for disassembly when the home is prepared for relocation.

FPN: See 5.50.2.6(k) for component interconnections.

(b) **Disconnecting Means.** Expandable or multi-unit manufactured homes not having permanently installed feeders that are to be moved from one location to another shall be permitted to have disconnecting means with branch-circuit protective equipment in each unit when so located that after assembly or joining together of units, the requirements of 5.50.2.1 will be met.

5.50.2.11 Outdoor Outlets, Luminaires (Fixtures), Air-Cooling Equipment, and So Forth.

(a) **Listed for Outdoor Use.** Outdoor luminaires (fixtures) and equipment shall be listed for outdoor use. Outdoor receptacle or convenience outlets shall be of a gasketed-cover type for use in wet locations. Where located on the underside of the home or located under roof extensions or similarly protected locations, outdoor luminaires (fixtures) and equipment shall be listed for use in damp locations.

(b) **Outside Heating Equipment, Air-Conditioning Equipment, or Both.** A mobile home provided with a branch circuit designed to energize outside heating equipment, air-conditioning equipment, or both, located outside the mobile home, other than room air conditioners, shall have such branch-circuit conductors terminate in a listed outlet box, or disconnecting means, located on the outside of the mobile home. A label shall be permanently affixed adjacent to the outlet box and shall contain the following information:

THIS CONNECTION IS FOR HEATING
AND/OR AIR-CONDITIONING EQUIPMENT.
THE BRANCH CIRCUIT IS RATED AT NOT
MORE THAN _____ AMPERES, AT _____ VOLTS, 60 HERTZ,
_____ CONDUCTOR AMPACITY.
A DISCONNECTING MEANS SHALL BE LOCATED
WITHIN SIGHT OF THE EQUIPMENT.

The correct voltage and ampere rating shall be given. The tag shall be not less than 0.50 mm thick etched brass, stainless steel, anodized or alclad aluminum, or equivalent. The tag shall not be less than 75 mm by 45 mm minimum size.

5.50.2.16 Arc-Fault Circuit-Interrupter Protection.

(a) **Definition.** Arc-fault circuit interrupters are defined in Article 2.10.1.12(a).

(b) **Bedrooms of Mobile Homes and Manufactured Homes.** All branch circuits that supply 250-volt and/or 125-volt, single-phase, 15- and 20-ampere outlets installed in bedrooms of mobile homes and manufactured homes shall be protected by arc-fault circuit interrupter(s).

5.50.3 Services and Feeders

5.50.3.1 Distribution System. The mobile home park secondary electrical distribution system to mobile home lots shall be single-phase, 230 volts or 115/230 volts, nominal. For the purpose of Part 5.50.3, where the park service exceeds 230 volts, nominal, transformers and secondary distribution panelboards shall be treated as services.

5.50.3.2 Allowable Demand Factors. Park electrical wiring systems shall be calculated (at 230 volts or 115/230 volts) on the larger of the following:

- (1) 16 000 volt-amperes for each mobile home lot
- (2) The load calculated in accordance with 5.50.2.9 for the largest typical mobile home that each lot will accept

It shall be permissible to calculate the feeder or service load in accordance with Table 5.50.3.2. No demand factor shall be allowed for any other load, except as provided in this Code.

Service and feeder conductors to a mobile home in compliance with 3.10.1.15(b)(6) shall be permitted.

Table 5.50.3.2 Demand Factors for Services and Feeders

Number of Mobile Homes	Demand Factor (Percent)
1	100
2	55
3	44
4	39
5	33
6	29
7-9	28
10-12	27
13-15	26
16-21	25
22-40	24
41-60	23
61 and over	22

5.50.3.3 Service Equipment.

(a) **Mobile Home Service Equipment.** The mobile home service equipment shall be located adjacent to the mobile home and not mounted in or on the mobile home. The service equipment shall be located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves. The service equipment shall be permitted to be located elsewhere on the premises, provided that a disconnecting means suitable for use as service equipment is located within sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves and is rated not less than that required for service equipment per 5.50.3.3(c). Grounding at the disconnecting means shall be in accordance with 2.50.2.13.

(b) **Manufactured Home Service Equipment.** The manufactured home service equipment shall be permitted to be installed in or on a manufactured home, provided that all of the following conditions are met:

(1) The manufacturer shall include in its written installation instructions information indicating that the home shall be secured in place by an anchoring system or installed on and secured to a permanent foundation.

(2) The installation of the service equipment shall comply with Article 2.30.

(3) Means shall be provided for the connection of a grounding electrode conductor to the service equipment and routing it outside the structure.

(4) Bonding and grounding of the service shall be in accordance with Article 2.50.

(5) The manufacturer shall include in its written installation instructions one method of grounding the service equipment at the installation site. The instructions shall clearly state that other methods of grounding are found in Article 2.50.

(6) The minimum size grounding electrode conductor shall be specified in the instructions.

(7) A red warning label shall be mounted on or adjacent to the service equipment. The label shall state the following:

WARNING
DO NOT PROVIDE ELECTRICAL POWER
UNTIL THE GROUNDING ELECTRODE(S)
IS INSTALLED AND CONNECTED
(SEE INSTALLATION INSTRUCTIONS).

Where the service equipment is not installed in or on the unit, the installation shall comply with the other provisions of this section.

(c) **Rating.** Mobile home service equipment shall be rated at not less than 100 amperes at 230 volts or 115/230 volts, and provisions shall be made for connecting a mobile home feeder assembly by a permanent wiring method. Power outlets used as mobile home service equipment shall also be permitted to contain receptacles rated up to 50 amperes with appropriate overcurrent protection. Fifty-ampere receptacles shall conform to the configuration shown in Figure 5.50.2.1(c).

FPN: Complete details of the 50-ampere plug and receptacle configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association Standard for Wiring Devices — Dimensional Requirements, Figure 14-50.

(d) **Additional Outside Electrical Equipment.** Means for connecting a mobile home accessory building or structure or additional electrical equipment located outside a mobile home by a fixed wiring method shall be provided in either the mobile home service equipment or the local external disconnecting means permitted in 5.50.3.3(a).

(e) **Additional Receptacles.** Additional receptacles shall be permitted for connection of electrical equipment located outside the mobile home, and all such 250-volt and/or 125-volt, single-phase, 15- and 20-ampere receptacles shall be protected by a listed ground-fault circuit interrupter.

(f) **Mounting Height.** Outdoor mobile home disconnecting means shall be installed so the bottom of the enclosure containing the disconnecting means is not less than 600 mm above finished grade or working platform. The disconnecting means shall be installed so that the center of the grip of the operating handle, when in the highest position, is not more than 2 000 mm above the finished grade or working platform.

(g) **Marking.** Where a 250-volt or 125/250-volt receptacle is used in mobile home service equipment, the service equipment shall be marked as follows:

TURN DISCONNECTING SWITCH OR
CIRCUIT BREAKER OFF BEFORE INSERTING
OR REMOVING PLUG. PLUG MUST BE FULLY
INSERTED OR REMOVED.

The marking shall be located on the service equipment adjacent to the receptacle outlet.

5.50.3.4 Feeder.

(a) **Feeder Conductors.** Feeder conductors shall consist of either a listed cord, factory installed in accordance with 5.50.2.1(b), or a permanently installed feeder consisting of three or four insulated, color-coded conductors that shall be identified by the factory or field marking of the conductors in compliance with 3.10.1.12. Equipment grounding conductors shall not be identified by stripping the insulation.

Exception: Where a feeder is installed between service equipment and a disconnecting means as covered in 5.50.3.3(a), it shall be permitted to omit the equipment grounding conductor where the grounded circuit conductor is grounded at the disconnecting means as required in 2.50.2.13(b).

(b) **Feeder Capacity.** Mobile home and manufactured home lot feeder circuit conductors shall have a capacity not less than the loads supplied and shall be rated at not less than 100 amperes at 230 volts or 115/230 volts.

ARTICLE 5.51 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

5.51.1 General

5.51.1.1 Scope. The provisions of this article cover the electrical conductors and equipment other than low-voltage and automotive vehicle circuits or extensions thereof, installed within or on recreational vehicles, the conductors that connect recreational vehicles to a supply of electricity, and the installation of equipment and devices related to electrical installations within a recreational vehicle park.

FPN: For information on low-voltage systems, see NFPA 1192-2002, Standard for Recreational Vehicles, and ANSI/RVIA 12V, Low Voltage Systems in Conversion and Recreational Vehicles, 2002 edition.

5.51.1.2 Definitions. (See Article 1.0 for additional definitions.)

Air-Conditioning or Comfort-Cooling Equipment. All of that equipment intended or installed for the purpose of processing the treatment of air so as to control simultaneously its temperature, humidity,

cleanliness, and distribution to meet the requirements of the conditioned space.

Appliance, Fixed. An appliance that is fastened or otherwise secured at a specific location.

Appliance, Portable. An appliance that is actually moved or can easily be moved from one place to another in normal use.

FPN: For the purpose of this article, the following major appliances, other than built-in, are considered portable if cord connected: refrigerators, range equipment, clothes washers, dishwashers without booster heaters, or other similar appliances.

Appliance, Stationary. An appliance that is not easily moved from one place to another in normal use.

Camping Trailer. A vehicular portable unit mounted on wheels and constructed with collapsible partial side walls that fold for towing by another vehicle and unfold at the campsite to provide temporary living quarters for recreational, camping, or travel use. (See Recreational Vehicle.)

Converter. A device that changes electrical energy from one form to another, as from alternating current to direct current.

Dead Front (as applied to switches, circuit breakers, switchboards, and distribution panelboards). Designed, constructed, and installed so that no current-carrying parts are normally exposed on the front.

Disconnecting Means. The necessary equipment usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors in a recreational vehicle and intended to constitute the means of cutoff for the supply to that recreational vehicle.

Distribution Panelboard. A single panel or group of panel units designed for assembly in the form of a single panel, including buses, and with or without switches and/or automatic overcurrent-protective devices for the control of light, heat, or power circuits of small individual as well as aggregate capacity; designed to be placed in a cabinet or cutout box placed in or against a wall or partition and accessible only from the front.

Frame. Chassis rail and any welded addition thereto of metal thickness of 1.35 mm or greater.

Low Voltage. An electromotive force rated 24 volts, nominal, or less, supplied from a transformer, converter, or battery.

Motor Home. A vehicular unit designed to provide temporary living quarters for recreational, camping, or travel use built on or permanently attached to a self-propelled motor vehicle chassis or on a chassis cab or van that is an integral part of the completed vehicle. (See Recreational Vehicle.)

Power-Supply Assembly. The conductors, including ungrounded, grounded, and equipment grounding conductors, the connectors, attachment plug caps, and all other fittings, grommets, or devices installed for the purpose of delivering energy from the source of electrical supply to the distribution panel within the recreational vehicle.

Recreational Vehicle. A vehicular-type unit primarily designed as temporary living quarters for recreational, camping, or travel use, which either has its own motive power or is mounted on or drawn by another vehicle. The basic entities are travel trailer, camping trailer, truck camper, and motor home.

Recreational Vehicle Park. A plot of land upon which two or more recreational vehicle sites are located, established, or maintained for occupancy by recreational vehicles of the general public as temporary living quarters for recreation or vacation purposes.

Recreational Vehicle Site. A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis. It can be used as either a recreational vehicle site or as a camping unit site.

Recreational Vehicle Site Feeder Circuit Conductors. The conductors from the park service equipment to the recreational vehicle site supply equipment.

Recreational Vehicle Site Supply Equipment. The necessary equipment, usually a power outlet, consisting of a circuit breaker or switch and fuse and their accessories, located near the point of entrance

of supply conductors to a recreational vehicle site and intended to constitute the disconnecting means for the supply to that site.

Recreational Vehicle Stand. That area of a recreational vehicle site intended for the placement of a recreational vehicle.

Transformer. A device that, when used, raises or lowers the voltage of alternating current of the original source.

Travel Trailer. A vehicular unit, mounted on wheels, designed to provide temporary living quarters for recreational, camping, or travel use, of such size or weight as not to require special highway movement permits when towed by a motorized vehicle, and of gross trailer area less than 30 m². (See Recreational Vehicle.)

Truck Camper. A portable unit constructed to provide temporary living quarters for recreational, travel, or camping use, consisting of a roof, floor, and sides, designed to be loaded onto and unloaded from the bed of a pick-up truck. (See Recreational Vehicle.)

5.51.1.4 General Requirements.

(a) Not Covered. A recreational vehicle not used for the purposes as defined in 5.51.1.2 shall not be required to meet the provisions of Part I pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if the recreational vehicle is provided with an electrical installation intended to be energized from a 230-volt or 115/230-volt, nominal, ac power-supply system.

(b) Systems. This article covers combination electrical systems, generator installations, and 230-volt or 115/230-volt, nominal, systems.

FPN: For information on low-voltage systems, refer to NFPA 1192-2002, Standard on Recreational Vehicles, and ANSI/RVIA 12V-2002, Standard for Low-Voltage Systems in Conversion and Recreational Vehicles.

5.51.2 Combination Electrical Systems

5.51.2.1 Combination Electrical Systems.

(a) General. Vehicle wiring suitable for connection to a battery or dc

supply source shall be permitted to be connected to a 230-volt or 115/230-volt source, provided the entire wiring system and equipment are rated and installed in full conformity with Parts 5.51.1, 5.51.2, 5.51.3, 5.51.4, and 5.51.5 requirements of this article covering 230-volt or 115/230-volt electrical systems. Circuits fed from ac transformers shall not supply dc appliances.

(b) Voltage Converters (230-Volt or 115-Volt Alternating Current to Low-Voltage Direct Current). The 230-volt or 115-volt ac side of the voltage converter shall be wired in full conformity with Parts 5.51.1, 5.51.2, 5.51.3, 5.51.4, and 5.51.5 requirements of this article for 230-volt or 115-volt electrical systems.

Exception: Converters supplied as an integral part of a listed appliance shall not be subject to 5.51.2.1(b).

All converters and transformers shall be listed for use in recreation vehicles and designed or equipped to provide over-temperature protection. To determine the converter rating, the following formula shall be applied to the total connected load, including average battery charging rate, of all 12-volt equipment:

- The first 20 amperes of load at 100 percent, plus
- The second 20 amperes of load at 50 percent, plus
- All load above 40 amperes at 25 percent

Exception: A low-voltage appliance that is controlled by a momentary switch (normally open) that has no means for holding in the closed position or refrigerators with a 230-volt or 115-volt function shall not be considered as a connected load when determining the required converter rating. Momentarily energized appliances shall be limited to those used to prepare the vehicle for occupancy or travel.

(c) Bonding Voltage Converter Enclosures. The non-current-carrying metal enclosure of the voltage converter shall be bonded to the frame of the vehicle with a minimum 8.0 mm² copper conductor. The voltage converter shall be provided with a separate chassis bonding conductor that shall not be used as a current-carrying conductor.

(d) Dual-Voltage Fixtures, Including Luminaires or Appliances. Fixtures, including luminaires, or appliances having both 230-volt or 115-volt and low-voltage connections shall be listed for dual voltage.

(e) **Autotransformers.** Autotransformers shall not be used.

(f) **Receptacles and Plug Caps.** Where a recreational vehicle is equipped with a 120-volt or 120/240-volt ac system, a low-voltage system, or both, receptacles and plug caps of the low-voltage system shall differ in configuration from those of the 230-volt, 115-volt or 115/230-volt system. Where a vehicle equipped with a battery or other low-voltage system has an external connection for low-voltage power, the connector shall have a configuration that will not accept 230-volt, 115-volt or 115/230-volt power.

5.51.3 Other Power Sources

5.51.3.1 Generator Installations.

(a) **Mounting.** Generators shall be mounted in such a manner as to be effectively bonded to the recreational vehicle chassis.

(b) **Generator Protection.** Equipment shall be installed to ensure that the current-carrying conductors from the engine generator and from an outside source are not connected to a vehicle circuit at the same time.

Receptacles used as disconnecting means shall be accessible (as applied to wiring methods) and capable of interrupting their rated current without hazard to the operator.

(c) **Installation of Storage Batteries and Generators.** Storage batteries and internal-combustion-driven generator units (subject to the provisions of this Code) shall be secured in place to avoid displacement from vibration and road shock.

(d) **Ventilation of Generator Compartments.** Compartments accommodating internal-combustion-driven generator units shall be provided with ventilation in accordance with instructions provided by the manufacturer of the generator unit.

FPN: For generator compartment construction requirements, see NFPA 1192-2002, Standard on Recreational Vehicles.

(e) **Supply Conductors.** The supply conductors from the engine generator to the first termination on the vehicle shall be of the stranded

type and be installed in listed flexible conduit or listed liquidtight flexible conduit. The point of first termination shall be in one of the following:

- (1) Panelboard
- (2) Junction box with a blank cover
- (3) Junction box with a receptacle
- (4) Enclosed transfer switch
- (5) Receptacle assembly listed in conjunction with the generator

The panelboard or junction box with a receptacle shall be installed within the vehicle's interior and within 460 mm of the compartment wall but not inside the compartment. If the generator is below the floor level and not in a compartment, the panelboard or junction box with receptacle shall be installed within the vehicle interior within 460 mm of the point of entry into the vehicle. A junction box with a blank cover shall be mounted on the compartment wall and shall be permitted inside or outside the compartment. A receptacle assembly listed in conjunction with the generator shall be mounted in accordance with its listing. If the generator is below floor level and not in a compartment, the junction box with blank cover shall be mounted either to any part of the generator supporting structure (but not to the generator) or to the vehicle floor within 460 mm of any point directly above the generator on either the inside or outside of the floor surface. Overcurrent protection in accordance with 2.40.1.4 shall be provided for supply conductors as an integral part of a listed generator or shall be located within 460 mm of their point of entry into the vehicle.

5.51.3.2 Multiple Supply Source.

(a) **Multiple Supply Sources.** Where a multiple supply system consisting of an alternate power source and a power-supply cord is installed, the feeder from the alternate power source shall be protected by an overcurrent-protective device. Installation shall be in accordance with 5.51.3.1(a), 5.51.3.1(b), and 5.51.4.1.

(b) **Multiple Supply Sources Capacity.** The multiple supply sources shall not be required to be of the same capacity.

(c) **Alternate Power Sources Exceeding 30 Amperes.** If an alternate power source exceeds 30 amperes, 115 volts, nominal, it shall be

permissible to wire it as a 230-volt, nominal, system, a 115-volt, nominal, system or a 115/230-volt, nominal, system, provided an overcurrent-protective device of the proper rating is installed in the feeder.

(d) Power-Supply Assembly Not Less Than 30 Amperes. The external power-supply assembly shall be permitted to be less than the calculated load but not less than 30 amperes and shall have overcurrent protection not greater than the capacity of the external power-supply assembly.

5.51.3.3 Other Sources. Other sources of ac power, such as inverters, motor generators, or engine generators, shall be listed for use in recreational vehicles and shall be installed in accordance with the terms of the listing. Other sources of ac power shall be wired in full conformity with the requirements in Parts 5.51.1, 5.51.2, 5.51.3, 5.51.4, and 5.51.5 covering 230-volt and 115-volt electrical systems.

5.51.3.4 Alternate Source Restriction. Transfer equipment, if not integral with the listed power source, shall be installed to ensure that the current-carrying conductors from other sources of ac power and from an outside source are not connected to the vehicle circuit at the same time.

5.51.4 Nominal 230-Volt, 115-Volt or 115/230-Volt Systems

5.51.4.1 230-Volt, 115-Volt or 115/230-Volt, Nominal, Systems.

(a) General Requirements. The electrical equipment and material of recreational vehicles indicated for connection to a wiring system rated 230 volts, nominal, 2-wire with ground, 115 volts, nominal, 2-wire with ground, or a wiring system rated 115/230 volts, nominal, 3-wire with ground, shall be listed and installed in accordance with the requirements of Parts 5.51.1, 5.51.2, 5.51.3, 5.51.4, and 5.51.5. Electrical equipment connected line-to-line shall have a voltage rating of 208–230 volts.

(b) Materials and Equipment. Electrical materials, devices, appliances, fittings, and other equipment installed in, intended for use in, or attached to the recreational vehicle shall be listed. All products shall be used only in the manner in which they have been tested and found suitable for the intended use.

(c) Ground-Fault Circuit-Interrupter Protection. The internal wiring of a recreational vehicle having only one 15- or 20-ampere branch circuit as permitted in 5.51.4.3(a) and 5.51.4.3(b) shall have ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be installed at the point where the power supply assembly terminates within the recreational vehicle. Where a separable cord set is not employed, the ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug of the power supply assembly. The ground-fault circuit interrupter shall provide protection also under the conditions of an open grounded circuit conductor, interchanged circuit conductors, or both.

5.51.4.2 Receptacle Outlets Required.

(a) Spacing. Receptacle outlets shall be installed at wall spaces 600 mm wide or more so that no point along the floor line is more than 1 800 mm, measured horizontally, from an outlet in that space.

Exception No. 1: Bath and hall areas.

Exception No. 2: Wall spaces occupied by kitchen cabinets, wardrobe cabinets, built-in furniture, behind doors that may open fully against a wall surface, or similar facilities.

(b) Location. Receptacle outlets shall be installed as follows:

(1) Adjacent to countertops in the kitchen (at least one on each side of the sink if countertops are on each side and are 300 mm or over in width)

(2) Adjacent to the refrigerator and gas range space, except where a gas-fired refrigerator or cooking appliance, requiring no external electrical connection, is factory installed

(3) Adjacent to countertop spaces of 300 mm or more in width that cannot be reached from a receptacle required in 5.51.4.2(b)(1) by a cord of 1 800 mm without crossing a traffic area, cooking appliance, or sink

(c) Ground-Fault Circuit-Interrupter Protection. Where provided, each 250-volt and/or 125-volt, single-phase, 15- or 20-ampere receptacle outlet shall have ground-fault circuit-interrupter protection for personnel in the following locations:

(1) Adjacent to a bathroom lavatory

(2) Where the receptacles are installed to serve the countertop surfaces and are within 1 800 mm of any lavatory or sink

Exception No. 1: Receptacles installed for appliances in dedicated spaces, such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment.

Exception No. 2: Single receptacles for interior connections of expandable room sections.

Exception No. 3: De-energized receptacles that are within 1 800 mm of any sink or lavatory due to the retraction of the expandable room section.

(3) In the area occupied by a toilet, shower, tub, or any combination thereof

(4) On the exterior of the vehicle

Exception: Receptacles that are located inside of an access panel that is installed on the exterior of the vehicle to supply power for an installed appliance shall not be required to have ground-fault circuit-interrupter protection.

The receptacle outlet shall be permitted in a listed luminaire (lighting fixture). A receptacle outlet shall not be installed in a tub or combination tub–shower compartment.

(d) Face-Up Position. A receptacle shall not be installed in a face-up position in any countertop or similar horizontal surfaces within the living area.

5.51.4.3 Branch Circuits Required.

Each recreational vehicle containing a 230-volt or 115-volt electrical system shall contain one of the following.

(a) One 15-Ampere Circuit. One 15-ampere circuit to supply lights, receptacle outlets, and fixed appliances. Such recreational vehicles shall be equipped with one 15-ampere switch and fuse or one 15-ampere circuit breaker.

(b) One 20-Ampere Circuit. One 20-ampere circuit to supply lights, receptacle outlets, and fixed appliances. Such recreational vehicles shall be equipped with one 20-ampere switch and fuse or one 20-ampere circuit breaker.

(c) Two to Five 15- or 20-Ampere Circuits. A maximum of five 15- or 20-ampere circuits to supply lights, receptacle outlets, and fixed appliances shall be permitted. Such recreational vehicles shall be equipped with a distribution panelboard rated at 230 volts maximum for a 230 volts power supply or 115 volts maximum for a 115 volts power supply, with a 30-ampere rated main power supply assembly. Not more than two 230-volt or 115-volt thermostatically controlled appliances (i.e., air conditioner and water heater) shall be installed in such systems unless appliance isolation switching, energy management systems, or similar methods are used.

Exception: Additional 15- or 20-ampere circuits shall be permitted where a listed energy management system rated at 30-ampere maximum is employed within the system.

FPN: See 2.10.2.4(a) for permissible loads. See 5.51.4.6(c) for main disconnect and overcurrent protection requirements.

(d) More Than Five Circuits Without a Listed Energy Management System. A 50-ampere, 230-volt or 115/230-volt power-supply assembly shall be used where six or more circuits are employed. The load distribution shall ensure a reasonable current balance between phases.

5.51.4.4 Branch-Circuit Protection.

(a) Rating. The branch-circuit overcurrent devices shall be rated as follows:

- (1) Not more than the circuit conductors, and
- (2) Not more than 150 percent of the rating of a single appliance rated 13.3 amperes or more and supplied by an individual branch circuit, but
- (3) Not more than the overcurrent protection size marked on an air conditioner or other motor-operated appliances

(b) Protection for Smaller Conductors. A 20-ampere fuse or circuit breaker shall be permitted for protection for fixtures, including luminaires, leads, cords, or small appliances, and 2.0mm² (1.6 mm dia.) tap conductors, not over 1 800 mm long for recessed luminaires (lighting fixtures).

(c) Fifteen-Ampere Receptacle Considered Protected by 20 Amperes. If more than one receptacle or load is on a branch circuit, a 15-ampere receptacle shall be permitted to be protected by a 20-ampere fuse or circuit breaker.

5.51.4.5 Power-Supply Assembly. Each recreational vehicle shall have only one of the following main power-supply assemblies.

(a) Fifteen-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 5.51.4.3(a) shall use a listed 15-ampere or larger main power-supply assembly.

(b) Twenty-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 5.51.4.3(b) shall use a listed 20-ampere or larger main power-supply assembly.

(c) Thirty-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 5.51.4.3(c) shall use a listed 30-ampere or larger main power-supply assembly.

(d) Fifty-Ampere Power-Supply Assembly. Recreational vehicles wired in accordance with 5.51.4.3(d) shall use a listed 50-ampere, 230-volt or 115/230-volt main power-supply assembly.

5.51.4.6 Distribution Panelboard.

(a) Listed and Appropriately Rated. A listed and appropriately rated distribution panelboard or other equipment specifically listed for this purpose shall be used. The grounded conductor termination bar shall be insulated from the enclosure as provided in 5.51.4.15(c). An equipment grounding terminal bar shall be attached inside the metal enclosure of the panelboard.

(b) Location. The distribution panelboard shall be installed in a readily accessible location. Working clearance for the panelboard shall be not less than 600 mm wide and 800 mm deep.

Exception No. 1: Where the panelboard cover is exposed to the inside aisle space, one of the working clearance dimensions shall be permitted to be reduced to a minimum of 560 mm. A panelboard is considered exposed where the panelboard cover is within 50 mm of the aisle's finished surface.

Exception No. 2: Compartment doors used for access to a generator shall be permitted to be equipped with a locking system.

(c) Dead-Front Type. The distribution panelboard shall be of the dead-front type and shall consist of one or more circuit breakers or Type S fuseholders. A main disconnecting means shall be provided where fuses are used or where more than two circuit breakers are employed. A main overcurrent protective device not exceeding the power-supply assembly rating shall be provided where more than two branch circuits are employed.

5.51.4.7 Means for Connecting to Power Supply.

(a) Assembly. The power-supply assembly or assemblies shall be factory supplied or factory installed and be of one of the types specified herein.

(1) Separable. Where a separable power-supply assembly consisting of a cord with a female connector and molded attachment plug cap is provided, the vehicle shall be equipped with a permanently mounted, flanged surface inlet (male, recessed-type motor-base attachment plug) wired directly to the distribution panelboard by an approved wiring method. The attachment plug cap shall be of a listed type.

(2) Permanently Connected. Each power-supply assembly shall be connected directly to the terminals of the distribution panelboard or conductors within a junction box and provided with means to prevent strain from being transmitted to the terminals. The ampacity of the conductors between each junction box and the terminals of each distribution panelboard shall be at least equal to the ampacity of the power-supply cord. The supply end of the assembly shall be equipped

with an attachment plug of the type described in 5.51.4.7(c). Where the cord passes through the walls or floors, it shall be protected by means of conduit and bushings or equivalent. The cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the vehicle is in transit.

(b) Cord. The cord exposed usable length shall be measured from the point of entrance to the recreational vehicle or the face of the flanged surface inlet (motor-base attachment plug) to the face of the attachment plug at the supply end.

The cord exposed usable length, measured to the point of entry on the vehicle exterior, shall be a minimum of 7 600 mm where the point of entrance is at the side of the vehicle or shall be a minimum 9 000 mm where the point of entrance is at the rear of the vehicle.

Where the cord entrance into the vehicle is more than 900 mm above the ground, the minimum cord lengths above shall be increased by the vertical distance of the cord entrance heights above 900 mm.

FPN: See 5.51.4.7(e).

(c) Attachment Plugs.

(1) Units with One 15-Ampere Branch Circuit. Recreational vehicles having only one 15-ampere branch circuit as permitted by 5.51.4.3(a) shall have an attachment plug that shall be 2-pole, 3-wire grounding type, rated 15 amperes, 250 volts or 125 volts, conforming to the configuration shown in Figure 5.51.4.7(c).

FPN: Complete details of this configuration can be found in National Electrical Manufacturers Association's ANSI/NEMA WD 6-1989, Standard for Dimensions of Attachment Plugs and Receptacle, Figure 5.15.

(2) Units with One 20-Ampere Branch Circuit. Recreational vehicles having only one 20-ampere branch circuit as permitted in 5.51.4.3(b) shall have an attachment plug that shall be 2-pole, 3-wire grounding type, rated 20 amperes, 250 volts or 125 volts, conforming to the configuration shown in Figure 5.51.4.7(c).

FPN: Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles, Figure 5.20.

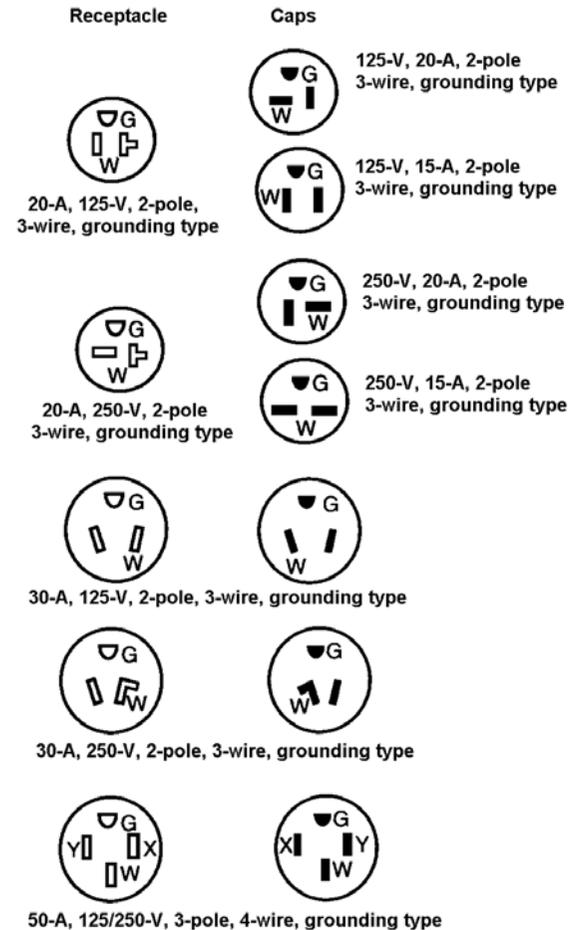

Figure 5.51.4.7(c) Configurations for Grounding-Type Receptacles and Attachment Plug Caps Used for Recreational Vehicle Supply Cords and Recreational Vehicle Lots.

(3) Units with Two to Five 15- or 20-Ampere Branch Circuits. Recreational vehicles wired in accordance with 5.51.4.3(c) shall have an attachment plug that shall be 2-pole, 3-wire grounding type, rated 30 amperes, 250 volts or 125 volts, conforming to the configuration shown in Figure 5.51.4.7(c), intended for use with units rated at 30 amperes, 250 volts or 125 volts.

FPN: Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles, Figure TT.

(4) Units with 50-Ampere Power Supply Assembly. Recreational vehicles having a power-supply assembly rated 50 amperes as permitted by 5.51.4.3(d) shall have a 3-pole, 4-wire grounding-type attachment plug rated 50 amperes, 125/250 volts, conforming to the configuration shown in Figure 5.51.4.7(c).

FPN: Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles, Figure 14.50.

(d) Labeling at Electrical Entrance. Each recreational vehicle shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply cord(s), a label 75 mm × 45 mm minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.50 mm thick, or other suitable material (e.g., 0.13 mm thick plastic laminate) that reads, as appropriate, either

THIS CONNECTION IS FOR 110–125-VOLT AC,
60 HZ, ____ AMPERE SUPPLY.

or

THIS CONNECTION IS FOR 115/230-VOLT AC,
3-POLE, 4-WIRE, 60 HZ, _____ AMPERE SUPPLY.

or

THIS CONNECTION IS FOR 230-VOLT AC,
2-POLE, 3-WIRE, 60 HZ, _____ AMPERE SUPPLY.

The correct ampere rating shall be marked in the blank space.

(e) Location. The point of entrance of a power-supply assembly shall be located within 4 500 mm of the rear, on the left (road) side or at the rear, left of the longitudinal center of the vehicle, within 460 mm of the outside wall.

Exception No. 1: A recreational vehicle equipped with only a listed flexible drain system or a side-vent drain system shall be permitted to have the electrical point of entrance located on either side, provided the drain(s) for the plumbing system is (are) located on the same side.

Exception No. 2: A recreational vehicle shall be permitted to have the electrical point of entrance located more than 4 500 mm from the rear. Where this occurs, the distance beyond the 4 500 mm dimension shall be added to the cord's minimum length as specified in 5.51.4.7(b).

Exception No. 3: Recreational vehicles designed for transporting livestock shall be permitted to have the electrical point of entrance located on either side or the front.

5.51.4.8 Wiring Methods.

(a) Wiring Systems. Cables and raceways installed in accordance with Articles 3.20, 3.22, 3.30 through 3.40, 3.42 through 3.62, 3.86, and 3.88 shall be permitted in accordance with their applicable article, except as otherwise specified in this article. An equipment grounding means shall be provided in accordance with 2.50.6.9.

(b) Conduit and Tubing. Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

(c) Nonmetallic Boxes. Nonmetallic boxes shall be acceptable only with nonmetallic-sheathed cable or nonmetallic raceways.

(d) Boxes. In walls and ceilings constructed of wood or other combustible material, boxes and fittings shall be flush with the finished surface or project therefrom.

(e) Mounting. Wall and ceiling boxes shall be mounted in accordance with Article 3.14.

Exception No. 1: Snap-in-type boxes or boxes provided with special wall or ceiling brackets that securely fasten boxes in walls or ceilings shall be permitted.

Exception No. 2: A wooden plate providing a 40 mm minimum width backing around the box and of a thickness of 12 mm or greater (actual) attached directly to the wall panel shall be considered as approved means for mounting outlet boxes.

(f) Raceway and Cable Continuity. Raceways and cable sheaths shall be continuous between boxes and other enclosures.

(g) Protected. Metal-clad, Type AC, or nonmetallic-sheathed cables and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 50 mm by 100 mm wood studs. However, they shall be protected where they pass through 50 mm by 50 mm wood studs or at other wood studs or frames where the cable or tubing would be less than 30 mm from the inside or outside surface. Steel plates on each side of the cable or tubing or a steel tube, with not less than 1.3 mm wall thickness, shall be installed to protect the cable or tubing. These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables pass through punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable.

(h) Bends. No bend shall have a radius of less than five times the cable diameter.

(i) Cable Supports. Where connected with cable connectors or clamps, cables shall be supported within 300 mm of outlet boxes, distribution panelboards, and splice boxes on appliances. Supports shall be provided every 1 400 mm at other places.

(j) Nonmetallic Box Without Cable Clamps. Nonmetallic-sheathed cables shall be supported within 200 mm of a nonmetallic outlet box without cable clamps. Where wiring devices with integral enclosures are employed with a loop of extra cable to permit future replacement of the

device, the cable loop shall be considered as an integral portion of the device.

(k) Physical Damage. Where subject to physical damage, exposed nonmetallic cable shall be protected by covering boards, guard strips, raceways, or other means.

(l) Metal Faceplates. Metal faceplates shall be of ferrous metal not less than 0.75 mm in thickness or of nonferrous metal not less than 1.0 mm in thickness. Nonmetallic faceplates shall be listed.

(m) Metal Faceplates Effectively Grounded. Where metal faceplates are used, they shall be effectively grounded.

(n) Moisture or Physical Damage. Where outdoor or under-chassis wiring is 115 volts, nominal, or over and is exposed to moisture or physical damage, the wiring shall be protected by rigid metal conduit, by intermediate metal conduit, or by electrical metallic tubing, rigid nonmetallic conduit, or Type MI cable, that is closely routed against frames and equipment enclosures or other raceway or cable identified for the application.

(o) Component Interconnections. Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding and shall be capable of enduring the vibration and shock occurring in recreational vehicles.

(p) Method of Connecting Expandable Units. The method of connecting expandable units to the main body of the vehicle shall comply with 5.51.4.8(p)(1) or (p)(2):

(1) Cord-and-Plug Connected. Cord and plug connections shall comply with (a) through (d).

a. That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the vehicle by means of an attachment plug and cord listed for hard usage. The cord and its connections shall

conform to all provisions of Article 4.0 and shall be considered as a permitted use under 4.0.1.7. Where the attachment plug and cord are located within the vehicle's interior, use of plastic thermoset or elastomer parallel cord Type SPT-3, SP-3, or SPE shall be permitted.

b. Where the receptacle provided for connection of the cord to the main circuit is located on the outside of the vehicle, it shall be protected with a ground-fault circuit interrupter for personnel and be listed for wet locations. A cord located on the outside of a vehicle shall be identified for outdoor use.

c. Unless removable or stored within the vehicle interior, the cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the vehicle is in transit.

d. The attachment plug and cord shall be installed so as not to permit exposed live attachment plug pins.

(2) Direct Wired. That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the vehicle by means of flexible cord in accordance with 5.51.4.8(p)(2)a through (p)(2)d.

a. The flexible cord shall be listed for hard usage and for use in wet locations.

b. The flexible cord shall be permitted to pass through the interior of a wall or through a floor in lengths not to exceed 600 mm before terminating at an outlet.

c. The flexible cord shall be installed in a nonflexible conduit or tubing that runs continuously from the outlet box inside the recreational vehicle to a strain relief connector listed for use in wet locations that is located on the underside of the recreational vehicle.

d. The outer jacket of the flexible cord shall not be removed for that portion that is installed in the conduit or tubing.

(q) Prewiring for Air-Conditioning Installation. Prewiring installed for the purpose of facilitating future air-conditioning installation shall conform to the applicable portions of this article and the following:

(1) An overcurrent protective device with a rating compatible with the circuit conductors shall be installed in the distribution panelboard and wiring connections completed.

(2) The load end of the circuit shall terminate in a junction box with a blank cover or other listed enclosure. Where a junction box with a

blank cover is used, the free ends of the conductors shall be adequately capped or taped.

(3) A label conforming to 5.51.4.7(d) shall be placed on or adjacent to the junction box and shall read

AIR-CONDITIONING CIRCUIT.
THIS CONNECTION IS FOR AIR CONDITIONERS
RATED 110–125-VOLT AC, 60 HZ,
___ AMPERES MAXIMUM. DO NOT EXCEED CIRCUIT RATING.

or

AIR-CONDITIONING CIRCUIT.
THIS CONNECTION IS FOR AIR CONDITIONERS
RATED 230-VOLT AC, 60 HZ,
___ AMPERES MAXIMUM. DO NOT EXCEED CIRCUIT RATING.

An ampere rating, not to exceed 80 percent of the circuit rating, shall be legibly marked in the blank space.

(4) The circuit shall serve no other purpose.

(r) Prewiring for Generator Installation. Prewiring installed for the purpose of facilitating future generator installation shall conform to the other applicable portions of this article and the following:

(1) Circuit conductors shall be appropriately sized in relation to the anticipated load and shall be protected by an overcurrent device in accordance with their ampacities.

(2) Where junction boxes are utilized at either of the circuit originating or terminus points, free ends of the conductors shall be adequately capped or taped.

(3) Where devices such as receptacle outlet, transfer switch, and so forth, are installed, the installation shall be complete, including circuit conductor connections. All devices shall be listed and appropriately rated.

(4) A label conforming to 5.51.4.7(d) shall be placed on the cover of each junction box containing incomplete circuitry and shall read, as appropriate, either

GENERATOR CIRCUIT. THIS CONNECTION IS FOR GENERATORS RATED 110–125-VOLT AC, 60 HZ, _____ AMPERES MAXIMUM.

or

GENERATOR CIRCUIT. THIS CONNECTION IS FOR GENERATORS RATED 115/230-VOLT AC, 60 HZ, _____ AMPERES MAXIMUM.

or

GENERATOR CIRCUIT. THIS CONNECTION IS FOR GENERATORS RATED 230-VOLT AC, 60 HZ, _____ AMPERES MAXIMUM.

The correct ampere rating shall be legibly marked in the blank space.

5.51.4.9 Conductors and Boxes. The maximum number of conductors permitted in boxes shall be in accordance with 3.14.2.2.

5.51.4.10 Grounded Conductors. The identification of grounded conductors shall be in accordance with 2.0.1.6.

5.51.4.11 Connection of Terminals and Splices. Conductor splices and connections at terminals shall be in accordance with 1.10.1.14.

5.51.4.12 Switches.

(a) Rating. Switches shall be rated in accordance with 5.51.4.12(a)(1) and (a)(2).

(1) **Lighting Circuits.** For lighting circuits, switches shall be rated not less than 10 amperes, 230-250 volts or 115–125 volts and in no case less than the connected load.

(2) **Motors or Other Loads.** Switches for motor or other loads shall comply with the provisions of 4.4.1.14.

(b) Location. Switches shall not be installed within wet locations in tub or shower spaces unless installed as part of a listed tub or shower

assembly.

5.51.4.13 Receptacles. All receptacle outlets shall be of the grounding type and installed in accordance with 4.6.1.3 and 2.10.2.3.

5.51.4.14 Luminaires (Lighting Fixtures).

(a) General. Any combustible wall or ceiling finish exposed between the edge of a luminaire (fixture) canopy, or pan and the outlet box, shall be covered with noncombustible material or a material identified for the purpose.

(b) Shower Luminaires (Fixtures). If a luminaire (lighting fixture) is provided over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type and listed for the type of installation, and it shall be ground-fault circuit-interrupter protected.

(c) Outdoor Outlets, Luminaires (Fixtures), Air-Cooling Equipment, and So On. Outdoor luminaires (fixtures) and other equipment shall be listed for outdoor use.

5.51.4.15 Grounding. (See also 5.51.4.17 on bonding of non-current-carrying metal parts.)

(a) Power-Supply Grounding. The grounding conductor in the supply cord or feeder shall be connected to the grounding bus or other approved grounding means in the distribution panelboard.

(b) Distribution Panelboard. The distribution panelboard shall have a grounding bus with sufficient terminals for all grounding conductors or other approved grounding means.

(c) Grounded Conductor. The grounded circuit conductor (neutral) shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded (neutral) circuit terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Connection of electric ranges and electric clothes dryers utilizing a grounded (neutral) conductor, if cord-connected, shall be

made with 4-conductor cord and 3-pole, 4-wire grounding-type plug caps and receptacles.

5.51.4.16 Interior Equipment Grounding.

(a) Exposed Metal Parts. In the electrical system, all exposed metal parts, enclosures, frames, luminaire (lighting fixture) canopies, and so forth, shall be effectively bonded to the grounding terminals or enclosure of the distribution panelboard.

(b) Equipment Grounding and Bonding Conductors. Bare wires, insulated wire with an outer finish that is green or green with one or more yellow stripes, shall be used for equipment grounding or bonding conductors only.

(c) Grounding of Electrical Equipment. Grounding of electrical equipment shall be accomplished by one or more of the following methods:

(1) Connection of metal raceway, the sheath of Type MC and Type MI cable where the sheath is identified for grounding, or the armor of Type AC cable to metal enclosures.

(2) A connection between the one or more equipment grounding conductors and a metal enclosure by means of a grounding screw, which shall be used for no other purpose, or a listed grounding device.

(3) The equipment grounding conductor in nonmetallic-sheathed cable shall be permitted to be secured under a screw threaded into the luminaire (fixture) canopy other than a mounting screw or cover screw, or attached to a listed grounding means (plate) in a nonmetallic outlet box for luminaire (fixture) mounting. [Grounding means shall also be permitted for luminaire (fixture) attachment screws.]

(d) Grounding Connection in Nonmetallic Box. A connection between the one or more grounding conductors brought into a nonmetallic outlet box shall be so arranged that a connection can be made to any fitting or device in that box that requires grounding.

(e) Grounding Continuity. Where more than one equipment grounding or bonding conductor of a branch circuit enters a box, all such conductors shall be in good electrical contact with each other, and the arrangement shall be such that the disconnection or removal of a

receptacle, luminaire (fixture), or other device fed from the box will not interfere with or interrupt the grounding continuity.

(f) Cord-Connected Appliances. Cord-connected appliances, such as washing machines, clothes dryers, refrigerators, and the electrical system of gas ranges, and so forth, shall be grounded by means of an approved cord with equipment grounding conductor and grounding-type attachment plug.

5.51.4.17 Bonding of Non-Current-Carrying Metal Parts.

(a) Required Bonding. All exposed non-current-carrying metal parts that may become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

(b) Bonding Chassis. A bonding conductor shall be connected between any distribution panelboard and an accessible terminal on the chassis. Aluminum or copper-clad aluminum conductors shall not be used for bonding if such conductors or their terminals are exposed to corrosive elements.

Exception: Any recreational vehicle that employs a unitized metal chassis-frame construction to which the distribution panelboard is securely fastened with a bolt(s) and nut(s) or by welding or riveting shall be considered to be bonded.

(c) Bonding Conductor Requirements. Grounding terminals shall be of the solderless type and listed as pressure terminal connectors recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be 8.0 mm² copper minimum, or equal.

(d) Metallic Roof and Exterior Bonding. The metal roof and exterior covering shall be considered bonded where both of the following conditions apply:

(1) The metal panels overlap one another and are securely attached to the wood or metal frame parts by metal fasteners.

(2) The lower panel of the metal exterior covering is secured by metal fasteners at each cross member of the chassis, or the lower panel is bonded to the chassis by a metal strap.

(e) **Gas, Water, and Waste Pipe Bonding.** The gas, water, and waste pipes shall be considered grounded if they are bonded to the chassis.

(f) **Furnace and Metal Air Duct Bonding.** Furnace and metal circulating air ducts shall be bonded.

5.51.4.18 Appliance Accessibility and Fastening. Every appliance shall be accessible for inspection, service, repair, and replacement without removal of permanent construction. Means shall be provided to securely fasten appliances in place when the recreational vehicle is in transit.

5.51.5 Factory Tests

5.51.5.1 Factory Tests (Electrical). Each recreational vehicle designed with a 230-volt, 115-volt or a 115/230-volt electrical system shall withstand the applied potential without electrical breakdown of a 1-minute, 900-volt dielectric strength test, or a 1-second, 1 080-volt dielectric strength test, with all switches closed, between ungrounded and grounded conductors and the recreational vehicle ground. During the test, all switches and other controls shall be in the “on” position. Fixtures, including luminaires and permanently installed appliances, shall not be required to withstand this test. The test shall be performed after branch circuits are complete prior to energizing the system and again after all outer coverings and cabinetry have been secured.

Each recreational vehicle shall be subjected to all of the following:

- (1) A continuity test to ensure that all metal parts are properly bonded
- (2) Operational tests to demonstrate that all equipment is properly connected and in working order
- (3) Polarity checks to determine that connections have been properly made

5.51.6 Recreational Vehicle Parks

5.51.6.1 Type Receptacles Provided. Every recreational vehicle site with electrical supply shall be equipped with at least one 20-ampere, 250-volt or 125-volt receptacle. A minimum of 20 percent of all recreational vehicle sites, with electrical supply, shall each be equipped

with a 50-ampere, 125/250-volt receptacle conforming to the configuration as identified in Figure 5.51.4.7(c). These electrical supplies shall be permitted to include additional receptacles that have configurations in accordance with 5.51.6.11. A minimum of 70 percent of all recreational vehicle sites with electrical supply shall each be equipped with a 30-ampere, 250-volt or 125-volt receptacle conforming to Figure 5.51.4.7(c). This supply shall be permitted to include additional receptacle configurations conforming to 5.51.6.11. The remainder of all recreational vehicle sites with electrical supply shall be equipped with one or more of the receptacle configurations conforming to 5.51.6.11. Dedicated tent sites with a 15- or 20-ampere electrical supply shall be permitted to be excluded when determining the percentage of recreational vehicle sites with 30- or 50-ampere receptacles.

Additional receptacles shall be permitted for the connection of electrical equipment outside the recreational vehicle within the recreational vehicle park.

All 250-volt and 125-volt, single-phase, 15- and 20-ampere receptacles shall have listed ground-fault circuit-interrupter protection for personnel.

FPN: The percentage of 50 ampere sites required by 5.51.6.1 may be inadequate for seasonal recreational vehicle sites serving a higher percentage of recreational vehicles with 50 ampere electrical systems. In that type of recreational vehicle park, the percentage of 50 ampere sites could approach 100 percent.

5.51.6.2 Distribution System. Receptacles rated at 50 amperes shall be supplied from a branch circuit of the voltage class and rating of the receptacle. Other recreational vehicle sites with 250-volt or 125-volt, 20- and 30-ampere receptacles shall be permitted to be derived from any grounded distribution system that supplies 230-volt or 115-volt single-phase power. The neutral conductors shall not be reduced in size below the size of the ungrounded conductors for the site distribution. The neutral conductors shall be permitted to be reduced in size below the minimum required size of the ungrounded conductors for 230-volt, line-to-line, permanently connected loads only.

5.51.6.3 Calculated Load.

(a) **Basis of Calculations.** Electrical service and feeders shall be calculated on the basis of not less than 9600 volt-amperes per site equipped with 50-ampere, 230-volt or 115/230-volt supply facilities; 3600 volt-amperes per site equipped with both 20-ampere and 30-ampere supply facilities; 2400 volt-amperes per site equipped with only 20-

ampere supply facilities; and 600 volt-amperes per site equipped with only 20-ampere supply facilities that are dedicated to tent sites. The demand factors set forth in Table 5.51.6.3 shall be the minimum allowable demand factors that shall be permitted in calculating load for service and feeders. Where the electrical supply for a recreational vehicle site has more than one receptacle, the calculated load shall only be calculated for the highest rated receptacle.

Where the electrical supply is in a location that serves two recreational vehicles, the equipment for both sites must comply with 5.51.6.7 and the calculated load shall only be computed for the two receptacles with the highest rating.

(b) Transformers and Secondary Distribution Panelboards. For the purpose of this Code, where the park service exceeds 230 volts, transformers and secondary distribution panelboards shall be treated as services.

(c) Demand Factors. The demand factor for a given number of sites shall apply to all sites indicated. For example, 20 sites calculated at 45 percent of 3 600 volt-amperes results in a permissible demand of 1 620 volt-amperes per site or a total of 32 400 volt-amperes for 20 sites.

FPN: These demand factors may be inadequate in areas of extreme hot or cold temperature with loaded circuits for heating or air conditioning.

(d) Feeder-Circuit Capacity. Recreational vehicle site feeder-circuit conductors shall have adequate ampacity for the loads supplied and shall be rated at not less than 30 amperes. The grounded conductors shall have the same ampacity as the ungrounded conductors.

FPN: Due to the long circuit lengths typical in most recreational vehicle parks, feeder conductor sizes found in the ampacity tables of Article 3.10 may be inadequate to maintain the voltage regulation suggested in the fine print note to 2.10.2.1. Total circuit voltage drop is a sum of the voltage drops of each serial circuit segment, where the load for each segment is calculated using the load that segment sees and the demand factors of 5.51.6.3(a).

Loads for other amenities such as, but not limited to, service buildings, recreational buildings, and swimming pools shall be sized separately and then be added to the value calculated for the recreational vehicle sites where they are all supplied by one service.

Table 5.51.7.3 Demand Factors for Site Feeders and Service-Entrance Conductors for Park Sites

Number of Recreational Vehicles Sites	Demand Factor (percent)
1	100
2	90
3	80
4	75
5	65
6	60
7-9	55
10-12	50
13-15	48
16-18	47
19-21	45
22-24	43
25-35	42
36 plus	41

5.51.6.4 Overcurrent Protection. Overcurrent protection shall be provided in accordance with Article 2.40.

5.51.6.5 Grounding. All electrical equipment and installations in recreational vehicle parks shall be grounded as required by Article 2.50.

5.51.6.6 Grounding — Recreational Vehicle Site Supply Equipment.

(a) Exposed Non-Current-Carrying Metal Parts. Exposed non-current-carrying metal parts of fixed equipment, metal boxes, cabinets, and fittings that are not electrically connected to grounded equipment shall be grounded by a continuous equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 2.50.6.13 and shall be permitted to be spliced by listed means.

The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.

(b) Secondary Distribution System. Each secondary distribution system shall be grounded at the transformer.

(c) Neutral Conductor Not to Be Used as an Equipment Ground. The neutral conductor shall not be used as an equipment ground for recreational vehicles or equipment within the recreational vehicle park.

(d) No Connection on the Load Side. No connection to a grounding electrode shall be made to the neutral conductor on the load side of the service disconnecting means except as covered in 2.50.2.11(a) for separately derived systems and 2.50.2.13(b)(2) for separate buildings.

5.51.6.7 Recreational Vehicle Site Supply Equipment.

(a) Location. Where provided on back-in sites, the recreational vehicle site electrical supply equipment shall be located on the left (road) side of the parked vehicle, on a line that is 1 500 mm to 2 100 mm from the left edge (driver's side of the parked RV) of the stand and shall be located at any point on this line from the rear of the stand to 4 500 mm forward of the rear of the stand.

For pull-through sites, the electrical supply equipment shall be permitted to be located at any point along the line that is 1 500 mm to 2 100 mm from the left edge (driver's side of the parked RV) from 4 900 mm forward of the rear of the stand to the center point between the two roads that gives access to and egress from the pull-through sites.

The left edge (driver's side of the parked RV) of the stand shall be marked.

(b) Disconnecting Means. A disconnecting switch or circuit breaker shall be provided in the site supply equipment for disconnecting the power supply to the recreational vehicle.

(c) Access. All site supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm wide and 2 000 mm high.

(d) Mounting Height. Site supply equipment shall be located not less than 600 mm or more than 2 000 mm above the ground.

(e) Working Space. Sufficient space shall be provided and maintained about all electrical equipment to permit ready and safe operation, in

accordance with 1.10.2.1.

(f) Marking. Where the site supply equipment contains a 250-volt or 125/250-volt receptacle, the equipment shall be marked as follows: "Turn disconnecting switch or circuit breaker off before inserting or removing plug. Plug must be fully inserted or removed." The marking shall be located on the equipment adjacent to the receptacle outlet.

5.51.6.8 Protection of Outdoor Equipment.

(a) Wet Locations. All switches, circuit breakers, receptacles, control equipment, and metering devices located in wet locations or outside of a building shall be rainproof equipment.

(b) Meters. If secondary meters are installed, meter sockets without meters installed shall be blanked off with an approved blanking plate.

5.51.6.9 Clearance for Overhead Conductors. Open conductors of not over 600 volts, nominal, shall have a vertical clearance of not less than 5 500 mm and a horizontal clearance of not less than 900 mm in all areas subject to recreational vehicle movement. In all other areas, clearances shall conform to 2.25.1.18 and 2.25.1.19.

FPN: For clearances of conductors over 600 volts, nominal, see 2.25.3.11 and 2.25.3.12.

5.51.6.10 Underground Service, Feeder, Branch-Circuit, and Recreational Vehicle Site Feeder-Circuit Conductors.

(a) General. All direct-burial conductors, including the equipment grounding conductor if of aluminum, shall be insulated and identified for the use. All conductors shall be continuous from equipment to equipment. All splices and taps shall be made in approved junction boxes or by use of material listed and identified for the purpose.

(b) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to

physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 rigid nonmetallic conduit. All such protection shall extend at least 460 mm into the trench from finished grade.

FPN: See 3.0.1.5 and Article 3.40 for conductors or Type UF cable used underground or in direct burial in earth.

5.51.6.11 Receptacles. A receptacle to supply electric power to a recreational vehicle shall be one of the configurations shown in Figure 5.51.4.7(c) in the following ratings.

- (1) 50-ampere — 125/250-volt, 50-ampere, 3-pole, 4-wire grounding type for 115/230-volt systems
- (2) 30-ampere — 250-volt or 125-volt, 30-ampere, 2-pole, 3-wire grounding type for 230-volt or 115-volt systems, respectively
- (3) 20-ampere — 250-volt or 125-volt, 20-ampere, 2-pole, 3-wire grounding type for 230-volt or 115-volt systems, respectively

FPN: Complete details of these configurations can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles, Figures 14-50, TT, and 5-20.

ARTICLE 5.52 — PARK TRAILERS

5.52.1 General

5.52.1.1 Scope. The provisions of this article cover the electrical conductors and equipment installed within or on park trailers not covered fully under Articles 5.50 and 5.51.

5.52.1.2 Definition. (See Articles 100, 5.50, and 5.51 for additional definitions.)

Park Trailer. A unit that is built on a single chassis mounted on wheels and has a gross trailer area not exceeding 40 m² in the set-up mode.

5.52.1.3 Other Articles. Wherever the provisions of other articles and Article 5.52 differ, the provisions of Article 5.52 shall apply.

5.52.1.4 General Requirements. A park trailer as specified in 5.52.1.2 is intended for seasonal use. It is not intended as a permanent dwelling unit or for commercial uses such as banks, clinics, offices, or similar.

5.52.2 Low-Voltage Systems

5.52.2.1 Low-Voltage Systems.

(a) Low-Voltage Circuits. Low-voltage circuits furnished and installed by the park trailer manufacturer, other than those related to braking, are subject to this Code. Circuits supplying lights subject to Municipal, City, Provincial or National regulations shall comply with applicable government regulations and this Code.

(b) Low-Voltage Wiring.

(1) Material. Copper conductors shall be used for low-voltage circuits.

Exception: A metal chassis or frame shall be permitted as the return path to the source of supply.

(2) Conductor Types. Conductors shall conform to the requirements for Type GXL, HDT, SGT, SGR, or Type SXL or shall have insulation in accordance with Table 3.10.1.13 or the equivalent. Conductor sizes 0.75 mm² (1.0 mm dia.) through 14 mm² or SAE shall be listed. Single-wire, low-voltage conductors shall be of the stranded type.

FPN: See SAE Standard J1128-1995 for Types GXL, HDT, and SXL and SAE Standard J1127-1995 for Types SGT and SGR.

(3) Marking. All insulated low-voltage conductors shall be surface marked at intervals not greater than 1 200 mm as follows:

- a. Listed conductors shall be marked as required by the listing agency.
- b. SAE conductors shall be marked with the name or logo of the manufacturer, specification designation, and wire size.
- c. Other conductors shall be marked with the name or logo of the manufacturer, temperature rating, wire size, conductor material, and insulation thickness.

(c) Low-Voltage Wiring Methods.

(1) Physical Protection. Conductors shall be protected against physical damage and shall be secured. Where insulated conductors are clamped to the structure, the conductor insulation shall be supplemented by an additional wrap or layer of equivalent material, except that jacketed cables shall not be required to be so protected. Wiring shall be routed away from sharp edges, moving parts, or heat sources.

(2) Splices. Conductors shall be spliced or joined with splicing devices that provide a secure connection or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined to be mechanically and electrically secure without solder, and then soldered. All splices, joints, and free ends of conductors shall be covered with an insulation equivalent to that on the conductors.

(3) Separation. Battery and other low-voltage circuits shall be physically separated by at least a 12 mm gap or other approved means from circuits of a different power source. Acceptable methods shall be by clamping, routing, or equivalent means that ensure permanent total separation. Where circuits of different power sources cross, the external jacket of the nonmetallic-sheathed cables shall be deemed adequate separation.

(4) Ground Connections. Ground connections to the chassis or frame shall be made in an accessible location and shall be mechanically secure. Ground connections shall be by means of copper conductors and copper or copper-alloy terminals of the solderless type identified for the size of wire used. The surface on which ground terminals make contact shall be cleaned and be free from oxide or paint or shall be electrically connected through the use of a cadmium, tin, or zinc-plated internal/external-toothed lockwasher or locking terminals. Ground terminal attaching screws, rivets or bolts, nuts, and lockwashers shall be cadmium, tin, or zinc-plated except rivets shall be permitted to be unanodized aluminum where attaching to aluminum structures.

The chassis-grounding terminal of the battery shall be bonded to the unit chassis with a minimum 8.0 mm² copper conductor. In the event the power lead from the battery exceeds 8.0 mm², the bonding conductor shall be of an equal size.

(d) Battery Installations. Storage batteries subject to the provisions of this Code shall be securely attached to the unit and installed in an area vaportight to the interior and ventilated directly to the exterior of the unit. Where batteries are installed in a compartment, the compartment shall be ventilated with openings having a minimum area of 1100 mm² at both the top and at the bottom. Where compartment doors are equipped for ventilation, the openings shall be within 50 mm of the top and bottom. Batteries shall not be installed in a compartment containing spark- or flame-producing equipment.

(e) Overcurrent Protection.

(1) Rating. Low-voltage circuit wiring shall be protected by overcurrent protective devices rated not in excess of the ampacity of copper conductors, in accordance with Table 5.52.2.1(e)(1).

Table 5.52.2.1(e)(1) Low-Voltage Overcurrent Protection

Wire Size [mm ² (mm dia.)]	Ampacity	Wire Type
0.75	6	Stranded only
1.25	8	Stranded only
2.0 (1.6)	15	Stranded or Solid
3.5 (2.0)	20	Stranded or Solid
5.5 (2.6)	30	Stranded or Solid

(2) Type. Circuit breakers or fuses shall be of an approved type, including automotive types. Fuseholders shall be clearly marked with maximum fuse size and shall be protected against shorting and physical damage by a cover or equivalent means.

FPN: For further information, see ANSI/SAE J554-1987, Standard for Electric Fuses (Cartridge Type); SAE J1284-1988, Standard for Blade Type Electric Fuses; and UL 275-1993, Standard for Automotive Glass Tube Fuses.

(3) Appliances. Appliances such as pumps, compressors, heater blowers, and similar motor-driven appliances shall be installed in accordance with the manufacturer's instructions.

Motors that are controlled by automatic switching or by latching-type manual switches shall be protected in accordance with 4.30.3.2(b).

(4) Location. The overcurrent protective device shall be installed in an accessible location on the unit within 460 mm of the point where the power supply connects to the unit circuits. If located outside the park trailer, the device shall be protected against weather and physical damage.

Exception: External low-voltage supply shall be permitted to have the overcurrent protective device within 460 mm after entering the unit or after leaving a metal raceway.

(f) Switches. Switches shall have a dc rating not less than the connected load.

(g) Luminaires (Lighting Fixtures). All low-voltage interior luminaires (lighting fixtures) rated more than 4 watts, employing lamps rated more than 1.2 watts, shall be listed.

5.52.3 Combination Electrical Systems

5.52.3.1 Combination Electrical Systems.

(a) General. Unit wiring suitable for connection to a battery or other low-voltage supply source shall be permitted to be connected to a 115-volt source, provided that the entire wiring system and equipment are rated and installed in full conformity with Parts 5.52.1, 5.52.3, 5.52.4, and 5.52.5 requirements covering 230-volt or 115-volt electrical systems. Circuits fed from ac transformers shall not supply dc appliances.

(b) Voltage Converters (230-Volt or 115-Volt Alternating Current to Low-Voltage Direct Current). The 230-volt or 115-volt ac side of the voltage converter shall be wired in full conformity with Parts 5.52.1, 5.52.3, 5.52.4, and 5.52.5 requirements for 230-volt or 115-volt electrical systems.

Exception: Converters supplied as an integral part of a listed appliance shall not be subject to 5.52.3.1(b).

All converters and transformers shall be listed for use in recreation units and designed or equipped to provide over-temperature protection. To determine the converter rating, the following formula shall be applied

to the total connected load, including average battery charging rate, of all 12-volt equipment:

- The first 20 amperes of load at 100 percent; plus
- The second 20 amperes of load at 50 percent; plus
- All load above 40 amperes at 25 percent

Exception: A low-voltage appliance that is controlled by a momentary switch (normally open) that has no means for holding in the closed position shall not be considered as a connected load when determining the required converter rating. Momentarily energized appliances shall be limited to those used to prepare the unit for occupancy or travel.

(c) Bonding Voltage Converter Enclosures. The non-current-carrying metal enclosure of the voltage converter shall be bonded to the frame of the unit with an 8.0 mm² copper conductor minimum. The grounding conductor for the battery and the metal enclosure shall be permitted to be the same conductor.

(d) Dual-Voltage Fixtures Including Luminaires or Appliances. Fixtures, including luminaires, or appliances having both 230-volt or 115-volt and low-voltage connections shall be listed for dual voltage.

(e) Autotransformers. Autotransformers shall not be used.

(f) Receptacles and Plug Caps. Where a park trailer is equipped with a 230-volt, 115-volt or 115/230-volt ac system, a low-voltage system, or both, receptacles and plug caps of the low-voltage system shall differ in configuration from those of the 230-volt, 115-volt or 115/230-volt system. Where a unit equipped with a battery or dc system has an external connection for low-voltage power, the connector shall have a configuration that will not accept 230-volt or 115-volt power.

5.52.4 Nominal 230-Volt, 115-Volt or 115/230-Volt Systems

5.52.4.1 230-Volt, 115-Volt or 115/230-Volt, Nominal, Systems.

(a) General Requirements. The electrical equipment and material of park trailers indicated for connection to a wiring system rated 230 volts, nominal, 2-wire with ground, 115 volts, nominal, 2-wire with ground, or a wiring system rated 115/230 volts, nominal, 3-wire with ground, shall be listed and installed in accordance with the requirements of Parts

5.52.1, 5.52.3, 5.52.4, and 5.52.5.

(b) Materials and Equipment. Electrical materials, devices, appliances, fittings, and other equipment installed, intended for use in, or attached to the park trailer shall be listed. All products shall be used only in the manner in which they have been tested and found suitable for the intended use.

5.52.4.2 Receptacle Outlets Required.

(a) Spacing. Receptacle outlets shall be installed at wall spaces 600 mm wide or more so that no point along the floor line is more than 1 800 mm, measured horizontally, from an outlet in that space.

Exception No. 1: Bath and hall areas.

Exception No. 2: Wall spaces occupied by kitchen cabinets, wardrobe cabinets, built-in furniture; behind doors that may open fully against a wall surface; or similar facilities.

(b) Location. Receptacle outlets shall be installed as follows:

(1) Adjacent to countertops in the kitchen (at least one on each side of the sink if countertops are on each side and are 300 mm or over in width)

(2) Adjacent to the refrigerator and gas range space, except where a gas-fired refrigerator or cooking appliance, requiring no external electrical connection, is factory-installed

(3) Adjacent to countertop spaces of 300 mm or more in width that cannot be reached from a receptacle required in 5.52.4.2(b)(1) by a cord of 1 800 mm without crossing a traffic area, cooking appliance, or sink

(c) Ground-Fault Circuit-Interrupter Protection. Each 250-volt or 125-volt, single-phase, 15- or 20-ampere receptacle shall have ground-fault circuit-interrupter protection for personnel in the following locations:

(1) Where the receptacles are installed to serve kitchen countertop surfaces

(2) Within 1 800 mm of any lavatory or sink

Exception: Receptacles installed for appliances in dedicated spaces, such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment.

(3) In the area occupied by a toilet, shower, tub, or any combination thereof

(4) On the exterior of the unit

Exception: Receptacles that are located inside of an access panel that is installed on the exterior of the unit to supply power for an installed appliance shall not be required to have ground-fault circuit-interrupter protection.

The receptacle outlet shall be permitted in a listed luminaire (lighting fixture). A receptacle outlet shall not be installed in a tub or combination tub–shower compartment.

(d) Pipe Heating Cable Outlet. Where a pipe heating cable outlet is installed, the outlet shall be as follows:

(1) Located within 600 mm of the cold water inlet

(2) Connected to an interior branch circuit, other than a small appliance branch circuit

(3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter protection for personnel

(4) Mounted on the underside of the park trailer and shall not be considered to be the outdoor receptacle outlet required in 5.52.4.2(e)

(e) Outdoor Receptacle Outlets. At least one receptacle outlet shall be installed outdoors. A receptacle outlet located in a compartment accessible from the outside of the park trailer shall be considered an outdoor receptacle. Outdoor receptacle outlets shall be protected as required in 5.52.4.2(c)(4).

(f) Receptacle Outlets Not Permitted.

(1) Shower or Bathtub Space. Receptacle outlets shall not be installed in or within reach (800 mm) of a shower or bathtub space.

(2) Face-Up Position. A receptacle shall not be installed in a face-up position in any countertop.

5.52.4.4 Power Supply.

(a) **Feeder.** The power supply to the park trailer shall be a feeder assembly consisting of not more than one listed 30-ampere or 50-ampere park trailer power-supply cord with an integrally molded or securely attached cap, or a permanently installed feeder.

(b) **Power-Supply Cord.** If the park trailer has a power-supply cord, it shall be permanently attached to the distribution panelboard or to a junction box permanently connected to the distribution panelboard, with the free end terminating in a molded-on attachment plug cap.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, or shipped with, a park trailer.

A suitable clamp or the equivalent shall be provided at the distribution panelboard knockout to afford strain relief for the cord to prevent strain from being transmitted to the terminals when the power-supply cord is handled in its intended manner.

The cord shall be a listed type with 3-wire, 230 volts or 3-wire, 115-volt or 4-wire, 115/230-volt conductors, one of which shall be identified by a continuous green color or a continuous green color with one or more yellow stripes for use as the grounding conductor.

(c) **Mast Weatherhead or Raceway.** Where the calculated load exceeds 50 amperes or where a permanent feeder is used, the supply shall be by means of one of the following:

(1) One mast weatherhead installation, installed in accordance with Article 2.30, containing four continuous, insulated, color-coded feeder conductors, one of which shall be an equipment grounding conductor

(2) A metal raceway, rigid nonmetallic conduit, or liquidtight flexible nonmetallic conduit from the disconnecting means in the park trailer to the underside of the park trailer, with provisions for the attachment to a suitable junction box or fitting to the raceway on the underside of the park trailer [with or without conductors as in 5.50.2.1(i)(1)]

5.52.4.5 Cord.

(a) **Permanently Connected.** Each power-supply assembly shall be factory supplied or factory installed and connected directly to the terminals of the distribution panelboard or conductors within a junction

box and provided with means to prevent strain from being transmitted to the terminals. The ampacity of the conductors between each junction box and the terminals of each distribution panelboard shall be at least equal to the ampacity of the power-supply cord. The supply end of the assembly shall be equipped with an attachment plug of the type described in 5.52.4.5(c). Where the cord passes through the walls or floors, it shall be protected by means of conduit and bushings or equivalent. The cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the unit is in transit.

(b) **Cord Length.** The cord-exposed usable length shall be measured from the point of entrance to the park trailer or the face of the flanged surface inlet (motor-base attachment plug) to the face of the attachment plug at the supply end.

The cord-exposed usable length, measured to the point of entry on the unit exterior, shall be a minimum of 7 000 mm where the point of entrance is at the side of the unit, or shall be a minimum 8 500 mm where the point of entrance is at the rear of the unit. The maximum length shall not exceed 11 m.

Where the cord entrance into the unit is more than 900 mm above the ground, the minimum cord lengths above shall be increased by the vertical distance of the cord entrance heights above 900 mm.

(c) Attachment Plugs.

(1) Units with Two to Five 15- or 20-Ampere Branch Circuits. Park trailers wired in accordance with 5.52.4.7(a) shall have an attachment plug that shall be 2-pole, 3-wire grounding-type, rated 30 amperes, 250 volts or 125 volts, conforming to the configuration shown in Figure 5.52.4.5(c) intended for use with units rated at 30 amperes, 250 volts or 125 volts.

FPN: Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles, Figure TT.

(2) Units with 50-Ampere Power Supply Assembly. Park trailers having a power-supply assembly rated 50 amperes as permitted by 5.52.4.4(b) shall have a 3-pole, 4-wire grounding-type attachment plug rated 50 amperes, 125/250 volts, conforming to the configuration shown in Figure 5.52.4.5(c).

FPN: Complete details of this configuration can be found in ANSI/NEMA WD 6-1989, National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, Figure 14-50.

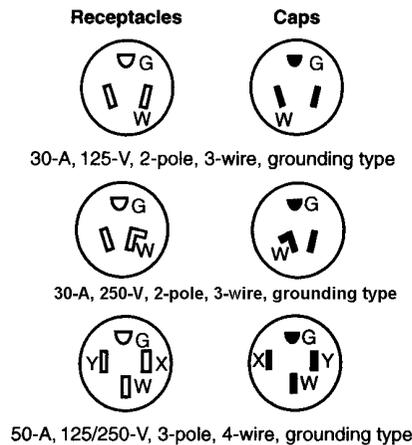

Figure 5.52.4.5(c) Attachment Cap and Receptacle Configurations.

(d) Labeling at Electrical Entrance. Each park trailer shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply assembly, a label 75 mm × 45 mm minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.50 mm thick, or other suitable material (e.g., 0.13 mm thick plastic laminate), that reads, as appropriate, either

THIS CONNECTION IS FOR 110–125-VOLT AC,
60 HZ, 30 AMPERE SUPPLY.

or

THIS CONNECTION IS FOR 115/230-VOLT AC,
3-POLE, 4-WIRE, 60 HZ, _____ AMPERE SUPPLY.

or

THIS CONNECTION IS FOR 230-VOLT AC,
2-POLE, 3-WIRE, 60 HZ, _____ AMPERE SUPPLY.

The correct ampere rating shall be marked in the blank space.

(e) Location. The point of entrance of a power-supply assembly shall be located within 4 500 mm of the rear, on the left (road) side or at the rear, left of the longitudinal center of the unit, within 460 mm of the outside wall.

Exception: A park trailer shall be permitted to have the electrical point of entrance located more than 4 500 mm from the rear. Where this occurs, the distance beyond the 4 500 mm dimension shall be added to the cord's minimum length as specified in 5.51.4.7(b).

5.52.4.6 Distribution Panelboard.

(a) Listed and Appropriately Rated. A listed and appropriately rated distribution panelboard shall be used. The grounded conductor termination bar shall be insulated from the enclosure as provided in 5.52.4.16(c). An equipment grounding terminal bar shall be attached inside the metal enclosure of the panelboard.

(b) Location. The distribution panelboard shall be installed in a readily accessible location. Working clearance for the panelboard shall be not less than 600 mm wide and 800 mm deep.

Exception: Where the panelboard cover is exposed to the inside aisle space, one of the working clearance dimensions shall be permitted to be reduced to a minimum of 560 mm. A panelboard shall be considered exposed where the panelboard cover is within 50 mm of the aisle's finished surface.

(c) Dead-Front Type. The distribution panelboard shall be of the dead-front type. A main disconnecting means shall be provided where fuses are used or where more than two circuit breakers are employed. A main overcurrent protective device not exceeding the power-supply assembly rating shall be provided where more than two branch circuits are employed.

5.52.4.7 Branch Circuits. Branch circuits shall be determined in accordance with 5.52.4.7(a) and 5.52.4.7(b).

(a) Two to Five 15- or 20-Ampere Circuits. Two to five 15- or 20-

ampere circuits to supply lights, receptacle outlets, and fixed appliances shall be permitted. Such park trailers shall be equipped with a distribution panelboard rated at 230 volts maximum for a 230 volts power supply or 115 volts maximum for a 115 volts power supply, with a 30-ampere rated main power supply assembly. Not more than two 230-volt or 115-volt thermostatically controlled appliances (e.g., air conditioner and water heater) shall be installed in such systems unless appliance isolation switching, energy management systems, or similar methods are used.

Exception: Additional 15- or 20-ampere circuits shall be permitted where a listed energy management system rated at 30 amperes maximum is employed within the system.

(b) More Than Five Circuits. Where more than five circuits are needed, they shall be determined in accordance with 5.52.4.7(b)(1), (b)(2), and (b)(3).

(1) Lighting. Based on 33 volt-amperes/m² multiplied by the outside dimensions of the park trailer (coupler excluded) divided by 230 volts for 230 volts power supply or 115 volts for 115/230 volts power supply to determine the number of 15- or 20-ampere lighting area circuits, for example,

$$\frac{33 \times \text{length} \times \text{width}}{230 \times 15 \text{ (or } 20)} = \text{No. of 15- (or 20-) ampere circuits}$$

or

$$\frac{33 \times \text{length} \times \text{width}}{115 \times 15 \text{ (or } 20)} = \text{No. of 15- (or 20-) ampere circuits}$$

The lighting circuits shall be permitted to serve built-in gas ovens with electric service only for lights, clocks or timers, or listed cord-connected garbage disposal units.

(2) Small Appliances. Small appliance branch circuits shall be installed in accordance with 2.10.1.11(c)(1).

(3) General Appliances. (including furnace, water heater, space heater, range, and central or room air conditioner, etc.) An individual branch circuit shall be permitted to supply any load for which it is rated. There shall be one or more circuits of adequate rating in accordance with (a) through (d).

FPN No. 1: For the laundry branch circuit, see 2.10.1.11(c)(2).
 FPN No. 2: For central air conditioning, see Article 4.40.

a. The total rating of fixed appliances shall not exceed 50 percent of the circuit rating if lighting outlets, general-use receptacles, or both, are also supplied.

b. For fixed appliances with a motor(s) larger than horsepower, the total calculated load shall be based on 125 percent of the largest motor plus the sum of the other loads. Where a branch circuit supplies continuous load(s) or any combination of continuous and noncontinuous loads, the branch-circuit conductor size shall be in accordance with 2.10.2.1(a).

c. The rating of a single cord- and plug-connected appliance supplied by other than an individual branch circuit shall not exceed 80 percent of the circuit rating.

d. The rating of a range branch circuit shall be based on the range demand as specified for ranges in 5.52.4.8(b)(5).

5.52.4.8 Calculations. The following method shall be employed in computing the supply-cord and distribution-panelboard load for each feeder assembly for each park trailer in lieu of the procedure shown in Article 2.20 and shall be based on a 2-wire, 230-volt supply with 230-volt loads or 3-wire, 115/230-volt supply with 115-volt loads balanced between the two phases of the 3-wire system.

(a) Lighting and Small Appliance Load. Lighting Volt-Amperes: Length times width of park trailer floor (outside dimensions) times 33 volt-amperes/m² (3 VA/ft²). For example,

$$\text{Length} \times \text{width} \times 33 = \text{lighting volt-amperes}$$

Small Appliance Volt-Amperes: Number of circuits times 1500 volt-amperes for each 20-ampere appliance receptacle circuit (see definition of Appliance, Portable with note) including 1500 volt-amperes for laundry circuit. For example,

$$\text{No. of circuits} \times 1500 = \text{small appliance volt-amperes}$$

Total: Lighting volt-amperes plus small appliance volt-amperes = total volt-amperes

First 3 000 total volt-amperes at 100 percent plus remainder at 35 percent = volt-amperes to be divided by 230 volts to obtain current (amperes) per line or per leg.

(b) Total Load for Determining Power Supply. Total load for determining power supply is the sum of the following:

(1) Lighting and small appliance load as calculated in 5.52.4.8(a).

(2) Nameplate amperes for motors and heater loads (exhaust fans, air conditioners, electric, gas, or oil heating). Omit smaller of the heating and cooling loads, except include blower motor if used as air-conditioner evaporator motor. Where an air conditioner is not installed and a 50-ampere power-supply cord is provided, allow 15 amperes per phase for air conditioning.

(3) Twenty-five percent of current of largest motor in (b)(2).

(4) Total of nameplate amperes for disposal, dishwasher, water heater, clothes dryer, wall-mounted oven, cooking units. Where the number of these appliances exceeds three, use 75 percent of total.

(5) Derive amperes for freestanding range (as distinguished from separate ovens and cooking units) by dividing the following values by 230 volts:

Nameplate Rating (Watts)	Use (volt-amperes)
0 – 10 000	80 percent of Rating
Over 10 000 – 12 500	8 000
Over 12 500 – 13 500	8 400
Over 13 500 – 14 500	8 800
Over 14 500 – 15 500	9 200
Over 15 500 – 16 500	9 600
Over 16 500 – 17 500	10 000

(6) If outlets or circuits are provided for other than factory-installed appliances, include the anticipated load.

FPN: Refer to Appendix D, Example D12, for an illustration of the application of this calculation.

(c) Optional Method of Calculation for Lighting and Appliance Load. For park trailers, the optional method for calculating lighting and appliance load shown in 2.20.4.3 shall be permitted.

5.52.4.9 Wiring Methods.

(a) Wiring Systems. Cables and raceways installed in accordance with Articles 3.20, 3.22, 3.30 through 3.40, 3.42 through 3.62, 3.86, and 3.88 shall be permitted in accordance with their applicable article, except as otherwise specified in this article. An equipment grounding means shall be provided in accordance with 2.50.6.9.

(b) Conduit and Tubing. Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

(c) Nonmetallic Boxes. Nonmetallic boxes shall be acceptable only with nonmetallic-sheathed cable or nonmetallic raceways.

(d) Boxes. In walls and ceilings constructed of wood or other combustible material, boxes and fittings shall be flush with the finished surface or project therefrom.

(e) Mounting. Wall and ceiling boxes shall be mounted in accordance with Article 3.14.

Exception No. 1: Snap-in-type boxes or boxes provided with special wall or ceiling brackets that securely fasten boxes in walls or ceilings shall be permitted.

Exception No. 2: A wooden plate providing a 40-mm minimum width backing around the box and of a thickness of 12 mm or greater (actual)

attached directly to the wall panel shall be considered as approved means for mounting outlet boxes.

(f) Sheath Armor. The sheath of nonmetallic-sheathed cable, metal-clad cable, and Type AC cable shall be continuous between outlet boxes and other enclosures.

(g) Protected. Metal-clad, Type AC, or nonmetallic-sheathed cables and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 50 mm by 100 mm wood studs. However, they shall be protected where they pass through 50 mm by 50 mm wood studs or at other wood studs or frames where the cable or tubing would be less than 30 mm from the inside or outside surface. Steel plates on each side of the cable or tubing, or a steel tube, with not less than 1.3 mm wall thickness, shall be installed to protect the cable or tubing. These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables pass through punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable.

(h) Cable Supports. Where connected with cable connectors or clamps, cables shall be supported within 300 mm of outlet boxes, distribution panelboards, and splice boxes on appliances. Supports shall be provided every 1 400 mm at other places.

(i) Nonmetallic Box Without Cable Clamps. Nonmetallic-sheathed cables shall be supported within 200 mm of a nonmetallic outlet box without cable clamps.

Exception: Where wiring devices with integral enclosures are employed with a loop of extra cable to permit future replacement of the device, the cable loop shall be considered as an integral portion of the device.

(j) Physical Damage. Where subject to physical damage, exposed nonmetallic cable shall be protected by covering boards, guard strips, raceways, or other means.

(k) Metal Faceplates. Metal faceplates shall be of ferrous metal not less than 0.75 mm in thickness or of nonferrous metal not less than 1.0 mm in thickness. Nonmetallic faceplates shall be listed.

(l) Metal Faceplates Effectively Grounded. Where metal faceplates are used, they shall be effectively grounded.

(m) Moisture or Physical Damage. Where outdoor or under-chassis wiring is 115 volts, nominal, or over and is exposed to moisture or physical damage, the wiring shall be protected by rigid metal conduit, by intermediate metal conduit, or by electrical metallic tubing or rigid nonmetallic conduit that is closely routed against frames and equipment enclosures or other raceway or cable identified for the application.

(n) Component Interconnections. Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding, and shall be capable of enduring the vibration and shock occurring in park trailers.

(o) Method of Connecting Expandable Units. The method of connecting expandable units to the main body of the vehicle shall comply with the following as applicable:

(1) That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the branch circuit in the main body of the vehicle by means of a flexible cord or attachment plug and cord listed for hard usage. The cord and its connections shall conform to all provisions of Article 4.0 and shall be considered as a permitted use under 4.0.1.7.

(2) If the receptacle provided for connection of the cord to the main circuit is located on the outside of the unit, it shall be protected with a ground-fault circuit interrupter for personnel and be listed for wet locations. A cord located on the outside of a unit shall be identified for outdoor use.

(3) Unless removable or stored within the unit interior, the cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the unit is in transit.

(4) If an attachment plug and cord is used, it shall be installed so as not to permit exposed live attachment plug pins.

(p) Prewiring for Air-Conditioning Installation. Prewiring installed for the purpose of facilitating future air-conditioning installation shall conform to the applicable portions of this article and the following:

(1) An overcurrent protective device with a rating compatible with the circuit conductors shall be installed in the distribution panelboard and wiring connections completed.

(2) The load end of the circuit shall terminate in a junction box with a blank cover or other listed enclosure. Where a junction box with a blank cover is used, the free ends of the conductors shall be adequately capped or taped.

(3) A label conforming to 5.52.4.5(d) shall be placed on or adjacent to the junction box and shall read

AIR-CONDITIONING CIRCUIT.
THIS CONNECTION IS FOR AIR CONDITIONERS
RATED 110–125-VOLT AC, 60 HZ,
____ AMPERES MAXIMUM.
DO NOT EXCEED CIRCUIT RATING.

or

AIR-CONDITIONING CIRCUIT.
THIS CONNECTION IS FOR AIR CONDITIONERS
RATED 230-VOLT AC, 60 HZ,
____ AMPERES MAXIMUM.
DO NOT EXCEED CIRCUIT RATING.

An ampere rating, not to exceed 80 percent of the circuit rating, shall be legibly marked in the blank space.

(4) The circuit shall serve no other purpose.

5.52.4.10 Maximum Number of Conductors in Boxes. The maximum number of conductors permitted in boxes shall be in accordance with 3.14.2.2.

5.52.4.11 Grounded Conductors. The identification of grounded conductors shall be in accordance with 2.0.1.6.

5.52.4.12 Connection of Terminals and Splices. Conductor splices and connections at terminals shall be in accordance with 1.10.1.14.

5.52.4.13 Switches. Switches shall be rated as required by 5.52.4.13(a) and 5.52.4.13(b).

(a) **Lighting Circuits.** For lighting circuits, switches shall be rated not less than 10 amperes, 230/250 volts or 115/125 volts, and in no case less than the connected load.

(b) **Motors or Other Loads.** For motors or other loads, switches shall have ampere or horsepower ratings, or both, adequate for loads controlled. (An ac general-use snap switch shall be permitted to control a motor 2 hp or less with full-load current not over 80 percent of the switch ampere rating.)

5.52.4.14 Receptacles. All receptacle outlets shall be of the grounding type and installed in accordance with 2.10.2.3 and 4.6.1.3.

5.52.4.15 Luminaires (Lighting Fixtures).

(a) **General.** Any combustible wall or ceiling finish exposed between the edge of a luminaire (fixture) canopy or pan and the outlet box shall be covered with noncombustible material or a material identified for the purpose.

(b) **Shower Luminaires (Fixtures).** If a luminaire (lighting fixture) is provided over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type and listed for the type of installation, and it shall be ground-fault circuit-interrupter protected.

The switch for shower luminaires (lighting fixtures) and exhaust fans, located over a tub or in a shower stall, shall be located outside the tub or shower space.

(c) **Outdoor Outlets, Luminaires (Fixtures), Air-Cooling Equipment, and So On.** Outdoor luminaires (fixtures) and other equipment shall be listed for outdoor use.

5.52.4.16 Grounding. (See also 5.52.4.18 on bonding of non-current-carrying metal parts.)

(a) **Power-Supply Grounding.** The grounding conductor in the supply cord or feeder shall be connected to the grounding bus or other approved grounding means in the distribution panelboard.

(b) Distribution Panelboard. The distribution panelboard shall have a grounding bus with sufficient terminals for all grounding conductors or other approved grounding means.

(c) Grounded Conductor. The grounded circuit conductor (neutral) shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded (neutral) circuit terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Connection of electric ranges and electric clothes dryers utilizing a grounded (neutral) conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plug caps and receptacles.

5.52.4.17 Interior Equipment Grounding.

(a) Exposed Metal Parts. In the electrical system, all exposed metal parts, enclosures, frames, luminaire (lighting fixture) canopies, and so forth, shall be effectively bonded to the grounding terminals or enclosure of the distribution panelboard.

(b) Equipment Grounding Conductors. Bare wires, green-colored wires, or green wires with a yellow stripe(s) shall be used for equipment grounding conductors only.

(c) Grounding of Electrical Equipment. Where grounding of electrical equipment is specified, it shall be permitted as follows:

(1) Connection of metal raceway (conduit or electrical metallic tubing), the sheath of Type MC and Type MI cable where the sheath is identified for grounding, or the armor of Type AC cable to metal enclosures.

(2) A connection between the one or more equipment grounding conductors and a metal box by means of a grounding screw, which shall be used for no other purpose, or a listed grounding device.

(3) The equipment grounding conductor in nonmetallic-sheathed cable shall be permitted to be secured under a screw threaded into the luminaire (fixture) canopy other than a mounting screw or cover screw or

attached to a listed grounding means (plate) in a nonmetallic outlet box for luminaire (fixture) mounting [grounding means shall also be permitted for luminaire (fixture) attachment screws].

(d) Grounding Connection in Nonmetallic Box. A connection between the one or more grounding conductors brought into a nonmetallic outlet box shall be arranged so that a connection can be made to any fitting or device in that box that requires grounding.

(e) Grounding Continuity. Where more than one equipment grounding conductor of a branch circuit enters a box, all such conductors shall be in good electrical contact with each other, and the arrangement shall be such that the disconnection or removal of a receptacle, fixture, including a luminaire, or other device fed from the box will not interfere with or interrupt the grounding continuity.

(f) Cord-Connected Appliances. Cord-connected appliances, such as washing machines, clothes dryers, refrigerators, and the electrical system of gas ranges, and so on, shall be grounded by means of an approved cord with equipment grounding conductor and grounding-type attachment plug.

5.52.4.18 Bonding of Non-Current-Carrying Metal Parts.

(a) Required Bonding. All exposed non-current-carrying metal parts that may become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

(b) Bonding Chassis. A bonding conductor shall be connected between any distribution panelboard and an accessible terminal on the chassis. Aluminum or copper-clad aluminum conductors shall not be used for bonding if such conductors or their terminals are exposed to corrosive elements.

Exception: Any park trailer that employs a unitized metal chassis-frame construction to which the distribution panelboard is securely fastened with a bolt(s) and nut(s) or by welding or riveting shall be considered to be bonded.

(c) Bonding Conductor Requirements. Grounding terminals shall be of the solderless type and listed as pressure terminal connectors

recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be 8.0 mm² copper minimum or equivalent.

(d) Metallic Roof and Exterior Bonding. The metal roof and exterior covering shall be considered bonded where both of the following conditions apply:

(1) The metal panels overlap one another and are securely attached to the wood or metal frame parts by metal fasteners.

(2) The lower panel of the metal exterior covering is secured by metal fasteners at each cross member of the chassis, or the lower panel is bonded to the chassis by a metal strap.

(e) Gas, Water, and Waste Pipe Bonding. The gas, water, and waste pipes shall be considered grounded if they are bonded to the chassis.

(f) Furnace and Metal Air Duct Bonding. Furnace and metal circulating air ducts shall be bonded.

5.52.4.19 Appliance Accessibility and Fastening.

Every appliance shall be accessible for inspection, service, repair, and replacement without removal of permanent construction. Means shall be provided to securely fasten appliances in place when the park trailer is in transit.

5.52.4.20 Outdoor Outlets, Fixtures, Including Luminaires, Air-Cooling Equipment, and So On.

(a) Listed for Outdoor Use. Outdoor fixtures, including luminaires, and equipment shall be listed for outdoor use. Outdoor receptacle or convenience outlets shall be of a gasketed-cover type for use in wet locations.

(b) Outside Heating Equipment, Air-Conditioning Equipment, or Both. A park trailer provided with a branch circuit designed to energize outside heating equipment or air-conditioning equipment, or both, located outside the park trailer, other than room air conditioners, shall have such branch-circuit conductors terminate in a listed outlet box or disconnecting means located on the outside of the park trailer. A label

shall be permanently affixed within 150 mm from the listed box or disconnecting means, and shall contain the following information:

THIS CONNECTION IS FOR HEATING
AND/OR AIR-CONDITIONING EQUIPMENT.
THE BRANCH CIRCUIT IS RATED AT NOT MORE THAN _____
AMPERES, AT _____ VOLTS, 60 HZ, _____ CONDUCTOR
AMPACITY.

A DISCONNECTING MEANS SHALL BE
LOCATED WITHIN SIGHT OF THE EQUIPMENT.

The correct voltage and ampere rating shall be given. The tag shall not be less than 0.50 mm thick etched brass, stainless steel, anodized or alclad aluminum, or equivalent. The tag shall not be less than 75 mm × 45 mm minimum size.

5.52.5 Factory Tests

5.52.5.1 Factory Tests (Electrical). Each park trailer shall be subjected to the tests required by 5.52.5.1(a) and 5.52.5.1(b).

(a) Circuits of 230 Volts, 115 Volts or 115/230 Volts. Each park trailer designed with a 230-volt, 115-volt or a 115/230-volt electrical system shall withstand the applied potential without electrical breakdown of a 1-minute, 900-volt dielectric strength test, or a 1-second, 1 080-volt dielectric strength test, with all switches closed, between ungrounded and grounded conductors and the park trailer ground. During the test, all switches and other controls shall be in the on position. Fixtures, including luminaires, and permanently installed appliances shall not be required to withstand this test.

Each park trailer shall be subjected to the following:

(1) A continuity test to ensure that all metal parts are properly bonded

(2) Operational tests to demonstrate that all equipment is properly connected and in working order

(3) Polarity checks to determine that connections have been properly made

(4) Receptacles requiring GFCI protection shall be tested for correct function by the use of a GFCI testing device

(b) Low-Voltage Circuits. Low-voltage circuit conductors in each park trailer shall withstand the applied potential without electrical breakdown of a 1-minute, 500-volt or a 1-second, 600-volt dielectric strength test. The potential shall be applied between ungrounded and grounded conductors.

The test shall be permitted on running light circuits before the lights are installed, provided the unit's outer covering and interior cabinetry have been secured. The braking circuit shall be permitted to be tested before being connected to the brakes, provided the wiring has been completely secured.

ARTICLE 5.53 — FLOATING BUILDINGS

5.53.1 General

5.53.1.1 Scope. This article covers wiring, services, feeders, and grounding for floating buildings.

5.53.1.2 Definition.

Floating Building. A building unit as defined in Article 1.0 that floats on water, is moored in a permanent location, and has a premises wiring system served through connection by permanent wiring to an electricity supply system not located on the premises.

5.53.1.3 Application of Other Articles. Wiring for floating buildings shall comply with the applicable provisions of other articles of this Code, except as modified by this article.

5.53.2 Services and Feeders

5.53.2.1 Location of Service Equipment. The service equipment for a floating building shall be located adjacent to, but not in or on, the building or any floating structure.

5.53.2.2. Service Conductors. One set of service conductors shall be permitted to serve more than one set of service equipment.

5.53.2.3 Feeder Conductors. Each floating building shall be supplied by a single set of feeder conductors from its service equipment.

Exception: Where the floating building has multiple occupancy, each occupant shall be permitted to be supplied by a single set of feeder conductors extended from the occupant's service equipment to the occupant's panelboard.

5.53.2.4 Installation of Services and Feeders.

(a) Flexibility. Flexibility of the wiring system shall be maintained between floating buildings and the supply conductors. All wiring shall be installed so that motion of the water surface and changes in the water level will not result in unsafe conditions.

(b) Wiring Methods. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit with approved fittings shall be permitted for feeders and where flexible connections are required for services. Extra-hard usage portable power cable listed for both wet locations and sunlight resistance shall be permitted for a feeder to a floating building where flexibility is required. Other raceways suitable for the location shall be permitted to be installed where flexibility is not required.

FPN: See 5.55.1.1 and 5.55.1.13.

5.53.3 Grounding

5.53.3.1 General Requirements. Grounding at floating buildings shall comply with 5.53.3.1(a) through (d).

(a) Grounding of Electrical and Nonelectrical Parts. Grounding of both electrical and nonelectrical parts in a floating building shall be through connection to a grounding bus in the building panelboard.

(b) Installation and Connection of Equipment Grounding Conductor. The equipment grounding conductor shall be installed with the feeder conductors and connected to a grounding terminal in the service equipment.

(c) Identification of Equipment Grounding Conductor. The equipment grounding conductor shall be an insulated copper conductor with a continuous outer finish that is either green or green with one or more yellow stripes. For conductors larger than 14 mm², or where

multiconductor cables are used, re-identification of conductors as allowed in 2.50.6.10(a)(2)b and (a)(2)c or 2.50.6.10(b)(2) and (b)(3) shall be permitted.

(d) Grounding Electrode Conductor Connection. The grounding terminal in the service equipment shall be grounded by connection through an insulated grounding electrode conductor to a grounding electrode on shore.

5.53.3.2 Insulated Neutral. The grounded circuit conductor (neutral) shall be an insulated conductor identified in conformance with 2.0.1.6. The neutral conductor shall be connected to the equipment grounding terminal in the service equipment, and, except for that connection, it shall be insulated from the equipment grounding conductors, equipment enclosures, and all other grounded parts. The neutral circuit terminals in the panelboard and in ranges, clothes dryers, counter-mounted cooking units, and the like shall be insulated from the enclosures.

5.53.3.3 Equipment Grounding.

(a) Electrical Systems. All enclosures and exposed metal parts of electrical systems shall be bonded to the grounding bus.

(b) Cord-Connected Appliances. Where required to be grounded, cord-connected appliances shall be grounded by means of an equipment grounding conductor in the cord and a grounding-type attachment plug.

5.53.3.4 Bonding of Non-Current-Carrying Metal Parts. All metal parts in contact with the water, all metal piping, and all non-current-carrying metal parts that may become energized shall be bonded to the grounding bus in the panelboard.

ARTICLE 5.55 — MARINAS AND BOATYARDS

5.55.1.1 Scope. This article covers the installation of wiring and equipment in the areas comprising fixed or floating piers, wharves, docks, and other areas in marinas, boatyards, boat basins, boathouses, yacht clubs, boat condominiums, docking facilities associated with residential condominiums, any multiple docking facility, or similar occupancies, and facilities that are used, or intended for use, for the

purpose of repair, berthing, launching, storage, or fueling of small craft and the moorage of floating buildings.

Private, noncommercial docking facilities constructed or occupied for the use of the owner or residents of the associated single-family dwelling are not covered by this article.

FPN: See NFPA 303-2000, Fire Protection Standard for Marinas and Boatyards, for additional information.

5.55.1.2 Definitions.

Electrical Datum Plane. The electrical datum plane is defined as follows:

(1) In land areas subject to tidal fluctuation, the electrical datum plane is a horizontal plane 600 mm above the highest tide level for the area occurring under normal circumstances, that is, highest high tide.

(2) In land areas not subject to tidal fluctuation, the electrical datum plane is a horizontal plane 600 mm above the highest water level for the area occurring under normal circumstances.

(3) The electrical datum plane for floating piers and landing stages that are (a) installed to permit rise and fall response to water level, without lateral movement, and (b) that are so equipped that they can rise to the datum plane established for (1) or (2), is a horizontal plane 800 mm above the water level at the floating pier or landing stage and a minimum of 300 mm above the level of the deck.

Marine Power Outlet. An enclosed assembly that can include receptacles, circuit breakers, fused switches, fuses, watt-hour meter(s), and monitoring means approved for marine use.

5.55.1.4 Distribution System. Yard and pier distribution systems shall not exceed 600 volts phase to phase.

5.55.1.5 Transformers. Transformers and enclosures shall be specifically approved for the intended location. The bottom of enclosures for transformers shall not be located below the electrical datum plane.

5.55.1.7 Location of Service Equipment. The service equipment for

floating docks or marinas shall be located adjacent to, but not on or in, the floating structure.

5.55.1.9 Electrical Connections. All electrical connections shall be located at least 300 mm above the deck of a floating pier. All electrical connections shall be located at least 300 mm above the deck of a fixed pier but not below the electrical datum plane.

5.55.1.10 Electrical Equipment Enclosures.

(a) Securing and Supporting. Electrical equipment enclosures installed on piers above deck level shall be securely and substantially supported by structural members, independent of any conduit connected to them. If enclosures are not attached to mounting surfaces by means of external ears or lugs, the internal screw heads shall be sealed to prevent seepage of water through mounting holes.

(b) Location. Electrical equipment enclosures on piers shall be located so as not to interfere with mooring lines.

5.55.1.11 Circuit Breakers, Switches, Panelboards, and Marine Power Outlets. Circuit breakers and switches installed in gasketed enclosures shall be arranged to permit required manual operation without exposing the interior of the enclosure. All such enclosures shall be arranged with a weep hole to discharge condensation.

5.55.1.12 Load Calculations for Service and Feeder Conductors. General lighting and other loads shall be calculated in accordance with Article 2.20, and, in addition, the demand factors set forth in Table 5.55.1.12 shall be permitted for each service and/or feeder circuit supplying receptacles that provide shore power for boats. These calculations shall be permitted to be modified as indicated in notes (1) and (2) to Table 5.55.1.12.

5.55.1.13 Wiring Methods and Installation.

(a) Wiring Methods.

(1) General. Wiring methods of Chapter 3 shall be permitted where identified for use in wet locations.

Table 5.55.1.12 Demand Factors

Number of Receptacles	Sum of the Rating of the Receptacles (percent)
1 – 4	100
5 – 8	90
9 – 14	80
15 – 30	70
31 – 40	60
41 – 50	50
51 – 70	40
71 – plus	30

Notes:

1. Where shore power accommodations provide two receptacles specifically for an individual boat slip and these receptacles have different voltages (for example, one 30 ampere, 250 volt and one 50 ampere, 125/250 volt), only the receptacle with the larger kilowatt demand shall be required to be calculated.

2. If the facility being installed includes individual kilowatt-hour submeters for each slip and is being calculated using the criteria listed in Table 5.55.1.12, the total demand amperes may be multiplied by 0.9 to achieve the final demand amperes.

FPN: These demand factors may be inadequate in areas of extreme hot or cold temperatures with loaded circuits for heating, air-conditioning, or refrigerating equipment.

(2) Portable Power Cables. Extra-hard usage portable power cables rated not less than 75°C, 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted as follows:

- a. As permanent wiring on the underside of piers (floating or fixed)
- b. Where flexibility is necessary as on piers composed of floating sections
- c. Temporary Wiring. Temporary wiring, except as permitted by Article 5.90, shall not be used to supply power to boats.

(b) Installation.

(1) Overhead Wiring. Overhead wiring shall be installed to avoid possible contact with masts and other parts of boats being moved in the yard.

Conductors and cables shall be routed to avoid wiring closer than 6 000 mm from the outer edge or any portion of the yard that can be used for moving vessels or stepping or unstepping masts.

(2) **Outside Branch Circuits and Feeders.** Outside branch circuits and feeders shall comply with Article 2.25 except that clearances for overhead wiring in portions of the yard other than those described in 5.55.1.13(b)(1) shall not be less than 5 500 mm above grade.

(3) **Wiring Over and Under Navigable Water.** Wiring over and under navigable water shall be subject to approval by the authority having jurisdiction.

FPN: See NFPA 303-2000, Fire Protection Standard for Marinas and Boatyards, for warning sign requirements.

(4) **Portable Power Cables.**

a. Where portable power cables are permitted by 5.55.1.13(a)(2), the installation shall comply with the following:

1. Cables shall be properly supported.
2. Cables shall be located on the underside of the pier.
3. Cables shall be securely fastened by nonmetallic clips to structural members other than the deck planking.
4. Cables shall not be installed where subject to physical damage.
5. Where cables pass through structural members, they shall be protected against chafing by a permanently installed oversized sleeve of nonmetallic material.

b. Where portable power cables are used as permitted in 5.55.1.13(a)(2)b, there shall be an approved junction box of corrosion-resistant construction with permanently installed terminal blocks on each pier section to which the feeder and feeder extensions are to be connected. Metal junction boxes and their covers, and metal screws and parts that are exposed externally to the boxes, shall be of corrosion-resistant materials or protected by material resistant to corrosion.

(5) **Protection.** Rigid metal or nonmetallic conduit suitable for the location shall be installed to protect wiring above decks of piers and landing stages and below the enclosure that it serves. The conduit shall be connected to the enclosure by full standard threads. The use of special

fittings of nonmetallic material to provide a threaded connection into enclosures on rigid nonmetallic conduit, employing joint design as recommended by the conduit manufacturer, for attachment of the fitting to the conduit shall be acceptable, provided the equipment and method of attachment are approved and the assembly meets the requirements of installation in damp or wet locations as applicable.

5.55.1.15 Grounding. Wiring and equipment within the scope of this article shall be grounded as specified in Article 2.50 and as required by 5.55.1.15(a) through 5.55.1.15(e).

(a) Equipment to Be Grounded. The following items shall be connected to an equipment grounding conductor run with the circuit conductors in the same raceway, cable, or trench:

- (1) Metal boxes, metal cabinets, and all other metal enclosures
- (2) Metal frames of utilization equipment
- (3) Grounding terminals of grounding-type receptacles

(b) Type of Equipment Grounding Conductor. The equipment grounding conductor shall be an insulated copper conductor with a continuous outer finish that is either green or green with one or more yellow stripes. The equipment grounding conductor of Type MI cable shall be permitted to be identified at terminations. For conductors larger than 14 mm², or where multiconductor cables are used, re-identification of conductors as allowed in 2.50.6.10(a)(2)b and (a)(2)c or 2.50.6.10(b)(2) and (b)(3) shall be permitted.

(c) Size of Equipment Grounding Conductor. The insulated copper equipment grounding conductor shall be sized in accordance with 2.50.6.13 but not smaller than 3.5 mm² (2.0 mm dia.).

(d) Branch-Circuit Equipment Grounding Conductor. The insulated equipment grounding conductor for branch circuits shall terminate at a grounding terminal in a remote panelboard or the grounding terminal in the main service equipment.

(e) Feeder Equipment Grounding Conductors. Where a feeder supplies a remote panelboard, an insulated equipment grounding conductor shall extend from a grounding terminal in the service equipment to a grounding terminal in the remote panelboard.

5.55.1.17 Disconnecting Means for Shore Power Connection(s).

Disconnecting means shall be provided to isolate each boat from its supply connection(s).

(a) Type. The disconnecting means shall be permitted to consist of a circuit breaker, switch, or both, and shall be properly identified as to which receptacle it controls.

(b) Location. The disconnecting means shall be readily accessible, located not more than 800 mm from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in marine power outlets complying with this section shall be permitted as the disconnecting means.

5.55.1.19 Receptacles. Receptacles shall be mounted not less than 300 mm above the deck surface of the pier and not below the electrical datum plane on a fixed pier.

(a) Shore Power Receptacles.

(1) Enclosures. Receptacles intended to supply shore power to boats shall be housed in marine power outlets listed as marina power outlets or listed for set locations, or shall be installed in listed enclosures protected from the weather or in listed weatherproof enclosures. The integrity of the assembly shall not be affected when the receptacles are in use with any type of booted or nonbooted attachment plug/cap inserted.

(2) Strain Relief. Means shall be provided where necessary to reduce the strain on the plug and receptacle caused by the weight and catenary angle of the shore power cord.

(3) Branch Circuits. Each single receptacle that supplies shore power to boats shall be supplied from a marine power outlet or panelboard by an individual branch circuit of the voltage class and rating corresponding to the rating of the receptacle.

FPN: Supplying receptacles at voltages other than the voltages marked on the receptacle may cause overheating or malfunctioning of connected equipment, for example, supplying single-phase, 115/230-volt, 3-wire loads from a 208Y/120-volt, 3-wire source.

(4) Ratings. Shore power for boats shall be provided by single receptacles rated not less than 30 amperes.

FPN: For locking- and grounding-type receptacles for auxiliary power to boats, see NFPA 303-2000, Fire Protection Standard for Marinas and Boatyards.

a. Receptacles rated not less than 30 amperes or more than 50 amperes shall be of the locking and grounding type.

FPN: For various configurations and ratings of locking and grounding-type receptacles and caps, see ANSI/NEMA 18WD 6-1989, National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles.

b. Receptacles rated for 60 amperes or 100 amperes shall be of the pin and sleeve type.

FPN: For various configurations and ratings of pin and sleeve receptacles, see ANSI/UL 1686, UL Standard for Safety Pin and Sleeve Configurations.

(b) Other Than Shore Power.

(1) Ground-Fault Circuit-Interrupter (GFCI) Protection for Personnel. Fifteen- and 20-ampere, single-phase, 250-volt and 125-volt receptacles installed outdoors, in boathouses, in buildings used for storage, maintenance, or repair where portable electrical hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used shall be provided with GFCI protection for personnel. Receptacles in other locations shall be protected in accordance with 2.10.1.8(b).

(2) Marking. Receptacles other than those supplying shore power to boats shall be permitted to be housed in marine power outlets with the receptacles that provide shore power to boats, provided they are marked to clearly indicate that they are not to be used to supply power to boats.

5.55.1.21 Motor Fuel Dispensing Stations — Hazardous (Classified)

Locations. Electrical wiring and equipment located at or serving motor fuel dispensing stations shall comply with Article 5.14 in addition to the requirements of this article. All electrical wiring for power and lighting shall be installed on the side of the wharf, pier, or dock opposite from the liquid piping system.

FPN: For additional information, see NFPA 303-2000, Fire Protection Standard for Marinas and Boatyards, and NFPA 30A-2003, Motor Fuel Dispensing Facilities and Repair Garages.

5.55.1.22 Repair Facilities — Hazardous (Classified) Locations.

Electrical wiring and equipment located at facilities for the repair of marine craft containing flammable or combustible liquids or gases shall comply with Article 5.11 in addition to the requirements of this article.

5.55.1.23 Marine Hoists, Railways, Cranes, and Monorails. Motors and controls for marine hoists, railways, cranes, and monorails shall not be located below the electrical datum plane. Where it is necessary to provide electric power to a mobile crane or hoist in the yard and a trailing cable is utilized, it shall be a listed portable power cable rated for the conditions of use and be provided with an outer jacket of distinctive color for safety.

ARTICLE 5.90 — TEMPORARY INSTALLATIONS

5.90.1.1 Scope. The provisions of this article apply to temporary electrical power and lighting installations.

5.90.1.2 All Wiring Installations.

(a) Other Articles. Except as specifically modified in this article, all other requirements of this Code for permanent wiring shall apply to temporary wiring installations.

(b) Approval. Temporary wiring methods shall be acceptable only if approved based on the conditions of use and any special requirements of the temporary installation.

5.90.1.3 Time Constraints.

(a) During the Period of Construction. Temporary electrical power and lighting installations shall be permitted during the period of construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.

FPN: For temporary wiring permit requirements please refer to Section 1.2.3.1.

(b) Decorative Lighting. Temporary electrical power and lighting installations shall be permitted for a period not to exceed 90 days for

holiday decorative lighting and similar purposes.

(c) Emergencies and Tests. Temporary electrical power and lighting installations shall be permitted during emergencies and for tests, experiments, and developmental work.

(d) Removal. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed.

5.90.1.4 General.

(a) Services. Services shall be installed in conformance with Article 2.30.

(b) Feeders. Overcurrent protection shall be provided in accordance with 2.40.1.4, 2.40.1.5, 2.40.9.1, and 2.40.9.2. They shall originate in an approved distribution center. Conductors shall be permitted within cable assemblies or within multiconductor cords or cables of a type identified in Table 4.0.1.4 for hard usage or extra-hard usage. For the purpose of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation or limitation by building construction type and without concealment within walls, floors, or ceilings.

Exception: Single insulated conductors shall be permitted where installed for the purpose(s) specified in 5.90.1.3(c), where accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

(c) Branch Circuits. All branch circuits shall originate in an approved power outlet or panelboard. Conductors shall be permitted within cable assemblies or within multiconductor cord or cable of a type identified in Table 4.0.1.4 for hard usage or extra-hard usage. Conductors shall be protected from overcurrent as provided in 2.40.1.4, 2.40.1.5, and 2.40.9.1. For the purposes of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation or limitation by building construction type and without concealment within walls, floors, or ceilings.

Exception: Branch circuits installed for the purposes specified in

5.90.1.3(b) or 5.90.1.3(c) shall be permitted to be run as single insulated conductors. Where the wiring is installed in accordance with 5.90.1.3(b), the voltage to ground shall not exceed 250 volts, the wiring shall not be subject to physical damage, and the conductors shall be supported on insulators at intervals of not more than 3 000 mm; or, for festoon lighting, the conductors shall be so arranged that excessive strain is not transmitted to the lampholders.

(d) Receptacles. All receptacles shall be of the grounding type. Unless installed in a continuous grounded metal raceway or metal-covered cable, all branch circuits shall contain a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductors. Receptacles on construction sites shall not be installed on branch circuits that supply temporary lighting. Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits that supply temporary lighting.

(e) Disconnecting Means. Suitable disconnecting switches or plug connectors shall be installed to permit the disconnection of all ungrounded conductors of each temporary circuit. Multiwire branch circuits shall be provided with a means to disconnect simultaneously all ungrounded conductors at the power outlet or panelboard where the branch circuit originated. Approved handle ties shall be permitted.

(f) Lamp Protection. All lamps for general illumination shall be protected from accidental contact or breakage by a suitable fixture or lampholder with a guard.

Brass shell, paper-lined sockets, or other metal-cased sockets shall not be used unless the shell is grounded.

(g) Splices. On construction sites, a box shall not be required for splices or junction connections where the circuit conductors are multiconductor cord or cable assemblies, provided that the equipment grounding continuity is maintained with or without the box. See 1.10.1.14(b) and 4.0.1.9. A box, conduit body, or terminal fitting having a separately bushed hole for each conductor shall be used wherever a change is made to a conduit or tubing system or a metal-sheathed cable system.

(h) Protection from Accidental Damage. Flexible cords and cables shall be protected from accidental damage. Sharp corners and projections

shall be avoided. Where passing through doorways or other pinch points, protection shall be provided to avoid damage.

(i) Termination(s) at Devices. Flexible cords and cables entering enclosures containing devices requiring termination shall be secured to the box with fittings designed for the purpose.

(j) Support. Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage. Vegetation shall not be used for support of overhead spans of branch circuits or feeders.

Exception: For holiday lighting in accordance with 5.90.1.3(b), where the conductors or cables are arranged with proper strain relief devices, tension take-up devices, or other approved means to avoid damage from the movement of the live vegetation, trees shall be permitted to be used for support of overhead spans of branch circuit conductors or cables.

5.90.1.5 Listing of Decorative Lighting. Decorative lighting used for holiday lighting and similar purposes, in accordance with 5.90.1.3(b), shall be listed.

5.90.1.6 Ground-Fault Protection for Personnel. Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 5.90.1.6(a) and 5.90.1.6(b). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities.

(a) Receptacle Outlets. All 250-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit interrupter protection for personnel. If a receptacle(s) is installed or exists as part of the permanent wiring of the building or structure and is used for temporary electric power, ground-fault circuit-interrupter protection for personnel shall be provided. For the purposes of this section, cord sets or devices incorporating listed ground-fault circuit interrupter protection for personnel identified for portable use

shall be permitted.

Exception: In industrial establishments only, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner are involved, an assured equipment grounding conductor program as specified in 5.90.1.6(b)(2) shall be permitted for only those receptacle outlets used to supply equipment that would create a greater hazard if power was interrupted or having a design that is not compatible with GFCI protection.

(b) Use of Other Outlets. Receptacles other than 250-volt and/or 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles shall have protection in accordance with (b)(1) or the assured equipment grounding conductor program in accordance with (b)(2).

(1) GFCI Protection. Ground-fault circuit interrupter protection for personnel.

(2) Assured Equipment Grounding Conductor Program. A written assured equipment grounding conductor program continuously enforced at the site by one or more designated persons to ensure that equipment grounding conductors for all cord sets, receptacles that are not a part of the permanent wiring of the building or structure, and equipment connected by cord and plug are installed and maintained in accordance with the applicable requirements of 2.50.6.5, 2.50.7.9, 4.6.1.3(c), and 5.90.1.4(d).

a. The following tests shall be performed on all cord sets, receptacles that are not part of the permanent wiring of the building or structure, and cord-and-plug-connected equipment required to be grounded:

1. All equipment grounding conductors shall be tested for continuity and shall be electrically continuous.

2. Each receptacle and attachment plug shall be tested for correct attachment of the equipment grounding conductor. The equipment grounding conductor shall be connected to its proper terminal.

3. All required tests shall be performed as follows:

a. Before first use on site

b. When there is evidence of damage
c. Before equipment is returned to service following any repairs

d. At intervals not exceeding 3 months

b. The tests required in item (2)(a) shall be recorded and made available to the authority having jurisdiction.

5.90.1.7 Guarding. For wiring over 600 volts, nominal, suitable fencing, barriers, or other effective means shall be provided to limit access only to authorized and licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

Chapter 6. Special Equipment

ARTICLE 6.0 — ELECTRIC SIGNS AND OUTLINE LIGHTING

6.0.1 General

6.0.1.1 Scope. This article covers the installation of conductors and equipment for electric sign and outline lighting. All installations and equipment using neon tubing, such as signs, decorative elements, skeleton tubing, or art forms, are covered by this article.

See Art 1.1 for the definition of Electric Sign & Outline Lighting

6.0.1.2 Definitions.

Electric-Discharge Lighting. Systems of illumination utilizing fluorescent lamps, high intensity discharge (HID) lamps, or neon tubing.

Neon Tubing. Electric-discharge tubing manufactured into shapes that form letters, parts of letters, skeleton tubing, outline lighting, other decorative elements, or art forms, and filled with various inert gases.

Section Sign. A sign or outline lighting system, shipped as subassemblies, that requires field-installed wiring between the subassemblies to complete the overall sign.

Sign Body. A portion of a sign that may provide protection from the weather, but is not an electrical enclosure.

Skeleton Tubing. Neon tubing that is itself the sign or outline lighting and not attached to an enclosure or sign body.

6.0.1.3 Listing. Electric signs and outline lighting — fixed, mobile, or portable — shall be listed and installed in conformance with that

listing, unless otherwise approved by special permission.

(a) Field installed skeleton tubing shall not be required to be listed where installed in conformance with this Code.

(b) Outline lighting shall not be required to be listed as a system when it consists of listed luminaires (lighting fixtures) wired in accordance with Chapter 3.

6.0.1.4 Markings.

(a) **Signs and Outline Lighting Systems.** Signs and outline lighting systems shall be marked with the manufacturer's name, trademark, or other means of identification; and, input voltage and current rating.

(b) **With Incandescent Lamp Holders.** Signs and outline lighting systems with incandescent lamp holders shall be marked to indicate the maximum allowable wattage of lamps. The markings shall be permanently installed, in letters at least 6.00 mm high, and shall be located where visible during relamping.

6.0.1.5 Branch Circuits.

(a) **Required Branch Circuit.** Each commercial building and each commercial occupancy accessible to pedestrians shall be provided with at least one outlet in an accessible location at each entrance to each tenant space for sign or outline lighting system use. The outlet(s) shall be supplied by a branch circuit rated at least 20 amperes that supplies no other load. Service hallways or corridors shall not be considered accessible to pedestrians.

(b) **Rating.** Branch circuits that supply signs shall be rated in accordance with:

(1) Incandescent and Fluorescent. Branch circuits that supply signs and outline lighting systems containing incandescent and fluorescent forms of illumination shall be rated not to exceed 20 amperes.

(2) Neon. Branch circuits that supply neon tubing installations shall not be rated in excess of 30 amperes.

(c) Wiring Methods. Wiring methods used to supply signs shall comply with:

(1) Supply. The wiring method used to supply signs and outline lighting systems shall terminate within a sign, an outline lighting system enclosure, a suitable box, or a conduit body.

(2) Enclosures as Pull Boxes. Signs and transformer enclosures shall be permitted to be used as pull or junction boxes for conductors supplying other adjacent signs, outline lighting systems, or floodlights that are part of a sign, and shall be permitted to contain both branch and secondary circuit conductors.

(3) Metal poles used to support signs shall be permitted to enclose supply conductors, provided the poles and conductors are installed in accordance with 4.10.4.1(b).

6.0.1.6 Disconnects. Each sign and outline lighting system, or feeder circuit or branch circuit supplying a sign or outline lighting system, shall be controlled by an externally operable switch or circuit breaker that will open all ungrounded conductors. Signs and outline lighting systems located within fountains shall have the disconnect located in accordance with 6.80.1.12.

Exception No. 1: A disconnecting means shall not be required for an exit directional sign located within a building.

Exception No. 2: A disconnecting means shall not be required for cord-connected signs with an attachment plug.

(a) Location.

(1) Within Sight of the Sign. The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that may be energized, the disconnecting means shall be capable of being locked in the open position.

(2) Within Sight of the Controller. The following shall apply for signs or outline lighting systems operated by electronic or electro-mechanical controllers located external to the sign or outline lighting system:

a. The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.

b. The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.

c. The disconnecting means shall be designed so that no pole can be operated independently and it shall be capable of being locked in the open position.

(b) Control Switch Rating. Switches, flashers, and similar devices controlling transformers and electronic power supplies shall be rated for controlling inductive loads or have a current rating not less than twice the current rating of the transformer.

FPN: See 4.4.1.14 for rating of snap switches.

6.0.1.7 Grounding. Signs and metal equipment of outline lighting systems shall be grounded.

(a) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary wiring of a transformer or power supply for use with electric discharge tubing shall be permitted as a bonding means in lengths not exceeding 30 m.

(b) Small Metal Parts. Small metal parts not exceeding 50 mm in any dimension, not likely to be energized, and spaced at least 19 mm from neon tubing shall not require bonding.

(c) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary wiring of a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 40 mm from the conduit when the circuit is operated at 100 Hz or less or 45 mm when the circuit is operated at over 100 Hz.

(d) Bonding Conductors. Bonding conductors shall be copper and not smaller than 2.0 mm² (1.6 mm dia.)

(e) **Metal Building Parts.** Metal parts of a building shall not be permitted as a grounded or equipment grounding conductor.

(f) **Signs in Fountains.** Signs or outline lighting installed inside a fountain shall have all metal parts and equipment grounding conductors bonded to the equipment grounding conductor for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in 6.80.5.4.

FPN: Refer to Section 6.0.2.3(j) for additional restrictions on length of high-voltage secondary conductors.

6.0.1.8 Enclosures. Live parts other than lamps and neon tubing shall be enclosed. Transformers and power supplies provided with an integral enclosure, including a primary and secondary circuit splice enclosure, shall not require an additional enclosure.

(a) **Strength.** Enclosures shall have ample structural strength and rigidity.

(b) **Material.** Sign and outline lighting system enclosures shall be constructed of metal or shall be listed.

(c) **Minimum Thickness of Enclosure Metal.** Sheet copper or aluminum shall be at least 0.50 mm thick. Sheet steel shall be at least 0.40 mm thick.

(d) **Protection of Metal.** Metal parts of equipment shall be protected from corrosion.

6.0.1.9 Location.

(a) **Vehicles.** Sign or outline lighting system equipment shall be at least 4 300 mm above areas accessible to vehicles unless protected from physical damage.

(b) **Pedestrians.** Neon tubing accessible to pedestrians, other than dry-location portable signs, shall be protected from physical damage.

(c) **Adjacent to Combustible Materials.** Signs and outline lighting systems shall be installed so that adjacent combustible materials shall not be subjected to temperatures in excess of 90°C.

The spacing between wood or other combustible materials and an incandescent or HID lamp or compact fluorescent lamp (CFL) or lampholder shall not be less than 50 mm.

(d) **Wet Location.** Signs and outline lighting system equipment for wet location use, other than listed watertight type, shall be weatherproof and have drain holes, as necessary, in accordance with the following.

(1) Drain hole shall not be larger than 13 mm or smaller than 6.00 mm

(2) Every low point or isolated section of the equipment shall have at least one drain hole.

(3) Drain holes shall be positioned such that there will be no external obstructions.

6.0.1.10 Portable or Mobile Signs

(a) **Support.** Portable or mobile signs shall be adequately supported and readily movable without the use of tools.

(b) **Attachment Plug.** An attachment plug shall be provided for each portable or mobile sign.

(c) **Wet or Damp Location.** Portable or mobile signs in wet or damp locations shall meet all of the following.

(1) **Cords.** All cords shall be junior hard service or hard service types as designated in Table 4.0.1.4, and have an equipment grounding conductor.

(2) **Ground-Fault Circuit Interrupter.** Portable or mobile signs shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the power-supply cord within 300 mm of the attachment plug.

(d) **Dry Location.** Portable or mobile signs in dry locations shall meet the following.

(1) Cords shall be SP-2, SPE-2, SPT-2, or heavier, as designated in Table 4.0.1.4.

(2) The cord shall not exceed 4 500 mm in length.

6.0.0.12 Field-Installed Secondary Wiring. The field-installed secondary circuit wiring of section signs shall comply with 6.0.2.2 if 1 000 volts or less, or with 6.0.2.3 if over 1 000 volts.

6.0.1.21 Ballasts, Transformers, and Electronic Power Supplies.

(a) **Accessibility.** Ballasts, transformers, and electronic power supplies shall be located where accessible and shall be securely fastened in place.

(b) **Location.** Ballasts, transformers, and electronic power supplies shall be installed as near to the lamps or neon tubing as practicable to keep the secondary conductors as short as possible.

(c) **Wet Location.** Ballasts, transformers, and electronic power supplies used in wet locations shall be of the weatherproof type or be of the outdoor type and protected from the weather by placement in a sign body or separate enclosure.

(d) **Working Space.** A working space at least 900 mm high, 900 mm wide, by 900 mm deep shall be provided at each ballast, transformer, and electronic power supply or its enclosure where not installed in a sign.

(e) **Attic & Soffit Locations.** Ballasts, transformers, and electronic power supplies shall be permitted to be located in attics and soffits, provided there is an access door at least 900 mm by 600 mm and a passageway of at least 900 mm high by 600 mm wide with a suitable permanent walkway at least 300 mm wide extending from the point of entry to each component.

(f) **Suspended Ceilings.** Ballasts, transformers, and electronic power supplies shall be permitted to be located above suspended ceilings, provided their enclosures are securely fastened in place and not dependent on the suspended ceiling grid for support. Ballasts, transformers, and electronic power supplies installed in suspended ceilings shall not be connected to the branch circuit by flexible cord.

6.0.1.22 Ballasts.

(a) **Type.** Ballasts shall be identified for the use and shall be listed.

(b) **Thermal Protection.** Ballasts shall be thermally protected.

6.0.1.23 Transformers and Electronic Power Supplies.

(a) **Type.** Transformers and electronic power supplies shall be identified for the use and shall be listed.

(b) **Secondary-Circuit Ground-Fault Protection.** Transformers and electronic power supplies other than the following shall have

secondary-circuit ground-fault protection:

(1) Transformers with isolated secondaries and with a maximum open circuit voltage of 7 500 volts or less

(2) Transformers with integral porcelain or glass secondary housing for the neon tubing and requiring no field wiring of the secondary circuit

(c) **Voltage.** Secondary-circuit voltage shall not exceed 15 000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7 500 volts, under any load conditions.

(d) **Rating.** Transformers and electronic power supplies shall have a secondary-circuit current rating of not more than 300 mA.

(e) **Secondary Connections.** Secondary circuit outputs shall not be connected in parallel or in series.

(f) **Marking.** A transformer or power supply must be marked to indicate that it has secondary fault protection.

6.0.1.24. Class 2 Power Sources. In addition to the requirements of Article 6.0, signs and outline lighting systems supplied by Class 2 transformers, power supplies, and power sources shall comply with 7.25.3.1.

6.0.2 Field-Installed Skeleton Tubing

6.0.2.1 Applicability. Part 6.0.2 shall apply only to field-installed skeleton tubing. These requirements are in addition to the requirements of Part 6.0.1.

6.0.2.2 Neon Secondary-Circuit Conductors, 1 000 Volts or Less, Nominal.

(a) **Wiring Method.** Conductors shall be installed using any wiring method included in Chapter 3 suitable for the conditions.

(b) **Insulation and Size.** Conductors shall be insulated, listed for the purpose, and not smaller than 0.75 mm² (1.0 mm dia.).

(c) **Number of Conductors in Raceway.** The number of conductors in a raceway shall be in accordance with Table 1 of Chapter 9.

(d) **Installation.** Conductors shall be installed so they are not subject to physical damage.

(e) **Protection of Leads.** Bushings shall be used to protect wires passing through an opening in metal.

6.0.2.3 Neon Secondary Circuit Conductors, Over 1 000 Volts, Nominal.

(a) Wiring Method.

(1) **Installation.** Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose. Wiring methods shall be installed in accordance with the requirements of Chapter 3.

(2) **Number of Conductors.** Conduit or tubing shall contain only one conductor.

(3) **Size.** Conduit or tubing shall be a minimum of 15 mm dia.

(4) **Spacing from Ground.** Other than at the location of connection to a metal enclosure or sign body, nonmetallic conduit or flexible nonmetallic conduit shall be spaced at least 40 mm from grounded or bonded parts when the conduit contains a conductor operating at 100 Hz or less, and shall be spaced no less than 45 mm from grounded or bonded parts when conduit contains a conductor operating at more than 100 Hz.

(5) **Metal Building Parts.** Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(b) **Insulation and Size.** Conductors shall be insulated, listed as gas tube sign and ignition cable type GTO, rated for 5, 10, or 15 kV, not smaller than 0.75 mm² (1.0 mm dia.) and have a minimum temperature rating of 105°C.

(c) **Installation.** Conductors shall be installed so they are not subject to physical damage.

(d) **Bends in Conductors.** Sharp bends in insulated conductors shall be avoided.

(e) **Spacing.** Conductors shall be separated from each other and from all objects other than insulators or neon tubing by a spacing of not less than 40 mm. GTO cable installed in metal conduit or tubing requires no spacing b/n the cable insulation and the conduit or tubing.

(f) **Insulators and Bushings.** Insulators and bushings for conductors shall be listed for the purpose.

(g) Conductors in Raceways.

(1) **Damp or Wet Locations.** In damp or wet locations, the insulation on all conductors shall extend not less than 100 mm beyond the metal conduit or tubing.

(2) **Dry Location.** In dry location, the insulation on all conductors shall extend not less than 65 mm beyond the metal conduit or tubing.

(h) **Between Neon Tubing and Grounded Midpoint.** Conductors shall be permitted to run from the ends of neon tubing to the grounded midpoint of transformers or electronic power supplies listed for the purpose and provided with terminals at the midpoint.

(i) **Dwelling Occupancies.** Equipment having an open circuit voltage exceeding 1 000 volts shall not be installed in or on dwelling occupancies.

(j) Length of Secondary Circuit Conductors.

(1) Secondary Conductor to the First Electrode. The length of secondary circuit conductors from a high-voltage terminal or lead of a transformer or electronic power supply to the first neon tube electrode shall not exceed the following:

- a. 6 000 mm where installed in metal conduit or tubing
- b. 15 000 mm where installed in nonmetallic conduit

(2) Other Secondary Circuit Conductors. All other sections of secondary circuit conductor in a neon tube circuit shall be as short as practicable.

6.0.2.12 Neon Tubing.

(a) **Design.** The length and design of the tubing shall not cause a continuous overcurrent beyond the design loading of the transformer or electronic power supply.

(b) **Support.** Tubing shall be supported by listed tube supports.

(c) **Spacing.** A spacing of not less than 6 mm shall be maintained between the tubing and the nearest surface, other than its support.

6.0.2.13 Electrode Connections.

(a) **Accessibility.** Terminals of the electrode shall not be accessible

to unqualified persons.

(b) Electrode Connections. Connections shall be made by use of a connection device, twisting the wires together, or use of an electrode receptacle. Connections shall be electrically and mechanically secure and shall be in an enclosure listed for the purpose.

(c) Support. The neon tubing and conductor shall be supported not more than 150 mm from the electrode connection.

(d) Receptacles. Electrode receptacles shall be listed.

(e) Bushings. Where electrodes penetrate an enclosure, bushings listed for the purpose shall be used, unless receptacles are provided.

(f) Wet Locations. A listed cap shall be used to close the opening between neon tubing and a receptacle where the receptacle penetrates a building. Where a bushing or neon tubing penetrates a building, the opening between neon tubing and the bushing shall be sealed.

(g) Electrode Enclosures. Electrode enclosures shall be listed.

ARTICLE 6.4 — MANUFACTURED WIRING SYSTEMS

6.4.1.1 Scope. The provisions of this article apply to field-installed wiring using off-site manufactured subassemblies for branch circuits, remote-control circuits, signaling circuits, and communications circuits in accessible areas.

6.4.1.2 Definition.

Manufactured Wiring System. A system containing component parts that are assembled in the process of manufacture and cannot be inspected at the building site without damage or destruction to the assembly.

6.4.1.3 Other Articles. Except as modified by the requirements of this article, all other applicable articles of this Code shall apply.

6.4.1.4 Uses Permitted. The manufactured wiring systems shall be permitted in accessible and dry locations and in ducts, plenums, and

other air-handling spaces where listed for this application and installed in accordance with 3.0.1.22.

Exception No. 1: In concealed spaces, one end of tapped cable shall be permitted to extend into hollow walls for direct termination at switch and outlet points.

Exception No. 2: Manufactured wiring system assemblies installed outdoors shall be listed for use in outdoor locations.

6.4.1.5 Uses Not Permitted. Manufactured wiring system types shall not be permitted where limited by the applicable article in Chapter 3 for the wiring method used in its construction.

6.4.1.6 Construction.

(a) Cable or Conduit Types.

(1) Cables. Cable shall be listed Type AC cable or listed Type MC cable containing nominal 600-volt, 8.0 mm²(3.2 mm dia) to 3.5 mm² (2.0 mm dia) insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

Other cables as listed in 7.25.3.21, 8.0.5.4, 8.20.5.4, and 8.30.6.1 shall be permitted in manufactured wiring systems for wiring of equipment within the scope of their respective articles.

(2) Conduits. Conduit shall be listed flexible metal conduit or listed liquidtight flexible conduit containing nominal 600-volt, 8.0 mm²(3.2 mm dia) to 3.5 mm² (2.0 mm dia) insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

Exception No. 1 to (1) and (2): A luminaire(fixture) tap, maximum 1 800 mm long, intended for connection to a single fixture shall be permitted to contain conductors smaller than 3.5 mm² (2.0 mm dia.) but not smaller than 0.75 mm² (1.0 mm dia.).

Exception No. 2 to (1) and (2): Listed manufactured wiring assemblies containing conductors smaller than 3.5 mm² (2.0 mm dia.)

shall be permitted for remote-control, signaling, or communication circuits.

(3) Flexible Cord. Flexible cord suitable for hard usage, with minimum 3.5 mm² (2.0 mm dia.) conductors, shall be permitted as part of a listed factory-made assembly not exceeding 1 800 mm in length when making a transition between components of a manufactured wiring system and utilization equipment, other than luminaries, not permanently secured to the building structure. The cord shall be visible for its entire length and shall not be subject to strain or physical damage.

(b) Marking. Each section shall be marked to identify the type of cable, flexible cord, or conduit.

(c) Receptacles and Connectors. Receptacles and connectors shall be of the locking type, uniquely polarized and identified for the purpose and shall be part of a listed assembly for the appropriate system.

(d) Other Component Parts. Other component parts shall be listed for the appropriate system.

(e) Securing and Supporting. Manufactured wiring systems shall be secured and supported in accordance with the applicable cable or conduit article for the cable or conduit type employed.

(f) Luminaires (Fixtures). Installation of listed electric-discharge luminaires (fixtures) complying with 4.10.6.9(c) shall be permitted.

6.4.1.7 Unused Outlets. All unused outlets shall be capped to effectively close the connector openings.

ARTICLE 6.5 — OFFICE FURNISHINGS (CONSISTING OF LIGHTING ACCESSORIES AND WIRED PARTITIONS)

6.5.1.1 Scope. This article covers electrical equipment, lighting accessories, and wiring systems used to connect, or contained within, or installed on relocatable wired partitions.

6.5.1.2 General. Wiring systems shall be identified as suitable for

providing power for lighting accessories and appliances in wired partitions. These partitions shall not extend from floor to ceiling.

Exception: Where permitted by the authority having jurisdiction, these relocatable wired partitions shall be permitted to extend to the ceiling but shall not penetrate the ceiling.

(a) Use. These assemblies shall be installed and used only as provided for by this article.

(b) Other Articles. Except as modified by the requirements of this article, all other articles of this Code shall apply.

(c) Hazardous (Classified) Locations. Where used in hazardous (classified) locations, these assemblies shall conform with Articles 5.0 through 5.17 in addition to this article.

6.5.1.3 Wireways. All conductors and connections shall be contained within wiring channels of metal or other material identified as suitable for the conditions of use. Wiring channels shall be free of projections or other conditions that may damage conductor insulation.

6.5.1.4 Partition Interconnections. The electrical connection between partitions shall be a flexible assembly identified for use with wired partitions or shall be permitted to be installed using flexible cord provided all the following conditions are met.

(1) The cord is extra-hard usage type with 3.5 mm² (2.0 mm dia.) or larger conductors, with an insulated grounding conductor.

(2) The partitions are mechanically contiguous.

(3) The cord is not longer than necessary for maximum positioning of the partitions but is in no case to exceed 600 mm.

(4) The cord is terminated at an attachment plug and cord connector with strain relief.

6.5.1.5 Lighting Accessories. Lighting equipment listed and identified for use with wired partitions shall comply with all of the following.

(a) Support. A means for secure attachment or support shall be provided.

(b) Connection. Where cord and plug connection is provided, the

cord length shall be suitable for the intended application but shall not exceed 2 700 mm in length. The cord shall not be smaller than 0.75 mm² (1.0 mm dia.), shall contain an equipment grounding conductor, and shall be of the hard usage type. Connection by other means shall be identified as suitable for the condition of use.

(c) **Receptacle Outlet.** Convenience receptacles shall not be permitted in lighting accessories.

6.5.1.6 Fixed-Type Partitions. Wired partitions that are fixed (secured to building surfaces) shall be permanently connected to the building electrical system by one of the wiring as methods of Chapter 3. Multiwire branch circuits supplying power to permanently connected freestanding partitions shall be provided with a means to disconnect simultaneously all ungrounded conductors at the panelboard where the branch circuit originates.

6.5.1.7 Freestanding-Type Partitions. Partitions of the freestanding type (not fixed) shall be permitted to be permanently connected to the building electrical system by one of the wiring methods of Chapter 3. Multiwire branch circuits supplying power to permanently connected freestanding partitions shall be provided with a means to disconnect simultaneously all ungrounded conductors at the panelboard where the branch circuit originates.

6.5.1.8 Freestanding-Type Partitions, Cord and Plug Connected. Individual partitions of the freestanding type, or groups of individual partitions that are electrically connected, mechanically contiguous, and do not exceed 9 000 mm when assembled, shall be permitted to be connected to the building electrical system by a single flexible cord and plug, provided all of the following conditions are met.

(a) **Flexible Power-Supply Cord.** The flexible power-supply cord shall be extra-hard usage type with 3.5 mm² (2.0 mm dia.) or larger conductors with an insulated equipment grounding conductor and not exceeding 600 mm in length.

(b) **Receptacle Supplying Power.** The receptacle(s) supplying power shall be on a separate circuit serving only panels and no other loads and shall be located not more than 300 mm from the partition that is connected to it.

(c) **Receptacle Outlets, Maximum.** Individual partitions or groups of interconnected individual partitions shall not contain more than thirteen 15-ampere, 125-volt and/or 250-volt receptacle outlets.

(d) **Multiwire Circuits, Not Permitted.** Individual partitions or groups of interconnected individual partitions shall not contain multiwire circuits.

FPN: See 2.10.1.4 for circuits supplying partitions in 6.5.1.6 and 6.5.1.7.

ARTICLE 6.10 — CRANES AND HOISTS

6.10.1 General

6.10.1.1 Scope. This article covers the installation of electrical equipment and wiring used in connection with cranes, monorail hoists, hoists, and all runways.

FPN: For further information, see ANSI B-30, Safety Code for Cranes, Derricks, Hoists, Jacks, and Slings.

6.10.1.2 Special Requirements for Particular Locations.

(a) **Hazardous (Classified) Locations.** All equipment that operates in a hazardous (classified) location shall conform to Article 5.0.

(1) Equipment used in locations that are hazardous because of the presence of flammable gases or vapors shall conform to Article 5.1.

(2) Equipment used in locations that are hazardous because of combustible dust shall conform to Article 5.2.

(3) Equipment used in locations that are hazardous because of the presence of easily ignitable fibers or flyings shall conform to Article 5.3

(b) **Combustible Materials.** Where a crane, hoist, or monorail hoist operates over readily combustible material, the resistors shall be located as permitted in the following:

(1) In a well-ventilated cabinet composed of noncombustible material constructed so that it will not emit flames or molten metal

(2) In a cage or cab constructed of noncombustible material that encloses the sides of the cage or cab from the floor to a point at least 150 mm above the top of the resistors

(c) **Electrolytic Cell Lines.** See 6.68.1.32.

6.10.2 Wiring

6.10.2.1 Wiring Method. Conductors shall be enclosed in raceways or be Type AC cable with insulated grounding conductor, Type MC cable, or Type MI cable unless otherwise permitted in (a) through (e).

(a) **Contact. Conductors.** Contact conductors are not required to be enclosed in raceways.

(b) **Exposed Conductors.** Short lengths of open conductors at resistors, collectors, and other equipment are not required to be enclosed in raceways.

(c) Where flexible connections are necessary, flexible stranded conductors shall be used. Conductors shall be in flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, multiconductor cable, or an approved nonmetallic flexible raceway.

(d) Where multiconductor cable is used with a suspended pushbutton station, the station shall be supported in some satisfactory manner that protects the electric conductors against strain.

(e) Where flexibility is required for power or control to moving parts, a cord suitable for the purpose shall be permitted provided

(1) Suitable strain relief and protection from physical damage is provided, and

(2) In Class 1, Division 2 locations, cord shall be approved for extra-hard usage.

6.10.2.2 Raceway or Cable Terminal Fittings. Conductors leaving raceways or cables shall comply with one of the following.

(a) **Separately Bushed Hole.** A box or terminal fitting that has a

separately bushed hole for each conductor shall be used wherever a change is made from a raceway or cable to open wiring. A fitting used for this purpose shall not contain taps or splices and shall not be used at luminaire (fixture) outlets.

(b) **Bushing in Lieu of a Box.** A bushing shall be permitted to be used in lieu of a box at the end of a rigid metal conduit, intermediate metal conduit, or electrical metallic tubing where the raceway terminates at unenclosed controls or similar equipment including contact conductors, collectors, resistors, brakes, power-circuit limit switches, and dc split-frame motors.

6.10.2.3 Types of Conductors. Conductors shall comply with Table 3.10.1.13 unless otherwise permitted in 6.10.2.3(a) through 6.10.2.3(d).

(a) **Exposed to External Heat or Connected to Resistors.** A conductor(s) exposed to external heat or connected to resistors shall have a flame-resistant outer covering or be covered with flame-resistant tape individually or as a group.

(b) **Contact Conductors.** Contact conductors along runways, crane bridges, and monorails shall be permitted to be bare, and shall be copper, aluminum, steel, or other alloys or combinations thereof in the form of hard drawn wire, tees, angles, tee rails, or other stiff shapes.

(c) **Flexibility.** Where flexibility is required, flexible cord or cable shall be permitted to be used and, where necessary, cable reels or take-up devices shall be used.

(d) **Class 1, Class 2, and Class 3 Circuits.** Conductors for Class 1, Class 2, and Class 3 remote-control, signaling, and power-limited circuits, installed in accordance with Article 7.25, shall be permitted.

6.10.2.4 Rating and Size of Conductors.

(a) **Ampacity.** The allowable ampacities of conductors shall be as shown in Table 6.10.2.4(a).

FPN: For the ampacities of conductors between controllers and resistors, see 4.30.2.3.

(b) Secondary Resistor Conductors. Where the secondary resistor is separate from the controller, the minimum size of the conductors between controller and resistor shall be calculated by multiplying the motor secondary current by the appropriate factor from Table 6.10.2.4(b) and selecting a wire from Table 6.10.2.4(a).

Table 6.10.2.4(B) Secondary Conductor Rating Factors

Time in Seconds		Ampacity of Wire in Percent of Full-Load Secondary Current
On	Off	
5	75	35
10	70	45
15	75	55
15	45	65
15	30	75
15	15	85
Continuous Duty		110

(c) Minimum Size. Conductors external to motors and controls shall not be smaller than 1.25 mm² (1.2 mm dia.) unless otherwise permitted in (1) and (2).

(1) 0.75 mm² (1.0 mm dia.) wire in multiconductor cord shall be permitted for control circuits at not over 7 amperes.

(2) Wires not smaller than 0.50 mm² (0.80 mm dia.) shall be permitted for electronic circuits.

(d) Contact Conductors. Contact wires shall have an ampacity not less than that required by Table 6.10.2.4(d) for 75°C wire, and in no case shall they be smaller than the following:

Table 6.10.2.4(D) Contact Conductor Supports

Distance Between End Strain Insulation or Clamp Type Intermediate Supports (m)	Size of Wire (mm ²)
Less than 9	14
9 – 18	22
Over 18	30

(e) Calculation of Motor Load.

(1) Single Motor. For one motor, 100 percent of motor nameplate full-load ampere rating shall be used.

(2) Multiple Motors on Single Crane or Hoists. For multiple motors on a single crane or hoist, the minimum ampacity of the power supply conductors shall be the nameplate full-load ampere rating of the largest motor or group of motors for any single crane motion, plus 50 percent of the nameplate full-load ampere rating of the next largest motor or group of motors, using that column of Table 6.10.2.4(a) that applies to the longest time-rated motor.

(3) Multiple Cranes or Hoists on a Common Conductor. For multiple cranes or hoists, or both, supplied by a common conductor system, compute the motor minimum ampacity for each crane as defined in 6.10.2.4(e), add them together, and multiply the sum by the appropriate demand factor from Table 6.10.2.4(e).

Table 6.10.2.4(e) Demand Factors

Number of Cranes or Hoists	Demand Factor
2	0.95
3	0.91
4	0.87
5	0.84
6	0.81
7	0.78

(f) Other Loads. Additional loads, such as heating, lighting, and air conditioning, shall be provided for by application of the appropriate sections of this *Code*.

(g) Nameplate. Each crane, monorail, or hoist shall be provided with a visible nameplate marked with the manufacture’s name, the rating in volts, frequency, number of phases, and circuit amperes as calculated in 6.10.2.4(e) and 6.10.2.4(f).

6.10.2.5 Common Return. Where a crane or hoist is operated by more than one motor, a common-return conductor of proper ampacity shall be permitted.

101-120	—	—	—	—	0.40	0.40

Note: Other insulations shown in Table 3.10.1.13 and approved for the temperature and location shall be permitted to be substituted for those shown in Table 6.10.2.4(a). The allowable ampacities of conductors used with 15-minute motors shall be the 30-minute ratings increased by 12 percent.

¹For 5 to 8 simultaneously energized power conductors in raceway or cable, the ampacity of each power conductor shall be reduced to a value of 80 percent of that shown in the table.

²For 4 to 6 simultaneously energized 125°C ac power conductors in raceway or cable, the ampacity of each power conductor shall be reduced to a value of 80 percent of that shown in the table.

6.10.3 Contact Conductors

6.10.3.1 Installation of Contact Conductors. Contact conductors shall comply with (a) through (h).

(a) Locating or Guarding Contact Conductors. Runway contact conductors shall be guarded, and bridge contact conductors shall be located or guarded in a manner that persons cannot inadvertently touch energized current-carrying parts.

(b) Contact Wires. Wires that are used as contact conductors shall be secured at the ends by means of approved strain insulators and shall be mounted on approved insulators so that the extreme limit of displacement of the wire will not bring the latter within less than 40 mm from the surface wired over.

(c) Supports Along Runways. Main contact conductors carried along runways shall be supported on insulating supports placed at intervals not exceeding 6 000 mm unless otherwise permitted in 6.10.3.1(f).

Such conductors shall be separated not less than 150 mm, other than for monorail hoists where a spacing of not less than 75 mm shall be permitted. Where necessary, intervals between insulating supports shall be permitted to be increased up to 12 m, the separation between conductors being increased proportionately.

(d) Supports on Bridges. Bridge wire contact conductors shall be kept at least 65 mm apart, and, where the span exceeds 25 m, insulating saddles shall be placed at intervals not exceeding 15 m.

(e) Supports for Rigid Conductors. Conductors along runways and crane bridges, that are of the rigid type specified in 6.10.2.3(b) and not contained within an approved enclosed assembly, shall be carried on insulating supports spaced at intervals of not more than 80 times the vertical dimension of the conductor, but in no case greater than 4 500 mm, and spaced apart sufficiently to give a clear electrical separation of conductors or adjacent collectors of not less than 25 mm.

(f) Track as Circuit Conductor. Monorail, tram rail, or crane runway tracks shall be permitted as a conductor of current for one

phase of a 3-phase, ac system furnishing power to the carrier, crane, or trolley, provided all of the following conditions are met.

(1) The conductors supplying the other two phases of the power supply are insulated.

(2) The power for all phases is obtained from an insulating transformer.

(3) The voltage does not exceed 300 volts.

(4) The rail serving as a conductor is effectively grounded at the transformer and also shall be permitted to be grounded by the fittings used for the suspension or attachment of the rail to a building or structure.

(g) Electrical Continuity of Contact Conductors. All sections of contact conductors shall be mechanically joined to provide a continuous electrical connection.

(h) Not to Supply Other Equipment. Contact conductors shall not be used as feeders for any equipment other than the crane(s) or hoist(s) that they are primarily designed to serve.

6.10.3.2 Collectors. Collectors shall be designed so as to reduce to a minimum sparking between them and the contact conductor; and, where operated in rooms used for the storage of easily ignitable combustible fibers and materials, they shall comply with Section 5.3.3.56.

6.10.4 Disconnecting Means

6.10.4.1 Runway Conductor Disconnecting Means. A disconnecting means that has a continuous ampere rating not less than that computed in 6.10.2.4(e) and 6.10.2.4(f) shall be provided between the runway contact conductors and the power supply. Such disconnecting means shall consist of a motor-circuit switch, circuit breaker, or molded case switch. This disconnecting means shall be as follows:

- (1) Readily accessible and operable from the ground or floor level
- (2) Capable of being locked in the open position
- (3) Open all ungrounded conductors simultaneously
- (4) Placed within view of the runway contact conductors

6.10.4.2 Disconnecting Means for Cranes and Monorail Hoists. A motor-circuit switch or circuit breaker arranged to be locked in the open position shall be provided in the leads from the runway contact conductors or other power supply on all cranes and monorail hoists. The disconnecting means shall be capable of being locked in the open position.

Where a monorail hoist or hand-propelled crane bridge installation meets all of the following, the disconnecting means shall be permitted to be omitted.

- (1) The unit is controlled from the ground or floor level.
- (2) The unit is within view of the power supply disconnecting means
- (3) No fixed work platform has been provided for servicing the unit.

Where the disconnecting means is not readily accessible from the crane or monorail hoist operating station, means shall be provided at the operating station to open the power circuit to all motors of the crane or monorail hoist.

6.10.4.3 Rating of Disconnecting Means. The continuous ampere rating of the switch or circuit breaker required by 6.10.4.2 shall not be less than 50 percent of the combined short-time ampere rating of the motors, nor less than 75 percent of the sum of the short-time ampere rating of the motors required for any single motion.

6.10.5 Overcurrent Protection

6.10.5.1 Feeders, Runway Conductors.

(a) Single Feeder. The runway supply conductors and main contact conductors of a crane or monorail shall be protected by an overcurrent device(s) that shall not be greater than the largest rating or setting of any branch-circuit protective device plus the sum of the nameplate ratings of all the other loads with application of the demand factors from Table 6.10.2.4(e).

(b) More than One Feeder Circuit. Where more than one feeder circuit is installed to supply runway conductors, each feeder circuit shall be sized and protected in compliance with 6.10.5.1(a).

6.10.5.2 Branch-Circuit Short-Circuit and Ground-Fault Protection. Branch circuits shall be protected in accordance with

6.10.5.1(a). Branch-circuit taps, where made, shall comply with 6.10.5.2(b).

(a) Fuse or Circuit Breaker Rating. Crane, hoist, and monorail hoist motor branch circuits shall be protected by fuses or inverse-time circuit breakers that have a rating in accordance with Table 4.30.4.2. Where two or more motors operate a single motion, the sum of their nameplate current ratings shall be considered as that of a single motor.

(b) Taps.

(1) Multiple Motors. Where two or more motors are connected to the same branch circuit, each tap conductor to an individual motor shall have an ampacity not less than one-third that of the branch circuit. Each motor shall be protected from overload according to 6.10.5.3.

(2) Control Circuits. Where taps to control circuits originate on the load side of a branch-circuit protective device, each tap and piece of equipment shall be protected in accordance with 4.30.6.2.

(3) Brake Coils. Taps without separate overcurrent protection shall be permitted to brake coils.

6.10.5.3 Overload Protection.

(a) Motor and Branch-Circuit Overload Protection. Each motor, motor controller, and branch-circuit conductor shall be protected from overload by one of the following means.

(1) A single motor shall be considered as protected where the branch-circuit overcurrent device meets the rating requirements of 6.10.5.2.

(2) Overload relay elements in each ungrounded circuit conductor, with all relay elements protected from short circuit by the branch-circuit protection.

(3) Thermal sensing devices, sensitive to motor temperature or to temperature and current, that are thermally in contact with the motor winding(s). A hoist or trolley is considered to be protected if the sensing device is connected in the hoist's upper limit switch circuit so as to prevent further hoisting during an overload condition of either motor.

(b) Manually Controlled Motor. If the motor is manually controlled, with spring return controls, the overload protective device shall not be required to protect the motor against stalled rotor conditions.

(c) Multimotor. Where two or more motors drive a single trolley, truck, or bridge and are controlled as a unit and protected by a single set of overload devices with a rating equal to the sum of their rated full-load currents. A hoist or trolley shall be considered to be protected if the sensing device is connected in the hoist's upper limit switch circuit so as to prevent further hoisting during an over temperature condition of either motor.

(d) Hoists and Monorail Hoists. Hoists and monorail hoists and their trolleys that are not used as part of an overhead traveling crane shall not require individual motor overload protection, provided the largest motor does not exceed 7½ hp and all motors are under manual control of the operator.

6.10.6 Control

6.10.6.1 Separate Controllers. Each motor shall be provided with an individual controller unless otherwise permitted in (a) or (b).

(a) Motions with More Than One Motor. Where two or more motors drive a single hoist, carriage, truck, or bridge, they shall be permitted to be controlled by a single controller.

(b) Multiple Motion Controller. One controller shall be permitted to be switched between motors, provided the following conditions:

- (1) The controller has a horsepower rating that is not lower than the horsepower rating of the largest motor.
- (2) Only one motor is operated at one time.

6.10.6.3 Overcurrent Protection. Conductors of control circuits shall be protected against overcurrent. Control circuits shall be considered as protected by overcurrent devices that are rated or set at not more than 300 percent of the ampacity of the control conductors, unless otherwise permitted in (a) or (b).

(a) Taps to Control Transformers. Taps to control transformers shall be considered as protected where the secondary circuit is protected by a device rated or set at not more than 200 percent of the rated secondary current of the transformer and not more than 200 percent of the ampacity of the control circuit conductors.

(b) Continuity of Power. Where the opening of the control circuit would create a hazard, as for example, the control circuit of a hot metal crane, the control circuit conductors shall be considered as being properly protected by the branch-circuit overcurrent devices.

6.10.6.5 Limit Switch. A limit switch or other device shall be provided to prevent the load block from passing the safe upper limit of travel of all hoisting mechanisms.

6.10.6.7 Clearance. The dimension of the working space in the direction of access to live parts that are likely to require examination, adjustment, servicing, or maintenance while energized shall be a minimum of 750 mm. Where controls are enclosed in cabinets, the door(s) shall either open at least 90 degrees or be removable.

6.10.7 Grounding

6.10.7.1 Grounding. All exposed non-current-carrying metal parts of cranes, monorail hoists, hoists, and accessories, including pendant controls, shall be metallically joined together into a continuous electrical conductor so that the entire crane or hoist will be grounded in accordance with Article 2.50. Moving parts, other than removable accessories or attachments, that have metal-to-metal bearing surfaces shall be considered to be electrically connected to each other through the bearing surfaces for grounding purposes. The trolley frame and bridge frame shall not be considered as electrically grounded through the bridge and trolley wheels and its respective tracks. A separate bonding conductor shall be provided.

**ARTICLE 6.20 — ELEVATORS, DUMBWAITERS,
ESCALATORS, MOVING WALKS, WHEELCHAIR
LIFTS, AND STAIRWAY CHAIR LIFTS**

6.20.1 General

6.20.1.1 Scope. This article covers the installation of electrical equipment and wiring used in connection with elevators, dumbwaiters, escalators, moving walks, wheelchair lifts, and stairway chair lifts.

FPN No. 1: For further information, see ASME/ANSI A17.1-2000, Safety Code for Elevators and Escalators.

FPN No. 2: For further information, see ASME/ANSI A17.5-1996 (CSA B44.1-1996), Elevator and Escalator Electrical Equipment Certification Standard.

6.20.1.2 Definitions.

Control Room (for Elevator, Dumbwaiter). An enclosed control space outside the hoistway, intended for full bodily entry, that contains the elevator motor controller. The room could also contain electrical and/or mechanical equipment used directly in connection with the elevator or dumbwaiter but not the electric driving machine or the hydraulic machine.

Control Space (for Elevator, Dumbwaiter). A space inside or outside the hoistway, intended to be accessed with or without full bodily entry, that contains the elevator motor controller. This space could also contain electrical and/or mechanical equipment used directly in connection with the elevator or dumbwaiter but not the electric driving machine or the hydraulic machine.

Control System. The overall system governing the starting, stopping, direction of motion, acceleration, speed, and retardation of the moving member.

Controller, Motion. The electric device(s) for that part of the control system that governs the acceleration, speed, retardation, and stopping of the moving member.

Controller, Motor. The operative units of the control system comprised of the starter device(s) and power conversion equipment

used to drive an electric motor, or the pumping unit used to power hydraulic control equipment.

Controller, Operation. The electric device(s) for that part of the control system that initiates the starting, stopping, and direction of motion in response to a signal from an operating device.

Machine Room (for Elevator, Dumbwaiter). An enclosed machinery space outside the hoistway, intended for full bodily entry, that contains the electrical driving machine or the hydraulic machine. The room could also contain electrical and/or mechanical equipment used directly in connection with the elevator or dumbwaiter.

Machinery Space (for Elevator, Dumbwaiter). A space inside or outside the hoistway, intended to be accessed with or without full bodily entry, that contains elevator or dumbwaiter mechanical equipment, and could also contain electrical equipment used directly in connection with the elevator or dumbwaiter. This space could also contain the electric driving machine or the hydraulic machine.

Operating Device. The car switch, push buttons, key or toggle switch(s), or other devices used to activate the operation controller.

Signal Equipment. Includes audible and visual equipment such as chimes, gongs, lights, and displays that convey information to the user.

FPN No. 1: The motor controller, motion controller, and operation controller may be located in a single enclosure or a combination of enclosures.

FPN No. 2: Figure 6.20.1.2 is for information only.

6.20.1.3 Voltage Limitations. The supply voltage shall not exceed 300 volts between conductors unless otherwise permitted in (a) through (c).

(a) Power Circuits. Branch circuits to door operator controllers and door motors and branch circuits and feeders to motor controllers, driving machine motors, machine brakes, and motor-generator sets shall not have a circuit voltage in excess of 600 volts. Internal voltages of power conversion and functionally associated equipment, including the interconnecting wiring, shall be permitted to have higher voltages provided that all such equipment and wiring shall be listed for the

higher voltages. Where the voltage exceeds 600 volts, warning labels or signs that read “DANGER — HIGH VOLTAGE” shall be attached to the equipment and shall be plainly visible.

(b) Lighting Circuits. Lighting circuits shall comply with the requirements of Article 4.10.

(c) Heating and Air-Conditioning Circuits. Branch circuits for heating and air-conditioning equipment located on the elevator car shall not have a circuit voltage in excess of 600 volts.

6.20.1.4 Live Parts Enclosed. All live parts of electrical apparatus in the hoistways, at the landings, in or on the cars of elevators and dumbwaiters, in the wellways or the landings of escalators or moving walks, or in the runways and machinery spaces of wheelchair lifts and stairway chair lifts shall be enclosed to protect against accidental contact.

FPN: See 1.10.2.2 for guarding of live parts (600 volts, nominal, or less).

6.20.1.5 Working Clearances. Working space shall be provided about controllers, disconnecting means, and other electrical equipment. The minimum working space shall not be less than that specified in 1.10.2.1(a).

Where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner will examine, adjust, service, and maintain the equipment, the clearance requirements of 1.10.2.1(a) shall be waived as permitted in 6.20.1.5(a) through 6.20.1.5(d).

(a) Flexible Connections to Equipment. Electrical equipment in (a)(1) through (a)(4) is provided with flexible leads to all external connections so that it can be repositioned to meet the clear working space requirements of 1.10.2.1(a).

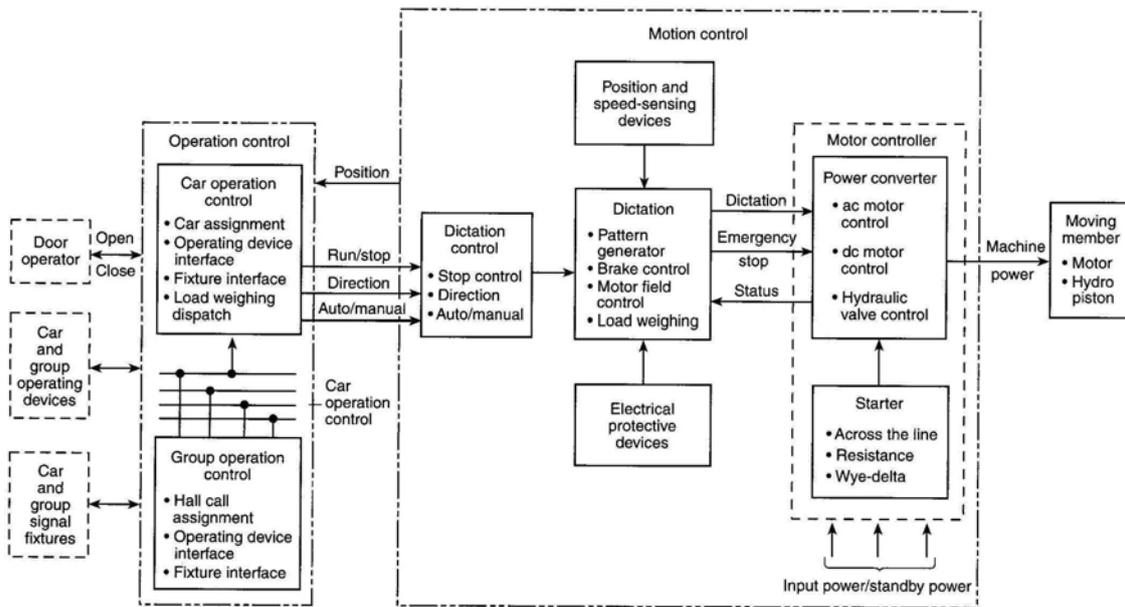

Figure 6.20.1.2 Control System

(1) Controllers and disconnecting means for dumbwaiters, escalator, moving walks, wheelchair lifts, and stairway chair lifts installed in the same space with the driving machine

(2) Controllers and disconnecting means for elevators installed in the hoistway or on the car

(3) Controllers for door operators

(4) Other electrical equipment installed in the hoistway or on the car

(b) **Guards.** Live parts of the electrical equipment are suitably guarded, isolated, or insulated, and the equipment can be examined, adjusted, serviced, or maintained while energized without removal of this protection.

FPN: See definition of Exposed in Article 1.0.

(c) **Examination, Adjusting, and Servicing.** Electrical equipment is not required to be examined, adjusted, serviced, or maintained while energized.

(d) **Low Voltage.** Uninsulated parts are at a voltage not greater than 30 volts rms, 42 volts peak, or 60 volts dc.

6.20.2 Conductors

6.20.2.1 Insulation of Conductors. The insulation of conductors shall comply with 6.20.2.1(a) through 6.20.2.1(d).

FPN: One method of determining that conductors are flame retardant is by testing the conductors to the VW-1 (Vertical-Wire) Flame Test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables, and Flexible Cords.

(a) **Hoistway Door Interlock Wiring.** The conductors to the hoistway door interlocks from the hoistway riser shall be flame retardant and suitable for a temperature of not less than 200°C. Conductors shall be Type SF or equivalent.

(b) **Traveling Cables.** Traveling cables used as flexible connections between the elevator or dumbwaiter car or counterweight and the raceway shall be of the types of elevator cable listed in Table 4.0.1.4 or other approved types.

(c) **Other Wiring.** All conductors in raceways shall have flame-retardant insulation.

Conductors shall be Type MTW, TF, TFF, TFN, TFFN, THHN, THW, THWN, TW, XHHW, hoistway cable, or any other conductor with insulation designated as flame retardant. Shielded conductors shall be permitted, if such conductors are insulated for the maximum nominal circuit voltage applied to any conductor within the cable or raceway system.

(d) **Insulation.** All conductors shall have an insulation voltage rating equal to at least the maximum nominal circuit voltage applied to any conductor within the enclosure, cable, or raceway. Insulations and outer coverings that are marked for limited smoke and are so listed shall be permitted.

6.20.2.2 Minimum Size of Conductors. The minimum size of conductors, other than conductors that form an integral part of control equipment, shall be in accordance with 6.20.2.2(a) and 6.20.2.2(b).

(a) Traveling Cables.

(1) **Lighting Circuits.** For lighting circuits: Copper 2.0 mm² (1.6 mm dia.). Copper 0.50 mm² (0.80 mm dia.) or larger conductors shall be permitted in parallel, provided the ampacity is equivalent to at least that of 2.0 mm² (1.6 mm dia.) copper.

(2) **Other Circuits.** For other circuits, 0.50 mm² (0.80 mm dia.) copper.

(b) **Other Wiring.** 0.20 mm² (0.50 mm dia.) copper. Smaller size listed conductors shall be permitted.

6.20.2.3 Feeder and Branch-Circuit Conductors. Conductors shall have an ampacity in accordance with 6.20.2.3(a) through 6.20.2.3(d). With generator field control, the conductor ampacity shall be based on the nameplate current rating of the driving motor of the motor-generator set that supplies power to the elevator motor.

FPN No. 1: The heating of conductors depends on root-mean-square current values, which, with generator field control, are reflected by the nameplate current rating of the motor-generator driving motor rather than by the rating of the elevator

motor, which represents actual but short-time and intermittent full-load current values.

FPN No. 2: See Figure 6.20.2.3. Single-Line Diagram

(a) Conductors Supplying Single Motor. Conductors supplying a single motor shall have an ampacity not less than the percentage of motor nameplate current determined from 4.30.2.2(a) General and 4.30.2.2(e) Other than Continuous Duty.

FPN: Elevator motor currents, or those of similar functions, may exceed the nameplate value, but since they are inherently intermittent duty, and the heating of the motor and conductors is dependent on the root-mean-square (rms) current value, conductors are sized for duty cycle service as shown in Table 4.30.2.2(e).

(b) Conductors Supplying a Single Motor Controller. Conductors supplying a single motor controller shall have an ampacity not less than the motor controller nameplate current rating, plus all other connected loads.

FPN: Motor controller nameplate current rating may be derived based on the rms value of the motor current using an intermittent duty cycle and other control system loads, if applicable.

(c) Conductors Supplying a Single Power Transformer. Conductors supplying a single power transformer shall have an ampacity not less than the nameplate current rating of the power transformer plus all other connected loads.

FPN No. 1: The nameplate current rating of a power transformer supplying a motor controller reflects the nameplate current rating of the motor controller at line voltage (transformer primary).

FPN No. 2: See Appendix D, Example D17.

(d) Conductors Supplying More than One Motor, Motor Controller, or Power Transformer. Conductors supplying more than one motor, motor controller, or power transformer shall have an ampacity not less than the sum of the nameplate current ratings of the equipment plus all other connected loads. The ampere ratings of motors to be used in the summation shall be determined from Table 4.30.2.2(e), and 4.30.2.4 and 4.30.2.4, Exception No. 1.

FPN: See Appendix D, Examples D16 and D17.

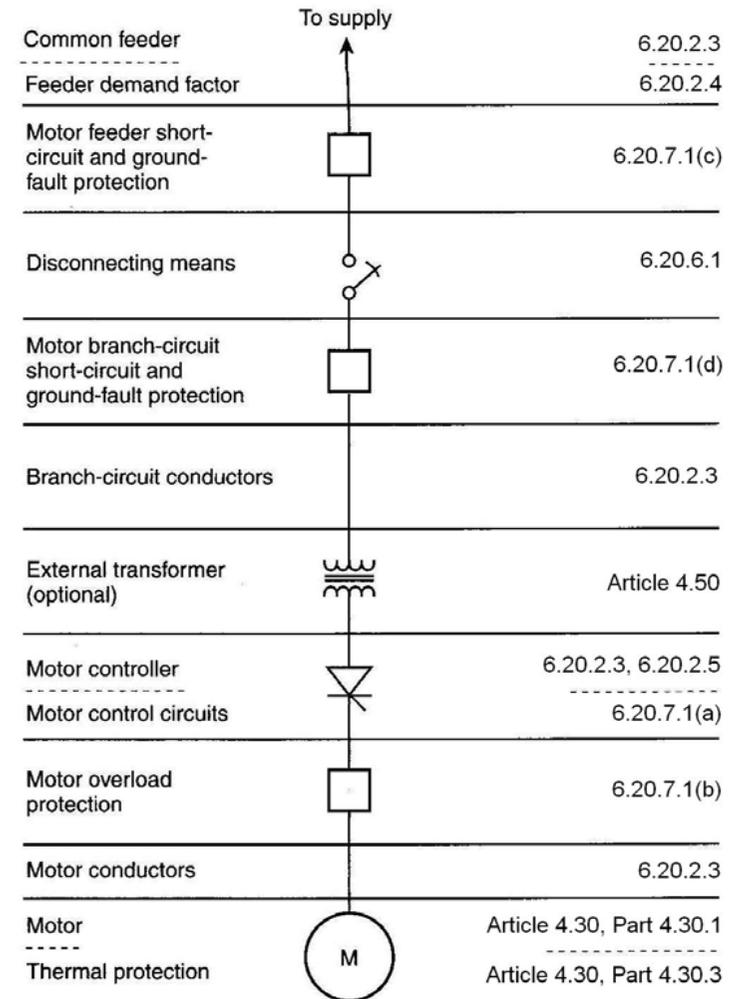

Figure 6.20.2.3 Single-Line Diagram

6.20.2.4 Feeder Demand Factor. Feeder conductors of less ampacity than required by 6.20.2.3 shall be permitted subject to the requirements of Table 6.20.2.4.

FPN: Demand factors are based on 50 percent duty cycle (i.e., half time on and half time off).

Table 6.20.2.4 Feeder Demand Factors for Elevators

Number of Elevators on a Single Feeder	Demand Factor
1	1.00
2	0.95
3	0.90
4	0.85
5	0.82
6	0.79
7	0.77
8	0.75
9	0.73
10 or more	0.72

6.20.2.5 Motor Controller Rating. The motor controller rating shall comply with Section 4.30.7.3. The rating shall be permitted to be less than the nominal rating of the elevator motor, when the controller inherently limits the available power to the motor and is marked as power limited.

FPN: For controller markings, see 430.8.

6.20.3 Wiring

6.20.3.1 Wiring Methods. Conductors and optical fibers located in hoistways, in escalator and moving walk wellways, in wheelchair lifts, stairway chair lift runways, and machinery spaces, in or on cars, and in machine and control rooms, not including the traveling cables connecting the car or counterweight and hoistway wiring, shall be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, rigid nonmetallic conduit, or wireways, or shall be

Type MC, MI, or AC cable unless otherwise permitted in 6.20.3.1(a) through 6.20.3.1(c).

(a) Elevators.

(1) Hoistways.

a. Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit shall be permitted in hoistways between risers and limit switches, interlocks, operating buttons, and similar devices.

b. Cables used in Class 2 power-limited circuits shall be permitted to be installed between risers and signal equipment and operating devices provided the cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

c. Flexible cords and cables that are components of listed equipment and used in circuits operating at 30 volts rms or less or 42 volts dc or less shall be permitted in lengths not to exceed 1 800 mm, provided the cords and cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

d. Flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit or flexible cords and cables, or conductors grouped together and taped or corded that are part of listed equipment, a driving machine, or a driving machine brake shall be permitted in the hoistway, in lengths not to exceed 1 800 mm, without being installed in a raceway and where located to be protected from physical damage and are of a flame-retardant type.

(2) Cars.

a. Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit of 10 mm (12 mm) nominal trade size or larger, not exceeding 1 800 mm in length shall be permitted on cars where located so as to be free from oil and if securely fastened in place.

Exception: Liquidtight flexible nonmetallic conduit of 10 mm (12 mm) nominal trade size or larger, as defined by 3.56.1.2(2) shall be permitted in lengths in excess of 1 800 mm.

b. Hard-service cords and junior hard-service cords that conform to the requirements of Article 4.0 (Table 4.0.1.4) shall be permitted as flexible connections between the fixed wiring on the car and devices on the car doors or gates. Hard-service cords only shall be permitted as flexible connections for the top-of-car operating device or the car-top work light. Devices or fixtures shall be grounded by means of an equipment grounding conductor run with the circuit conductors. Cables with smaller conductors and other types and thicknesses of insulation and jackets shall be permitted as flexible connections between the fixed wiring on the car and devices on the car doors or gates, if listed for this use.

c. Flexible cords and cables that are components of listed equipment and used in circuits operating at 30 volts rms or less or 42 volts dc or less shall be permitted in lengths not to exceed 1 800 mm provided the cords and cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

d. Flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit or flexible cords and cables, or conductors grouped together and taped or corded that are part of listed equipment, a driving machine, or a driving machine brake shall be permitted on the car assembly, in lengths not to exceed 1 800 mm without being installed in a raceway and where located to be protected from physical damage and are of a flame-retardant type.

(3) Within Machine Room, Control Rooms, and Machinery Spaces and Control Spaces.

a. Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit of 10 mm (12 mm) nominal trade size or larger, not exceeding 1 800 mm in length, shall be permitted between control panels and machine motors, machine brakes, motor-generator sets, disconnecting means, and pumping unit motors and valves.

Exception: Liquidtight flexible nonmetallic conduit, as defined in 3.56.1.2(2) shall be permitted to be installed in lengths in excess of 1 800 mm.

b. Where motor-generators, machine motors, or pumping unit motors and valves are located adjacent to or underneath control equipment and are provided with extra-length terminal leads not

exceeding 1 800 mm in length, such leads shall be permitted to be extended to connect directly to controller terminal studs without regard to the carrying-capacity requirements of Articles 4.30 and 4.45. Auxiliary gutters shall be permitted in machine and control rooms between controllers, starters, and similar apparatus.

c. Flexible cords and cables that are components of listed equipment and used in circuits operating at 30 volts rms or less or 42 volts dc or less shall be permitted in lengths not to exceed 1 800 mm provided the cords and cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

d. On existing or listed equipment, conductors shall also be permitted to be grouped together and taped or corded without being installed in a raceway. Such cable groups shall be supported at intervals not over 900 mm and located so as to be protected from physical damage.

(4) Counterweight. Flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit or flexible cords and cables, or conductors grouped together and taped or corded that are part of listed equipment, a driving machine, or a driving machine brake shall be permitted on the counterweight assembly, in lengths not to exceed 1 800 mm without being installed in a raceway and where located to be protected from physical damage and are of a flame-retardant type.

(b) Escalators.

(1) Wiring Methods. Flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit shall be permitted in escalator and moving walk wellways. Flexible metal conduit or liquidtight flexible conduit of 10 mm (12 mm) nominal trade size shall be permitted in lengths not in excess of 1 800 mm.

Exception: 10 mm (12 mm) nominal trade size or larger liquidtight flexible nonmetallic conduit, as defined in 3.56.1.2(2), shall be permitted to be installed in lengths in excess of 1 800 mm.

(2) Class 2 Circuit Cables. Cables used in Class 2 power-limited circuits shall be permitted to be installed within escalators and moving walkways provided the cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

(3) Flexible Cords. Hard-service cords that conform to the requirements of Article 4.0 (Table 4.0.1.4) shall be permitted as flexible connections on escalators and moving walk control panels and disconnecting means where the entire control panel and disconnecting means are arranged for removal from machine spaces as permitted in 6.20.1.5.

(c) Wheelchair Lifts and Stairway Chair Lift Raceways.

(1) Wiring Methods. Flexible metal conduit or liquidtight flexible metal conduit shall be permitted in wheelchair lifts and stairway chair lift runways and machinery spaces. Flexible metal conduit or liquidtight flexible conduit of 10 mm (12 mm) nominal trade size shall be permitted in lengths not in excess of 1 800 mm.

Exception: 10 mm (12 mm) nominal trade size or larger liquidtight flexible nonmetallic conduit, as defined in 3.56.1.2(2), shall be permitted to be installed in lengths in excess of 1 800 mm.

(2) Class 2 Circuit Cables. Cables used in Class 2 power-limited circuits shall be permitted to be installed within wheelchair lifts and stairway chair lift runways and machinery spaces provided the cables are supported and protected from physical damage and are of a jacketed and flame-retardant type.

6.20.3.2 Branch Circuits for Car Lighting, Receptacle(s), Ventilation, Heating, and Air Conditioning.

(a) Car Light Source. A separate branch circuit shall supply the car lights, receptacle(s), auxiliary lighting power source, and ventilation on each elevator car. The overcurrent device protecting the branch circuit shall be located in the elevator machine room/machinery space.

(b) Air-Conditioning and Heating Source. A dedicated branch circuit shall supply the air-conditioning and heating units on each elevator car. The overcurrent device protecting the branch circuit shall be located in the elevator machine room/machinery space.

6.20.3.3 Branch Circuit for Machine Room/Machinery Space Lighting and Receptacle(s).

(a) Separate Branch Circuit. A separate branch circuit shall supply

the machine room/ machinery space lighting and receptacle(s).

Required lighting shall not be connected to the load side of a ground-fault circuit interrupter.

(b) Lighting Switch. The machine room lighting switch shall be located at the point of entry to such machine rooms/machinery spaces.

(c) Duplex Receptacle. At least one 125-volt and/or 250-volt, single-phase, duplex receptacle shall be provided in each machine room and machinery space.

FPN: See Safety Code for Elevators and Escalators, ANSI/ASME A17.1-2000, for illumination levels.

6.20.3.4 Branch Circuit for Hoistway Pit Lighting and Receptacles.

(a) Separate Branch Circuit. A separate branch circuit shall supply the hoistway pit lighting and receptacles. Required lighting shall not be connected to the load side of a ground-fault circuit interrupter.

(b) Lighting Switch. The lighting switch shall be located so as to be readily accessible from the pit access door.

(c) Duplex Receptacle. At least one 125-volt and/or 250-volt, single-phase, duplex receptacle shall be provided in the hoistway pit.

FPN: See Safety Code for Elevators and Escalators, ANSI/ASME A17.1-2000, for illumination levels.

6.20.3.5. Branch Circuit for Other Utilization Equipment.

(a) Additional Branch Circuits. Additional branch circuit(s) shall supply utilization equipment not identified in 6.20.3.2, 6.20.3.3, and 6.20.3.4. Other utilization equipment shall be restricted to that equipment identified in 6.20.1.1.

(b) Overcurrent Devices. The overcurrent devices protecting the branch circuit(s) shall be located in the elevator machinery room or control room/machinery space or control space.

6.20.4 Installation of Conductors

6.20.4.1 Metal Wireways and Nonmetallic Wireways. The sum of the cross-sectional area of the individual conductors in a wireway shall not be more than 50 percent of the interior cross-sectional area of the wireway.

Vertical runs of wireways shall be securely supported at intervals not exceeding 4 500 mm and shall have not more than one joint between supports. Adjoining wireway sections shall be securely fastened together to provide a rigid joint.

6.20.4.2 Number of Conductors in Raceways. The sum of the cross-sectional area of the individual conductors in raceways shall not exceed 40 percent of the interior cross-sectional area of the raceway, except as permitted in 6.20.4.1 for wireways.

6.20.4.3 Supports. Supports for cables or raceways in a hoistway or in an escalator or moving walk wellway or wheelchair lift and stairway chair lift runway shall be securely fastened to the guide rail; escalator or moving walk truss; or to the hoistway, wellway, or runway construction.

6.20.4.4 Auxiliary Gutters. Auxiliary gutters shall not be subject to the restrictions of 3.66.2.3(2) as to length or of 3.66.2.13 as to number of conductors.

6.20.4.5 Different Systems in One Raceway or Traveling Cable. Optical fiber cables and conductors for operating devices, operation and motion control, power, signaling, fire alarm, lighting, heating, and air-conditioning circuits of 600 volts or less shall be permitted to be run in the same traveling cable or raceway system if all conductors are insulated for the maximum voltage applied to any conductor within the cables or raceway system and if all live parts of the equipment are insulated from ground for this maximum voltage. Such a traveling cable or raceway shall also be permitted to include shielded conductors and/or one or more coaxial cables, if such conductors are insulated for the maximum voltage applied to any conductor within the cable or raceway system. Conductors shall be permitted to be covered with suitable shielding for telephone, audio, video, or higher frequency communications circuits.

6.20.4.6 Wiring in Hoistways and Machine Rooms.

(a) Uses Permitted. Only such electric wiring, raceways, and cables used directly in connection with the elevator or dumbwaiter, including wiring for signals; for communication with the car; for lighting, heating, air conditioning, and ventilating the elevator car; for fire detecting systems; for pit sump pumps; and for heating, lighting, and ventilating the hoistway, shall be permitted inside the hoistway and the machine room.

(b) Lightning Protection. Bonding of elevator rails (car and/or counterweight) to a lightning protection system grounding down conductor(s), shall be permitted. The lightning protection system grounding down conductor(s) shall not be located within the hoistway. Elevator rails or other hoistway equipment shall not be used as the grounding down conductor for lightning protection systems.

FPN: See Section 2.50.5.17 for bonding requirements. For further information, see Standard for the Installation of Lightning Protection Systems, NFPA 780-2004.

(c) Main Feeders. Main feeders for supplying power to elevators and dumbwaiters shall be installed outside the hoistway unless as follows.

(1) By special permission, feeders for elevators shall be permitted within an existing hoistway if no conductors are spliced within the hoistway.

(2) Feeders shall be permitted inside the hoistway for elevators with driving machine motors located in the hoistway or on the car or counterweight.

6.20.4.7 Electrical Equipment in Garages and Similar Occupancies. Electrical equipment and wiring used for elevators, dumbwaiters, escalators, moving walks, and wheelchair lifts and stairway chair lifts in garages shall comply with the requirements of Article 5.11.

FPN: Garages used for parking or storage and where no repair work is done in accordance with 5.11.1.3 are not classified.

6.20.5 Traveling Cables

6.20.5.1 Suspension of Traveling Cables. Traveling cables shall be suspended at the car and hoistways' ends, or counterweight end where applicable, so as to reduce the strain on the individual copper conductors to a minimum.

Traveling cables shall be supported by one of the following means:

- (1) By its steel supporting member(s)
- (2) By looping the cables around supports for unsupported lengths less than 30 m
- (3) By suspending from the supports by a means that automatically tightens around the cable when tension is increased for unsupported lengths up to 60 m.

FPN: Unsupported length for the hoistway suspension means is that length of cable as measured from the point of suspension in the hoistway to the bottom of the loop, with the elevator car located at the bottom landing. Unsupported length for the car suspension means is that length of cable as measured from the point of suspension on the car to the bottom of the loop, with the elevator car located at the top landing.

6.20.5.2 Hazardous (Classified) Locations. In hazardous (classified) locations, traveling cables shall be of a type approved for hazardous (classified) locations and shall comply with 5.1.3.41, 5.2.3.41, or 5.3.3.41, as applicable.

6.20.5.3 Location of and Protection for Cables. Traveling cable supports shall be located so as to reduce to a minimum the possibility of damage due to the cables coming in contact with the hoistway construction or equipment in the hoistway. Where necessary, suitable guards shall be provided to protect the cables against damage.

6.20.5.4 Installation of Traveling Cables. Traveling cable shall be permitted to be run without the use of a raceway for a distance not exceeding 1 800 mm in length as measured from the first point of support on the elevator car or hoistway wall, or counterweight where applicable, provided the conductors are grouped together and taped or corded, or in the original sheath.

Traveling cables shall be permitted to be continued to elevator controller enclosures and to elevator car and machine room

connections, as fixed wiring, provided they are suitably supported and protected from physical damage.

6.20.6 Disconnecting Means and Control

6.20.6.1 Disconnecting Means. A single means for disconnecting all ungrounded main power supply conductors for each unit shall be provided and be designed so that no pole can be operated independently. Where multiple driving machines are connected to a single elevator, escalator, moving walk, or pumping unit, there shall be one disconnecting means to disconnect the motor(s) and control valve operating magnets.

The disconnecting means for the main power supply conductors shall not disconnect the branch circuit required in 6.20.3.2, 6.20.3.3, and 6.20.3.4.

(a) **Type.** The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position. The disconnecting means shall be a listed device.

FPN: For additional information, see Safety Code for Elevators and Escalators, ASME/ANSI A17.1-2000.

Exception: Where an individual branch circuit supplies a wheelchair lift, the disconnecting means required by 6.20.6.1(c)(4) shall be permitted to comply with 4.30.9.9(c). This disconnecting means shall be listed and shall be capable of being locked in the open position.

(b) **Operation.** No provision shall be made to open or close this disconnecting means from any other part of the premises. If sprinklers are installed in hoistways, machine rooms, or machinery spaces, the disconnecting means shall be permitted to automatically open the power supply to the affected elevator(s) prior to the application of water. No provision shall be made to automatically close this disconnecting means. Power shall only be restored by manual means.

FPN: To reduce hazards associated with water on live elevator electrical equipment.

(c) **Location.** The disconnecting means shall be located where it is readily accessible to licensed electrical practitioner or non licensed

electrical practitioner under the supervision of a licensed electrical practitioner.

(1) On Elevators Without Generator Field Control. On elevators without generator field control, the disconnecting means shall be located within sight of the motor controller. Driving machines or motion and operation controllers not within sight of the disconnecting means shall be provided with a manually operated switch installed in the control circuit to prevent starting. The manually operated switch(s) shall be installed adjacent to this equipment.

Where the driving machine is located in a remote machinery space, a single means for disconnecting all ungrounded main power supply conductors shall be provided and be capable of being locked in the open position.

(2) On Elevators with Generator Field Control. On elevators with generator field control, the disconnecting means shall be located within sight of the motor controller for the driving motor of the motor-generator set. Driving machines, motor-generator sets, or motion and operation controllers not within sight of the disconnecting means shall be provided with a manually operated switch installed in the control circuit to prevent starting. The manually operated switch(s) shall be installed adjacent to this equipment.

Where the driving machine or the motor-generator set is located in a remote machinery space, a single means for disconnecting all ungrounded main power supply conductors, shall be provided and be capable of being locked in the open position.

(3) On Escalators and Moving Walks. On escalators and moving walks, the disconnecting means shall be installed in the space where the controller is located.

(4) On Wheelchair Lifts and Stairway Chair Lifts. On wheelchair lifts and stairway chair lifts, the disconnecting means shall be located within sight of the motor controller.

(d) Identification and Signs. Where there is more than one driving machine in a machine room, the disconnecting means shall be numbered to correspond to the identifying number of the driving machine that they control.

The disconnecting means shall be provided with a sign to identify the location of the supply side overcurrent protective device.

6.20.6.2 Power from More than One Source.

(a) Single-car and Multicar Installations. On single-car and multicar installations, equipment receiving electrical power from more than one source shall be provided with a disconnecting means for each source of electrical power. The disconnecting means shall be within sight of the equipment served.

(b) Warning Sign for Multiple Disconnecting Means. Where multiple disconnecting means are used and parts of the controllers remain energized from a source other than the one disconnected, a warning sign shall be mounted on or next to the disconnecting means. The sign shall be clearly legible and shall read

WARNING — PARTS OF THE CONTROLLER ARE
NOT DE-ENERGIZED BY THIS SWITCH

(c) Interconnection Multicar Controllers. Where interconnections between controllers are necessary for the operation of the system on multicar installations that remain energized from a source other than the one disconnected, a warning sign in accordance with 6.20.6.2(b) shall be mounted on or next to the disconnecting means.

6.20.6.3 CarLight, Receptacle(s), and Ventilation Disconnecting Means. Elevators shall have a single means for disconnecting all ungrounded car light, receptacle(s), and ventilation power-supply conductors for that elevator car.

The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position and shall be located in the machine room for that elevator car. Where there is no machine room or control room, the disconnecting means shall be located in the same space as the disconnecting means required by 6.20.6.1.

The disconnecting means shall be numbered to correspond to the identifying number of the elevator car whose light source they control. The disconnecting means shall be provided with a sign to identify the location of the supply side overcurrent protective device.

6.20.6.4 Heating and Air-Conditioning Disconnecting Means. Elevators shall have a single means for disconnecting all ungrounded car heating and air-conditioning power-supply conductors for that

elevator car.

The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position and shall be located in the machine room for that elevator car. Where there is no machine room or control room, the disconnecting means shall be located in the same space as the disconnecting means required by 6.20.6.1.

Where there is equipment for more than one elevator car in the machine room, the disconnecting means shall be numbered to correspond to the identifying number of the elevator car whose heating and air conditioning source they control.

The disconnecting means shall be provided with a sign to identify the location of the supply side overcurrent protective device.

6.20.6.5. Utilization Equipment Disconnecting Means. Each branch circuit for other utilization equipment shall have a single means for disconnecting all ungrounded conductors. The disconnecting means shall be capable of being locked in the open position and shall be located in the machine room or control room/machine space or control space. Where there is more than one branch circuit for other utilization equipment, the disconnecting means shall be numbered to correspond to the identifying number of the equipment served. The disconnecting means shall be provided with a sign to identify the location of the supply side overcurrent protective device.

6.20.7 Overcurrent Protection

6.20.7.1 Overcurrent Protection. Overcurrent protection shall be provided as follows.

(a) **Operating Devices, Control, and Signaling Circuits.** Operating devices, control and signaling circuits shall be protected against overcurrent in accordance with the requirements of Sections 7.25.2.3 and 7.25.2.4.

Class 2 power-limited circuits shall be protected against overcurrent in accordance with the requirements Notes to Tables 11(a) and 11(b).

(b) **Overload Protection for Motors.** Motor and branch-circuit overload protection shall conform to Part 4.30.3.

(1) Duty on elevator and dumbwaiter driving machine motors and driving motors of motor-generators used with generator field control shall be rated as intermittent. Such motors shall be protected against overload in accordance with 4.30.3.3.

(2) Duty on escalator and moving walk driving machine motors shall be rated as continuous. Such motors shall be protected against overload in accordance with 4.30.3.2.

(3) Escalator and moving walk driving machine motors and driving motors of motor-generator sets shall be protected against running overload as provided in Table 4.30.3.7.

(4) Duty on wheelchair lift and stairway chair lift driving machine motors shall be rated as intermittent. Such motors shall be protected against overload in accordance with 4.30.3.3.

FPN: For further information, see Section 4.30.3.4 for orderly shutdown.

(c) **Motor Feeder Short-Circuit and Ground-Fault Protection.** Motor feeder short-circuit and ground-fault protection shall be as required in Part 4.30.5.

(d) **Motor Branch-Circuit Short-Circuit and Ground-Fault Protection.** Motor branch-circuit short-circuit and ground-fault protection shall be as required in Part 4.30.4.

6.20.7.2 Selective Coordination. Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective devices.

6.20.8 Machine Room

6.20.8.1 Guarding Equipment. Elevator, dumbwaiter, escalator, and moving walk driving machines; motor-generator sets; motor controllers; and disconnecting means shall be installed in a room or enclosure set aside for that purpose unless otherwise permitted in (a) or (b). The room or enclosure shall be secured against unauthorized access.

(a) **Motor Controllers.** Motor controllers shall be permitted outside the spaces herein specified, provided they are in enclosures with doors

or removable panels that are capable of being locked in the closed position and the disconnecting means is located adjacent to or is an integral part of the motor controller. Motor controller enclosures for escalator or moving walks shall be permitted in the balustrade on the side located away from the moving steps or moving treadway. If the disconnecting means is an integral part of the motor controller, it shall be operable without opening the enclosure.

(b) Driving Machines. Elevators with driving machines located on the car, counterweight, or in the hoistway, and driving machines for dumbwaiters, wheelchair lifts, and stairway lifts shall be permitted outside the spaces herein specified.

6.20.9 Grounding

6.20.9.1 Metal Raceways Attached to Cars. Metal raceways, Type MC cable, Type MI cable, or Type AC cable attached to elevator cars shall be bonded to grounded metal parts of the car that they contact.

6.20.9.2 Electric Elevators. For electric elevators, the frames of all motors, elevator machines, controllers, and the metal enclosures for all electrical equipment in or on the car or in the hoistway shall be grounded in accordance with Article 2.50.

6.20.9.3 Nonelectric Elevators. For elevators other than electric having any electric conductors attached to the car, the metal frame of the car, where normally accessible to persons, shall be grounded in accordance with Article 2.50.

6.20.9.4 Escalators, Moving Walks, Wheelchair Lifts, and Stairway Chair Lifts. Escalators, moving walks, wheelchair lifts, and stairway chair lifts shall comply with Article 250.

6.20.9.5 Ground-Fault Circuit-Interrupter Protection for Personnel. Each 125-volt and/or 250-volt, single-phase, 15- and 20-ampere receptacle installed in pits, *in hoistways*, on elevator car tops, and in escalator and moving walk wellways shall be of the ground-fault circuit-interrupter type.

All 125-volt and/or 250-volt, single-phase, 15- and 20-ampere receptacles installed in machine rooms and machinery spaces shall have ground-fault circuit-interrupter protection for personnel.

A single receptacle supplying a permanently installed sump pump shall not require ground-fault circuit-interrupter protection.

6.20.10 Emergency and Standby Power Systems

6.20.10.1 Emergency and Standby Power Systems. An elevator(s) shall be permitted to be powered by an emergency or standby power system.

FPN: See ASME/ANSI A17.1-2000, Rule 2.27.2, and CAN/CSA-B44-1994, Clause 3.12.13, for additional information.

(a) Regenerative Power. For elevator systems that regenerate power back into the power source, which is unable to absorb the regenerative power under overhauling elevator load conditions, a means shall be provided to absorb this power.

(b) Other Building Loads. Other building loads, such as power and lighting shall be permitted as the energy absorption means required in (a) provided that such loads are automatically connected to the emergency or standby power system operating the elevators and are large enough to absorb the elevator regenerative power.

(c) Disconnecting Means. The disconnecting means required by 6.20.6.1 shall disconnect the elevator from both the emergency or standby power system and the normal power system.

Where an additional power source is connected to the load side of the disconnecting means, the disconnecting means required in 6.20.6.1 shall be provided with an auxiliary contact that is positively opened mechanically and the opening shall not be solely dependent on springs. This contact shall cause the additional power source to be disconnected from its load when the disconnecting means is in the open position.

ARTICLE 6.25 — ELECTRIC VEHICLE CHARGING SYSTEM

6.25.1 General

6.25.1.1 Scope. The provisions of this article cover the electrical

conductors and equipment external to an electric vehicle that connect an electric vehicle to a supply of electricity by conductive or inductive means, and the installation of equipment and devices related to electric vehicle charging.

FPN: For industrial trucks, see Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operation, NFPA 505-2002.

6.25.1.2 Definitions.

Electric Vehicle. An automotive-type vehicle for highway use, such as passenger automobiles, buses, trucks, vans, and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current. For the purpose of this article, electric motorcycles and similar type vehicles and off-road self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.

Electric Vehicle Connector. A device that by insertion into an electric vehicle inlet, establishes an electrical connection to the electric vehicle for the purpose of charging and information exchange. This is part of the electric vehicle coupler.

Electric Vehicle Coupler. A mating electric vehicle inlet and electric vehicle connector set.

Electric Vehicle Inlet. The device on the electric vehicle into which the electric vehicle connector is inserted for charging and information exchange. This is part of the electric vehicle coupler. For the purposes of this Code, the electric vehicle inlet is considered to be part of the electric vehicle and not part of the electric vehicle supply equipment.

Electric Vehicle Nonvented Storage Battery. A hermetically-sealed battery comprised of one or more rechargeable electrochemical cells that has no provision for release of excessive gas pressure, or the addition of water or electrolyte, or for external measurements of electrolyte specific gravity.

Electric Vehicle Supply Equipment. The conductors, including the ungrounded, grounded, and equipment grounding conductors and the

electric vehicle connectors, attachment plugs, and all other fittings, devices, power outlets, or apparatuses installed specifically for the purpose of delivering energy from the premises wiring to the electric vehicle.

Personnel Protection System. A system of personnel protection devices and constructional features that when used together provide protection against electric shock of personnel.

6.25.1.3 Other Articles. Wherever the requirements of other articles of this Code and Article 6.25 differ, the requirements of Article 6.25 shall apply.

6.25.1.4 Voltages. Unless other voltages are specified, the nominal ac system voltages of 120, 120/240, 208Y/120, 240, 480Y/277, 480, 600Y/347, and 600 volts shall be used to supply equipment covered by this article.

6.25.1.5 Listed or Labeled. All electrical materials, devices, fittings, and associated equipment shall be listed or labeled.

6.25.2 Wiring Methods

6.25.2.1 Electric Vehicle Coupler. The electric vehicle coupler shall comply with 6.25.2.1(a) through 6.25.2.1(f).

(a) **Polarization.** The electric vehicle coupler shall be polarized unless part of a system identified and listed as suitable for the purpose.

(b) **Noninterchangeability.** The electric vehicle coupler shall have a configuration that is noninterchangeable with wiring devices in other electrical systems. Nongrounding-type electric vehicle couplers shall not be interchangeable with grounding-type electric vehicle couplers.

(c) **Construction and Installation.** The electric vehicle coupler shall be constructed and installed so as to guard against inadvertent contact by persons with parts made live from the electric vehicle supply equipment or the electric vehicle battery.

(d) **Unintentional Disconnection.** The electric vehicle coupler shall be provided with a positive means to prevent unintentional

disconnection.

(e) Grounding Pole. The electric vehicle coupler shall be provided with a grounding pole, unless part of a system identified and listed as suitable for the purpose in accordance with Article 2.50.

(f) Grounding Pole Requirements. If a grounding pole is provided, the electric vehicle coupler shall be designed so that the grounding pole connection is the first to make and the last to break contact.

6.25.3 Equipment Construction

6.25.3.1 Electric Vehicle Supply Equipment. Electric vehicle supply equipment rated at 250-volt, single phase, 15 or 20 amperes or part of a system identified and listed as suitable for the purpose and meeting the requirements of 6.25.3.6, 6.25.3.7, and 6.25.5.2 shall be permitted to be cord and plug connected. All other electric vehicle supply equipment shall be permanently connected and fastened in place. This equipment shall have no exposed live parts.

6.25.3.2 Rating. Electric vehicle supply equipment shall have sufficient rating to supply the load served. For the purposes of this article, electric vehicle charging loads shall be considered to be continuous loads.

6.25.3.3 Markings. The electric vehicle supply equipment shall comply with (a) through (c).

(a) General. All electric vehicle supply equipment shall be marked by the manufacturer

FOR USE WITH ELECTRIC VEHICLES

(b) Ventilation Not Required. Where marking is required by 6.25.5.2(c), the electric vehicle supply equipment shall be clearly marked by the manufacturer.

VENTILATION NOT REQUIRED

The marking shall be located so as to be clearly visible after installation.

(c) Ventilation Required. Where marking is required by 6.25.5.2(d), the electric vehicle supply equipment shall be clearly marked by the manufacturer “Ventilation Required.” The marking shall be located so as to be clearly visible after installation.

6.25.3.4 Means of Coupling. The means of coupling to the electric vehicle shall be either conductive or inductive. Attachment plugs, electric vehicle connectors, and electric vehicle inlets shall be listed or labeled for the purpose.

6.25.3.5 Cable. The electric vehicle supply equipment cable shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Article 4.0 and Table 4.0.1.4. Ampacities shall be as specified in Table 4.0.1.5(a) for 5.5 mm² (2.6 mm dia.) and smaller and Table 4.0.1.5(b) for 8.0 mm² (3.2 mm dia.) and larger. The overall length of the cable shall not exceed 7 600 mm. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

6.25.3.6 Interlock. Electric vehicle supply equipment shall be provided with an interlock that de-energizes the electric vehicle connector and its cable whenever the electric connector is uncoupled from the electric vehicle. An interlock shall not be required for portable cord- and plug-connected electric vehicle supply equipment intended for connection to receptacle outlets rated 125-volts and/or 250-volts, single phase, 15 and 20 amperes.

6.25.3.7 Automatic De-energization of Cable. The electric vehicle supply equipment or the cable-connector combination of the equipment shall be provided with an automatic means to de-energize the cable conductors and electric vehicle connector upon exposure to strain that could result in either cable rupture or separation of the cable from the electric connector and exposure of live parts. Automatic means to de-energize the cable conductors and electric vehicle connector shall not be required for portable cord- and plug-connected electric vehicle supply equipment intended for connection to receptacle outlets rated at 125-volt and/or 250-volt, single phase, 15 and 20 amperes.

6.25.4 Control and Protection

6.25.4.1 Overcurrent Protection. Overcurrent protection for feeders and branch circuits supplying electric vehicle supply equipment shall be sized for continuous duty and shall have a rating of not less than 125 percent of the maximum load of the electric vehicle supply equipment. Where noncontinuous loads are supplied from the same feeder or branch circuit, the overcurrent device shall have a rating of not less than the sum of the noncontinuous loads plus 125 percent of the continuous loads.

6.25.4.2 Personnel Protection System. The electric vehicle supply equipment shall have a listed system of protection against electric shock of personnel. The personnel protection system shall be composed of listed personnel protection devices and constructional features. Where cord- and plug-connected electric vehicle supply equipment is used, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cable not more than 300 mm from the attachment plug.

6.25.4.3 Disconnecting Means. For electric vehicle supply equipment rated more than 60 amperes or more than 150 volts to ground, the disconnecting means shall be provided and installed in a readily accessible location. The disconnecting means shall be capable of being locked in the open position.

6.25.4.5 Loss of Primary Source. Means shall be provided such that upon loss of voltage from the utility or other electric system(s), energy cannot be backfed through the electric vehicle supply equipment to the premises wiring system unless permitted by 6.25.4.6.

6.25.4.6 Interactive Systems. Electric vehicle supply equipment and other parts of a system, either on-board or off-board the vehicle, that are identified for and intended to standby system or an electric power production source or provide for bi-directional power feed shall be listed as suit-system, the requirements of Article 702 shall apply, and when used as an electric power production source, the requirements of Article 7.5 shall apply.

6.25.5 Electric Vehicle Supply Equipment Locations

6.25.5.1 Hazardous (Classified) Locations. Where electric vehicle supply equipment or wiring is installed in a hazardous (classified) location, the requirements of Articles 5.0 through 5.16 shall apply.

6.25.5.2 Indoor Sites. Indoor sites shall include, but not be limited to, integral, attached, and detached residential garages; enclosed and underground parking structures; repair and nonrepair commercial garages; and agricultural buildings.

(a) **Location.** The electric vehicle supply equipment shall be located to permit direct connection to the electric vehicle.

(b) **Height.** Unless specifically listed for the purpose and location, the coupling means of the electric vehicle supply equipment shall be stored or located at a height of not less than 450 mm and not more than 1 200 mm above the floor level.

(c) **Ventilation Not Required.** Where electric vehicle nonvented storage batteries are used or where the electric vehicle supply equipment is listed or labeled as suitable for charging electric vehicles indoors without ventilation and marked in accordance with 6.25.3.3(b), mechanical ventilation shall not be required.

(d) **Ventilation Required.** Where the electric vehicle supply equipment is listed or labeled as suitable for charging electric vehicles that require ventilation for indoor charging and marked in accordance with 6.25.3.3(c), mechanical ventilation, such as a fan, shall be provided. The ventilation shall include both supply and exhaust equipment and shall be permanently installed and located to intake from, and vent directly to, the outdoors. Positive pressure ventilation systems shall only be permitted in buildings or areas that have been specifically designed and approved for that application. Mechanical ventilation requirements shall be determined by one of the methods specified in 6.25.5.2(d)(1) through (d)(4).

(1) **Table Values.** For supply voltages and currents specified in Table 6.25.5.2(d)(1) or Table 6.25.5.2(d)(2), the minimum ventilation requirements shall be specified in Table 6.25.5.2(d)(1) or

6.25.5.2(d)(2) for each of the total number of electric vehicles that can be charged at one time.

(2) Other Values. For supply voltages and currents other than specified in Table 6.25.5.2(d)(1) or Table 6.25.5.2(d)(2), the minimum ventilation requirements shall be calculated by means of the following general formulas as applicable:

a. Single phase:

$$\text{Ventilation}_{\text{single phase}} \text{ in cubic meters per minute (m}^3\text{/min)} = \frac{(\text{volts})(\text{amperes})}{1\,718}$$

b. Three phase:

$$\text{Ventilation}_{\text{three phase}} \text{ in cubic meters per minute (m}^3\text{/min)} = \frac{1.732 (\text{volts})(\text{amperes})}{1\,718}$$

(3) Engineered System. For an electric vehicle supply equipment ventilation system designed by a person qualified to perform such calculations as an integral part of a building's total ventilation system, the minimum ventilation requirements shall be permitted to be determined per calculations specified in the engineering study.

(4) Supply Circuits. The supply circuit to the mechanical ventilation equipment shall be electrically interlocked with the electric vehicle supply equipment and shall remain energized during the entire electric vehicle charging cycle. Electric vehicle supply equipment shall be marked in accordance with 6.25.3.3. Electric vehicle supply equipment receptacles rated at 125-volt and/or 250-volt, single phase, 15 and 20 amperes shall be marked in accordance with 6.25.3.3(c) and shall be switched and the mechanical ventilation system shall be electrically interlocked through the switch supply power to the receptacle.

Table 6.25.5.2(d)(1) Minimum Ventilation Required in Cubic Metres per Minute(m³/min) for Each of the Total Number of Electric Vehicles that Can Be Charged at One Time

Branch-Circuit Ampere Rating	Branch-Circuit Voltage			
	Single Phase		Three Phase	
	115 V	230 V or 115/230 V	230 V or 230Y/133 V	460 V or 460Y/266 V
15	1.004	2.008	—	—
20	1.338	2.677	4.636	9.273
30	2.008	4.015	6.954	13.909

350	—	—	81.135	162.270
400	—	—	92.725	185.451

6.25.5.3 Outdoor Sites. Outdoor sites shall include, but not be limited to, residential carports and driveways, curbside, open parking structures, parking lots, and commercial charging facilities.

(a) Location. The electric vehicle supply equipment shall be located to permit direct connection to the electric vehicle.

(b) Height. Unless specifically listed for the purpose and location, the coupling means of electric vehicle supply equipment shall be stored or located at a height of not less than 600 mm and not more than 1 200 mm above the parking surface.

Table 6.25.5.2(d)(2) Minimum Ventilation Required in Cubic Feet per Minute (cfm) for Each of the Total Number of Electric Vehicles that Can Be Charged at One Time

ARTICLE 6.30 — ELECTRIC WELDERS

6.30.1 General

6.30.1.1 Scope. This article covers apparatus for electric arc welding, resistance welding, plasma cutting, and other similar welding and cutting process equipment that is connected to an electric supply system.

6.30.2 Arc Welders

6.30.2.1 Ampacity of Supply Conductors. The ampacity of conductors for arc welders shall be in accordance with 6.30.2.1(a) and 6.30.2.1(b).

(a) Individual Welders. The ampacity of the supply conductors shall not be less than the I_{eff} value on the rating plate. Alternatively, if the I_{eff} is not given, the ampacity of the supply conductors shall not be less than the current value determined by multiplying the rated primary current in amperes given on the welder rating plate by the factor shown in Table 6.30.2.1(a) based on the duty cycle of the welder.

(b) Group of Welders. Minimum conductor ampacity shall be based on the individual currents determined in 6.30.2.1(a) as the sum of 100 percent of the two largest welders, plus 85 percent of the third largest welder, plus 70 percent of the fourth largest welder, plus 60 percent of all remaining welders.

Exception: Percentage values lower than those given in 6.30.2.1(b) shall be permitted in cases where the work is such that a high-operating duty cycle for individual welders is impossible.

FPN: Duty cycle considers welder loading based on the use to be made of each welder and the number of welders supplied by the conductors that will be in use at the same time. The load value used for each welder considers both the magnitude and the duration of the load while the welder is in use.

Table 6.30.2.1(a) Duty Cycle Multiplication Factors for Arc Welders

Duty Cycle	Multiplier for Arc Welders	
	Nonmotor Generator	Motor Generator
100	1.00	1.00
90	0.95	0.96
80	0.89	0.91
70	0.84	0.86
60	0.78	0.81
50	0.71	0.75
40	0.63	0.69
30	0.55	0.62
20 or less	0.45	0.55

6.30.2.2 Overcurrent Protection. Overcurrent protection for arc welders shall be as provided in 6.30.2.2(a) and 6.30.2.2(b). Where the values as determined by this section do not correspond with the

standard ampere ratings provided in 2.40.1.6 or the rating or setting specified results in unnecessary opening of the overcurrent device, the next higher standard rating or setting shall be permitted.

(a) For Welders. Each welder shall have overcurrent protection rated or set at not more than 200 percent of I_{1max} . Alternatively, if the I_{1max} is not given, the overcurrent protection shall be rated or set at not more than 200 percent of the rated primary current of the welder.

An overcurrent device shall not be required for a welder that has supply conductors protected by an overcurrent device rated or set at not more than 200 percent of I_{1max} or the rated primary current of the welder.

If the supply conductors for a welder are protected by an overcurrent device rated or set at not more than 200 percent of I_{1max} or rated primary current of the welder, a separate overcurrent device shall not be required.

(b) For Conductors. Conductors that supply one or more welders shall be protected by an overcurrent device rated or set at not more than 200 percent of the conductor rating.

FPN: I_{1max} is the maximum value of the rated supply current at maximum rated output. I_{1eff} is the maximum value of the effective supply current, calculated from the rated supply current (I_1), the corresponding duty cycle (duty factor) (X), and the supply current at no-load (I_0) by the following formula.

$$I_{1eff} = \sqrt{I_1^2 X + I_0(1-X)}$$

6.30.2.3 Disconnecting Means. A disconnecting means shall be provided in the supply circuit for each arc welder that is not equipped with a disconnect mounted as an integral part of the welder.

The disconnecting means shall be a switch or circuit breaker, and its rating shall not be less than that necessary to accommodate overcurrent protection as specified under 6.30.2.2.

6.30.2.4 Marking. A rating plate shall be provided for arc welders giving the following information:

- (1) Name of manufacturer
- (2) Frequency

- (3) Number of phases
- (4) Primary voltage
- (5) I_{1max} and I_{1eff} , or rated primary current
- (6) Maximum open-circuit voltage
- (7) Rated secondary current and
- (8) Basis of rating, such as the duty cycle

6.30.2.5 Grounding of Welder Secondary Circuit. The secondary circuit conductors of an arc welder, consisting of the electrode conductor and the work conductor, shall not be considered as premises wiring for the purpose of applying Article 2.50.

FPN: Connecting welder secondary circuits to grounded objects can create parallel paths and can cause objectionable current over equipment grounding conductors.

6.30.3 Resistance Welders

6.30.3.1 Ampacity of Supply Conductors. The ampacity of the supply conductors for resistance welders necessary to limit the voltage drop to a value permissible for the satisfactory performance of the welder is usually greater than that required to prevent overheating as described in 6.30.3.1(a) and 6.30.3.1(b).

(a) Individual Welders. The rated ampacity for conductors for individual welders shall comply with the following.

(1) The ampacity of the supply conductors for a welder that may be operated at different times at different values of primary current or duty cycle shall not be less than 70 percent of the rated primary current for seam and automatically fed welders, and 50 percent of the rated primary current for manually operated nonautomatic welders.

(2) The ampacity of the supply conductors for a welder wired for a specific operation for which the actual primary current and duty cycle are known and remain unchanged shall not be less than the product of the actual primary current and the multiplier specified in Table 6.30.3.1(a)(2) for the duty cycle at which the welder will be operated.

(b) Groups of Welders. The ampacity of conductors that supply two or more welders shall not be less than the sum of the value obtained in accordance with 6.30.3.1(a) for the largest welder supplied and 60 percent of the values obtained for all the other welders

supplied.

FPN: Explanation of Terms

(1) The rated primary current is the rated kilovolt-amperes (kVA) multiplied by 1 000 and divided by the rated primary voltage, using values given on the nameplate.

(2) The actual primary current is the current drawn from the supply circuit during each welder operation at the particular heat tap and control setting used.

(3) The duty cycle is the percentage of the time during which the welder is loaded. For instance, a spot welder supplied by a 60-Hz system (216 000 cycles per hour) making four hundred 15-cycle welds per hour would have a duty cycle of 2.8 percent (400 multiplied by 15, divided by 216 000, multiplied by 100). A seam welder operating 2 cycles “on” and 2 cycles “off” would have a duty cycle of 50 percent.

**Table 6.30.3.1(a)(2) Duty Cycle Multiplication
Factors for Resistance Welders**

Duty Cycle (percent)	Multiplier
50	0.71
40	0.63
30	0.55
25	0.50
20	0.45
15	0.39
10	0.32
7.5	0.27
5 or less	0.22

6.30.3.2 Overcurrent Protection. Overcurrent protection for resistance welders shall be as provided in 6.30.3.2(a) and 6.30.3.2(b). Where the values as determined by this section do not correspond with the standard ampere ratings provided in 2.40.1.6 or the rating or setting specified results in unnecessary opening of the overcurrent device, the next higher standard rating or setting shall be permitted.

(a) For Welders. Each welder shall have an overcurrent device rated or set at not more than 300 percent of the rated primary current of the welder. If the supply conductors for a welder are protected by an overcurrent device rated or set at not more than 200 percent of the rated primary current of the welder, a separate overcurrent device shall not be required.

(b) For Conductors. Conductors that supply one or more welders shall be protected by an overcurrent device rated or set at not more than 300 percent of the conductor rating.

6.30.3.3 Disconnecting Means. A switch or circuit breaker shall be provided by which each resistance welder and its control equipment can be disconnected from the supply circuit. The ampere rating of this disconnecting means shall not be less than the supply conductor ampacity determined in accordance with 6.30.3.1. The supply circuit switch shall be permitted as the welder disconnecting means where the circuit supplies only one welder.

6.30.3.4 Marking. A nameplate shall be provided for each resistance welder giving the following information:

- (1) Name of manufacturer
 - (2) Frequency
 - (3) Primary voltage
 - (4) Rated kilovolt-amperes (kVA) at 50 percent duty cycle
 - (5) Maximum and minimum open-circuit secondary voltage
 - (6) Short-circuit secondary current at maximum secondary voltage,
- and
- (7) Specified throat and gap setting

6.30.4 Welding Cable

6.30.4.1 Conductors. Insulation of conductors intended for use in the secondary circuit of electric welders shall be flame retardant.

6.30.4.2 Installation. Cables shall be permitted to be installed in a dedicated cable tray as provided in 6.30.4.2(a), (b), and (c).

(a) Cable Support. The cable tray shall provide support at not greater than 150 mm intervals.

(b) Spread of Fire and Products of Combustion. The installation shall comply with 3.0.1.21.

(c) Signs. A permanent sign shall be attached to the cable tray at intervals not greater than 6 000 mm. The sign shall read

CABLE TRAY FOR WELDING CABLES ONLY

ARTICLE 6.40 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUIPMENT

6.40.1 General

6.40.1.1 Scope. This article covers equipment and wiring for audio signal generation, recording, processing, amplification and reproduction; distribution of sound; public address; speech input systems; temporary audio system installations; and electronic organs or other electronic musical instruments. This also includes audio systems subject to Part 5.17.6, and Articles 5.18, 5.20, 5.25, and 5.30.

FPN No. 1: Examples of permanently installed distributed audio system locations include, but are not limited to, restaurant, hotel, business office, commercial and retail sales environments, churches, and schools. Both portable and permanently installed equipment locations include, but are not limited to, residences, auditoriums, theaters, stadiums, and movie and television studios. Temporary installations include, but are not limited to, auditoriums, theaters, stadiums (which use both temporary and permanently installed systems), and outdoor events such as fairs, festivals, circuses, public events, and concerts.

FPN No. 2: Fire and burglary alarm signaling devices are specifically not encompassed by this article.

6.40.1.2 Definitions. For purposes of this article, the following definitions apply.

Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

Audio Amplifier or Pre-Amplifier. Electronic equipment that increases the current or voltage, or both, potential of an audio signal

intended for use by another piece of audio equipment. Amplifier is the term used to denote an audio amplifier within this article.

Audio Autotransformer. A transformer with a single winding and multiple taps intended for use with an amplifier loudspeaker signal output.

Audio Signal Processing Equipment. Electrically operated equipment that produces or processes, or both, electronic signals that, when appropriately amplified and reproduced by a loudspeaker, produce an acoustic signal within the range of normal human hearing (typically 20-20 kHz). Within this article, the terms equipment and audio equipment are assumed to be equivalent to audio signal processing equipment.

FPN: This equipment includes, but is not limited to, loudspeakers; headphones; pre-amplifiers; microphones and their power supplies; mixers; MIDI (musical instrument digital interface) equipment or other digital control systems; equalizers, compressors, and other audio signal processing equipment; audio media recording and playback equipment including turntables, tape decks and disk players (audio and multimedia), synthesizers, tone generators, and electronic organs. Electronic organs and synthesizers may have integral or separate amplification and loudspeakers. With the exception of amplifier outputs, virtually all such equipment is used to process signals (utilizing analog or digital techniques) that have nonhazardous levels of voltage or current potential.

Audio System. Within this article, the term audio system means the totality of all equipment and interconnecting wiring used to fabricate a fully functional audio signal processing, amplification, and reproduction system.

Audio Transformer. A transformer with two or more electrically isolated windings and multiple taps intended for use with an amplifier loudspeaker signal output.

Equipment Rack. A framework for the support enclosure, or both, of equipment. May be portable or stationary. See ANSI/EIA/310-D-1992, Cabinets, Racks, Panels and Associated Equipment.

Loudspeaker. Equipment that converts an ac electric signal into an acoustic signal. The term speaker is commonly used to mean loudspeaker.

Maximum Output Power. The maximum output power delivered

by an amplifier into its rated load as determined under specified test conditions. This may exceed the manufacturer's rated output power for the same amplifier.

Mixer. Equipment used to combine and level match a multiplicity of electronic signals, such as from microphones, electronic instruments, and recorded audio.

Mixer-Amplifier. Equipment that combines the functions of a mixer and amplifier within a single enclosure.

Portable Equipment. Equipment fed with portable cords or cables intended to be moved from one place to another.

Powered Loudspeaker. Equipment that consists of a loudspeaker and amplifier within the same enclosure. Other signal processing may also be included.

Rated Load Impedance. The amplifier manufacturer's stated or marked speaker impedance into which an amplifier will deliver its rated output power. 2Ω, 4Ω, and 8Ω are typical ratings.

Rated Output Power. The amplifier manufacturer's stated or marked output power capability into its rated load.

Rated Output Voltage. For audio amplifiers of the constant-voltage type, this is the nominal output voltage when the amplifier is delivering full rated power. Rated output voltage is used for determining approximate acoustic output in distributed speaker systems that typically employ impedance matching transformers. Typical ratings are 25 volts, 70.7 volts, and 100 volts.

Technical Power System. An electrical distribution system with grounding in accordance with 2.50.7.17(d), where the equipment grounding conductor is isolated from the premises grounded conductor except at a single grounded termination point within a branch circuit panelboard, the originating (main breaker) branch-circuit panelboard, or at the premises grounding electrode.

Temporary Equipment. Portable wiring and equipment intended for use with events of a transient or temporary nature where all

equipment is presumed to be removed at the conclusion of the event.

6.40.1.3 Locations and Other Articles. Circuits and equipment shall comply with 6.40.1.3(a) through 6.40.1.3(l), as applicable.

(a) Spread of Fire or Product of Combustion. See 3.0.1.21.

(b) Ducts, Plenums, and Other Air-Handling Spaces. See 3.0.1.22, where installed in ducts or plenums or other space used for environmental air.

FPN: Standard for the Installation of Air Conditioning and Ventilation Systems, NFPA 90A-2002, 2-3.10.1(a), Exception No. 3, permits loudspeakers, loudspeaker assemblies, and their accessories listed in accordance with Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces, UL 2043-1996, to be installed in other spaces used for environmental air (ceiling cavity plenums).

(c) Cable Trays. Cable trays shall be used in accordance with Article 3.18.

FPN: See 7.25.3.21(c) for the use of Class 2, Class 3, and Type PLTC cable in cable trays.

(d) Hazardous (Classified) Locations. Equipment used in hazardous (classified) locations shall comply with the applicable requirements of Chapter 5.

(e) Assembly Occupancies. Equipment used in places of assembly shall comply with Article 5.18.

(f) Theaters, Audience Areas of Motion Picture and Television Studios, and Similar Locations. Equipment used in theaters, audience areas of motion picture and television studios, and similar locations shall comply with Article 5.20.

(g) Carnivals, Circuses, Fairs, and Similar Events. Equipment used in carnivals, circuses, fairs, and similar events shall comply with Article 5.25.

(h) Motion Picture and Television Studios. Equipment used in motion picture and television studios shall comply with Article 5.30.

(i) Swimming Pools, Fountains, and Similar Locations. Audio equipment used in or near swimming pools, fountains, and similar locations shall comply with Article 6.80.

(j) Combination Systems. Where the authority having jurisdiction permits audio systems for paging or music, or both, to be combined with fire alarm systems, the wiring shall comply with Article 7.60.

FPN: For installation requirements for such combination systems, refer to National Fire Alarm Code®, NFPA 72-1996, and Life Safety Code®, NFPA 101®, 1997.

(k) Antennas. Equipment used in audio systems that contain an audio or video tuner and an antenna input shall comply with Article 8.10. Wiring other than antenna wiring that connects such equipment to other audio equipment shall comply with this article.

(l) Generators. Generators shall be installed in accordance with 4.45.1.10 through 4.45.1.12, 4.45.1.14 through 4.45.1.16, and 4.45.1.18.

6.40.1.4 Protection of Electrical Equipment. Amplifiers, loudspeakers, and other equipment shall be so located or protected so as to guard against environmental exposure or physical damage, such as might result in fire, shock, or personal hazard.

6.40.1.5 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.

6.40.1.6 Mechanical Execution of Work. Equipment and cabling shall be installed in a neat and workmanlike manner. Cables for installed systems shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall conform to 3.0.1.4(d) and 3.0.1.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

6.40.1.7 Grounding.

(a) General. Wireways and auxiliary gutters shall be grounded and bonded in accordance with the requirements of Article 2.50. Where the wireway or auxiliary gutter does not contain power-supply wires, the equipment grounding conductor shall not be required to be larger than 2.0 mm² (1.6 mm dia.) copper or its equivalent. Where the wireway or auxiliary gutter contains power-supply wires, the equipment grounding conductor shall not be smaller than specified in 2.50.6.13.

(b) Separately Derived Systems with 60 Volts to Ground. Grounding of separately derived systems with 60 volts to ground shall be in accordance with 6.47.1.6.

(c) Isolated Ground Receptacles. Isolated grounding-type receptacles shall be permitted as described in 2.50.7.17(d), and for the implementation of other technical power systems in compliance with Article 2.50. For separately derived systems with 60 volts to ground, the branch-circuit equipment grounding conductor shall be terminated as required in 6.47.1.6(b).

FPN: See 4.6.1.2(d) for grounding-type receptacles and required identification.

6.40.1.8 Grouping of Conductors. Insulated conductors of different systems grouped or bundled so as to be in close physical contact with each other in the same raceway or other enclosure, or in portable cords or cables, shall comply with 3.0.1.3(c)(1).

6.40.1.9 Wiring Methods.

(a) Wiring to and Between Audio Equipment.

(1) Power Wiring. Wiring and equipment from source of power to and between devices connected to the premises wiring systems shall comply with the requirements of Chapters 1 through 4, except as modified by this article.

(2) Separately Derived Power Supply Wiring. Separately derived systems shall comply with the applicable articles of this Code, except as modified by this article. Separately derived systems with 60 volts to ground shall be permitted for use in audio system installations as specified in Article 6.47.

(3) Other Wiring. All wiring not connected to the premises wiring system or to a wiring system separately derived from the premises wiring system shall comply with Article 7.25.

(b) Auxiliary Power Supply Wiring. Equipment that has a separate input for an auxiliary power supply shall be wired in compliance with Article 7.25. Battery installation shall be in accordance with Article 4.80.

FPN No. 1: This section does not apply to the use of uninterruptable power supply (ups) equipment, or other sources of supply, that are intended to act as a direct replacement for the primary circuit power source and are connected to the primary circuit input.

FPN No. 2: Refer to National Fire Alarm Code, NFPA 72-2002, where equipment is used for a fire alarm system.

(c) Output Wiring and Listing of Amplifiers. Amplifiers with output circuits carrying audio program signals shall be permitted to employ Class 1, Class 2, or Class 3 wiring where the amplifier is listed and marked for use with the specific class of wiring method. Such listing shall ensure the energy output is equivalent to the shock and fire risk of the same class as stated in Article 7.25. Overcurrent protection shall be provided and shall be permitted to be inherent to the amplifier.

Audio circuits wired using Class 1 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 1 wiring methods.

Audio circuits wired using Class 2 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 2 wiring methods.

Audio circuits wired using Class 3 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 3 wiring methods.

FPN No. 1: Amplifiers for Fire Protective Signaling Systems, ANSI/UL 1711-1994, contains requirements for the listing of amplifiers used for fire alarm systems in compliance with National Fire Alarm Code, NFPA 72-2002.

FPN No. 2: Examples of requirements for listing amplifiers used in residential, commercial, and professional use are found in Commercial Audio Equipment, ANSI/UL 813-1996, Professional Video and Audio Equipment, ANSI/UL 1419-1997, Audio-Video Products and Accessories, ANSI/UL 1492-1996, or Audio/Video and Musical Instrument Apparatus for Household, Commercial, and Similar Use, ANSI/UL 6500-1996.

(d) Use of Audio Transformers and Autotransformers. Audio transformers and autotransformers shall only be used for audio signals in a manner so as not to exceed the manufacturer's stated input or output voltage, impedance, or power limitations. The input or output wires of an audio transformer or autotransformer shall be allowed to connect directly to the amplifier or loudspeaker terminals. No electrical terminal or lead shall be required to be grounded or bonded.

6.40.1.10 Audio Systems Near Bodies of Water. Audio systems near bodies of water, either natural or artificial, shall be subject to the following restrictions specified in 6.40.1.10(a) and 6.40.1.10(b).

Exception: This section does not include audio systems intended for use on boats, yachts, or other forms of land or water transportation used near bodies of water, whether or not supplied by branch-circuit power.

FPN: See 6.80.2.8 for installation of underwater audio equipment.

(a) Equipment Supplied by Branch-Circuit Power. Audio system equipment supplied by branch-circuit power shall not be placed laterally within 1 500 mm of the inside wall of a pool, spa, hot tub, or fountain, nor within 1 500 mm of the prevailing or tidal high water mark. The equipment shall be provided with branch-circuit power protected by a ground-fault circuit interrupter where required by other articles.

(b) Equipment Not Supplied by Branch-Circuit Power. Audio system equipment powered by a listed Class 2 power supply or by the output of an amplifier listed as permitting the use of Class 2 wiring shall only be restricted in placement by the manufacturer's recommendations.

FPN: Placement of the power supply or amplifier, if supplied by branch-circuit power, is still subject to 6.40.1.10(a).

6.40.2 Permanent Audio System Installations

6.40.2.1 Use of Flexible Cords and Cables.

(a) Between Equipment and Branch-Circuit Power. Power supply cords for audio equipment shall be suitable for the use and shall

be permitted to be used where the interchange, maintenance, or repair of such equipment is facilitated through the use of a power supply cord.

(b) Between Loudspeakers and Amplifiers, or Between Loudspeakers. Cables used to connect loudspeakers to each other or to an amplifier shall comply with Article 7.25. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(c) Between Equipment. Cables used for the distribution of audio signals between equipment shall comply with Article 7.25. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted. Other cable types and assemblies specified by the equipment manufacturer as acceptable for the use shall be permitted in accordance with 1.10.1.3(b).

(d) Between Equipment and Power Supplies Other than Branch-Circuit Power. The following power supplies, other than branch-circuit power supplies, shall be installed and wired between equipment in accordance with the requirements of this Code for the voltage and power delivered:

- (1) Storage batteries
- (2) Transformers
- (3) Transformer rectifiers.
- (4) Other ac or dc power supplies

FPN: For some equipment, sources such as in (1) and (2) will serve as the only source of power. These could, in turn, be supplied with intermittent or continuous branch-circuit power.

(e) Between Equipment Racks and Premises Wiring System. Flexible cords and cables shall be permitted for the electrical connection of permanently installed equipment racks to the premises wiring system to facilitate access to equipment or for the purpose of isolating the technical ground of the rack from the premises ground. Connection shall be made using either approved plugs and receptacles or by direct connection within an approved enclosure. Flexible cords and cables shall not be subjected to physical manipulation or abuse while the rack is in use.

6.40.2.2 Wiring of Equipment Racks. Equipment racks shall be fabricated of metal and grounded. Bonding shall not be required if the rack is connected to a technical power ground.

Equipment racks shall be wired in a neat and workmanlike manner. Wires, cables, structural components, or other equipment shall not be placed in such a manner as to prevent reasonable access to equipment power switches and resettable or replaceable circuit overcurrent protection devices.

Supply cords or cables, if used, shall terminate within the equipment rack enclosure in an identified connector assembly. The supply cords or cable (and connector assembly, if used) shall have sufficient ampacity to carry the total load connected to the equipment rack and shall be protected by overcurrent devices.

6.40.2.3 Conduit or Tubing.

(a) Number of Conductors. The number of conductors permitted in a single conduit or tubing shall not exceed the percentage fill specified in Table 1, Chapter 9.

(b) Nonmetallic Conduit or Tubing and Insulating Bushings. The use of nonmetallic conduit or tubing and insulating bushings shall be permitted where a technical ground system is employed and shall comply with applicable articles.

6.40.2.4 Wireways, Gutters, and Auxiliary Gutters. The use of metallic and nonmetallic wireways, gutters, and auxiliary gutters shall be permitted for use with audio signal conductors and shall comply with applicable articles with respect to permitted locations, construction, and fill.

6.40.2.5 Loudspeaker Installation in Fire Resistance-Rated Partitions, Walls, and Ceilings. Loudspeakers installed in a fire resistance-rated partition, wall, or ceiling shall be listed for the purpose or installed in an enclosure or recess that maintains the fire resistance rating.

FPN: Fire-rated construction is the fire-resistive classification used in building codes. One method of determining fire rating is testing in accordance with Standard Methods of Tests of Fire Endurance of Building Construction and Materials, NFPA 251-1999.

6.40.3 Portable and Temporary Audio System Installations

6.40.3.1 Multipole Branch-Circuit Cable Connectors. Multipole branch-circuit cable connectors, male and female, for power supply cords and cables shall be constructed so that tension on the cord or cable will not be transmitted to the connections. The female half shall be attached to the load end of the power supply cord or cable. The connector shall be rated in amperes and designed so that differently rated devices cannot be connected together. Alternating-current multipole connectors shall be polarized and comply with 4.6.1.6(a) and 4.6.1.6(b) and 4.6.1.9. Alternating-current or direct-current multipole connectors utilized for connection between loudspeakers and amplifiers, or between loudspeakers, shall not be compatible with nonlocking 15- or 20-ampere rated connectors intended for branch-circuit power, nor with connectors rated 250 volts or greater of either the locking or nonlocking type. Signal cabling not intended for such loudspeaker and amplifier interconnection shall not be permitted to be compatible with multipole branch-circuit cable connectors of any accepted configuration.

FPN: See 4.0.1.10 for pull at terminals.

6.40.3.2 Use of Flexible Cords and Cables.

(a) Between Equipment and Branch-Circuit Power. Power supply cords for audio equipment shall be listed and shall be permitted to be used where the interchange, maintenance, or repair of such equipment is facilitated through the use of a power supply cord.

(b) Between Loudspeakers and Amplifiers, or Between Loudspeakers. Flexible cords and cables used to connect loudspeakers to each other or to an amplifier shall comply with Articles 4.0 and Article 7.25, respectively. Cords and cables listed for portable use, either hard or extra-hard usage as defined by Article 4.0, shall also be permitted. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(c) Between Equipment and/or Between Equipment Racks.

Flexible cords and cables used for the distribution of audio signals between equipment shall comply with Articles 4.0 and Article 7.25, respectively. Cords and cables listed for portable use, either hard or extra-hard service as defined by Article 4.0, shall also be permitted. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(d) Between Equipment, Equipment Racks, and Power Supplies Other than Branch-Circuit Power. Wiring between the following power supplies, other than branch-circuit power supplies, shall be installed, connected, or wired in accordance with the requirements of this Code for the voltage and power required:

- (1) Storage batteries
- (2) Transformers
- (3) Transformer rectifiers
- (4) Other ac or dc power supplies

(e) Between Equipment Racks and Branch-Circuit Power. The supply to a portable equipment rack shall be by means of listed extra-hard usage cords or cables, as defined in Table 4.0.1.4. For outdoor portable or temporary use, the cords or cables shall be further listed as being suitable for wet locations and sunlight resistant. Section 5.20.1.5, 5.20.1.10 and 5.25.1.3 shall apply as appropriate when the following conditions exist:

- (1) Where equipment racks include audio and lighting and/or power equipment
- (2) When using and constructing of cable extensions, adapters, and breakout assemblies

6.40.3.3 Wiring of Equipment Racks. Equipment racks fabricated of metal shall be grounded. Nonmetallic racks with covers (if provided) removed shall not allow access to Class 1, Class 3, or primary circuit power without the removal of covers over terminals or the use of tools. Equipment racks shall be wired in a neat and workmanlike manner. Wires, cables, structural components, or other equipment shall not be placed in such a manner as to prevent reasonable access to equipment power switches and resettable or replaceable circuit overcurrent protection devices.

Wiring that exits the equipment rack for connection to other equipment or to a power supply shall be relieved of strain or otherwise suitably terminated such that a pull on the flexible cord or cable shall not increase the risk of damage to the cable or connected equipment such as to cause an unreasonable risk of fire or electric shock.

6.40.3.4 Environmental Protection of Equipment. Temporary outdoor, unsheltered placement or use of portable equipment not listed for the purpose shall be permitted only where appropriate protection of such equipment from adverse weather conditions is provided to prevent risk of fire or electrical shock. Where the system is intended to remain operable during adverse weather, arrangements shall be made for maintaining operation and ventilation of heat dissipating equipment.

6.40.3.5 Protection of Wiring. Where accessible to the public, flexible cords and cables laid or run on the ground or on the floor shall be covered with approved nonconductive mats. Cables and mats shall be arranged so as not to present a tripping hazard.

6.40.3.6 Equipment Access. Equipment likely to present a risk of fire, electrical shock, or physical injury to the public shall be protected by barriers or supervised by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner so as to prevent public access.

ARTICLE 6.45 — INFORMATION TECHNOLOGY EQUIPMENT

6.45.1.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems, including terminal units, in an information technology equipment room.

FPN: For further information, see Standard for the Protection of Information Technology Equipment, NFPA 75-2003

6.45.1.2 Special Requirements for Information Technology Equipment Room. This article applies, provided all the following conditions are met.

(a) Disconnecting means complying with 6.45.1.10 are provided.

(b) A separate heating/ventilating/air-conditioning (HVAC) system is provided that is dedicated for information technology equipment use and is separated from other areas of occupancy. Any HVAC system that serves other occupancies shall be permitted to also serve the information technology equipment room if fire/smoke dampers are provided at the point of penetration of the room boundary. Such dampers shall operate on activation of smoke detectors and also by operation of the disconnecting means required by 6.45.1.10.

FPN: For further information, see Standard for the Protection of Information Technology Equipment, NFPA 75-2003. Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.

(c) Listed information technology equipment is installed.

(d) The room is occupied only by those personnel needed for the maintenance and functional operation of the installed information technology equipment.

(e) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.

FPN: For further information, see Standard for the Protection of Information Technology Equipment, NFPA 75-2003

6.45.1.5 Supply Circuits and Interconnecting Cables.

(a) **Branch-Circuit Conductors.** The branch-circuit conductors supplying one or more units of a data processing system shall have an ampacity not less than 125 percent of the total connected load.

(b) **Cord-and-Plug Connections.** The data processing system shall be permitted to be connected to a branch circuit by any of the following means:

(1) Flexible cord and an attachment plug cap not to exceed 4 500 m.

(2) Cord set assembly. Where run on the surface of the floor, they shall be protected against physical damage.

(c) Interconnecting Cables. Separate data processing units shall be permitted to be interconnected by means of cables and cable assemblies listed for the purpose. Where run on the surface of the floor, they shall be protected against physical damage.

(d) Under Raised Floors. Power cables, communications cables, connecting cables, interconnecting cables, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following conditions are met:

(1) The raised floor is of suitable construction and the area under the floor is accessible.

(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, metal wireway, surface metal raceway with metal cover, flexible metal conduit, liquidtight flexible metal or nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 3.0.1.11.

(3) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 6.45.1.4(2). The ventilation system shall be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space the circulation of air will cease.

(4) Openings in raised floors for cables protect cables against abrasions and minimize the entrance of debris beneath the floor.

(5) Cables, other than those covered in (2) and those complying with (a), (b), and (c) below, shall be listed as Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room.

a. Interconnecting cables enclosed in a raceway.

b. Interconnecting cables listed with equipment manufactured prior to July 1, 1994, being installed with that equipment.

c. Cable type designations Type TC (Article 3.36); Types CL2, CL3, and PLTC (Article 7.25); Type ITC (Article 7.27); Types NPLF and FPL (Article 7.60); Types OFC and OFN (Article 7.70); Types CM (Article 8.0); Type CATV (Article 8.20). These designations shall be permitted to have an additional letter P or R or G. Green insulated single conductor cables, 14 mm² and larger, marked “for use in cable trays” or “for CT use” shall be permitted for equipment grounding.

FPN: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the “Vertical Tray Flame Test” referenced in the Standard for Electrical Wires, Cables, and Flexible Cords, ANSI/UL 1581-2001. Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m when performing the CSA “Vertical Flame Test — Cables in Cable Trays,” as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-2001.

(6) Abandoned cables shall be removed unless contained in metal raceways.

(e) Securing in Place. Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place.

6.45.1.6 Cables Not in Information Technology Equipment Room.

Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this Code.

FPN: For signaling circuits, refer to Article 7.25; for fiber optic circuits, refer to Article 7.70; and for communications circuits, refer to Article 8.0. For fire alarm systems, refer to Article 7.60.

6.45.1.7 Penetrations. Penetrations of the fire-resistant room boundary shall be in accordance with 3.0.1.21.

6.45.1.10 Disconnecting Means. A means shall be provided to disconnect power to all electronic equipment in the information technology equipment room. There shall also be a similar means to disconnect the power to all dedicated HVAC systems serving the room and cause all required fire/smoke dampers to close. The control for these disconnecting means shall be grouped and identified and shall be readily accessible at the principal exit doors. A single means to control both the electronic equipment and HVAC systems shall be permitted.

Exception: Installations qualifying under the provisions of Article 6.85.

6.45.1.11 Uninterruptible Power Supplies (UPS). Unless otherwise permitted in 6.45.1.11(1) or 6.45.1.11(2), UPS systems installed within the information technology room, and their supply and output

circuits, shall comply with 6.45.1.10. The disconnecting means shall also disconnect the battery from its load.

(a) Installations qualifying under the provisions of Article 6.85.

(b) Power sources limited to 750 volt-amperes or less derived either from UPS equipment or from battery circuits integral to electronic equipment.

6.45.1.15 Grounding. All exposed noncurrent-carrying metal parts of an information technology system shall be grounded in accordance with Article 2.50 or shall be double insulated. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 2.50.2.1(d). Where signal reference structures are installed, they shall be bonded to the equipment grounding system provided for the information technology equipment.

FPN No. 1: The bonding and grounding requirements in the product standards governing this listed equipment ensure that it complies with Article 2.50.

FPN No. 2: Where isolated grounding-type receptacles are used, see 2.50.7.17(d) and 4.6.1.2(d).

6.45.1.16 Marking. Each unit of an information technology system supplied by a branch circuit shall be provided with a manufacturer's nameplate, which shall also include the input power requirements for voltage, frequency, and maximum rated load in amperes.

6.45.1.17 Power Distribution Units. Power distribution units that are used for information technology equipment shall be permitted to have multiple panelboards within a single cabinet, provided that each panelboard has no more than 42 overcurrent devices and the power distribution unit is utilization equipment listed for information technology application.

ARTICLE 6.47 – SENSITIVE ELECTRONIC EQUIPMENT

6.47.1.1 Scope. This article covers the installation and wiring of

separately derived systems operating at 120 volts line-to-line and 60 volts to ground for sensitive electronic equipment.

6.47.1.3 General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in sensitive electronic equipment locations, provided that the following conditions apply:

(1) The system is installed only in commercial or industrial occupancies.

(2) The system's use is restricted to areas under close supervision by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

(3) All of the requirements in 6.47.1.4 through 6.47.1.8 are met.

6.47.1.4 Wiring Methods.

(a) **Panelboards and Overcurrent Protection.** Use of standard single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly marked on the face of the panel or on the inside of the panel doors. Common trip two-pole circuit breakers or a combination two-pole fused disconnecting means that are identified for use at the system voltage shall be provided for both ungrounded conductors in all feeders and branch circuits. Branch circuits and feeders shall be provided with a means to simultaneously disconnect all ungrounded conductors.

(b) **Junction Boxes.** All junction box covers shall be clearly marked to indicate the distribution panel and the system voltage.

(c) **Color Coding.** All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging, or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.

(d) **Voltage Drop.** The voltage drop on any branch circuit shall not exceed 1.5 percent. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.5 percent.

(1) Fixed Equipment. The voltage drop on branch circuits supplying equipment connected using wiring methods in Chapter 3 shall not exceed 1.5 percent. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.5 percent.

(2) Cord-Connected Equipment. The voltage drop on branch circuits supplying receptacles shall not exceed 1 percent. For the purposes of making this calculations, the load connected to the receptacle outlet shall be considered to be 50 percent of the branch-circuit rating. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.0 percent.

FPN: The purpose of this provision is to limit voltage drop to 1.5 percent where portable cords may be used as a means of connecting equipment.

6.47.1.5 Three-Phase Systems. Where 3-phase power is supplied, a separately derived 6-phase “wye” system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than six main disconnects.

6.47.1.6 Grounding.

(a) **General.** The system shall be grounded as provided in 2.50.2.11 as separately derived single-phase 3-wire system.

(b) **Grounding Conductors Required.** Permanently wired utilization equipment and receptacles shall be grounded by means of an equipment grounding conductor run with the circuit conductors to an equipment grounding bus prominently marked “Technical Equipment Ground: in the originating branch-circuit panelboard. The grounding bus shall be connected to the grounded conductor on the line side of the separately derived system’s disconnecting means. The grounding conductor shall not be smaller than that specified in Table 2.50.6.13 and run with the feeder conductors. The technical equipment grounding bus need not be bonded to the panelboard enclosure. Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with this article.

FPN No. 1: See 2.50.6.13 for equipment grounding conductor sizing requirements where circuit conductors are adjusted in size to compensate for voltage drop.

FPN No. 2: These requirements limit the impedance of the ground fault path where only 60 volts apply to a fault condition instead of the usual 120 volts.

6.47.1.7 Receptacles.

(a) **General.** Where receptacles are used as a means of connecting equipment, the following conditions shall be met:

(1) All 15- and 20-ampere receptacles shall be GFCI protected.

(2) All outlet strips, adapters, receptacle covers, and faceplates shall be marked with the following words or equivalent:

WARNING – TECHNICAL POWER
Do not connect to lighting equipment.
For electronic equipment use only.
60/120 V 1 Φ ac
GFCI protected

(3) A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet having one of its current-carrying poles connected to a grounded circuit conductor shall be located within 1 800 mm of all permanently installed 15- or 20-ampere-rated 60/120-volt technical power-system receptacles.

(4) All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and be identified for use with this class of system. All 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

(b) **Isolated Ground Receptacles.** Isolated ground receptacles shall be permitted as described in 2.50.7.17(d); however, the branch circuit

equipment grounding conductor shall be terminated as required in 6.47.1.6(b).

6.47.1.8 Lighting Equipment. Lighting equipment installed under this article for the purpose of reducing electrical noise originating from lighting equipment shall meet the conditions of 6.47.1.8(a) through 6.47.1.8(c).

(a) **Disconnecting Means.** All luminaries (lighting fixtures) connected to separately derived systems operating at 60 volts to ground, and associated control equipment if provided, shall have a disconnecting means that simultaneously opens all ungrounded conductors. The disconnecting means shall be located within sight of the luminaire (lighting fixture) or be capable of being locked in the open position.

(b) **Luminaires (Lighting Fixtures).** All luminaries (lighting fixtures) shall be permanently installed and listed for connection to a separately derived system at 120 volts line-to-line and 60 volts to ground.

(c) **Screw-Shell.** Luminaires installed under this section shall not have an exposed lamp screw-shell.

ARTICLE 6.50 — PIPE ORGANS

6.50.1.1 Scope. This article covers those electrical circuits and parts of electrically operated pipe organs that are employed for the control of the sounding apparatus and keyboards.

6.50.1.3 Other Articles. Electronic organs shall comply with the appropriate provisions of Article 6.40.

6.50.1.4 Source of Energy. The source of power shall be a transformer-type rectifier, the dc potential of which shall not exceed 30 volts dc.

6.50.1.5 Grounding. The rectifier shall be grounded according to the provisions in 2.50.6.3(b).

6.50.1.6 Conductors. Conductors shall comply with 6.50.1.6(a)

through 6.50.1.6(d).

(a) **Size.** Not less than 0.08 mm² (0.3 mm dia.) for electronic signal circuits and not less than 0.125 mm² (mm dia.) for electromagnetic valve supply and the like. A main common-return conductor in the electromagnetic supply shall not be less than 2.0 mm² (1.6 mm dia.).

(b) **Insulation.** Conductors shall have thermoplastic or thermosetting insulation.

(c) **Conductors to Be Cabled.** Except for the common-return conductor and conductors inside the organ proper, the organ sections and the organ console conductors shall be cabled. The common-return conductors shall be permitted under an additional covering enclosing both cable and return conductor, or shall be permitted as a separate conductor and shall be permitted to be in contact with the cable.

(d) **Cable Covering.** Each cable shall be provided with an outer covering, either overall or on each of any subassemblies of grouped conductors. Tape shall be permitted in place of a covering. Where not installed in metal raceway, the covering shall be flame retardant or the cable or each cable subassembly shall be covered with a closely wound fireproof tape.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in the ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

6.50.1.6 Installation of Conductors. Cables shall be securely fastened in place and shall be permitted to be attached directly to the organ structure without insulating supports. Cables shall not be placed in contact with other conductors.

6.50.1.8 Overcurrent Protection. Circuits shall be so arranged that 0.125 mm² (mm dia.) and 0.08 mm² (0.3 mm dia.) conductors shall be protected by an overcurrent device rated at not more than 6 amperes. Other conductor sizes shall be protected in accordance with their ampacity. A common return conductor shall not require overcurrent protection.

ARTICLE 6.60 — X-RAY EQUIPMENT

6.60.1 General

6.60.1.1 Scope. This article covers all X-ray equipment operating at any frequency or voltage for industrial or other nonmedical or nondental use.

FPN: See Part 5.17.5, for X-ray installations in health care facilities.

Nothing in this article shall be construed as specifying safeguards against the useful beam or stray X-ray radiation.

FPN No. 1: Radiation safety and performance requirements of several classes of X-ray equipment are regulated under Public Law 90-602 and are enforced by the Department of Health and Human Services.

FPN No. 2: In addition, information on radiation protection by the National Council on Radiation Protection and Measurements is published as Reports of the National Council on Radiation Protection and Measurement. These reports can be obtained from NCRP Publications, 7910 Woodmont Ave., Suite 1016, Bethesda, MD 20814.

6.60.1.2 Definitions.

Long-Time Rating. A rating based on an operating interval of 5 minutes or longer.

Mobile. X-ray equipment mounted on a permanent base with wheels and/or casters for moving while completely assembled.

Momentary Rating. A rating based on an operating interval that does not exceed 5 seconds.

Portable. X-ray equipment designed to be hand-carried.

Transportable. X-ray equipment to be installed in a vehicle or that may be readily disassembled for transport in a vehicle.

6.60.1.3 Hazardous (Classified) Locations. Unless approved for the location, X-ray and related equipment shall not be installed or operated in hazardous (classified) locations.

FPN: See Part 5.17.4.

6.60.1.4 Connection to Supply Circuit.

(a) Fixed and Stationary Equipment. Fixed and stationary X-ray equipment shall be connected to the power supply by means of a wiring method meeting the general requirements of this Code. Equipment properly supplied by a branch circuit rated at not over 30 amperes shall be permitted to be supplied through a suitable attachment plug cap and hard-service cable or cord.

(b) Portable, Mobile, and Transportable Equipment. Individual branch circuits shall not be required for portable, mobile, and transportable X-ray equipment requiring a capacity of not over 60 amperes. Portable and mobile types of X-ray equipment of any capacity shall be supplied through a suitable hard-service cable or cord. Transportable X-ray equipment of any capacity shall be permitted to be connected to its power supply by suitable connections and hard-service cable or cord.

(c) Over 600 Volts, Nominal. Circuits and equipment operated at more than 600 volts, nominal, shall comply with Article 490.

6.60.1.5 Disconnecting Means. A disconnecting means of adequate capacity for at least 50 percent of the input required for the momentary rating or 100 percent of the input required for the long-time rating of the X-ray equipment, whichever is greater, shall be provided in the supply circuit. The disconnecting means shall be operable from a location readily accessible from the X-ray control. For equipment connected to a 230-volt, nominal, branch circuit of 30 amperes or less, a grounding-type attachment plug cap and receptacle of proper rating shall be permitted to serve as a disconnecting means.

6.60.1.6 Rating of Supply Conductors and Overcurrent Protection.

(a) Branch-Circuit Conductors. The ampacity of supply branch-circuit conductors and the overcurrent protective devices shall not be less than 50 percent of the momentary rating or 100 percent of the long-time rating, whichever is greater.

(b) Feeder Conductors. The rated ampacity of conductors and overcurrent devices of a feeder for two or more branch circuits supplying X-ray units shall not be less than 100 percent of the

momentary demand rating [as determined by (a)] of the two largest X-ray apparatus plus 20 percent of the momentary ratings of other X-ray apparatus.

FPN: The minimum conductor size for branch and feeder circuits is also governed by voltage regulation requirements. For a specific installation, the manufacturer usually specifies minimum distribution transformer and conductor sizes, rating of disconnect means, and overcurrent protection.

6.60.1.7 Wiring Terminals. X-ray equipment not provided with a permanently attached cord or cord set shall be provided with suitable wiring terminals or leads for the connection of power-supply conductors of the size required by the rating of the branch circuit for the equipment.

6.60.1.8 Number of Conductors in Raceway. The number of control circuit conductors installed in a raceway shall be determined in accordance with 3.0.1.17.

6.60.1.9 Minimum Size of Conductors. Size 0.75 mm^2 (1.0 mm dia.) or 1.25 mm^2 (1.2 mm dia.) fixture wires, as specified in Section 7.25.2.7, and flexible cords shall be permitted for the control and operating circuits of X-ray and auxiliary equipment where protected by not larger than 20-ampere overcurrent devices.

6.60.1.10 Equipment Installations. All equipment for new X-ray installations and all used or reconditioned X-ray equipment moved to and reinstalled at a new location shall be of an approved type.

6.60.2 CONTROL

6.60.2.1 Fixed and Stationary Equipment.

(a) **Separate Control Device.** A separate control device, in addition to the disconnecting means, shall be incorporated in the X-ray control supply or in the primary circuit to the high-voltage transformer. This device shall be a part of the X-ray equipment but shall be permitted in a separate enclosure immediately adjacent to the X-ray control unit.

(b) **Protective Device.** A protective device, which shall be permitted to be incorporated into the separate control device, shall be provided to control the load resulting from failures in the high-voltage circuit.

6.60.2.2 Portable and Mobile Equipment. Portable and mobile equipment shall comply with 6.60.2.1, but the manually controlled device shall be located in or on the equipment.

6.60.2.4 Industrial and Commercial Laboratory Equipment.

(a) **Radiographic and Fluoroscopic Types.** All radiographic- and fluoroscopic-type equipment shall be effectively enclosed or shall have interlocks that de-energize the equipment automatically to prevent ready access to live current-carrying parts.

(b) **Diffraction and Irradiation Types.** Diffraction- and irradiation-type equipment or installations not effectively enclosed or provided with interlocks to prevent access to live current-carrying parts during operation shall be provided with a positive means to indicate when they are energized. The indicator shall be a pilot light, readable meter deflection, or equivalent means.

6.60.2.5 Independent Control. Where more than one piece of equipment is operated from the same high-voltage circuit, each piece or each group of equipment as a unit shall be provided with a high-voltage switch or equivalent disconnecting means. This disconnecting means shall be constructed, enclosed, or located so as to avoid contact by persons with its live parts.

6.60.3 Transformers and Capacitors

6.60.3.1 General. Transformers and capacitors that are part of an X-ray equipment shall not be required to comply with Articles 4.50 and 4.60.

6.60.3.2 Capacitors. Capacitors shall be mounted within enclosures of insulating material or grounded metal.

6.60.4 Guarding and Grounding

6.60.4.1 General

(a) **High-Voltage Parts.** All high-voltage parts, including X-ray

tubes, shall be mounted within grounded enclosures. Air, oil, gas, or other suitable insulating media shall be used to insulate the high voltage from the grounded enclosure. The connection from the high-voltage equipment to X-ray tubes and other high-voltage components shall be made with high-voltage shielded cables.

(b) Low-Voltage Cables. Low-voltage cables connecting to oil-filled units that are not completely sealed, such as transformers, condensers, oil coolers, and high-voltage switches, shall have insulation of the oil-resistant type.

6.60.4.2 Grounding. Noncurrent-carrying metal parts of X-ray and associated equipment (controls, tables, X-ray tube supports, transformer tanks, shielded cables, X-ray tube heads, etc.) shall be grounded in the manner specified in Article 2.50. Portable and mobile equipment shall be provided with an approved grounding-type attachment plug cap.

Exception: Battery-operated equipment.

ARTICLE 6.65 — INDUCTION AND DIELECTRIC HEATING

6.65.1 General

6.65.1.1 Scope. This article covers the construction and installation of induction and dielectric heating equipment and accessories for industrial and scientific applications. Medical or dental applications, appliances, or line frequency pipelines and vessels heating are not covered in this article.

FPN No. 1: See Part 4.27.5, for line frequency induction heating of pipelines and vessels.

6.65.1.2 Definitions.

Converting Device. That part of the heating equipment that converts input mechanical or electrical energy to the voltage, current, and frequency suitable for the heating applicator. A converting device shall consist of equipment using mains frequency, all static

multipliers, oscillator-type units using vacuum tubes, inverters using solid state devices, or motor generator equipment.

Dielectric Heating. Dielectric heating is the heating of a nominally insulating material due to its own dielectric losses when the material is placed in a varying electric field.

Heating Equipment. The term heating equipment as used in this article includes any equipment used for heating purposes whose heat is generated by induction or dielectric methods.

Heating Equipment Applicator. The device used to transfer energy between the output circuit and the object or mass to be heated.

Induction Heating, Melting and Welding. The heating of a nominally conductive material due to its own I^2R losses when the material is placed in a varying electromagnetic field.

6.65.1.3 Other Articles. Wiring from the source of power to the heating equipment shall comply with Chapters 1 through 4. Circuits and equipment operated at more than 600 volts, nominal, shall comply with Article 4.90.

6.65.1.4 Hazardous (Classified) Locations Heating equipment shall not be installed in hazardous (classified) locations as defined in Article 5.0 unless the equipment and wiring are designed and approved for the hazardous (classified) locations.

6.65.1.5 Output Circuit. The output circuit shall include all output components external to the converting device, including contactors, switches, bus bars, and other conductors. The current flow from the output circuit to ground under operating and ground-fault conditions shall be limited to a value that does not cause 50 volts or more to ground to appear on any accessible part of the heating equipment and its load. The output circuit shall be permitted to be isolated from ground.

6.65.1.7 Remote Control

(a) Multiple Control Points. Where multiple control points are used for applicator energization, a means shall be provided and

interlocked so that the applicator can be energized from only one control point at a time. A means for de-energizing the applicator shall be provided at each control point.

(b) Foot Switches. Switches operated by foot pressure shall be provided with a shield over the contact button to avoid accidental closing of a foot switch.

6.65.1.10 Ampacity of Supply Conductors. The ampacity of supply conductors shall be determined by 6.65.10 (a) or 6.65.10(b).

(a) Nameplate Rating. The ampacity of conductors supplying one or more pieces of equipment shall not be less than the sum of the nameplate ratings for the largest group of machines capable of simultaneous operation, plus 100 percent of the standby currents of the remaining machines. Where standby currents are not given on the nameplate, the nameplate rating shall be used as the standby current.

(b) Motor-Generator Equipment. The ampacity of supply conductors for motor generator equipment shall be determined in accordance with Part 4.30.2.

6.65.1.11 Overcurrent Protection. Overcurrent protection for the heating equipment shall be provided as specified in Article 2.40. This overcurrent protection shall be permitted to be provided separately or as a part of the equipment.

6.65.1.12 Disconnecting Means. A readily accessible disconnecting means shall be provided to disconnect each heating equipment from its supply circuit. The disconnecting means shall be located within sight from the controller or be capable of being locked in the open position. The rating of this disconnecting means shall not be less than the nameplate rating of the heating equipment. Motor-generator equipment shall comply with Part 4.30.9. The supply circuit disconnecting means shall be permitted to serve as the heating equipment disconnecting means where only one heating equipment is supplied.

6.65.2 Guarding, Grounding, and Labeling

6.65.2.1 Component Interconnection. The interconnection

components required for a complete heating equipment installation shall be guarded.

6.65.2.2 Enclosures. The converting apparatus (including the dc line) and high-frequency electric circuits (excluding the output circuits and remote-control circuits) shall be completely contained within an enclosure or enclosures of noncombustible material.

6.65.2.3 Panel Controls. All panel controls shall be of dead-front construction.

6.65.2.4 Access to Internal Equipment. Doors or detachable panels shall be employed for internal access. Where doors are used giving access to voltages from 500 to 1 000 volts ac or dc, either door locks shall be provided or interlocking shall be installed. Where doors are used giving access to voltages of over 1 000 volts ac or dc, either mechanical lockouts with a disconnecting means to prevent access until voltage is removed from the cubicle, or both door interlocking and mechanical door locks, shall be provided. Detachable panels not normally used for access to such parts shall be fastened in a manner that will make them inconvenient to remove.

6.65.2.5 Warning Labels or Signs. Warning labels or signs that read “DANGER — HIGH VOLTAGE — KEEP OUT” shall be attached to the equipment and shall be plainly visible where unauthorized persons might come in contact with energized parts, even when doors are open or when panels are removed from compartments containing over 250 volts ac or dc.

6.65.2.6 Capacitors. The time and means of discharge shall be in accordance with 4.60.1.6 for capacitors rated 600 volts, nominal, and under. The time and means of discharge shall be in accordance with 4.60.2.5 for capacitors rated over 600 volts, nominal. Capacitor internal pressure switches connected to a circuit-interrupter device shall be permitted for capacitor overcurrent protection.

6.65.2.7 Dielectric Heating Applicator Shielding. Protective cages or adequate shielding shall be used to guard dielectric heating applicators. Interlock switches shall be used on all hinged access doors, sliding panels, or other easy means of access to the applicator. All interlock switches shall be connected in such a manner as to

remove all power from the applicator when any one of the access doors or panels is open.

6.65.2.8 Grounding and Bonding. Grounding or inter-unit bonding, or both, shall be used wherever required for circuit operation, for limiting to a safe value radio frequency potentials between all exposed noncurrent-carrying parts of the equipment and earth ground, between all equipment parts and surrounding objects, and between such objects and earth ground. Such grounding and bonding shall be installed in accordance with Parts 2.50.2 and 2.50.5.

FPN: Under certain conditions, contact between the object being heated and the applicator results in an unsafe condition, such as eruption of heated materials. This unsafe condition may be prevented by grounding of the object being heated and ground detection.

6.65.2.9 Marking. Each heating equipment shall be provided with a nameplate giving the manufacturer's name and model identification and the following input data: line volts, frequency, number of phases, maximum current, full-load kilovolt-amperes (kVA), and full-load power factor. Additional data shall be permitted.

ARTICLE 6.68 — ELECTROLYTIC CELLS

6.68.1.1 Scope. The provisions of this article apply to the installation of the electrical components and accessory equipment of electrolytic cells, electrolytic cell lines, and process power supply for the production of aluminum, cadmium, chlorine, copper, fluorine, hydrogen peroxide, magnesium, sodium, sodium chlorate, and zinc. Not covered by this article are cells used as a source of electric energy and for electroplating processes and cells used for the production of hydrogen.

FPN No. 1: In general, any cell line or group of cell lines operated as a unit for the production of a particular metal, gas, or chemical compound may differ from any other cell lines producing the same product because of variations in the particular raw materials used, output capacity, use of proprietary methods or process practices, or other modifying factors to the extent that detailed Code requirements become overly restrictive and do not accomplish the stated purpose of this Code.

FPN No. 2: For further information, see Standard for Electrical Safety Practices in Electrolytic Cell Line Working Zones, IEEE 463-1993.

6.68.1.2 Definitions.

Cell Line. An assembly of electrically interconnected electrolytic cells supplied by a source of direct-current power.

Cell Line Attachments and Auxiliary Equipment. As applied to this article, cell line attachments and auxiliary equipment include, but are not limited to, auxiliary tanks; process piping; duct work; structural supports; exposed cell line conductors; conduits and other raceways; pumps, positioning equipment, and cell cutout or bypass electrical devices. Auxiliary equipment includes tools, welding machines, crucibles, and other portable equipment used for operation and maintenance within the electrolytic cell line working zone.

In the cell line working zone, auxiliary equipment includes the exposed conductive surfaces of ungrounded cranes and crane-mounted cell-servicing equipment.

Electrically Connected. A connection capable of carrying current as distinguished from connection through electromagnetic induction.

Electrolytic Cell. A tank or vat in which electrochemical reactions are caused by applying electrical energy for the purpose of refining or producing usable materials.

Electrolytic Cell Line Working Zone. The cell line working zone is the space envelope wherein operation or maintenance is normally performed on or in the vicinity of exposed energized surfaces of electrolytic cell lines or their attachments.

6.68.1.3 Other Articles.

(a) Lighting, Ventilating, Material Handling. Chapters 1 through 4 shall apply to services, feeders, branch circuits, and apparatus for supplying lighting, ventilating, material handling, and the like, that are outside the electrolytic cell line working zone.

(b) Systems Not Electrically Connected. Those elements of a cell line power-supply system that are not electrically connected to the cell supply system, such as the primary winding of a two-winding transformer, the motor of a motor-generator set, feeders, branch circuits, disconnecting means, motor controllers, and overload

protective equipment shall be required to comply with all applicable provisions of this Code.

(c) Electrolytic Cell Lines. Electrolytic cell lines shall comply with the provisions of Chapters 1, 2, 3, and 4 except as amended in 6.68.1.3(c)(1), (c)(2), (c)(3), or (c)(4).

(1) The electrolytic cell line conductors shall not be required to comply with the provisions of Articles 1.10, 2.10, 2.15, 2.20, and 2.25. See 6.68.1.11.

(2) Overcurrent protection of electrolytic cell dc process power circuits shall not be required to comply with the requirements of Article 240.

(3) Equipment located or used within the electrolytic cell line working zone or associated with the cell line dc power circuits shall not be required to comply with the provisions of Article 2.50.

(4) The electrolytic cells, cell line attachments, and the wiring of auxiliary equipments and devices within the cell line working zone shall not be required to comply with the provisions of Articles 1.10, 2.10, 2.15, 2.20, and 2.25. See 6.68.1.30.

FPN: See 6.68.1.15 for equipment, apparatus, and structural component grounding.

6.68.1.10 Cell Line Working Zone.

(a) Area Covered. The space envelope of the cell line working zone shall encompass any space:

(1) Within 2 400 mm above energized surfaces of electrolytic cell lines or their energized attachments.

(2) Below energized surfaces of electrolytic cell lines or their energized attachments, provided the headroom in the space beneath is less than 2 400 mm.

(3) Within 1 000 mm horizontally from energized surfaces of electrolytic cell lines or their energized attachments or from the space envelope described in 6.68.1.10(a)(1) or (a)(2).

(b) Area Not Covered. The cell line working zone shall not be required to extend through or beyond walls, floors, roofs, partitions, barriers, or the like.

6.68.1.11 Direct-Current Cell Line Process Power Supply.

(a) Not Grounded. The dc cell line process power-supply conductors shall not be required to be grounded.

(b) Metal Enclosures Grounded. All metal enclosures of dc cell line process power-supply apparatus operating at a power-supply potential between terminals of over 50 volts shall be grounded as follows:

(1) Through protective relaying equipment, or

(2) By a minimum 60 mm² copper grounding conductor or a conductor of equal or greater conductance.

(c) Grounding Requirements. The grounding connections required by 6.68.1.11(b) shall be installed in accordance with 2.50.1.8, 2.50.1.10, 2.50.1.12, 2.50.3.19, and 2.50.3.21.

6.68.1.12 Cell Line Conductors.

(a) Insulation and Material. Cell line conductors shall be either bare, covered, or insulated and of copper, aluminum, copper-clad aluminum, steel, or other suitable material.

(b) Size. Cell line conductors shall be of such cross-sectional area that the temperature rise under maximum load conditions and at maximum ambient shall not exceed the safe operating temperature of the conductor insulation or the material of the conductor supports.

(c) Connections. Cell line conductors shall be joined by bolted, welded, clamped, or compression connectors.

6.68.1.13 Disconnecting Means.

(a) More than One Process Power Supply. Where more than one dc cell line process power supply serves the same cell line, a disconnecting means shall be provided on the cell line circuit side of each power supply to disconnect it from the cell line circuit.

(b) Removable Links or Conductors. Removable links or

removable conductors shall be permitted to be used as the disconnecting means.

6.68.1.14 Shunting Means.

(a) **Partial or Total Shunting.** Partial or total shunting of cell line circuit current around one or more cells shall be permitted.

(b) **Shunting One or More Cells.** The conductors, switches, or combination of conductors and switches used for shunting one or more cells shall comply with the applicable requirements of 6.68.1.12.

6.68.1.15 Grounding. For equipment, apparatus, and structural components that are required to be grounded by provisions of Article 6.68, the provisions of Article 2.50 shall apply, except a water pipe electrode shall not be required to be used. Any electrode or combination of electrodes described in 2.50.3.3 shall be permitted.

6.68.1.20 Portable Electrical Equipment.

(a) **Portable Electrical Equipment Not to Be Grounded.** The frames and enclosures of portable electrical equipment used within the cell line working zone shall not be grounded.

Exception No. 1: Where the cell line voltage does not exceed 200 volts dc, these frames and enclosures shall be permitted to be grounded.

Exception No. 2: These frames and enclosures shall be permitted to be grounded where guarded.

(b) **Isolating Transformers.** Electrically powered, hand-held, cord-connected portable equipment with ungrounded frames or enclosures used within the cell line working zone shall be connected to receptacle circuits that have only ungrounded conductors such as a branch circuit supplied by an isolating transformer with an ungrounded secondary.

(c) **Marking.** Ungrounded portable electrical equipment shall be distinctively marked and shall employ plugs and receptacles of a configuration that prevents connection of this equipment to grounding receptacles and that prevents inadvertent interchange of ungrounded and grounded portable electrical equipments.

6.68.1.21 Power Supply Circuits and Receptacles for Portable Electrical Equipment.

(a) **Isolated Circuits.** Circuits supplying power to ungrounded receptacles for hand-held, cord-connected equipments shall be electrically isolated from any distribution system supplying areas other than the cell line working zone and shall be ungrounded. Power for these circuits shall be supplied through isolating transformers. Primaries of such transformers shall operate at not more than 600 volts between conductors and shall be provided with proper overcurrent protection. The secondary voltage of such transformers shall not exceed 300 volts between conductors, and all circuits supplied from such secondaries shall be ungrounded and shall have an approved overcurrent device of proper rating in each conductor.

(b) **Noninterchangeability.** Receptacles and their mating plugs for ungrounded equipment shall not have provision for a grounding conductor and shall be of a configuration that prevents their use for equipment required to be grounded.

(c) **Marking.** Receptacles on circuits supplied by an isolating transformer with an ungrounded secondary shall be a distinctive configuration, distinctively marked, and shall not be used in any other location in the plant.

6.68.1.30 Fixed and Portable Electrical Equipment.

(a) **Electrical Equipment Not Required to Be Grounded.** Alternating-current systems supplying fixed and portable electrical equipments within the cell line working zone shall not be required to be grounded.

(b) **Exposed Conductive Surfaces Not Required to Be Grounded.** Exposed conductive surfaces, such as electrical equipment housings, cabinets, boxes, motors, raceways, and the like, that are within the cell line working zone shall not be required to be grounded.

(c) **Wiring Methods.** Auxiliary electrical equipment such as motors, transducers, sensors, control devices, and alarms, mounted on an

electrolytic cell or other energized surface, shall be connected to premises wiring systems by any of the following means.

(1) Multiconductor hard usage cord.

(2) Wire or cable in suitable raceways or metal or nonmetallic cable trays. If metal conduit, cable tray, armored cable, or similar metallic systems are used, they shall be installed with insulating breaks such that they will not cause a potentially hazardous electrical condition.

(d) **Circuit Protection.** Circuit protection shall not be required for control and instrumentation that are totally within the cell line working zone.

(e) **Bonding.** Bonding of fixed electrical equipment to the energized conductive surfaces of the cell line, its attachments, or auxiliaries shall be permitted. Where fixed electrical equipment is mounted on an energized conductive surface, it shall be bonded to that surface.

6.68.1.31 Auxiliary Nonelectric Connections. Auxiliary nonelectric connections, such as air hoses, water hoses, and the like, to an electrolytic cell, its attachments, or auxiliary equipments shall not have continuous conductive reinforcing wire, armor, braids, and the like. Hoses shall be of a nonconductive material.

6.68.1.32 Cranes and Hoists.

(a) **Conductive Surfaces to Be Insulated from Ground.** The conductive surfaces of cranes and hoists that enter the cell line working zone shall not be required to be grounded. The portion of an overhead crane or hoist that contacts an energized electrolytic cell or energized attachments shall be insulated from ground.

(b) **Hazardous Electrical Conditions.** Remote crane or hoist controls that may introduce hazardous electrical conditions into the cell line working zone shall employ one or more of the following systems:

(1) Isolated and ungrounded control circuit in accordance with 6.68.1.21(a)

(2) Nonconductive rope operator

(3) Pendant pushbutton with nonconductive supporting means and having nonconductive surfaces or ungrounded exposed conductive surfaces

(4) Radio.

6.68.1.40 Enclosures. General-purpose electrical equipment enclosures shall be permitted where a natural draft ventilation system prevents the accumulation of gases.

ARTICLE 6.69 — ELECTROPLATING

6.69.1.1 Scope. The provisions of this article apply to the installation of the electrical components and accessory equipment that supply the power and controls for electroplating, anodizing, electropolishing, and electrostripping. For purposes of this article, the term electroplating shall be used to identify any or all of these processes.

6.69.1.3 General. Equipment for use in electroplating processes shall be identified for such service.

6.69.1.5 Branch-Circuit Conductors. Branch-circuit conductors supplying one or more units of equipment shall have an ampacity of not less than 125 percent of the total connected load. The ampacities for busbars shall be in accordance with 366.10.

6.69.1.6 Wiring Methods. Conductors connecting the electrolyte tank equipment to the conversion equipment shall be in accordance with 6.69.1.6(a) and 6.69.1.6(b).

(a) **Systems Not Exceeding 50 Volts Direct Current.** Insulated conductors shall be permitted to be run without insulated support provided they are protected from physical damage. Bare copper or aluminum conductors shall be permitted where supported on insulators.

(b) **Systems Exceeding 50 Volts Direct Current.** Insulated conductors shall be permitted to be run on insulated supports, provided they are protected from physical damage. Bare copper or aluminum conductors shall be permitted where supported on insulators and guarded against accidental contact up to the point of termination in accordance with 1.10.2.2.

6.69.1.7 Warning Signs. Warning signs shall be posted to indicate the presence of bare conductors.

6.69.1.8 Disconnecting Means.

(a) **More than One Power Supply.** Where more than one power supply serves the same dc system, a disconnecting means shall be provided on the dc side of each power supply.

(b) **Removable Links or Conductors.** Removable links or removable conductors shall be permitted to be used as the disconnecting means.

6.69.1.9 Overcurrent Protection. Direct-current conductors shall be protected from overcurrent by one or more of the following:

- (1) Fuses or circuit breakers,
 - (2) A current-sensing device that operates a disconnecting means,
- or
- (3) Other approved means

ARTICLE 6.70 — INDUSTRIAL MACHINERY

6.70.1.1 Scope. This article covers the definition of, the nameplate data for, and the size and overcurrent protection of supply conductors to industrial machinery.

FPN: For information on the workspace requirements for equipment containing supply conductor terminals, see 1.10.2.1. For information on the workspace requirements for machine power and control equipment, see Electrical Standard for Industrial Machinery, NFPA 79-2002.

6.70.1.2 Definitions.

Industrial Machinery (Machine). A power-driven machine (or a group of machines working together in a coordinated manner), not portable by hand while working, that is used to process material by cutting; forming; pressure; electrical, thermal, or optical techniques; lamination; or a combination of these processes. It can include associated equipment used to transfer material or tooling (including fixtures), assemble/disassemble, inspect or test, or package. [The

associated electrical equipment including the logic controller(s) and associated software or logic together with the machine actuators and sensors are considered as part of the industrial machine].

Industrial Manufacturing System. A systematic array of one or more industrial machines not portable by hand and that includes any associated material handling, manipulating, gauging, measuring, or inspection equipment.

6.70.1.3 Machine Nameplate Data.

(a) **Permanent Nameplate.** A permanent nameplate shall be attached to the control equipment enclosure or machine and shall be plainly visible after installation. The nameplate shall include the following information:

- (1) Supply voltage, phase, frequency, and full-load current
- (2) Maximum ampere rating of the short-circuit and ground-fault protective device
- (3) Ampere rating of largest motor, from the motor nameplate, or load
- (4) Short circuit current rating of the machine industrial control panel based on one of the following:

- a. Short circuit current rating of a listed and labeled machine control enclosure or assembly.
- b. Short circuit current rating established utilizing an approved method.

FPN: UL 508A-2001, Supplement SB, is an example of an approved method.

- (5) Electrical diagram number(s) or the number of the index to the electrical drawings.

The full-load current shown on the nameplate shall not be less than the sum of the full-load currents required for all motors and other equipment that may be in operation at the same time under normal conditions of use. Where unusual type loads, duty cycles, etc., require oversized conductors, the required capacity shall be included in the marked "full-load current." Where more than one incoming supply

circuit is to be provided, the nameplate shall state the above information for each circuit.

FPN: See 4.30.2.2(e) and 4.30.2.6 for duty cycle requirements.

(b) Overcurrent Protection. Where overcurrent protection is provided in accordance with 6.70.1.4(b), the machine shall be marked “overcurrent protection provided at machine supply terminals.”

6.70.1.4 Supply Conductors and Overcurrent Protection.

(a) Size. The size of the supply conductor shall be such as to have an ampacity not less than 125 percent of the full-load current rating of all resistance heating loads plus 125 percent of the full-load current rating of highest rated motor plus the sum of the full-load current ratings of all other connected motors and apparatus that may be in operation at the same time.

FPN No. 1: See the 0 – 2 000-volt ampacity tables of Article 3.10 for ampacity of conductors rated 600 volts and below.

FPN No. 2: See 4.30.2.2(e) and 4.30.2.6 for duty cycle requirements.

(b) Disconnecting Means. A machine shall be considered as an individual unit and therefore shall be provided with disconnecting means. The disconnecting means shall be permitted to be supplied by branch circuits protected by either fuses or circuit breakers. The disconnecting means shall not be required to incorporate overcurrent protection.

(c) Overcurrent Protection. Where furnished as part of the machine, overcurrent protection shall consist of a single circuit breaker or set of fuses, the machine shall bear the marking required in 6.70.1.3, and the supply conductors shall be considered either as feeders or taps as covered by 2.40.2.2.

The rating or setting of the overcurrent protective device for the circuit supplying the machine shall not be greater than the sum of the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device provided with the machine, plus 125 percent of the full-load current rating of all resistance heating loads, plus the sum of the full-load currents of all other motors and apparatus that may be in operation at the same time.

Exception: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted by 4.30.4.2(c), the procedure specified above for determining the maximum rating of the protective device for the circuit supplying the machine shall apply with the following provision. For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table 4.30.4.2 for the type of machine supply circuit protective device employed.

Where no branch-circuit short-circuit and ground-fault protective device is provided with the machine, the rating or setting of the overcurrent protective device shall be based on 4.30.4.2 and 4.30.4.3, as applicable.

ARTICLE 6.75 — ELECTRICALLY DRIVEN OR CONTROLLED IRRIGATION MACHINES

6.75.1 General

6.75.1.1 Scope. The provisions of this article apply to electrically driven or controlled irrigation machines, and to the branch circuits and controllers for such equipment.

6.75.1.2 Definitions.

Center Pivot Irrigation Machines. A multimotored irrigation machine that revolves around a central pivot and employs alignment switches or similar devices to control individual motors.

Collector Rings. An assembly of slip rings for transferring electrical energy from a stationary to a rotating member.

Irrigation Machines. An electrically driven or controlled machine, with one or more motors, not hand portable, and used primarily to transport and distribute water for agricultural purposes.

6.75.1.3 Other Articles. These provisions are in addition to, or amendatory of, the provisions of Article 430 and other articles in this Code that apply except as modified in this article.

6.75.1.4 Irrigation Cable.

(a) **Construction.** The cable used to interconnect enclosures on the structure of an irrigation machine shall be an assembly of stranded, insulated conductors with nonhygroscopic and nonwicking filler in a core of moisture- and flame-resistant nonmetallic material overlaid with a metallic covering and jacketed with a moisture-, corrosion-, and sunlight-resistant nonmetallic material.

The conductor insulation shall be of a type listed in Table 3.10.1.13 for an operating temperature of 75°C and for use in wet locations. The core insulating material thickness shall not be less than 0.76 mm, and the metallic overlay thickness shall not be less than 0.20 mm. The jacketing material thickness shall not be less than 1.27 mm.

A composite of power, control, and grounding conductors in the cable shall be permitted.

(b) **Alternate Wiring Methods.** Installation of other listed cables complying with the construction requirements of 6.75.1.4(a) shall be permitted.

(c) **Supports.** Irrigation cable shall be secured by straps, hangers, or similar fittings identified for the purpose and installed as not to damage the cable. Cable shall be supported at intervals not exceeding 1 200 mm.

(d) **Fittings.** Fittings shall be used at all points where irrigation cable terminates. The fittings shall be designed for use with the cable and shall be suitable for the conditions of service.

6.75.1.5 More than Three Conductors in a Raceway or Cable. The signal and control conductors of a raceway or cable shall not be counted for the purpose of derating the conductors as required in 3.10.1.15(b)(2)a.

6.75.1.6 Marking on Main Control Panel. The main control panel shall be provided with a nameplate that shall give the following information:

- (1) The manufacturer's name, the rated voltage, the phase, and the frequency
- (2) The current rating of the machine, and
- (3) The rating of the main disconnecting means and size of overcurrent protection required

6.75.1.7 Equivalent Current Ratings. Where intermittent duty is not involved, the provisions of Article 4.30 shall be used for determining ratings for controllers, disconnecting means, conductors, and the like. Where irrigation machines have inherent intermittent duty, the following determinations of equivalent current ratings in 6.75.1.7(a) and 6.75.1.7(b) shall be used.

(a) **Continuous-Current Rating.** The equivalent continuous-current rating for the selection of branch-circuit conductors and overcurrent protection shall be equal to 125 percent of the motor nameplate full-load current rating of the largest motor plus a quantity equal to the sum of each of the motor nameplate full-load current ratings of all remaining motors on the circuit multiplied by the maximum percent duty cycle at which they can continuously operate.

(b) **Locked-Rotor Current.** The equivalent locked-rotor current rating shall be equal to the numerical sum of the locked-rotor current of the two largest motors plus 100 percent of the sum of the motor nameplate full-load current ratings of all the remaining motors on the circuit.

6.75.1.8 Disconnecting Means.

(a) **Main Controller.** A controller that is used to start and stop the complete machine shall meet all of the following requirements:

- (1) An equivalent continuous current rating not less than specified in 6.75.1.7(a) or 6.75.2.2(a)
- (2) A horsepower rating not less than the value from Table 4.30.13.11(a) and Table 4.30.13.11(b) based on the equivalent locked-rotor current specified in 6.75.1.7(b) or 6.75.2.2(b).

Exception: A listed molded case switch shall not require a horsepower rating.

(b) Main Disconnecting Means. The main disconnecting means for the machine shall provide overcurrent protection and shall be at the point of connection of electrical power to the machine or shall be visible and not more than 15 m from the machine and shall be readily accessible and capable of being locked in the open position. This disconnecting means shall have a horsepower and current rating not less than required for the main controller.

Exception 1: Circuit breakers without marked horsepower ratings shall be permitted in accordance with 4.30.9.9.

Exception 2: A listed fusible molded case switch without marked horsepower ratings shall be permitted.

(c) Disconnecting Means for Individual Motors and Controllers. A disconnecting means shall be provided to simultaneously disconnect all ungrounded conductors for each motor and controller and shall be located as required by Part 4.30.9. The disconnecting means shall not be required to be readily accessible.

6.75.1.9 Branch-Circuit Conductors. The branch-circuit conductors shall have an ampacity not less than specified in 6.75.1.7(a) or 6.75.2.2(a).

6.75.1.10 Several Motors on One Branch Circuit.

(a) Protection Required. Several motors, each not exceeding 2-hp rating, shall be permitted to be used on an irrigation machine circuit protected at not more than 30 amperes at 600 volts, nominal, or less, provided all of the following conditions are met.

(1) The full-load rating of any motor in the circuit shall not exceed 6 amperes.

(2) Each motor in the circuit shall have individual overload protection in accordance with 4.30.3.2.

(3) Taps to individual motors shall not be smaller than 2.0 mm² (1.6 mm dia.) copper and not more than 7 500 mm in length.

(b) Individual Protection Not Required. Individual branch-circuit short-circuit protection for motors and motor controllers shall not be required where the requirements of 6.75.1.10(a) are met.

6.75.1.11 Collector Rings.

(a) Transmitting Current for Power Purposes. Collector rings shall have a current rating not less than 125 percent of the full-load current of the largest device served plus the full-load current of all other devices served, or as determined from 6.75.1.7(a) or 6.75.2.2(a).

(b) Control and Signal Purposes. Collector rings for control and signal purposes shall have a current rating not less than 125 percent of the full-load current of the largest device served plus the full-load current of all other devices served.

(c) Grounding. The collector ring used for grounding shall have a current rating of not less than that sized in accordance with 6.75.1.11(a).

(d) Protection. Collector rings shall be protected from the expected environment and from accidental contact by means of a suitable enclosure.

6.75.1.12 Grounding. The following equipment shall be grounded:

- (1) All electrical equipment on the irrigation machine
- (2) All electrical equipment associated with the irrigation machine
- (3) Metal junction boxes and enclosures, and
- (4) Control panels or control equipment that supply or control electrical equipment to the irrigation machine

Exception: Grounding shall not be required on machines where all of the following provisions are met.

(a) The machine is electrically controlled but not electrically driven.

(b) The control voltage is 30 volts or less.

(c) The control or signal circuits are current limited as specified in Chapter 9, Tables 11(a) and 11(b).

6.75.1.13 Methods of Grounding. Machines that require grounding shall have a noncurrent-carrying equipment grounding conductor provided as an integral part of each cord, cable, or raceway. This

grounding conductor shall be sized not less than the largest supply conductor in each cord, cable, or raceway. Feeder circuits supplying power to irrigation machines shall have an equipment grounding conductor sized according to Table 2.50.6.13.

6.75.1.14 Bonding. Where electrical grounding is required on an irrigation machine, the metallic structure of the machine, metallic conduit, or metallic sheath of cable shall be bonded to the grounding conductor. Metal-to-metal contact with a part that is bonded to the grounding conductor and the noncurrent-carrying parts of the machine shall be considered as an acceptable bonding path.

6.75.1.15 Lightning Protection. If an irrigation machine has a stationary point, a grounding electrode system in accordance with Part 2.50.3, shall be connected to the machine at the stationary point for lightning protection.

6.75.1.16 Energy from More than One Source. Equipment within an enclosure receiving electrical energy from more than one source shall not be required to have a disconnecting means for the additional source, provided that its voltage is 30 volts or less and it meets the requirements of Part 7.25.3.

6.75.1.17 Connectors. External plugs and connectors on the equipment shall be of the weatherproof type. Unless provided solely for the connection of circuits meeting the requirements of Part 7.25.3, external plugs and connectors shall be constructed as specified in 2.50.6.15(a).

6.75.2 Center Pivot Irrigation Machines

6.75.2.1 General. The provisions of Part 6.75.2 are intended to cover additional special requirements that are peculiar to center pivot irrigation machines. See 6.75.1.2 for definition of Center Pivot Irrigation Machines.

6.75.2.2 Equivalent Current Ratings. In order to establish ratings of controllers, disconnecting means, conductors, and the like, for the inherent intermittent duty of center pivot irrigation machines, the following determination shall be used.

(a) Continuous-Current Rating. The equivalent continuous-current rating for the selection of branch-circuit conductors and branch-circuit devices shall be equal to 125 percent of the motor nameplate full-load current rating of the largest motor plus 60 percent of the sum of the motor nameplate full-load current ratings of all remaining motors on the circuit.

(b) Locked-Rotor Current. The equivalent locked-rotor current rating shall be equal to the numerical sum of two times the locked-rotor current of the largest motor plus 80 percent of the sum of the motor nameplate full-load current ratings of all the remaining motors on the circuit.

ARTICLE 6.80 — SWIMMING POOLS, FOUNTAINS, AND SIMILAR INSTALLATIONS

6.80.1 General

6.80.1.1 Scope. The provisions of this article apply to the construction and installation of electrical wiring for and equipment in or adjacent to all swimming, wading, therapeutic, and decorative pools, fountains, hot tubs, spas, and hydromassage bathtubs, whether permanently installed or storable, and to metallic auxiliary equipment, such as pumps, filters, and similar equipment. The term body of water used throughout Part 6.80.1 applies to all bodies of water covered in this scope unless otherwise amended.

6.80.1.2 Definitions.

Cord- and Plug-Connected Lighting Assembly. A lighting assembly consisting of a lighting fixture intended for installation in the wall of a spa, hot tub, or storable pool, and a cord- and plug-connected transformer.

Dry-Niche Luminaire (Lighting Fixture). A lighting fixture intended for installation in the wall of a pool or fountain in a niche that is sealed against the entry of pool water.

Equipment, Fixed. Equipment that is fastened or otherwise secured at a specific location.

Equipment, Portable. Equipment that is actually moved or can easily be moved from one place to another in normal use.

Equipment, Stationary. Equipment that is not easily moved from one place to another place in normal use.

Forming Shell. A structure designed to support a wet-niche lighting fixture assembly and intended for mounting in a pool or fountain structure.

Fountain. As used in this article, the term includes fountains, ornamental pools, display pools, and reflection pools. It does not include drinking fountains.

Hydromassage Bathtub. A permanently installed bathtub equipped with a recirculating piping system, pump, and associated equipment. It is designed so it can accept, circulate, and discharge water upon each use.

Maximum Water Level. The highest level that water can reach before it spills out.

No-Niche Luminaire (Lighting Fixture). A lighting fixture intended for installation above or below the water without a niche.

Packaged Spa or Hot Tub Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a spa or hot tub. Equipment may include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Packaged Therapeutic Tub or Hydrotherapeutic Tank Equipment Assembly. A factory-fabricated unit consisting of water-circulating, heating, and control equipment mounted on a common base, intended to operate a therapeutic tub or hydrotherapeutic tank. Equipment may include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Permanently Installed Decorative Fountains and Reflection Pools. Those that are constructed in the ground, on the ground, or in a building in such a manner that the fountain cannot be readily disassembled for storage, whether or not served by electrical circuits

of any nature. These units are primarily constructed for their aesthetic value and are not intended for swimming or wading.

Permanently Installed Swimming, Wading, and Therapeutic Pools. Those that are constructed in the ground or partially in the ground, and all others capable of holding water in a depth greater than 1 000 mm and all pools installed inside of a building, regardless of water depth, whether or not served by electrical circuits of any nature.

Pool. As used in this article, the term includes swimming, wading, and permanently installed therapeutic pools.

Pool Cover, Electrically Operated. Motor-driven equipment designed to cover and uncover the water surface of a pool by means of a flexible sheet or rigid frame.

Self-Contained Spa or Hot Tub. Factory-fabricated unit consisting of a spa or hot tub vessel with all water-circulating, heating, and control equipment integral to the unit. Equipment may include pumps, air blowers, heaters, lights, controls, sanitizer generators, etc.

Self-Contained Therapeutic Tubs or Hydrotherapeutic Tanks. A factory-fabricated unit consisting of a therapeutic tub or hydrotherapeutic tank with all water-circulating, heating, and control equipment integral to the unit. Equipment may include pumps, air blowers, heaters, light controls, sanitizer generators, etc.

Spa or Hot Tub. A hydromassage pool, or tub for recreational or therapeutic use, not located in health care facilities, designed for immersion of users, and usually having a filter, heater, and motor-driven blower. It may be installed indoors or outdoors, on the ground or supporting structure, or in the ground or supporting structure. Generally, a spa or hot tub is not designed or intended to have its contents drained or discharged after each use.

Storable Swimming or Wading Pool. Those that are constructed on or above the ground and are capable of holding water to a maximum depth of 1 000 mm, or a pool with nonmetallic, molded polymeric walls or inflatable fabric walls regardless of dimension.

Through-Wall Lighting Assembly. A lighting assembly intended

for installation above grade, on or through the wall of a pool, consisting of two interconnected groups of components separated by the pool wall.

Wet-Niche Luminaire (Lighting Fixture). A lighting fixture intended for installation in a forming shell mounted in a pool or fountain structure where the fixture will be completely surrounded by water.

6.80.1.3 Other Articles. Except as modified by this article, wiring and equipment in or adjacent to pools and fountains shall comply with other applicable provisions of this Code, including those provisions identified in Table 6.80.1.3.

Table 6.80.3 Other Articles

Topic	Section or Article
Wiring	Chapter 1-4
Junction box support	3.14.2.9
Rigid nonmetallic conduit	3.52.2.3
Audio Equipment	6.40.1, 6.40.2
Adjacent to pools and fountains	6.40.1.10
Underwater speakers*	

*Underwater loudspeakers shall be installed in accordance with 6.80.2.8(a).

6.80.1.4 Approval of Equipment. All electrical equipment installed in the water, walls, or decks of pools, fountains, and similar installations shall comply with the provisions of this article.

6.80.1.5 Ground-Fault Circuit Interrupters. Ground-fault circuit interrupters (GFCIs) shall be self-contained units, circuit-breaker types, receptacle types, or other approved types.

6.80.1.6 Grounding. Electrical equipment shall be grounded in accordance with Parts 2.50.5, 2.50.6, and 2.50.7 and connected by wiring methods of Chapter 3, except as modified by this article. The following equipment shall be grounded:

- (1) Through-wall lighting assemblies and underwater luminaries (lighting fixtures), other than those low-voltage systems listed for the application without a grounding conductor.
- (2) All electrical equipment located within 1 500 mm of the inside wall of the specified body of water
- (3) All electrical equipment associated with the recirculation system of the specified body of water
- (4) Junction boxes
- (5) Transformer enclosures
- (6) Ground-fault circuit interrupters
- (7) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the specified body of water.

6.80.1.7 Cord-and Plug-Connected Equipment. Fixed or stationary equipment other than an underwater luminaire (lighting fixture) for a permanently installed pool shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

(a) Length. For other than storable pools, the flexible cord shall not exceed 900 mm in length.

(b) Equipment Grounding. The flexible cord shall have a copper equipment grounding conductor sized in accordance with 2.50.6.13 but not smaller than 3.5 mm². The cord shall terminate in a grounding-type attachment plug.

(c) Construction. The equipment grounding conductors shall be connected to a fixed metal part of the assembly. The removable part shall be mounted on or bonded to the fixed metal part.

6.80.1.8 Overhead Conductor Clearances. Overhead conductors shall meet the clearance requirements in this section. Where a minimum clearance from the water level is given, the measurement shall be taken from the maximum water level of the specified body of water.

(a) Power. With respect to service drop conductors and open overhead wiring, swimming pool and similar installations shall

comply with the minimum clearances given in Table 6.80.1.8 and illustrated in Figure 6.80.1.8.

FPN: Open overhead wiring as used in this article typically refers to conductor(s) not in an enclosed raceway.

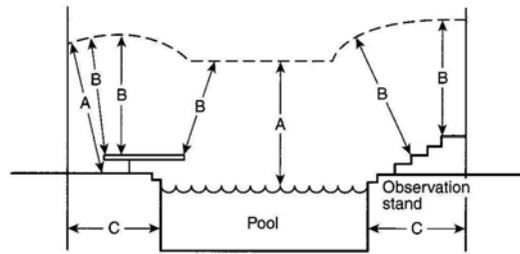

Figure 6.80.1.8 Clearances from Pool Structures

(b) Communication Systems. Communication, radio, and television coaxial cables within the scope of Articles 8.0 through 8.20 shall be permitted at a height of not less than 3 000 mm above swimming and wading pools, diving structures, and observation stands, towers, or platforms.

(c) Network-Powered Broadband Communications Systems. The minimum clearances from overhead network-powered broadband communications systems conductors from pools or fountains shall comply with the provisions in Table 6.80.1.8 for conductors operating at 0 to 750 volts to ground.

6.80.1.9 Electric Pool Water Heaters. All electric pool water heaters shall have the heating elements subdivided into loads not exceeding 48 amperes and protected at not over 60 amperes. The ampacity of the branch-circuit conductors and the rating or setting of overcurrent protective devices shall not be less than 125 percent of the total nameplate-rated load.

Table 6.80.1.8 Overhead Conductor Clearances

Clearance Parameters	Insulated Supply or Service Drop Cables, 0 – 750 Volts to Ground, Supported on and Cabled Together with an Effectively Grounded Bare Messenger or Effectively Grounded Neutral Conductor	All Other Supply or Service-Drop Conductors Voltage to Ground	
		0 through 15 kV	Over 15 through 50 kV
A. Clearance in any direction to the water level, edge of water surface, base of diving platform, or permanently anchored raft	6 900 mm	7 500 mm	8 000 mm
B. Clearance in any direction to the diving platform or tower	4 400 mm	5 200 mm	5 500 mm
C. Horizontal limit of clearance measured from inside wall of the pool	This limit shall extend to the outer edge of the structures listed in A and B of this table but not to less than 3 000 mm		

6.80.1.10 Underground Wiring Location. Underground wiring shall not be permitted under the pool or within the area extending 1 500 mm horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed 1 500 mm or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as given in Table 6.80.1.10.

Table 6.80.1.10 Minimum Burial Depths

Wiring Method	Minimum Burial (mm)
Rigid metal conduit	150
Intermediate metal conduit	150
Nonmetallic raceways listed for direct burial without concrete encasement	450
Other approved raceways*	450

*Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm thick.

6.80.1.11 Equipment Rooms and Pits. Electric equipment shall not be installed in rooms or pits that do not have adequate drainage to prevent water accumulation during normal operation or filter maintenance.

6.80.1.12 Maintenance Disconnecting Means. One or more means to disconnect all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be readily accessible and within sight from its equipment.

6.80.2 Permanently Installed Pools

6.80.2.1 General. Electrical installations at permanently installed pools shall comply with the provisions of Parts 6.80.1 and 6.80.2 of this article.

6.80.2.2. Motors.

(a) Wiring Methods.

(1) General. The branch circuits for pool-associated motors shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or Type MC cable listed for the location. Other wiring methods and materials shall be permitted in specific locations or applications as covered in this section. Any wiring method employed shall contain an insulated copper equipment grounding conductor sized in accordance with 2.50.6.13 but not smaller than 3.5 mm².

(2) On or Within Buildings. Where installed on or within buildings, electrical metallic tubing shall be permitted.

(3) Flexible Connections. Where necessary to employ flexible connections at or adjacent to the motor, liquidtight flexible metal or nonmetallic conduit with approved fittings shall be permitted.

(4) One-Family Dwellings. In the interior of one-family dwellings, or in the interior of accessory buildings associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that comply with the provisions of this paragraph shall be permitted. Where run in a cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly.

(5) Cord-and-Plug Connections. Pool-associated motors shall be permitted to employ cord-and-plug connections. The flexible cord shall not exceed 900 mm in length. The flexible cord shall include an equipment grounding conductor sized in accordance with 2.50.6.13 and shall terminate in a grounding-type attachment plug.

(b) Double Insulated Pool Pumps. A listed cord-and-plug-connected pool pump incorporating an approved system of double insulation that provides a means for grounding only the internal and nonaccessible, non-current-carrying metal parts of the pump shall be connected to any wiring method recognized in Chapter 3 that is suitable for the location. Where the bonding grid is connected to the equipment grounding conductor of the motor circuit in accordance with the second paragraph of 6.80.2.7(b)(4), the branch circuit wiring shall comply with 6.80.2.2(a).

6.80.2.3 Area Lighting, Receptacles, and Equipment.

(a) Receptacles.

(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 3 000 mm from the inside walls of the pool, or not less than 1 500 mm from the inside walls of the pool if they meet all of the following conditions:

- a. Consist of single receptacles
- b. Employ a locking configuration
- c. Are of the grounding type
- d. Have GFCI protection

(2) Other Receptacles, Location. Other receptacles shall be not less than 3 000 mm from the inside walls of a pool.

(3) Dwelling Unit(s). Where a permanently installed pool is installed at a dwelling unit(s), no fewer than one 230-volt 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than 3 000 mm from, and not more than 6 000 mm from, the inside wall of the pool. This receptacle shall be located not more than 2 000 mm above the floor, platform, or grade level serving the pool.

(4) Restricted Space. Where a pool is within 3 000 mm of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if not less than 1 500 mm measured horizontally from the inside wall of the pool.

(5) GFCI Protection. All 15- and 20-ampere, single-phase, 230-volt receptacles located within 6 000 mm of the inside walls of a pool shall be protected by a ground-fault circuit interrupter. Receptacles that supply pool pump motors and that are rated 15 or 20 amperes, 125 volts through 250 volts, single phase, shall be provided with GFCI protection.

(6) Measurements. In determining the dimensions in this section addressing receptacle spacings, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(b) Luminaires (Lighting Fixtures), Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) New Outdoor Installation Clearances. In outdoor pool areas, luminaires (lighting fixtures), lighting outlets, and ceiling-suspended (paddle) fans installed above the pool or the area extending 1 500 mm horizontally from the inside walls of the pool shall be installed at a height not less than 3 600 mm above the maximum water level of the pool.

(2) Indoor Clearances. For installations in indoor pool areas, the clearances shall be the same as for outdoor areas unless modified as provided in this paragraph. If the branch circuit supplying the equipment is protected by a ground-fault circuit interrupter, the following equipment shall be permitted at a height not less than 2 300 mm above the maximum pool water level:

- a. Totally enclosed luminaires (fixtures)
- b. Ceiling-suspended (paddle) fans identified for use beneath ceiling structures such as provided on porches or patios

(3) Existing Installations. Existing luminaires (lighting fixtures) and lighting outlets located less than 1 500 mm measured horizontally from the inside walls of a pool shall be not less than 1 500 mm above the surface of the maximum water level, shall be rigidly attached to the existing structure, and shall be protected by a ground-fault circuit interrupter.

(4) GFCI Protection in Adjacent Areas. Luminaires (lighting fixtures), lighting outlets, and ceiling-suspended (paddle) fans installed in the area extending between 1 500 mm and 3 000 mm horizontally from the inside walls of a pool shall be protected by a ground-fault circuit interrupter unless installed not less than 1 500 mm above the maximum water level and rigidly attached to the structure adjacent to or enclosing the pool.

(5) Cord-and-Plug-Connected Luminaires (Lighting Fixtures). Cord-and-plug-connected luminaires (lighting fixtures) shall comply with the requirements of 6.80.1.7 where installed within 4 900 mm of any point on the water surface, measured radially.

(c) Switching Devices. Switching devices shall be located at least 1 500 mm horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier.

Alternatively, a switch that is listed as being acceptable for use within 1 500 mm shall be permitted.

6.80.2.4 Underwater Luminaires (Lighting Fixtures). This section covers all luminaires (lighting fixtures) installed below the normal water level of the pool.

(a) General.

(1) Luminaire (Fixture) Design, Normal Operation. The design of an underwater luminaire (lighting fixture) supplied from a branch circuit either directly or by way of a transformer meeting the requirements of this section shall be such that, where the luminaire (fixture) is properly installed without a ground-fault circuit interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping).

(2) Transformers. Transformers used for the supply of underwater luminaires (fixtures), together with the transformer enclosure, shall be listed as a swimming pool and spa transformer. The transformer shall be an isolated winding type with an ungrounded secondary that has a grounded metal barrier between the primary and secondary windings.

(3) GFCI Protection, Relamping. A ground-fault circuit interrupter shall be installed in the branch circuit supplying luminaires (fixtures) operating at more than 15 volts such that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the luminaire (fixture) to ground.

(4) Voltage Limitation. No luminaires (lighting fixtures) shall be installed for operation on supply circuits over 150 volts between conductors.

(5) Location, Wall-Mounted Luminaires (Fixtures). Luminaires (lighting fixtures) mounted in walls shall be installed with the top of the luminaire (fixture) lens not less than 450 mm below the normal water level of the pool, unless the luminaire (lighting fixture) is listed and identified for use at lesser depths. No luminaire (fixture) shall be installed less than 100 mm below the normal water level of the pool.

(6) Bottom-Mounted Luminaires (Fixtures). A luminaire (lighting fixture) facing upward shall have the lens adequately guarded to prevent contact by any person.

(7) Dependence on Submersion. Luminaires (fixtures) that depend on submersion for safe operation shall be inherently protected against the hazards of overheating when not submerged.

(8) Compliance. Compliance with these requirements shall be obtained by the use of a listed underwater luminaire (lighting fixture) and by installation of a listed ground-fault circuit interrupter in the branch circuit or a listed transformer for luminaires (fixtures) operating at not more than 15 volts.

(b) Wet-Niche Luminaires (Fixtures).

(1) Forming Shells. Forming shells shall be installed for the mounting of all wet-niche underwater luminaires (fixtures) and shall be equipped with provisions for conduit entries. Metal parts of the luminaire (fixture) and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal. All forming shells used with nonmetallic conduit systems, other than those that are part of a listed low-voltage lighting system not requiring grounding, shall include provisions for terminating an 8 mm² copper conductor.

(2) Wiring Extending Directly to the Forming Shell. Conduit shall be installed from the forming shell to a junction box or other enclosure conforming to the requirements in 6.80.2.5. Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic, or rigid nonmetallic.

a. Metal Conduit. Metal conduit shall be approved and shall be of brass or other approved corrosion-resistant metal.

b. Nonmetallic Conduit. Where a nonmetallic conduit is used, an 8 mm² insulated solid or stranded copper bonding jumper shall be installed in this conduit unless a listed low-voltage lighting system not requiring grounding is used. The bonding jumper shall be terminated in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure. The termination of the 8 mm² bonding jumper in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect the connection from the possible deteriorating effect of pool water.

(3) Equipment Grounding Provisions for Cords. Wet-niche luminaires (lighting fixtures) that are supplied by a flexible cord or cable shall have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than **16 AWG**.

(4) Luminaire (Fixture) Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a luminaire (fixture) shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the luminaire (fixture) through the cord or its conductors. In addition, the grounding connection within a luminaire (fixture) shall be similarly treated to protect such connection from the deteriorating effect of pool water in the event of water entry into the luminaire (fixture).

(5) Luminaire (Fixture) Bonding. The luminaire (fixture) shall be bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the luminaire (fixture) from the forming shell. Bonding shall not be required for luminaires (fixtures) that are listed for the application and have no non-current-carrying metal parts.

(6) Servicing. All luminaires shall be removable from the water for relamping or normal maintenance. Luminaires shall be installed in such a manner that personnel can reach the luminaire for relamping, maintenance, or inspection while on the deck or equivalently dry location.

(c) Dry-Niche Luminaires (Fixtures).

(1) Construction. A dry-niche luminaire (lighting fixture) shall be provided with a provision for drainage of water and a means for accommodating one equipment grounding conductor for each conduit entry.

(2) Junction Box. A junction box shall not be required but, if used, shall not be required to be elevated or located as specified in 6.80.2.5(a)(2) if the luminaire (fixture) is specifically identified for the purpose.

(d) No-Niche Luminaires (Fixtures). A no-niche luminaire

(fixture) shall meet the construction requirements of 6.80.2.4(b)(3) and be installed in accordance with the requirements of 6.80.1.2(b). Where connection to a forming shell is specified, the connection shall be to the mounting bracket.

(e) Through-Wall Lighting Assembly. A through-wall lighting assembly shall be equipped with a threaded entry or hub, or a nonmetallic hub, for the purpose of accommodating the termination of the supply conduit. A through-wall lighting assembly shall meet the construction requirements of 6.80.2.4(b)(3) and be installed in accordance with the requirements of 6.80.2.4. Where connection to a forming shell is specified, the connection shall be to the conduit termination point.

(f) Branch-Circuit Wiring.

(1) Wiring Methods. Branch-circuit wiring on the supply side of enclosures and junction boxes connected to conduits run to wet-niche and no-niche luminaires (fixtures), and the field wiring compartments of dry-niche luminaires (fixtures), shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing, Type MC cable, or electrical metallic tubing shall be permitted.

Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted. The length shall not exceed 1 800 mm for any one length or exceed 3 000 mm in total length used. Liquidtight flexible nonmetallic conduit, Type B (LFNC-B), shall be permitted in lengths longer than 1 800 mm.

(2) Equipment Grounding. Through-wall lighting assemblies, wet-niche, dry-niche, or no-niche luminaires (lighting fixtures) shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (f)(2)a and (f)(2)b. The equipment grounding conductor shall be sized in accordance with Table 2.50.6.13 but shall not be smaller than 3.5 mm².

Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.

a. If more than one underwater luminaire (lighting fixture) is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche luminaires (fixtures), or between the field-wiring compartments of dry-niche luminaires (fixtures), shall be permitted to be terminated on grounding terminals.

b. If the underwater luminaire (lighting fixture) is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater luminaire (lighting fixture), the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.

(3) Conductors. Conductors on the load side of a ground-fault circuit interrupter or of a transformer, used to comply with the provisions of 6.80.2.4(a)(8), shall not occupy raceways, boxes, or enclosures containing other conductors unless one of the following conditions applies:

a. The other conductors are protected by ground-fault circuit interrupters.

b. The other conductors are grounding conductors.

c. The other conductors are supply conductors to a feed-through type ground-fault circuit interrupter.

d. Ground-fault circuit interrupters shall be permitted in a panelboard that contains circuits protected by other than ground-fault circuit interrupters.

6.80.2.5 Junction Boxes and Enclosures for Transformers or Ground-Fault Circuit Interrupters.

(a) Junction Boxes. A junction box connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche

luminaire (fixture) shall meet the requirements of this section.

(1) Construction. The junction box shall be listed as a swimming pool junction box and shall comply with the following conditions:

a. Be equipped with threaded entries or hubs or a nonmetallic hub.

b. Be comprised of copper, brass, suitable plastic, or other approved corrosion-resistant material.

c. Be provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box.

(2) Installation. Where the luminaire (fixture) operates over 15 volts, the junction box location shall comply with (a)(2)a and (a)(2)b. Where the luminaire (fixture) operates at less than 15 volts, the junction box location shall be permitted to comply with (a)(2)c.

a. Vertical Spacing. The junction box shall be located not less than 100 mm, measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 200 mm above the maximum pool water level, whichever provides the greater elevation.

b. Horizontal Spacing. The junction box shall be located not less than 1 200 mm from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

c. Flush Deck Box. If used on a lighting system operating at 15 volts or less, a flush deck box shall be permitted if both of the following apply:

1. An approved potting compound is used to fill the box to prevent the entrance of moisture.

2. The flush deck box is located not less than 1 200 mm from the inside wall of the pool.

(b) Other Enclosures. An enclosure for a transformer, ground-fault circuit interrupter, or a similar device connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche luminaire (fixture) shall meet the requirements of this section.

(1) Construction. The enclosure shall be listed and labeled for the purpose and meet the following requirements:

- a. Equipped with threaded entries or hubs or a nonmetallic hub
- b. Comprised of copper, brass, suitable plastic, or other approved corrosion-resistant material
- c. Provided with an approved seal, such as duct seal at the conduit connection, that prevents circulation of air between the conduit and the enclosures
- d. Provided with electrical continuity between every connected metal conduit and the grounding terminals by means of copper, brass, or other approved corrosion-resistant metal that is integral with the box

(2) Installation.

a. Vertical Spacing. The enclosure shall be located not less than 100 mm, measured from the inside of the bottom of the box, above the ground level, or pool deck, or not less than 200 mm above the maximum pool water level, whichever provides the greater elevation.

b. Horizontal Spacing. The enclosure shall be located not less than 1 200 mm from the inside wall of the pool, unless separated from the pool by a solid fence, wall, or other permanent barrier.

(c) Protection. Junction boxes and enclosures mounted above the grade of the finished walkway around the pool shall not be located in the walkway unless afforded additional protection, such as by location under diving boards, adjacent to fixed structures, and the like.

(d) Grounding Terminals. Junction boxes, transformer enclosures, and ground-fault circuit-interrupter enclosures connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche luminaire (fixture) shall be provided with a number of grounding terminals that shall be at least one more than the number of conduit entries.

(e) Strain Relief. The termination of a flexible cord of an underwater lighting fixture within a junction box, transformer enclosure, ground-fault circuit interrupter, or other enclosure shall be provided with a strain relief.

(f) Grounding. The junction box, transformer enclosure, or other enclosure in the supply circuit to a wet-niche or no-niche luminaire (lighting fixture) and the field-wiring chamber of a dry-niche luminaire (lighting fixture) shall be grounded to the equipment grounding terminal of the panelboard. This terminal shall be directly connected to the panelboard enclosure.

6.80.2.6 Feeders. These provisions shall apply to any feeder on the supply side of panelboards supplying branch circuits for pool equipment covered in 6.80.2 and on the load side of the service equipment or the source of a separately derived system.

(a) Wiring Methods. Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight, flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted where installed on or within a building, and electrical nonmetallic tubing shall be permitted where installed within a building.

Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly that includes an equipment grounding conductor within its outer sheath. The equipment grounding conductor shall comply with 2.50.2.5(a)(5).

(b) Grounding. An equipment grounding conductor shall be installed with the feeder conductors between the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system. For other than (1) existing feeders covered in 6.80.2.6(a), Exception, or (2) feeders to separate buildings that do not utilize an insulated equipment grounding conductor in accordance with 6.80.2.6(b)(2), this equipment grounding conductor shall be insulated.

(1) Size. This conductor shall be sized in accordance with 2.50.6.13 but not smaller than 3.5 mm². On separately derived systems, this conductor shall be sized in accordance with Table 2.50.3.17 but not smaller than 8 mm².

(2) Separate Buildings. A feeder to a separate building or structure shall be permitted to supply swimming pool equipment branch circuits, or feeders supplying swimming pool equipment

branch circuits, if the grounding arrangements in the separate building meet the requirements in 250.32(b)(1). Where installed in other than existing feeders covered in 6.80.2.6(a), Exception, a separate equipment grounding conductor shall be an insulated conductor.

6.80.2.7 Equipotential Bonding.

(a) Performance. The equipotential bonding required by this section shall be installed to eliminate voltage gradients in the pool area as prescribed.

FPN: The 8 mm² or larger solid copper bonding conductor shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode.

(b) Bonded Parts. The parts specified in 6.80.2.7(b)(1) through (b)(5) shall be bonded together.

(1) Metallic Structural Components. All metallic parts of the pool structure, including the reinforcing metal of the pool shell, coping stones, and deck, shall be bonded. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. If reinforcing steel is effectively insulated by an encapsulating nonconductive compound at the time of manufacture and installation, it shall not be required to be bonded. Where reinforcing steel of the pool shell or the reinforcing steel of coping stones and deck is encapsulated with a nonconductive compound or another conductive material is not available, provisions shall be made for an alternative means to eliminate voltage gradients that would otherwise be provided by unencapsulated, bonded reinforcing steel.

(2) Underwater Lighting. All metal forming shells and mounting brackets of no-niche luminaires (fixtures) shall be bonded unless a listed low-voltage lighting system with nonmetallic forming shells not requiring bonding is used.

(3) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm in any dimension and do not penetrate into the pool structure more than 25 mm shall not require bonding.

(4) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers,

including electric motors, shall be bonded. Accessible metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, non-current-carrying metal parts shall not be bonded by a direct connection to the equipotential bonding grid. The means for grounding internal nonaccessible, non-current carrying metal parts shall be an equipment grounding conductor run with the power-supply conductors in the case of motors supplied with a flexible cord, or a grounding terminal in the case of motors intended for permanent connection.

Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid 8 mm² copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.

(5) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts that are within the following distances of the pool, except those separated from the pool by a permanent barrier, shall be bonded.

- a. Within 1 500 mm horizontally of the inside walls of the pool
- b. Within 3 700 mm measured vertically above the maximum water level of the pool, or any observation stands, towers, or platforms, or any diving structures

(c) Equipotential Bonding Grid. The parts specified in 6.80.2.7(b) shall be connected to an equipotential bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than 8 mm² or rigid metal conduit of brass or other identified corrosion-resistant metal conduit. Connection shall be made by exothermic welding or by listed pressure connectors or clamps that are labeled as being suitable for the purpose and are of stainless steel, brass, copper, or copper alloy. The equipotential common bonding grid shall extend under paved walking surfaces for 1 000 mm horizontally beyond the inside walls of the pool and shall be permitted to be any of the following:

(1) Structural Reinforcing Steel. The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent

(2) Bolted or Welded Metal Pools. The wall of a bolted or welded metal pool

(3) Alternate Means. This system shall be permitted to be constructed as specified in (a) through (c):

a. Materials and Connections. The grid shall be constructed of minimum 8 mm² bare solid copper conductors. Conductors shall be bonded to each other at all points of crossing. Connections shall be made as required by 6.80.2.7(d).

b. Grid Structure. The equipotential bonding grid shall cover the contour of the pool and the pool deck extending 1 000 mm horizontally from the inside walls of the pool. The equipotential bonding grid shall be arranged in a 300 mm by 300 mm network of conductors in a uniformly spaced perpendicular grid pattern with tolerance of 100 mm.

c. Securing. The below-grade grid shall be secured within or under the pool and deck media.

(d) Connections. Where structural reinforcing steel or the walls of bolted or welded metal pool structures are used as an equipotential bonding grid for nonelectrical parts, the connections shall be made in accordance with 2.50.1.8.

(e) Pool Water Heaters. For pool water heaters rated at more than 50 amperes that have specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded, and only those parts designated to be grounded shall be grounded.

6.80.2.8 Specialized Pool Equipment

(a) Underwater Audio Equipment. All underwater audio equipment shall be identified for the purpose.

(1) Speakers. Each speaker shall be mounted in an approved metal forming shell, the front of which is enclosed by a captive metal screen, or equivalent, that is bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to open for installation or servicing of the speaker. The forming shell shall be installed in a recess in the wall or floor of the pool.

(2) Wiring Methods. Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal or rigid nonmetallic conduit shall extend from the forming shell to a suitable junction box or other enclosure as provided in 6.80.2.5. Where rigid nonmetallic conduit is used, a 8.0 mm² (3.2 mm dia.) insulated copper conductor shall be installed in this conduit with provisions for terminating in the forming shell and the junction box. The termination of the 8.0 mm² (3.2 mm dia.) conductor in the forming shell shall be covered with, or encapsulated in, a suitable potting compound to protect such connection from the possible deteriorating effect of pool water.

(3) Forming Shell and Metal Screen. The forming shell and metal screen shall be of brass or other approved corrosion-resistant metal. All forming shells shall include provisions for terminating an 8 mm² copper conductor.

(b) Electrically Operated Pool Covers.

(1) Motors and Controllers. The electric motors, controllers, and wiring shall be located at 1 500 mm from the inside wall of the pool unless separated from the pool by a wall, cover, or other permanent barrier. Electric motors installed below grade level shall be of the totally enclosed type. The device that controls the operation of the motor for an electrically operated pool cover shall be located such that the operator has full view of the pool.

FPN No. 1: For cabinets installed in damp and wet locations, see 3.12.1.2(a).

FPN No. 2: For switches or circuit breakers installed in wet locations, see 4.4.1.4.

FPN No. 3: For protection against liquids, see 4.30.1.11.

(2) Protection. The electric motor and controller shall be connected to a circuit protected by a ground-fault circuit interrupter.

(c) Deck Area Heating. These provisions of this section shall apply to all pool deck areas, including a covered pool, where electrically operated comfort heating units are installed within 6 000 mm of the inside wall of the pool.

(1) Unit Heaters. Unit heaters shall be rigidly mounted to the structure and shall be of the totally enclosed or guarded types. Unit heaters shall not be mounted over the pool or within the area extending 1 500 mm horizontally from the inside walls of a pool.

(2) Permanently Wired Radiant Heaters. Radiant electric heaters shall be suitably guarded and securely fastened to their mounting device(s). Heaters shall not be installed over a pool or within the area extending 1 500 mm horizontally from the inside walls of the pool and shall be mounted at least 3 700 mm vertically above the pool deck unless otherwise approved.

(3) Radiant Heating Cables Not Permitted. Radiant heating cables embedded in or below the deck shall not be permitted.

6.80.3 Storable Pools

6.80.3.1 General. Electrical installations at storable pools shall comply with the provisions of Parts 6.80.1 and 6.80.3.

6.80.3.2 Pumps. A cord-connected pool filter pump shall incorporate an approved system of double insulation or its equivalent and shall be provided with means for grounding only the internal and nonaccessible non-current-carrying metal parts of the appliance.

The means for grounding shall be an equipment grounding conductor run with the power-supply conductors in the flexible cord that is properly terminated in a grounding-type attachment plug having a fixed grounding contact member.

6.80.3.3 Ground-Fault Circuit Interrupters Required. All electrical equipment, including power-supply cords, used with storable pools shall be protected by ground-fault circuit interrupters.

All 125-volt and/or 250-volt receptacles located within 6 000 mm of the inside walls of a storable pool shall be protected by a ground-fault circuit interrupter. In determining these dimensions, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

FPN: Where flexible cords are used, see 4.0.1.4.

6.80.3.4 Luminaires (Lighting Fixtures). An underwater luminaire (lighting fixture), if installed, shall be installed in or on the wall of the storable pool. It shall comply with either 6.80.3.4(a) or 6.80.3.4(b).

(a) 15 Volts or Less. A luminaire (lighting fixture) shall be part of a cord- and plug-connected lighting assembly. This assembly shall be listed as an assembly for the purpose and have the following construction features:

- (1) No exposed metal parts
- (2) A luminaire (fixture) lamp that operates at 15 volts or less
- (3) An impact-resistant polymeric lens, luminaire (fixture) body, and transformer enclosure
- (4) A transformer meeting the requirements of 6.80.2.4(a)(2) with a primary rating not over 250 volts

(b) Over 15 Volts But Not Over 250 Volts. A lighting assembly without a transformer, and with the fixture lamp(s) operating at not over 250 volts, shall be permitted to be cord- and plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 6.80.2.4(a)(5), and the assembly shall have the following construction features:

- (1) No exposed metal parts.
- (2) An impact-resistant polymeric lens and luminaire (fixture) body.
- (3) A ground-fault circuit interrupter with open neutral protection is provided as an integral part of the assembly.
- (4) The luminaire (fixture) lamp is permanently connected to the ground-fault circuit interrupter with open-neutral protection.
- (5) Compliance with the requirements of 6.80.2.4(a).

6.80.3.5 Receptacle Locations. Receptacles shall not be less than 3 000 mm from the inside walls of a pool. In determining these dimensions, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

6.80.4 Spas and Hot Tubs

6.80.4.1. General. Electrical installations at spas and hot tubs shall comply with the provisions of 6.80.1 and 6.80.4.

6.80.4.2 Emergency Switch for Spas and Hot Tubs. A clearly

labeled emergency shutoff or control switch for the purpose of stopping the motor(s) that provide power to the recirculation system and jet system shall be installed readily accessible to the users and at least 1 500 mm away, adjacent to, and within sight of the spa or hot tub. This requirement shall not apply to single-family dwellings.

6.80.4.3 Outdoor Installations. A spa or hot tub installed outdoors shall comply with the provisions of Parts 6.80.1 and 6.80.2 except as permitted in 6.80.4.3(a) and 6.80.4.3(b), that would otherwise apply to pools installed outdoors.

(a) Flexible Connections. Listed packaged spa or hot tub equipment assemblies or self-contained spas or hot tubs utilizing a factory-installed or assembled control panel or panelboard shall be permitted to use flexible connections as covered in 6.80.4.3(a)(1) and (a)(2).

(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted in lengths of not more than 1 800 mm.

(2) Cord-and-Plug Connections. Cord-and-plug connections with a cord not longer than 4 600 mm shall be permitted where protected by a ground-fault circuit interrupter.

(b) Bonding. Bonding by metal-to-metal mounting on a common frame or base shall be permitted. The metal bands or hoops used to secure wooden staves shall not be required to be bonded as required in 6.80.2.7.

(c) Interior Wiring to Outdoor Installations. In the interior of a one-family dwelling or in the interior of another building or structure associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that contain a copper equipment grounding conductor that is insulated or enclosed within the outer sheath of the wiring method and not smaller than 3.5 mm dia shall be permitted to be used for the connection to motor, heating, and control loads that are part of a self-contained spa or hot tub or a packaged spa or hot tub equipment assembly. Wiring to an underwater light shall comply with 6.80.2.4 or 6.80.3.4.

6.80.4.4 Indoor Installations. A spa or hot tub installed indoors shall comply with the provisions of Parts 6.80.1 and 6.80.2 of this article

except as modified by this section and shall be connected by the wiring methods of Chapter 3.

Exception: Listed spa and hot tub packaged units rated 20 amperes or less shall be permitted to be cord and plug connected to facilitate the removal or disconnection of the unit for maintenance and repair.

(a) Receptacles. At least one 125-volt and/or 250-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located a minimum of 1 500 mm from and not more than 3 000 mm from the inside wall of the spa or hot tub.

(1) Location. Receptacles shall be located at least 1 500 mm measured horizontally from the inside walls of the spa or hot tub.

(2) Protection, General. Receptacles of 125 volts located within 3 000 mm of the inside walls of a spa or hot tub shall be protected by a ground-fault circuit interrupter.

(3) Protection, Spa or Hot Tub Supply Receptacle. Receptacles that provide power for a spa or hot tub shall be ground-fault circuit-interrupter protected.

(4) Measurements. In determining the dimensions in this section addressing receptacle spacings, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(b) Installation of Luminaires (Lighting Fixtures), Lighting Outlets, and Ceiling-Suspended (Paddle) Fans.

(1) Elevation. Luminaires (lighting fixtures), except as covered in 6.80.4.4(b)(2), lighting outlets, and ceiling-suspended (paddle) fans located over the spa or hot tub or within 1 500 mm from the inside walls of the spa or hot tub shall comply with the clearances specified in (b)(1)a, (b)(1)b, and (b)(1)c above the maximum water level.

a. Without GFCI. Where no GFCI protection is provided, the mounting height shall be not less than 3 700 mm.

b. With GFCI. Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2 300 mm.

c. Below 2 300 mm. Luminaires (lighting fixtures) meeting the requirements of item (1) or (2) and protected by a ground-fault circuit interrupter shall be permitted to be installed less than 2 300 mm over a spa or hot tub:

1. Recessed luminaire (fixtures) with a glass or plastic lens and nonmetallic or electrically isolated metal trim, suitable for use in damp locations.

2. Surface-mounted luminaire (fixtures) with a glass or plastic globe and a nonmetallic body or a metallic body isolated from contact suitable for use in damp locations.

(2) Underwater Applications. Underwater luminaires (lighting fixtures) shall comply with the provisions of 6.80.2.4 or 6.80.3.4.

(c) Wall Switches. Switches shall be located at least 1 500 mm, measured horizontally, from the inside walls of the spa or hot tub.

(d) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the spa or hot tub structure.

(2) Metal parts of electrical equipment associated with the spa or hot tub water circulating system, including pump motors.

(3) Metal conduit and metal piping within 1 500 mm of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub by a permanent barrier.

(4) All metal surfaces that are within 1 500 mm of the inside walls of the spa or hot tub and not separated from the spa or hot tub area by a permanent barrier.

Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings, where not connected to metallic piping, towel bars, mirror frames, and similar nonelectrical equipment, shall not be required to be bonded.

(5) Electrical devices and controls not associated with the spas or hot tubs shall be located a minimum of 1 500 mm away from such units or be bonded to the spa or hot tub system.

(e) Methods of Bonding. All metal parts associated with the spa or

hot tub shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings

(2) Metal-to-metal mounting on a common frame or base

(3) The provisions of a copper bonding jumper, insulated, covered, or bare, not smaller than 3.2 mm dia. solid.

(f) Grounding. The following equipment shall be grounded:

(1) All electric equipment located within 1 500 mm of the inside wall of the spa or hot tub

(2) All electric equipment associated with the circulating system of the spa or hot tub

(g) Underwater Audio Equipment. Underwater audio equipment shall comply with the provisions of Part 6.80.2.

6.80.4.5 Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained spa or hot tub, a packaged spa or hot tub equipment assembly, or a field-assembled spa or hot tub shall be protected by a ground-fault circuit interrupter.

(a) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly that includes integral ground-fault circuit-interrupter protection for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, and so forth) shall be permitted without additional GFCI protection.

(b) Other Units. A field assembled spa or hot tub rated 3 phase or rated over 250 volts or with a heater load of more than 50 amperes shall not require the supply to be protected by a ground-fault circuit interrupter.

(c) Combination Pool and Spa or Hot Tub. A combination pool/hot tub or spa assembly commonly bonded need not be protected by a ground-fault circuit interrupter.

FPN: See 6.80.1.2 for definitions of self-contained spa or hot tub and for packaged spa or hot tub equipment assembly.

6.80.5 Fountains

6.80.5.1 General. The provisions of Parts 6.80.1 and 6.80.5 of this article shall apply to all permanently installed fountains as defined in 6.80.1.2. Fountains that have water common to a pool shall additionally comply with the requirement in Part 6.80.2 of this article. Part 6.80.5 does not cover self-contained, portable fountains not larger than 1 500 mm in any dimension. Portable fountains shall comply with Parts 4.22.2 and 4.22.3.

6.80.5.2 Luminaires (Lighting Fixtures), Submersible Pumps, and Other Submersible Equipment.

(a) **Ground-Fault Circuit Interrupter.** Luminaires (lighting fixtures), submersible pumps, and other submersible equipment unless listed for operation at 15 volts or less and supplied by a transformer that complies with 6.80.2.4(a)(2), shall be protected by a ground-fault circuit interrupter.

(b) **Operating Voltage.** No luminaires (lighting fixtures) shall be installed for operation on supply circuits over 150 volts between conductors. Submersible pumps and other submersible equipment shall operate at 300 volts or less between conductors.

(c) **Lighting Fixture Lenses.** Lighting fixtures shall be installed with the top of the fixture lens below the normal water level of the fountain unless approved for above-water locations. A lighting fixture facing upward shall have the lens adequately guarded to prevent contact by any person.

(d) **Overheating Protection.** Electrical equipment that depends on submersion for safe operation shall be protected against overheating by a low-water cutoff or other approved means when not submerged.

(e) **Wiring.** Equipment shall be equipped with provisions for threaded conduit entries or be provided with a suitable flexible cord. The maximum length of exposed cord in the fountain shall be limited to 3 000 mm. Cords extending beyond the fountain perimeter shall be enclosed in approved wiring enclosures. Metal parts of equipment in contact with water shall be of brass or other approved corrosion-resistant metal.

(f) **Servicing.** All equipment shall be removable from the water for relamping or normal maintenance. Fixtures shall not be permanently imbedded into the fountain structure so that the water level must be reduced or fountain drained for relamping, maintenance, or inspection.

(g) **Stability.** Equipment shall be inherently stable or be securely fastened in place.

6.80.5.3 Junction Boxes and Other Enclosures.

(a) **General.** Junction boxes and other enclosures used for other than underwater installation shall comply with 6.80.2.5.

(b) **Underwater Junction Boxes and Other Underwater Enclosures.** Junction boxes and other underwater enclosures shall meet the requirements of 6.80.5.3(b)(1) and (b)(2).

(1) Construction.

a. Underwater enclosures shall be equipped with provisions for threaded conduit entries or compression glands or seals for cord entry.

b. Underwater enclosures shall be submersible and made of copper, brass, or other approved corrosion-resistant material.

(2) **Installation.** Underwater enclosure installations shall comply with (a) and (b).

a. Underwater enclosures shall be filled with an approved potting compound to prevent the entry of moisture.

b. Underwater enclosures shall be firmly attached to the supports or directly to the fountain surface and bonded as required. Where the junction box is supported only by the conduit, the conduit shall be of copper, brass, stainless steel, or other approved corrosion-resistant metal. Where the box is fed by nonmetallic conduit, it shall have additional supports and fasteners of copper, brass, or other approved corrosion-resistant material.

FPN: See 3.14.2.9 for support of enclosures.

6.80.5.4 Bonding. All metal piping systems associated with the

fountain shall be bonded to the equipment grounding conductor of the branch circuit supplying the fountain.

FPN: See 2.50.6.13 for sizing of these conductors.

6.80.5.5 Grounding. The following equipment shall be grounded:

(1) All electrical equipment located within the fountain or within 1 500 mm of the inside wall of the fountain

(2) All electrical equipment associated with the recirculating system of the fountain

(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain

6.80.5.6 Methods of Grounding.

(a) **Applied Provisions.** The provisions of 6.80.2.2(a), 6.80.2.4(b)(3), 6.80.2.4(f)(1), 6.80.2.4(f)(2), 6.80.2.5(f), and 6.80.2.6 shall apply.

(b) **Supplied by a Flexible Cord.** Electrical equipment that is supplied by a flexible cord shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

6.80.5.7 Cord- and Plug-Connected Equipment.

(a) **Ground-Fault Circuit Interrupter.** All electrical equipment, including power-supply cords, shall be protected by ground-fault circuit interrupters.

(b) **Cord Type.** Flexible cord immersed in or exposed to water shall be of a type for extra hard usage, as designated in Table 4.0.1.4 and shall be a listed type with a “W” suffix.

(c) **Sealing.** The end of the flexible cord jacket and the flexible cord conductor termination within equipment shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the equipment through the cord or its conductors. In

addition, the ground connection within equipment shall be similarly treated to protect such connections from the deteriorating effect of water that may enter into the equipment.

(d) **Terminations.** Connections with flexible cord shall be permanent, except that grounding-type attachment plugs and receptacles shall be permitted to facilitate removal or disconnection for maintenance, repair, or storage of fixed or stationary equipment not located in any water-containing part of a fountain.

6.80.5.8 Signs.

(a) **General.** This section covers electric signs installed within a fountain or within 3 000 mm of the fountain edge.

(b) **Ground-Fault Circuit-Interrupter Protection for Personnel.** All circuits supplying the sign shall have ground-fault circuit-interrupter protection for personnel.

(c) **Location.**

(1) **Fixed or Stationary.** A fixed or stationary electric sign installed within a fountain shall be not less than 1 500 mm inside the fountain measured from the outside edges of the fountain.

(2) **Portable.** A portable electric sign shall not be placed within a pool or fountain or within 1 500 mm measured horizontally from the inside walls of the fountain.

(d) **Disconnect.** A sign shall have a local disconnecting means in accordance with 6.0.1.6 and 6.80.1.12.

(e) **Bonding and Grounding.** A sign shall be grounded and bonded in accordance with 6.0.1.7.

6.80.5.8 GFCI Protection for Adjacent Receptacle Outlets. All 15- or 20-ampere, single-phase 125-volt through 250-volt receptacles located within 6 000 mm of a fountain edge shall be provided with GFCI protection.

6.80.6 Pools and Tubs for Therapeutic Use

6.80.6.1 General. The provisions of Parts 6.80.1 and 6.80.6 shall apply to pools and tubs for therapeutic use in health care facilities, gymnasiums, athletic training rooms, and similar areas. Portable therapeutic appliances shall comply with Parts 4.22.2 and 4.22.3.

FPN: See 5.17.1.2 for definition of health care facilities.

6.80.6.2 Permanently Installed Therapeutic Pools. Therapeutic pools that are constructed in the ground, on the ground, or in a building in such a manner that the pool cannot be readily disassembled shall comply with Parts 6.80.1 and 6.80.2.

Exception: The limitations of 6.80.2.3(b)(1) through (b)(4) shall not apply where all luminaires (lighting fixtures) are of the totally enclosed type.

6.80.6.3 Therapeutic Tubs (Hydrotherapeutic Tanks). Therapeutic tubs, used for the submersion and treatment of patients, that are not easily moved from one place to another in normal use or that are fastened or otherwise secured at a specific location, including associated piping systems, shall conform to this part.

(a) Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained therapeutic tub or hydrotherapeutic tank, a packaged therapeutic tub or hydrotherapeutic tank, or a field-assembled therapeutic tub or hydrotherapeutic tank shall be protected by a ground-fault circuit interrupter.

(1) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly that includes integral ground-fault circuit-interrupter protection for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, and so forth) shall be permitted without additional GFCI protection.

(2) Other Units. A therapeutic tub or hydrotherapeutic tank rated 3 phase or rated over 250 volts or with a heater load of more than 50 amperes shall not require the supply to be protected by a ground-fault circuit interrupter.

(b) Bonding. The following parts shall be bonded together.

(1) All metal fittings within or attached to the tub structure.

(2) Metal parts of electrical equipment associated with the tub water circulating system, including pump motors.

(3) Metal-sheathed cables and raceways and metal piping that are within 1 500 mm of the inside walls of the tub and not separated from the tub by a permanent barrier.

(4) All metal surfaces that are within 1 500 mm of the inside walls of the tub and not separated from the tub area by a permanent barrier.

(5) Electrical devices and controls not associated with the therapeutic tubs shall be located a minimum of 1 500 mm away from such units

(c) Methods of Bonding. All metal parts associated with the tub shall be bonded by any of the following methods:

(1) The interconnection of threaded metal piping and fittings,

(2) Metal-to-metal mounting on a common frame or base,

(3) Connections by suitable metal clamps, or

(4) By the provisions of a solid copper bonding jumper, insulated, covered, or bare, not smaller than 3.2 mm dia.

(d) Grounding.

(1) Fixed or Stationary Equipment. The equipment specified in (d)(1)a and (d)(1)b shall be grounded.

a. Location. All electrical equipment located within 1 500 mm of the inside wall of the tub shall be grounded

b. Circulation System. All electrical equipment associated with the circulating system of the tub shall be grounded.

(2) Portable Equipment. Portable therapeutic appliances shall meet the grounding requirements in 2.50.6.5.

(e) Receptacles. All receptacles within 1 500 mm of a therapeutic tub shall be protected by a ground-fault circuit interrupter.

(f) Luminaires (Lighting Fixtures). All luminaires (lighting fixtures) used in therapeutic tub areas shall be of the totally enclosed type.

6.80.7 Hydromassage Bathtubs

6.80.7.1 General. Hydromassage bathtubs as defined in 6.80.1.2 shall comply with Part 6.80.7. They shall not be required to comply with other parts of this article.

6.80.7.2 Protection. Hydromassage bathtubs and their associated electrical components shall be protected by a ground-fault circuit interrupter. All 125-volt and/or 250-volt, single-phase receptacles within 1 500 mm measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter(s).

6.80.7.2 Other Electrical Equipment. Lighting fixtures, switches, receptacles, and other electrical equipment located in the same room, and not directly associated with a hydromassage bathtub, shall be installed in accordance with the requirements of Chapters 1 through 4 in this Code covering the installation of that equipment in bathrooms.

6.80.7.3 Accessibility. Hydromassage bathtub electrical equipment shall be accessible without damaging the building structure or building finish.

6.80.7.4 Bonding. All metal piping systems, metal parts of electrical equipment, and pump motors associated with the hydromassage tub shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller than 3.2 mm dia. solid.

ARTICLE 6.82 — NATURAL AND ARTIFICIALLY MADE BODIES OF WATER

6.82.1 General

6.82.1.1 Scope. This article applies to the installation of electrical wiring for, and equipment in and adjacent to, natural or artificially made bodies of water not covered by other articles in this Code, such as but not limited to aeration ponds, fish farm ponds, storm retention basins, treatment ponds, irrigation (channels) facilities.

6.82.1.2 Definitions.

Artificially Made Bodies of Water. Bodies of water that have been constructed or modified to fit some decorative or commercial purpose such as, but not limited to, aeration ponds, fish farm ponds, storm retention basins, treatment ponds, irrigation (channel) facilities. Water depths may vary seasonally or be controlled.

Electrical Datum Plane. The electrical datum plane as used in this article is defined as follows:

(1) In land areas subject to tidal fluctuation, the electrical datum plane is a horizontal plane 600 mm above the highest tide level for the area occurring under normal circumstances, that is, highest high tide.

(2) In land areas not subject to tidal fluctuation, the electrical datum plane is a horizontal plane 600 mm above the highest water level for the area occurring under normal circumstances.

(3) In land areas subject to flooding, the electrical datum plane based on (1) or (2) above is a horizontal plane 600 mm above the point identified as the prevailing high water mark or an equivalent benchmark based on seasonal or storm-driven flooding from the authority having jurisdiction.

(4) The electrical datum plane for floating structures and landing stages that are (1) installed to permit rise and fall response to water level, without lateral movement, and (2) that are so equipped that they can rise to the datum plane established for (1) or (2) above, is a horizontal plane 750 mm above the water level at the floating structure or landing stage and a minimum of 300 mm above the level of the deck.

Equipotential Plane. An area where wire mesh or other conductive elements are on, embedded in, or placed under the walk surface within 75 mm, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.

Natural Bodies of Water. Bodies of water such as lakes, streams, ponds, rivers, and other naturally occurring bodies of water, which may vary in depth throughout the year.

Shoreline. The farthest extent of standing water under the applicable conditions that determine the electrical datum plane for the specified body of water.

6.82.1.3 Other Articles. Wiring and equipment in or adjacent to natural or artificially made bodies of water shall comply with the applicable provisions of other articles of this Code, except as modified by this article. If the water is subject to boat traffic, the wiring shall comply with 5.55.1.13(b).

6.82.2 Installation

6.82.2.1 Electrical Equipment and Transformers. Electrical equipment and transformers, including their enclosures, shall be specifically approved for the intended location. No portion of an enclosure for electrical equipment not identified for operation while submerged shall be located below the electrical datum plane.

6.82.2.2 Location of Service Equipment. On land, the service equipment for floating structures and submersible electrical equipment shall be located no closer than 1 500 mm horizontally from the shoreline and live parts elevated a minimum of 300 mm above the electrical datum plane. Service equipment shall disconnect when the water level reaches the height of the established electrical datum plane.

6.82.2.3 Electrical Connections. All electrical connections not intended for operation while submerged shall be located at least 300 mm above the deck of a floating or fixed structure, but not below the electrical datum plane.

6.82.2.4 Wiring Methods and Installation. Wiring methods and installations of Chapter 3 and Articles 5.53, 5.55, and 5.90 shall be permitted where identified for use in wet locations.

6.82.2.5 Disconnecting Means for Floating Structures or Submersible Electrical Equipment.

(a) **Type.** The disconnecting means shall be permitted to consist of a circuit breaker, switch, or both and shall be properly identified as to which structure or equipment it controls.

(b) **Location.** The disconnecting means shall be readily accessible on land and shall be located in the supply circuit ahead of the structure or the equipment connection. The disconnecting means shall be located not more than 750 mm from the structure or equipment connection. The disconnecting means shall be within sight of, but not closer than, 1 500 mm horizontally from the edge of the shoreline and live parts elevated a minimum of 300 mm above the electrical datum plane.

6.82.2.6 Ground Fault Circuit Interrupter (GFCI) Protection. Fifteen- and 20-ampere single-phase, 125-volt through 250-volt receptacles installed outdoors and in or on floating buildings or structures within the electrical datum plane area that are used for storage, maintenance, or repair where portable electric hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used shall be provided with GFCI protection. The GFCI protection device shall be located not less than 300 mm above the established electrical datum plane.

6.82.3 Grounding and Bonding

6.82.3.1 Grounding. Wiring and equipment within the scope of this article shall be grounded as specified in Articles 2.50, 5.53, and 5.55 and with the requirements in 6.82.3.

6.82.3.2 Equipment Grounding Conductors.

(a) **Type.** Equipment grounding conductors shall be insulated copper conductors sized in accordance with 2.50.6.13 but not smaller than 3.5 mm².

(b) **Feeders.** Where a feeder supplies a remote panel board, an insulated equipment grounded conductor shall extend from a grounding terminal in the service to a grounding terminal and busbar in the remote panel board.

(c) **Branch Circuits.** The insulated equipment grounding conductor for branch circuits shall terminate at a grounding terminal in a remote panel board or the grounding terminal in the main service equipment.

(d) Cord-and-Plug-Connected Appliances. Where required to be grounded, cord-and-plug-connected appliances shall be grounded by means of an equipment grounding conductor in the cord and a grounding-type attachment plug.

6.82.3.3 Bonding of Non-Current-Carrying Metal Parts. All metal parts in contact with the water, all metal piping, tanks, and all non-current-carrying metal parts that may become energized shall be bonded to the grounding bus in the panelboard.

6.82.3.4 Equipotential Planes and Bonding of Equipment Planes. An equipotential plane shall be installed where required in this section to mitigate step and touch voltages at electrical equipment.

(a) Areas Requiring Equipotential Planes. Equipotential planes shall be installed adjacent to all outdoor service equipment or disconnecting means that control equipment in or on water, that have a metallic enclosure and controls accessible to personnel, and that are likely to become energized. The equipotential plane shall encompass the area around the equipment and shall extend from the area directly below the equipment out not less than 900 mm in all directions from which a person would be able to stand and come in contact with the equipment.

(b) Areas Not Requiring Equipotential Planes. Equipotential planes shall not be required for the controlled equipment supplied by the service equipment or disconnecting means. All circuits rated not more than 60 amperes at 120 through 250 volts, single phase, shall have GFCI protection.

(c) Bonding. Equipotential planes shall be bonded to the electrical grounding system. The bonding conductor shall be solid copper, insulated, covered or bare, and not smaller than 8 mm². Connections shall be made by exothermic welding or by listed pressure connectors or clamps that are labeled as being suitable for the purpose and are of stainless steel, brass, copper, or copper alloy.

ARTICLE 6.85 — INTEGRATED ELECTRICAL SYSTEMS

6.85.1 General

6.85.1.1 Scope. This article covers integrated electrical systems, other than unit equipment, in which orderly shutdown is necessary to ensure safe operation. An integrated electrical system as used in this article is a unitized segment of an industrial wiring system where all of the following conditions are met:

(1) An orderly shutdown is required to minimize personnel hazard and equipment damage,

(2) The conditions of maintenance and supervision ensure that licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner will service the system. The name(s) of the licensed electrical practitioner(s) or non licensed electrical practitioner(s) under the supervision of a licensed electrical practitioner shall be kept in a permanent record at the office of the establishment in charge of the completed installation.

A person designated as a licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner shall possess the skills and knowledge related to the construction and operation of the electrical equipment and installation and shall have received documented safety training on the hazards involved. Documentation of their qualifications shall be on file with the office of the establishment in charge of the completed installation.

(3) Effective safeguards, acceptable to the authority having jurisdiction, are established and maintained

6.85.1.3 Application of Other Articles. The articles/sections in Table 6.85.1.3 apply to particular cases of installation of conductors and equipment, where there are orderly shutdown requirements that are in addition to those of this article or are modifications of them.

6.85.2 Orderly Shutdown

6.85.2.1 Location of Overcurrent Devices in or on Premises. Location of overcurrent devices that are critical to integrated electrical systems shall be permitted to be accessible, with mounting heights permitted to ensure security from operation by *unqualified personnel*.

ARTICLE 6.90 — SOLAR PHOTOVOLTAIC SYSTEMS

6.90.1 General

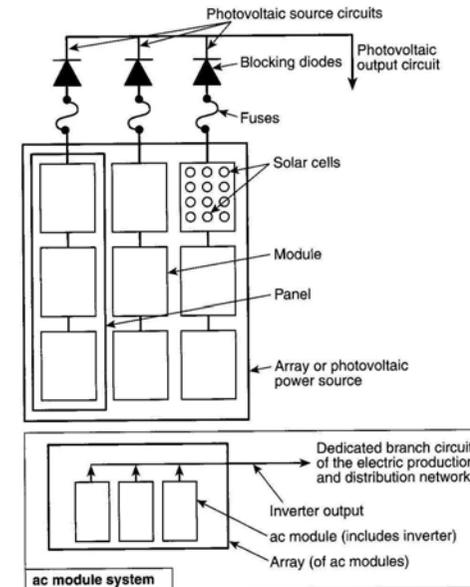

6.90.1.1 Scope. The provisions of this article apply to solar photovoltaic electrical energy systems including the array circuit(s), inverter(s), and controller(s) for such systems [See Figure 6.90.1.1(a) and Fig. 6.90.1.1(b)]. Solar photovoltaic systems covered by this article may be interactive with other electrical power production sources or stand alone, with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.

Table 6.85.1.3 Application of Other Articles

Conductor/Equipment	Section
More than one building or other structure	2.25.2
Ground-fault protection of equipment	2.30.7.6, Exception No. 1
Protection of conductors	2.40.1.4
Electrical system coordination	2.40.1.12
Ground-fault protection of equipment	2.40.1.13(1)
Grounding ac systems of 50 to 1 000 volts	2.50.2.2
Equipment protection	4.27.3.9
Orderly shutdown	4.30.3.14
Disconnection	4.30.6.4, Exception Nos. 1 and 2
Disconnecting means in sight from controller	4.30.9.2(a), Exception No. 2
Energy from more than one source	4.30.9.13, Exception Nos. 1 and 2
Disconnecting means	6.45.1.10, Exception
Uninterruptible power supplies (UPS)	6.45.1.11(1)
Point of connection	7.5.1.12(a)

6.85.2.3 Direct-Current System Grounding. Two-wire dc circuits shall be permitted to be ungrounded.

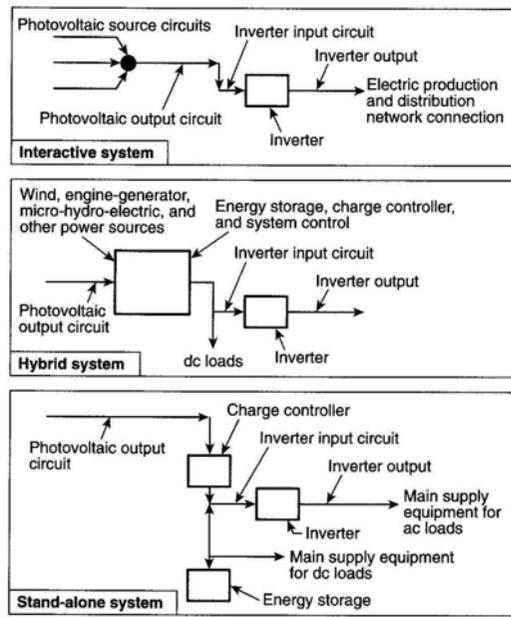

6.85.2.5 Ungrounded Control Circuits. Where operational continuity is required, control circuits of 250 volts, or less, from separately derived systems shall be permitted to be ungrounded.

Notes:

1. These diagrams are intended to be a means of identification for photovoltaic system components, circuits, and connections.
2. Disconnecting means required by Part 6.90.3 are not shown.
3. Systems grounding and equipment grounding are not shown. See Part 6.90.5.

Figure 6.90.1.1(a) Identification of solar photovoltaic system components

Notes:

1. These diagrams are intended to be a means of identification for photovoltaic system components, circuits, and connections.
2. Disconnecting means and overcurrent protection required by Article 6.90 are not shown.
3. Systems grounding and equipment grounding are not shown. See Part 6.90.5.
4. Custom designs occur in each configuration and some components are optical.

Figure 6.90.1.1(b) Identification of solar photovoltaic system components in common system configurations

6.90.1.2 Definitions.

Alternating-Current (ac) Module (Alternating-Current Photovoltaic Module). A complete, environmentally protected unit consisting of solar cells, optics, inverter, and other components, exclusive of tracker, designed to generate ac power when exposed to sunlight.

Array. A mechanically integrated assembly of modules or panels with a support structure and foundation, tracker, and other components, as required, to form a direct-current power-producing unit.

Bipolar Photovoltaic Array. A photovoltaic array that has two outputs, each having opposite polarity to a common reference point or center tap.

Blocking Diode. A diode used to block reverse flow of current into a photovoltaic source circuit.

Building Integrated Photovoltaics. Photovoltaic cells, devices, modules, or modular materials that are integrated into the outer surface or structure of a building and serve as the outer protective surface of that building.

Charge Controller. Equipment that controls dc voltage or dc current, or both, used to charge a battery.

Diversion Charge Controller. Equipment that regulates the charging process of a battery by diverting power from energy storage to direct-current or alternating –current loads or to an interconnected utility service.

Electrical Production and Distribution Network. A power production, distribution, and utilization system, such as a utility system and connected loads, that is external to and not controlled by the photovoltaic power system.

Hybrid System. A system comprised of multiple power sources. These power sources may include photovoltaic, wind, micro-hydro generators, engine-driven generators, and others, but do not include electrical production and distribution network systems. Energy storage systems, such as batteries, do not constitute a power source for the purpose of this definition.

Interactive System. A solar photovoltaic system that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy

storage subsystem of a solar photovoltaic system, such as a battery, is not another electrical production source.

Inverter. Equipment that is used to change voltage level or waveform, or both, of electrical energy. Commonly, an inverter [also known as a power conditioning unit (PCU) or power conversion system (PCS)] is a device that changes dc input to an ac output. Inverters may also function as battery chargers that use alternating current from another source and convert it into direct current for charging batteries.

Inverter Input Circuit. Conductors between the inverter and the battery in stand-alone systems or the conductors between the inverter and the photovoltaic output circuits for electrical production and distribution network.

Inverter Output Circuit. Conductors between the inverter and an ac load center for stand-alone systems or the conductors between the inverter and the service equipment or another electric power production source, such as a utility, for electrical production and distribution network.

Module. A complete, environmentally protected unit consisting of solar cells, optics, and other components, exclusive of tracker, designed to generate dc power when exposed to sunlight.

Panel. A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.

Photovoltaic Output Circuit. Circuit conductors between the photovoltaic source circuit(s) and the inverter or dc utilization equipment.

Photovoltaic Power Source. An array or aggregate of arrays that generates dc power at system voltage and current.

Photovoltaic Source Circuit. Circuits between modules and from modules to the common connection point(s) of the dc system.

Photovoltaic System Voltage. The direct current (dc) voltage of any photovoltaic source or photovoltaic output circuit. For multiwire

installations, the photovoltaic system voltage is the highest voltage between any two dc conductors.

Solar Cell. The basic photovoltaic device that generates electricity when exposed to light.

Solar Photovoltaic System. The total components and subsystems that, in combination, convert solar energy into electrical energy suitable for connection to a utilization load.

Stand-Alone System. A solar photovoltaic system that supplies power independently of an electrical production and distribution network.

6.90.1.3 Other Articles. Wherever the requirements of other articles of this Code and Article 6.90 differ, the requirements of Article 6.90 shall apply and, if the system is operated in parallel with a primary source(s) of electricity, the requirements in 7.5.1.14, 7.5.1.16, 7.5.1.32, and 7.5.1.43 shall apply.

Exception: Solar photovoltaic systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with 5.0.1.1, 5.5.1.1, and 5.10.1.1.

6.90.1.4 Installation.

(a) Solar Photovoltaic System. A solar photovoltaic system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(b) Conductors of Different Systems. Photovoltaic source circuits and photovoltaic output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as feeders or branch circuits of other systems, unless the conductors of the different systems are separated by a partition or are connected together.

(c) Module Connection Arrangement. The connections to a module or panel shall be arranged so that removal of a module or panel from a photovoltaic source circuit does not interrupt a grounded conductor to another photovoltaic source circuit. Sets of modules

interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single-source circuit. Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purpose of this section

(d) Equipment. Inverters or motor generators shall be identified for use in solar photovoltaic systems.

6.90.1.5 Ground-Fault Protection. Roof-mounted dc photovoltaic arrays located on dwellings shall be provided with dc ground-fault protection to reduce fire hazards.

(a) Ground-Fault Detection and Interruption. The ground-fault protection device or system shall be capable of detecting a ground fault, interrupting the flow of fault current, and providing an indication of the fault.

(b) Disconnection of Conductors. The ungrounded conductors of the faulted source circuit shall be automatically disconnected. If the grounded conductors of the faulted source circuit are disconnected to comply with the requirements of 6.90.1.5(a), all conductors of the faulted source circuit shall be opened automatically and simultaneously. Opening the grounded conductor of the array or opening the faulted sections of the array shall be permitted to interrupt the ground-fault current path.

(c) Labels and Markings. Labels and markings shall be applied near the ground-fault indicator at a visible location stating that if a ground fault is indicated, the normally grounded conductors may be energized and ungrounded.

6.90.1.6 Alternating-Current (ac) Modules.

(a) Photovoltaic Source Circuits. The requirements of Article 6.90 pertaining to photovoltaic source circuits shall not apply to ac modules. The photovoltaic source circuit, conductors, and inverters shall be considered as internal wiring of an ac module.

(b) Inverter Output Circuit. The output of an ac module shall be

considered an inverter output circuit.

(c) Disconnecting Means. A single disconnecting means, in accordance with Sections 6.90.3.3 and 6.90.3.5, shall be permitted for the combined ac output of one or more ac modules. Additionally, each ac module in a multiple ac-module system shall be provided with a connector, bolted, or terminal-type disconnecting means.

(d) Ground-Fault Detection. Alternating-current-module systems shall be permitted to use a single detection device to detect only ac ground faults and to disable the array by removing ac power to the ac module(s).

(e) Overcurrent Protection. The output circuits of ac modules shall be permitted to have overcurrent protection and conductor sizing in accordance with 2.40.1.5(b)(2).

6.90.2. Circuit Requirements

6.90.2.1 Maximum Voltage.

(a) Maximum System Voltage. In a dc photovoltaic source circuit or output circuit, the maximum system voltage for that circuit shall be computed as the sum of the rated open-circuit voltage of the series-connected photovoltaic modules corrected for the lowest expected ambient temperature. For crystalline and multi-crystalline silicon modules, the rated open-circuit voltage shall be multiplied by the correction factor provided in Table 6.90.2.1. This voltage shall be used to determine the voltage rating of cables, disconnects, overcurrent devices, and other equipment. Where the lowest expected ambient temperature is below -40°C, or where other than crystalline or multi-crystalline silicon photovoltaic modules are used, the system voltage adjustment shall be made in accordance with the manufacturer's instructions.

(b) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform with 2.10.1.6.

(c) Photovoltaic Source and Output Circuits. In one- and two-family dwellings, photovoltaic source circuits and photovoltaic output circuits that do not include lampholders, fixtures, or receptacles shall

be permitted to have a maximum system voltage up to 600 volts. Other installations with a maximum system voltage over 600 volts shall comply with Part 6.90.1.

Table 6.90.2.1 Voltage Correction Factors for Crystalline and Multi-Crystalline Silicon Modules

Ambient Temperature (⁰ C)	Correction factor for ambient temperatures below 25 ⁰ C, multiply the rated open-circuit voltage by the appropriate correction factor shown below
25 to 10	1.06
9 to 0	1.10
- 1 to - 10	1.13
- 11 to - 20	1.17
- 21 to - 40	1.25

(d) Circuits Over 150 Volts to Ground. In one- and two-family dwellings, live parts in photovoltaic source circuits and photovoltaic output circuits over 150 volts to ground shall not be accessible to other than licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner while energized.

FPN: See 1.10.2.2 for guarding of live parts, and 2.10.1.6 for voltage to ground and between conductors.

(e) Bipolar Source and Output Circuits. For 2-wire circuits connected to bipolar systems, the maximum system voltage shall be the highest voltage between the conductors of the 2-wire circuit if all of the following conditions apply:

- (1) One conductor of each circuit is solidly grounded.
- (2) Each circuit is connected to a separate subarray.
- (3) The equipment is clearly marked with a label as follows:

WARNING
BIPOLAR PHOTOVOLTAIC ARRAY.
DISCONNECTION OF NEUTRAL OR
GROUNDED CONDUCTORS MAY RESULT IN
OVERVOLTAGE ON ARRAY OR INVERTER.

6.90.2.2 Circuit Sizing and Current.

(a) Computation of Maximum Circuit Current. The maximum current for the specific circuit shall be calculated in accordance with 6.90.2.2(a)(1) through (a)(4).

(1) Photovoltaic Source Circuit Currents. The maximum current shall be the sum of parallel module rated short-circuit currents multiplied by 125 percent.

(2) Photovoltaic Output Circuit Currents. The maximum current shall be the sum of parallel source circuit maximum currents as calculated in 6.90.2.2(a)(1).

(3) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.

(4) Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.

(b) Ampacity and Overcurrent Device Ratings. Photovoltaic system currents shall be considered continuous.

(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 6.90.2.2(a). The rating or setting of overcurrent devices shall be permitted in accordance with 2.40.1.4(b) and (c).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

(2) Internal Current Limitation. Overcurrent protection for photovoltaic output circuits with devices that internally limit the current from the photovoltaic output circuit shall be permitted to be rated at less than the value calculated in 6.90.2.2(b)(1). This reduced rating shall be at least 125 percent of the limited current value. Photovoltaic output circuit conductors shall be sized in accordance with 6.90.2.2(b)(1).

Exception: An overcurrent device in an assembly listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

(c) Systems with Multiple Direct-Current Voltages. For a photovoltaic power source that has multiple output circuit voltages and employs a common-return conductor, the ampacity of the common-return conductor shall not be less than the sum of the ampere ratings of the overcurrent devices of the individual output circuits.

(d) Sizing of Module Interconnection Conductors. Where a single overcurrent device is used to protect a set of two or more parallel-connected module circuits, the ampacity of each of the module interconnection conductors shall not be less than the sum of the rating of the single fuse plus 125 percent of the short-circuit current from the other parallel-connected modules.

6.90.2.3 Overcurrent Protection.

(a) Circuits and Equipment. Photovoltaic source circuit, photovoltaic output circuit, inverter output circuit, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 2.40. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 6.90.2.2(b) and located where

(a) There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters, or

(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter into the photovoltaic output circuit and photovoltaic source circuits, is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules.

(b) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with

4.50.1.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected toward the photovoltaic power source not less than the short-circuit output current rating of the inverter shall be permitted without overcurrent protection from that source.

(c) Photovoltaic Source Circuits. Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in photovoltaic source circuits. The overcurrent devices shall be accessible, but shall not be required to be readily accessible.

Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments, starting at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 2.40.1.6(a).

(d) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a photovoltaic power system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupt ratings.

(e) Series Overcurrent Protection. In series-connected strings of two or more modules, a single overcurrent protection device shall be permitted.

6.90.2.4 Stand-Alone Systems. The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this Code except as modified by (a) and (b).

(a) Inverter Output. The ac inverter output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(b) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors

shall be protected from overcurrents in accordance with Article 2.40. The overcurrent protection shall be located at the output of the inverter.

(c) Single 120-Volt Supply. The inverter output of a stand-alone solar photovoltaic system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS

6.90.3 Disconnecting Means

6.90.3.1 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch or circuit breaker shall not be installed in a grounded conductor unless that switch or circuit breaker is part of a ground-fault detection system required by 6.90.1.5 and that switch or circuit breaker is automatically opened and indicated as a normal function of the device in responding to ground faults.

FPN: The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

6.90.3.2 Additional Provisions. Photovoltaic disconnecting means shall comply with 6.90.3.2(a) through 6.90.3.2(d).

(a) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with 6.90.3.5.

(b) Equipment. Equipment such as photovoltaic source circuit

isolating switches, overcurrent devices, and blocking diodes shall be permitted on the photovoltaic side of the photovoltaic disconnecting means.

(c) Requirements for Disconnecting Means. Means shall be provided to disconnect all conductors in a building or other structure from the photovoltaic system conductors.

(1) Location. The photovoltaic disconnecting means shall be installed at a readily accessible location either on the outside of a building or structure or inside nearest the point of entrance of the system conductors.

Exception: Installations that comply with 6.90.4.1(e) shall be permitted to have the disconnecting means located remote from the point of entry of the system conductors.

The photovoltaic system disconnecting means shall not be installed in bathrooms.

(2) Marking. Each photovoltaic system disconnecting means shall be permanently marked to identify it as a photovoltaic system disconnect.

(3) Suitable for Use. Each photovoltaic system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 5.0 through 5.17.

(4) Maximum Number of Disconnects. The photovoltaic system disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(5) Grouping. The photovoltaic system disconnecting means shall be grouped with other disconnecting means for the system to comply with 6.90.3.2(c)(4). A photovoltaic disconnecting means shall not be required at the photovoltaic module or array location.

(d) Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):

(1) A direct-current photovoltaic disconnecting means shall be mounted within sight of or in the inverter.

(2) An alternating-current disconnecting means shall be mounted within sight of or in the inverter.

(3) The alternating-current output conductors from the inverter and an additional alternating-current disconnecting means for the inverter shall comply with 6.90.3.2(c)(1).

(4) A plaque shall be installed in accordance with 7.5.1.10.

6.90.3.3 Disconnection of Photovoltaic Equipment. Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified.

A single disconnecting means in accordance with 6.90.3.5 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.

6.90.3.4 Fuses. Disconnecting means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. Such a fuse in a photovoltaic source circuit shall be capable of being disconnected independently of fuses in other photovoltaic source circuits.

6.90.3.5 Switch or Circuit Breaker. The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s) complying with all of the following requirements:

- (1) Located where readily accessible,
- (2) Externally operable without exposing the operator to contact with live parts,
- (3) Plainly indicating whether in the open or closed position, and
- (4) Shall have an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment.

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to

the disconnecting means. The sign shall be clearly legible and shall read substantially:

WARNING
ELECTRIC SHOCK HAZARD
DO NOT TOUCH TERMINALS
TERMINALS ON BOTH THE LINE AND LOAD SIDES
MAY BE ENERGIZED IN THE OPEN POSITION.

Exception: A connector shall be permitted to be used as an ac or dc disconnecting means provided that it complies with the requirement of 6.90.4.3 and is listed and identified for the use.

6.90.3.6 Installation and Service of an Array. Open circuiting, short circuiting, or opaque covering shall be used to disable an array or portions of an array for installation and service.

FPN: Photovoltaic modules are energized while exposed to light. Installation, replacement, or servicing of array components while a module(s) is irradiated may expose persons to electric shock.

6.90.4 Wiring Methods

6.90.4.1 Methods Permitted.

(a) **Wiring Systems.** All raceway and cable wiring methods included in this Code and other wiring systems and fittings specifically intended and identified for use on photovoltaic arrays shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

FPN: Photovoltaic modules operate at elevated temperatures when exposed to high ambient temperatures and to bright sunlight. These temperatures may routinely exceed 70°C in many locations. Module interconnection conductors are available with insulation rated for wet locations and a temperature rating of 90°C or greater.

(b) **Single Conductor Cable.** Types SE, UF, USE and USE-2 single-conductor cable shall be permitted in photovoltaic source circuits where installed in the same manner as a Type UF multiconductor cable in accordance with Article 3.39. Where exposed to direct rays of the sun, Type UF cable identified as sunlight-resistant or Type USE cable shall be used.

(c) Flexible Cords and Cables. Flexible cords and cables, where used to connect the moving parts of tracking PV modules, shall comply with Article 4.0 and shall be of a type identified as a hard service cord or portable power cable; shall be suitable for extra-hard usage, listed for outdoor use, water resistant, and sunlight resistant. Allowable ampacities shall be in accordance with 4.0.1.5. For ambient temperatures exceeding 30°C, the ampacities shall be derated by the appropriate factors given in Table 6.90.4.1(c).

Table 6.90.4.1(c) Correction Factors

Ambient Temperature (°C)	Temperature Rating of Conductor			
	60°C	75°C	90°C	105°C
30	1.00	1.00	1.00	1.00
31 - 35	0.91	0.94	0.96	0.97
36 - 40	0.82	0.88	0.91	0.93
41 - 45	0.71	0.82	0.87	0.89
46 - 50	0.58	0.75	0.82	0.86
51 - 55	0.41	0.67	0.76	0.82
56 - 60	—	0.58	0.71	0.77
61 - 70	—	0.33	0.58	0.68
71 - 80	—	—	0.41	0.58

(d) Small Conductor Cables. Single-conductor cables listed for outdoor use that are sunlight resistant and moisture resistant with sizes 1.25 mm² (1.2 mm dia.) and 0.75 mm² (1.0 mm dia.) shall be permitted for module interconnections where such cables meet the ampacity requirements of 6.90.2.2. Section 3.10.1.15 shall be used to determine the cable ampacity and temperature derating factors.

(e) Direct-Current Photovoltaic Source and Output Circuits Inside a Building. Where direct current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metallic raceways or enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14(A) through 690.14(D).

6.90.4.2 Component Interconnections. Fittings and connectors that are intended to be concealed at the time of on-site assembly, where listed for such use, shall be permitted for on-site interconnection of modules or other array components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstand, and shall be capable of resisting the effects of the environment in which they are used.

6.90.4.3 Connectors. The connectors permitted by Article 6.90 shall comply with 6.90.4.3(a) through 6.90.4.3(e).

(a) Configuration. The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.

(b) Guarding. The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.

(c) Type. The connectors shall be of the latching or locking type.

(d) Grounding Member. The grounding member shall be the first to make and the last to break contact with the mating connector.

(e) Interruption of Circuit. The connectors shall be capable of interrupting the circuit current without hazard to the operator.

6.90.4.4 Access to Boxes. Junction, pull, and outlet boxes located behind modules or panels shall be installed so that the wiring contained in them can be rendered accessible directly or by displacement of a module(s) or panel(s) secured by removable fasteners and connected by a flexible wiring system.

6.90.4.5 Ungrounded Photovoltaic Power Systems. Photovoltaic power systems shall be permitted to operate with ungrounded photovoltaic source and output circuits where the system complies with 6.90.4.5(a) through 6.90.4.5(g).

(a) Disconnects. All photovoltaic source and output circuit conductors shall have disconnects complying with 6.90.3.

(b) Overcurrent Protection. All photovoltaic source and output

circuit conductors shall have overcurrent protection complying with 6.90.2.3.

(c) Ground-Fault Protection. All photovoltaic source and output circuits shall be provided with a ground-fault protection device or system that complies with (1) through (3):

- (1) Detects a ground fault.
- (2) Indicates that a ground fault has occurred
- (3) Automatically disconnects the conductors and/or shuts off the utility-interactive inverter or charge controller for that portion of the faulted array

(d) The photovoltaic source and output conductors shall consist of sheathed (jacketed) multi-conductor cables or shall be installed in a raceway.

(e) The photovoltaic power system direct-current circuits shall be permitted to be used with ungrounded battery systems complying with 6.90.8.1(g).

(f) The photovoltaic power source shall be labeled with the following warning at each junction box, combiner box, disconnect, and device where the ungrounded circuits may be exposed during service:

WARNING
ELECTRIC SHOCK HAZARD. THE DIRECT
CURRENT CIRCUIT CONDUCTORS OF THIS
PHOTOVOLTAIC POWER SYSTEM ARE
UNGROUNDING BUT MAY BE ENERGIZED
WITH RESPECT TO GROUND DUE TO
LEAKAGE PATHS AND/OR GROUND FAULTS.

(g) The inverters or charge controllers used in systems with ungrounded photovoltaic source and output circuits shall be listed for the purpose.

6.90.5 Grounding

6.90.5.1 System Grounding. For a photovoltaic power source, one conductor of a 2-wire system rated over 50 volts and a neutral conductor of a 3-wire system shall be solidly grounded.

Exception: Systems complying with 6.90.4.5.

6.90.5.2 Point of System Grounding Connection. The dc circuit grounding connection shall be made at any single point on the photovoltaic output circuit.

FPN: Locating the grounding connection point as close as practicable to the photovoltaic source will better protect the system from voltage surges due to lightning.

6.90.5.3 Equipment Grounding. Exposed noncurrent-carrying metal parts of module frames, equipment, and conductor enclosures shall be grounded regardless of voltage.

6.90.5.5 Size of Equipment Grounding Conductor. Where not protected by the ground-fault protection equipment required by 6.90.1.5, the equipment-grounding conductor for photovoltaic source and photovoltaic output circuits shall be sized for 125 percent of the photovoltaic-originated short-circuit currents in that circuit. Where protected by the ground-fault protection equipment required by 6.90.1.5, the equipment-grounding conductors for photovoltaic source and photovoltaic output circuits shall be sized in accordance with 2.50.6.13.

6.90.5.7 Grounding Electrode System.

(a) Alternating-Current Systems. If installing an ac system, a grounding electrode system shall be provided in accordance with 2.50.3.1 through 2.50.3.11. The grounding electrode conductor shall be installed in accordance with 2.50.3.15.

(b) Direct-Current Systems. If installing a dc system, a grounding electrode system shall be provided in accordance with 2.50.8.7 for grounded systems or 250.169 for ungrounded systems. The grounding electrode conductor shall be installed in accordance with 2.50.3.15.

(c) Systems with Alternating-Current and Direct-Current Grounding Requirements. Photovoltaic power systems with both alternating-current and direct-current (dc) grounding requirements shall be permitted to be grounded as described in (1) or (2):

(1) A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode. The dc grounding-electrode conductor shall be sized according to 2.50.8.7. The dc grounding electrode shall be bonded to the ac-grounding electrode to make a grounding electrode system according to 2.50.3.3 and 2.50.3.4. The bonding conductor shall be no smaller than the largest grounding electrode conductor, either ac or dc.

(2) The dc grounding electrode conductor and ac grounding electrode conductor shall be connected to a single grounding electrode. The separate grounding electrode conductors shall be sized as required by 2.50.3.17 (ac) and 2.50.8.7 (dc).

6.90.5.8 Continuity of Equipment Grounding Systems. Where the removal of equipment disconnects the bonding connection between the grounding electrode conductor and exposed conducting surfaces in the photovoltaic source or output circuit equipment, a bonding jumper shall be installed while the equipment is removed.

6.90.5.9 Continuity of Photovoltaic Source and Output Circuit Grounded Conductors. Where the removal of the utility-interactive inverter or other equipment disconnects the bonding connection between the grounding electrode conductor and the photovoltaic source and/or photovoltaic output circuit grounded conductor, a bonding jumper shall be installed to maintain the system grounding while the inverter or other equipment is removed.

6.90.6 Marking

6.90.6.1 Modules. Modules shall be marked with identification of terminals or leads as to polarity, maximum overcurrent device rating for module protection, and with the following ratings:

- (1) Open-circuit voltage
- (2) Operating voltage
- (3) Maximum permissible system voltage
- (4) Operating current
- (5) Short-circuit current, and
- (6) Maximum power

6.90.6.2 Alternating-Current Photovoltaic Modules. Alternating-current modules shall be marked with identification of terminals or leads, and with identification of the following rating:

- (1) Nominal operating ac voltage
- (2) Nominal operating ac frequency
- (3) Maximum ac power
- (4) Maximum ac current, and
- (5) Maximum overcurrent device rating for ac module protection

6.90.6.3 Direct-Current Photovoltaic Power Source. A marking for the direct-current photovoltaic power source indicating items (1) through (4) shall be provided by the installer at an accessible location at the disconnecting means for this power source:

- (1) Operating current
- (2) Operating voltage
- (3) Maximum system voltage
- (4) Short-circuit current

FPN: Reflecting systems used for irradiance enhancement may result in increased levels of output current and power.

6.90.6.4 Interactive System Point of Interconnection. All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source with the maximum ac output operating current and the operating ac voltage.

6.90.6.5 Photovoltaic Power Systems Employing Energy Storage. Photovoltaic power systems employing energy storage shall also be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.

6.90.6.6 Identification of Power Sources.

(a) Facilities with Stand-Alone Systems. Any structure or building with a photovoltaic power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure

at a readily visible location acceptable to the authority having jurisdiction. The plaque or directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system.

(b) Facilities with Utility Services and PV Systems. Buildings or structures with both utility service and a photovoltaic system shall have a permanent plaque or directory providing the location of the service disconnecting means and the photovoltaic system disconnecting means, if not located at the same location.

6.90.7 Connection to Other Sources

6.90.7.1 Identified Interactive Equipment. Only inverters and ac modules listed and identified as interactive shall be permitted in interactive systems.

6.90.7.2 Loss of Interactive System Power. An inverter or an ac module in an interactive solar photovoltaic system shall automatically de-energize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the electrical production and distribution network voltage has been restored.

A normally interactive solar photovoltaic system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

6.90.7.3 Ampacity of Neutral Conductor. If a single-phase, 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire, wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

6.90.7.4 Unbalanced Interconnections.

(a) Single Phase. Single-phase inverters for photovoltaic systems and ac modules in interactive solar photovoltaic systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.

(b) Three Phase. Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of, or unbalanced, voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

6.90.7.5 Point of Connection. The output of a photovoltaic power source shall be connected as specified in 6.90.7.5(a) or 6.90.7.5(b).

(a) Supply Side. A photovoltaic power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 2.30.6.13(6).

(b) Load Side. A photovoltaic power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises provided that all of the following conditions are met.

(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

(3) The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

(4) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

Exception: Equipment with power supplied from a single point of connection.

(5) Circuit breakers, if backfed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 6.90.7.1 shall not be required to be individually clamped to the panelboard bus bars. A front panel shall clamp all circuit breakers to the panelboard bus bars. Main circuit breakers connected directly to energized feeders shall also be individually clamped.

6.90.8 Storage Batteries

6.90.8.1 Installation.

(a) **General.** Storage batteries in a solar photovoltaic system shall be installed in accordance with the provisions of Article 4.80. The interconnected battery cells shall be considered grounded where the photovoltaic power source is installed in accordance with 6.90.5.1.

(b) Dwellings.

(1) **Operating Voltage.** Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 6.90.2.1 shall be permitted.

(2) **Guarding of Live Parts.** Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in solar photovoltaic systems are subject to extensive charge-discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(c) **Current Limiting.** A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds

the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 6.90.3.4.

(d) **Battery Nonconductive Cases and Conductive Racks.** Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.

(e) **Disconnection of Series Battery Circuits.** Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner. Non-load-break bolted or plug-in disconnects shall be permitted.

(f) **Battery Maintenance Disconnecting Means.** Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the photovoltaic electrical system. A non-load-break-rated switch shall be permitted to be used as the disconnecting means.

(g) **Battery Systems of More Than 48 Volts.** On photovoltaic systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The photovoltaic array source and output circuits shall comply with 6.90.5.1.

(2) The dc and ac load circuits shall be solidly grounded.

(3) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(4) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

6.90.8.2 Charge Control.

(a) **General.** Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the photovoltaic source circuit is matched to the voltage rating and charge current requirements of the interconnected battery cells, and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer.

All adjusting means for control of the charging process shall be accessible only to licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

(b) Diversion Charge Controller.

(1) **Sole Means of Regulating Charging.** A photovoltaic power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second independent means to prevent overcharging of the battery.

(2) **Circuits with Direct-Current Diversion Charge Controller and Diversion Load.** Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

a. The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum

battery voltage. The power rating of the diversion load shall be at least 150 percent of the power rating of the photovoltaic array.

b. The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

(3) **PV Systems Using Utility-Interactive Inverters.** Photovoltaic power systems using utility-interactive inverters to control battery state-of-charge by diverting excess power into the utility system shall comply with (1) and (2):

a. These systems shall not be required to comply with 6.90.8.2(b)(2). The charge regulation circuits used shall comply with the requirements of 6.90.2.2.

b. These systems shall have a second, independent means of controlling the battery charging process for use when the utility is not present or when the primary charge controller fails or is disabled.

6.90.8.4 Battery Interconnections. Flexible cables, as identified in Article 4.0, in sizes 60 mm² and larger shall be permitted within the battery enclosure from battery terminals to nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard service use and identified as moisture resistant.

6.90.9 Systems Over 600 Volts

6.90.9.1 General. Solar photovoltaic systems with a maximum system voltage over 600 volts dc shall comply with Article 4.90 and other requirements applicable to installations rated over 600 volts.

6.90.9.6 Definitions. For the purposes of Part 6.90.9, the voltages used to determine cable and equipment ratings shall be defined as follows.

Battery Circuits. In battery circuits, the voltage shall be the highest voltage experienced under charging or equalizing conditions.

Photovoltaic Circuits. In dc photovoltaic source circuits and photovoltaic output circuits, the voltage shall be the maximum system voltage.

ARTICLE 6.92 — FUEL CELL SYSTEMS

6.92.1 General

6.92.1.1 Scope. This article identifies the requirements for the installation of fuel cell power systems, which may be stand-alone or interactive with other electrical power production sources and may be with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.

6.92.1.2 Definitions.

Fuel Cell. An electrochemical system that consumes fuel to produce an electric current. The main chemical reaction used in a fuel cell for producing electric power is not combustion. However, there may be sources of combustion used within the overall fuel cell system such as reformers/fuel processors.

Fuel Cell System. The complete aggregate of equipment used to convert chemical fuel into usable electricity. A fuel cell system typically consists of a reformer, stack, power inverter, and auxiliary equipment.

Interactive System. A fuel cell system that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy storage subsystem of a fuel cell system, such as a battery, is not another electrical production source.

Maximum System Voltage. The highest fuel cell inverter output voltage between any ungrounded conductors present at accessible output terminals.

Output Circuit. The conductors used to connect the fuel cell system to its electrical point of delivery. In the case of sites that have series- or parallel-connected multiple units, the term output circuit also refers to the conductors used to electrically interconnect the fuel cell system(s).

Point of Common Coupling. The point at which the power production and distribution network and the customer interface occurs in an interactive system. Typically, this is the load side of the power network meter.

Stand-Alone System. A fuel cell system that supplies power independently of an electrical production and distribution network.

6.92.1.3 Other Articles. Wherever the requirements of other articles of this Code and Article 6.92 differ, the requirements of Article 6.92 shall apply, and, if the system is operated in parallel with a primary source(s) of electricity, the requirements in 7.5.1.14, 7.5.1.16, 7.5.1.32, and 7.5.1.43 shall apply.

6.92.1.4 Installation.

(a) Fuel Cell System. A fuel cell system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(b) Identification. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location.

6.92.1.6 Listing Requirement. The fuel cell system shall be evaluated and listed for its intended application prior to installation.

6.92.2 Circuit Requirements

6.92.2.1 Circuit Sizing and Current.

(a) Nameplate Rated Circuit Current. The nameplate(s) rated circuit current shall be the rated current indicated on the fuel cell nameplate(s).

(b) Conductor Ampacity and Overcurrent Device Ratings. The ampacity of the feeder circuit conductors from the fuel cell system(s) to the premises wiring system shall not be less than the greater of (1) nameplate(s) rated circuit current or (2) the rating of the fuel cell system(s) overcurrent protective device(s).

(c) Ampacity of Grounded or Neutral Conductor. If an interactive single-phase, 2-wire fuel cell output(s) is connected to the grounded or neutral conductor and a single ungrounded conductor of a 3-wire system or of a 3-phase, 4-wire wye-connected system, the maximum unbalanced neutral load current plus the fuel cell system(s) output rating shall not exceed the ampacity of the grounded or neutral conductor.

6.92.2.2 Overcurrent Protection.

(a) Circuits and Equipment. If the fuel cell system is provided with overcurrent protection sufficient to protect the circuit conductors that supply the load, additional circuit overcurrent devices shall not be required. Equipment and conductors connected to more than one electrical source shall be protected.

(b) Accessibility. Overcurrent devices shall be readily accessible.

6.92.2.3 Stand-Alone Systems. The premises wiring system shall meet the requirements of this Code except as modified by 6.92.2.3(a), (b), and (a).

(a) Fuel Cell System Output. The fuel cell system output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(b) Sizing and Protection. The circuit conductors between the fuel cell system(s) output and the building or structure disconnecting means shall be sized based on the output rating of the fuel cell system(s). These conductors shall be protected from overcurrents in accordance with 2.40.1.4. The overcurrent protection shall be located at the output of the fuel cell system(s).

(c) Single 120-Volt Nominal Supply. The inverter output of a stand-alone fuel cell system shall be permitted to supply 120 volts, nominal, to single-phase, 3-wire 120/240-volt service equipment or distribution panels where there are no 240-volt loads and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the fuel cell system(s) shall be less than the rating of the service equipment. This equipment

shall be marked as follows:

WARNING
SINGLE 120-VOLT SUPPLY.
DO NOT CONNECT MULTIWIRE
BRANCH CIRCUITS!

6.92.3 Disconnecting Means

6.92.3.1 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a fuel cell system power source from all other conductors in a building or other structure.

6.92.3.2 Provisions. The provisions of 2.25.2.2 and 2.25.2.4 through 2.25.2.11 shall apply to the fuel cell source disconnecting means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with 6.92.3.5.

6.92.3.3 Switch or Circuit Breaker. The disconnecting means for ungrounded conductors shall consist of readily accessible, manually operable switch(es) or circuit breaker(s).

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and shall have the following words or equivalent:

DANGER
ELECTRIC SHOCK HAZARD.
DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE AND
LOAD SIDES MAY BE ENERGIZED
IN THE OPEN POSITION.

6.92.4 Wiring Methods

6.92.4.1 Wiring Systems. All raceway and cable wiring methods included in Chapter 3 of this Code and other wiring systems and fittings specifically intended and identified for use with fuel cell systems shall be permitted. Where wiring devices with integral

enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

6.92.5 Grounding

6.92.5.1 System Grounding. For a fuel cell system output circuit, one conductor of a 2-wire system rated over 50 volts and a neutral conductor of a 3-wire system shall be solidly grounded by either 6.92.5.1(a) or 6.92.5.1(b).

(a) **Stand-Alone Systems.** Grounding and bonding shall be in accordance with 2.50.2.11.

(b) **Other Than Stand-Alone Systems.**

(1) **Two-Wire Systems.** One conductor shall be terminated at the grounded circuit conductor terminal of the premises wiring system.

(2) **Three-Wire Systems.** The neutral conductor shall be terminated at the grounded circuit conductor terminal of the premises wiring system.

6.92.5.4 Equipment Grounding Conductor. A separate equipment grounding conductor shall be installed.

6.92.5.5 Size of Equipment Grounding Conductor. The equipment grounding conductor shall be sized in accordance with 2.50.6.13.

6.92.5.7 Grounding Electrode System. Any supplementary grounding electrode(s) required by the manufacturer shall be connected to the equipment grounding conductor specified in 2.50.6.9.

6.92.6 Marking

6.92.6.1 Fuel Cell Power Sources. A marking specifying the fuel cell system, output voltage, output power rating, and continuous output current rating shall be provided at the disconnecting means for the fuel cell power source at an accessible location on the site.

6.92.6.2 Fuel Shut-Off. The location of the manual fuel shut-off valve shall be marked at the location of the primary disconnecting means of the building or circuits supplied.

6.92.6.3 Stored Energy. A fuel cell system that stores electrical energy shall require the following warning sign, or equivalent, at the location of the service disconnecting means of the premises:

WARNING
FUEL CELL POWER SYSTEM CONTAINS
ELECTRICAL ENERGY STORAGE DEVICES.

6.92.7 Connection to Other Circuits

6.92.7.1 Transfer Switch. A transfer switch shall be required in non-grid-interactive systems that use utility grid backup. The transfer switch shall maintain isolation between the electrical production and distribution network and the fuel cell system. The transfer switch shall be permitted to be located externally or internally to the fuel cell system unit. When the utility service conductors of the structure are connected to the transfer switch, the switch shall comply with Part 2.30.5.

6.92.7.2 Identified Interactive Equipment. Only fuel cell systems listed and identified as interactive shall be permitted in interactive systems.

6.92.7.3 Output Characteristics. The output of a fuel cell system operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term compatible does not necessarily mean matching the primary source wave shape.

6.92.7.4 Loss of Interactive System Power. The fuel cell system shall be provided with a means of detecting when the electrical production and distribution network has become de-energized and shall not feed the electrical production and distribution network side of the point of common coupling during this condition. The fuel cell system shall remain in that state until the electrical production and distribution network voltage has been restored.

A normally interactive fuel cell system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

6.92.7.5 Unbalanced Interconnections.

(a) Single Phase. Single-phase interactive fuel cell systems shall not be connected to a 3-phase power system unless the interactive system is so designed that significant unbalanced voltages cannot result.

(b) Three Phase. Three-phase interactive fuel cell systems shall have all phases automatically de-energized upon loss of voltage, or upon unbalance of voltage in one or more phases, unless the interactive system is designed so that significant unbalanced voltages will not result.

6.92.7.6 Point of Connection. The output of a fuel cell system power source shall be connected as specified in 6.92.7.7(a) or 6.92.7.7(b).

(a) Supply Side. A fuel cell system power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 2.30.6.13(6).

(b) Load Side. A fuel cell system power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions are met:

(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

(3) The interconnection point shall be on the line side of all ground-fault protection equipment.

(4) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

(5) Equipment such as circuit breakers, if backfed, shall be identified for such operation.

(6) The circuit breaker on the dedicated output of a utility-interactive inverter shall be positioned in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location. A permanent warning label shall be applied to the distribution equipment with the following, or equivalent:

WARNING
FUEL CELL POWER SYSTEM OUTPUT.
DO NOT RELOCATE THIS CIRCUIT BREAKER.

6.92.8 Outputs Over 600 Volts

6.92.8.1 General. Fuel cell systems with a maximum output voltage over 600 volts ac shall comply with the requirements of other articles applicable to such installations.

ARTICLE 6.95 — FIRE PUMPS

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 20-2003, Standard for the Installation of Stationary Pumps for Fire Protection. Only editorial changes were made to the extracted text to make it consistent with this Code.

6.95.1.1 Scope.

(a) Covered. This article covers the installation of the following:

(1) Electric power sources and interconnecting circuits
(2) Switching and control equipment dedicated to fire pump drivers

(b) Not Covered. This article does not cover the following:

(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system

(2) Pressure maintenance (jockey or makeup) pumps

FPN: See Standard for the Installation of Centrifugal Fire Pumps, NFPA 20-2003, for further information.

6.95.1.2 Definitions.

Fault Tolerant External Control Circuits. Those control circuits either entering or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump from all other internal or external means and may cause the controller to start the pump under these conditions.

On-Site Power Production Facility. The normal supply of electric power for the site that is expected to be constantly producing power.

On-Site Standby Generator. A facility producing electric power on site as the alternate supply of electric power. It differs from an on-site power production facility, in that it is not constantly producing power.

6.95.1.3 Power Source(s) for Electric Motor-Driven Fire Pumps. Electric motor-driven fire pumps shall have a reliable source of power.

(a) **Individual Sources.** Where reliable, and where capable of carrying indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply, the power source for an electric motor-driven fire pump shall be one or more of the following.

(1) **Electric Utility Service Connection.** A fire pump shall be permitted to be supplied by a separate service, or by a tap located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means. The connection shall be located and arranged so as to minimize the possibility of damage by fire from within the premises and from exposing hazards. A tap ahead of the service disconnecting means shall comply with 2.30.6.13(5). The service equipment shall comply with the labeling requirements in 2.30.1.2 and the location requirements in 2.30.6.3(b). [NFPA 20:9.2.2]

(2) **On-Site Power Production Facility.** A fire pump shall be permitted to be supplied by an on-site power production facility. The source facility shall be located and protected to minimize the possibility of damage by fire. [NFPA 20:9.2.3]

(b) **Multiple Sources.** Where reliable power cannot be obtained from a source described in 6.95.1.3(a), power shall be supplied from an approved combination of two or more of either of such sources, or from an approved combination of feeders constituting two or more power sources as covered in 6.95.1.3(b)(2), or from an approved combination of one or more of such power sources in combination with an on-site standby generator complying with 6.95.1.3(b)(1) and (b)(3).

(1) **Generator Capacity.** An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load. Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. The requirements of 4.30.9.13 shall not apply. [NFPA 20:9.6.1]

(2) **Feeder Sources.** This section applies to multi-building campus-style complexes with fire pumps at one or more buildings. Where sources in 6.95.1.3(a) are not practicable, and with the approval of the authority having jurisdiction, two or more feeder sources shall be permitted as one power source or as more than one power source where such feeders are connected to or derived from separate utility services. The connection(s), overcurrent protective device(s), and disconnecting means for such feeders shall meet the requirements of 6.95.1.4(b). [NFPA 20:9.2.5.3]

(3) **Arrangement.** The power sources shall be arranged so that a fire at one source will not cause an interruption at the other source. [NFPA 20:2.5.1]

6.95.1.4 Continuity of Power. Circuits that supply electric motor-driven fire pumps shall be supervised from inadvertent disconnection as covered in (a) or (b).

(a) Direct Connection. The supply conductors shall directly connect the power source to either a listed fire pump controller or listed combination fire pump controller and power transfer switch. *[NFPA 20:9.3.2.2.2]*

(b) Supervised Connection. A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between a remote power source and one of the following:

- (1) A listed fire pump controller
- (2) A listed fire pump power transfer switch, or
- (3) A listed combination fire pump controller and power transfer switch

For systems installed under the provisions of 6.95.1.3(b)(2) only, such additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized according to 4.30.5.2 to provide short-circuit protection only. All disconnecting devices and overcurrent protective devices that are unique to the fire pump loads shall comply with 6.95.1.4(b)(1) through (b)(5).

(a) Overcurrent Device Selection. The overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply.

(b) Disconnecting Means. The disconnecting means shall be

- (1) Be identified as suitable for use as service equipment,
- (2) Be lockable in the closed position, and
- (3) Not be located within equipment that feeds loads other than the fire pump.
- (4) Be located sufficiently remote from other building or other fire pump source disconnecting means that inadvertent contemporaneous operation would be unlikely.

(c) Disconnect Marking. The disconnecting means shall be marked "Fire Pump Disconnecting Means." The letters shall be at least 25 mm in height, and they shall be visible without opening enclosure doors or covers.

(d) Controller Marking. A placard shall be placed adjacent to the fire pump controller stating the location of this disconnecting means and the location of the key (if the disconnecting means is locked).

(e) Supervision. The disconnecting means shall be supervised in the closed position by one of the following methods:

- (1) Central station, proprietary, or remote station signal device
- (2) Local signaling service that will cause the sounding of an audible signal at a constantly attended point
- (3) Locking the disconnecting means in the closed position
- (4) Sealing of disconnecting means and approved weekly recorded inspections when the disconnecting means are located within fenced enclosures or in buildings under the control of the owner *[NFPA 20:9.3.2.2.3]*

6.95.1.5 Transformers. Where the service or system voltage is different from the utilization voltage of the fire pump motor, transformer(s) protected by disconnecting means and overcurrent protective devices shall be permitted to be installed between the system supply and the fire pump controller in accordance with 6.95.1.5(a) and (b), or (c). Only transformers covered in 6.95.1.5(c) shall be permitted to supply loads not directly associated with the fire pump system.

(a) Size. Where a transformer supplies an electric motor-driven fire pump, it shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the associated fire pump accessory equipment supplied by the transformer.

(b) Overcurrent Protection. The primary overcurrent protective device(s) shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated

fire pump accessory equipment when connected to this power supply. Secondary overcurrent protection shall not be permitted. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

(c) Feeder Source. Where a feeder source is provided in accordance with 6.95.1.3(b)(2), transformers supplying the fire pump system shall be permitted to supply other loads. All other loads shall be calculated in accordance with Article 2.20, including demand factors as applicable.

(1) Size. Transformers shall be rated at a minimum of 125 percent of the sum of the fire pump motor(s) and pressure maintenance pump(s) motor loads, and 100 percent of the remaining load supplied by the transformer.

(2) Overcurrent Protection. The transformer size, the feeder size, and the overcurrent protective device(s) shall be coordinated such that overcurrent protection is provided for the transformer in accordance with 4.50.1.3 and for the feeder in accordance with 2.15.1.3, and such that the overcurrent protective device(s) is selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s), the pressure maintenance pump motor(s), the full-load current of the associated fire pump accessory equipment, and 100 percent of the remaining loads supplied by the transformer. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices in the fire pump motor circuit(s).

6.95.1.6 Power Wiring. Power circuits and wiring methods shall comply with the requirements in 6.95.1.6(a) through (h), and as permitted in 230.90(a), Exception No. 4; 230.7.5, Exception No. 4; 230.7.6, Exception No. 2; 240.1.13; 230.8.9; 240.1.4(a); and 4.30.3.1.

(a) Service Conductors. Supply conductors shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 2.30. Where supply conductors cannot be physically routed outside buildings, they shall be permitted to be routed through buildings where installed in accordance with 2.30.1.6(1) or 2.30.1.6(2). Where a fire pump is wired under the provisions of 6.95.1.3(b)(2), this requirement shall apply to all supply

conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump.

Exception: Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement shall only apply to those conductors on the load side of that point of automatic connection between sources.

(b) Circuit Conductors. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 6.95.1.4(b) shall be kept entirely independent of all other wiring. They shall supply only loads that are directly associated with the fire pump system, and they shall be protected to resist potential damage by fire, structural failure, or operational accident. They shall be permitted to be routed through a building(s) using one of the following methods:

- (1) Be encased in a minimum 50 mm of concrete
- (2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistive rating
- (3) Be a listed electrical circuit protective system with a minimum 1-hour fire rating

Exception: The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 7.0.2.1(d) of this Code.

(c) Conductor Size.

(1) Fire Pump Motors and Other Equipment. Conductors supplying a fire pump motor(s), pressure maintenance pumps, and associated fire pump accessory equipment shall have a minimum rating of 125 percent of the sum of the fire pump motor(s) and pressure maintenance motor(s) full-load current(s), and 100 percent of the associated fire pump accessory equipment.

(2) Fire Pump Motors Only. Conductors supplying only a fire pump motor(s) shall have a minimum rating of 125 percent of the fire pump motor(s) full-load current(s).

(d) Overload Protection. Power circuits shall not have automatic protection against overloads. Branch-circuit and feeder conductors shall be protected against short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors in accordance with 2.30.1.6. The applicable distance and size restrictions in 2.40.2.2 shall not apply.

Exception No. 1: Conductors between storage batteries and the engine shall not require overcurrent protection or disconnecting means.

Exception No. 2: For on-site standby generator(x0 rated to produce continuous current in excess of 225 percent of the full-load amperes of the fire pump motor, the conductors between the on-site generator(s) and the combination fire pump transfer switch controller or separately mounted transfer switch shall be installed in accordance with 6.95.1.6(b) or protected in accordance with 4.30.4.2.

The protection provided shall be in accordance with the short-circuit current rating of the combination fire pump transfer switch controller or separately mounted transfer switch.

(e) Pump Wiring. All wiring from the controllers to the pump motors shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit Type LFNC-B, or Type MI cable.

(f) Junction Points. Where wire connectors are used in the fire pump circuit, the connectors shall be listed. A fire pump controller or fire pump power transfer switch, where provided, shall not be used as a junction box to supply other equipment including a pressure maintenance (jockey) pump(s). A fire pump controller and fire pump power transfer switch, where provided, shall not serve any load other than the fire pump for which it is intended.

(g) Mechanical Protection. All wiring from engine controllers and batteries shall be protected against mechanical injury, and shall be installed in accordance with the controller and engine manufacturer's instructions.

(h) Ground Fault Protection of Equipment. Ground fault protection of equipment shall not be permitted for fire pumps.

6.95.1.7 Voltage Drop. The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor starting conditions. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

Exception: This limitation shall not apply for emergency run mechanical starting. [NFPA 20:9.4]

6.95.1.10 Listed Equipment. Diesel engine fire pump controllers, electric fire pump controllers, electric motors, fire pump power transfer switches, foam pump controllers, and limited service controllers shall be listed for fire pump service. [NFPA 20:9.5.1.1, 10.1.2.1, 12.1.3.1]

6.95.1.12 Equipment Location.

(a) Controllers and Transfer Switches. Electric motor-driven fire pump controllers and power transfer switches shall be located as close as practicable to, and within sight of, the motors that they control.

(b) Engine-Drive Controllers. Engine-drive fire pump controllers shall be located as close as is practical to, and within sight of, the engines that they control.

(c) Storage Batteries. Storage batteries for fire pump engine drives shall be supported above the floor, secured against displacement, and located where they are not subject to physical damage, flooding with water, excessive temperature, or excessive vibration.

(d) Energized Equipment. All energized equipment parts shall be located at least 300 mm above the floor level.

(e) Protection Against Pump Water. Fire pump controllers and power transfer switches shall be located or protected so that they will not be damaged by water escaping from pumps or pump connections.

(f) Mounting. All fire pump control equipment shall be mounted in a substantial manner on noncombustible supporting structures.

6.95.1.14 Control Wiring.

(a) **Control Circuit Failures.** External control circuits shall be arranged so that failure of any external circuit (open or short circuit) shall not prevent the operation of a pump(s) from all other internal or external means. Breakage, disconnecting, shorting of the wires, or loss of power to these circuits may cause continuous running of the fire pump, but shall not prevent the controller(s) from starting the fire pump(s) due to causes other than these external control circuits. All control conductors within the fire pump room that are not fault tolerant shall be protected against physical damage. [NFPA 20:10.5.2.6, 12.5.2.5]

(b) **Sensor Functioning.** No undervoltage, phase-loss, frequency-sensitive, or other sensor(s) shall be installed that automatically or manually prohibit actuation of the motor contactor. [NFPA 20:10.4.5.6]

Exception: A phase loss sensor(s) shall be permitted only as a part of a listed fire pump controller.

(c) **Remote Device(s).** No remote device(s) shall be installed that will prevent automatic operation of the transfer switch. [NFPA 20:10.8.1.3]

(d) **Engine-Drive Control Wiring.** All wiring between the controller and the diesel engine shall be stranded and sized to continuously carry the charging or control currents as required by the controller manufacturer. Such wiring shall be protected against mechanical injury. Controller manufacturer's specifications for distance and wire size shall be followed. [NFPA 20:12.3.5.1].

(e) **Electric Fire Pump Control Wiring Methods.** All electric motor-driven fire pump control wiring shall be in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit Type B (LFNC-B), listed Type MC cable with an impervious covering, or Type MI cable.

(f) **Generator Control Wiring Methods.** Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be

kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) encased in 50 mm of concrete or within enclosed construction dedicated to the fire pump circuits and having a minimum 1-hour fire resistance rating, or circuit protective systems with a minimum of 1-hour fire resistance. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.

Chapter 7. Special Conditions

ARTICLE 7.0 — EMERGENCY SYSTEMS

7.0.1 General

7.0.1.1 Scope. The provisions of this article apply to the electrical safety of the installation, operation, and maintenance of emergency systems consisting of circuits and equipment intended to supply, distribute, and control electricity for illumination, power, or both, to required facilities when the normal electrical supply or system is interrupted.

Emergency systems are those systems legally required and classed as emergency by municipal, state, federal, or other codes, or by any governmental agency having jurisdiction. These systems are intended to automatically supply illumination, power, or both, to designated areas and equipment in the event of failure of the normal supply or in the event of accident to elements of a system intended to supply, distribute, and control power and illumination essential for safety to human life.

FPN No. 1: For further information regarding wiring and installation of emergency systems in health care facilities, see Article 5.17.

FPN No. 2: For further information regarding performance and maintenance of emergency systems in health care facilities, see NFPA 99-2002, Standard for Health Care Facilities.

FPN No. 3: Emergency systems are generally installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions. Emergency systems may also provide power for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps, public safety communications systems, industrial processes where current interruption would produce serious life safety or health hazards, and similar functions.

FPN No. 4: For specification of locations where emergency lighting is considered essential to life safety, see NFPA 101@-2003, Life Safety Code@.

FPN No. 5: For further information regarding performance of emergency and standby power systems, see NFPA 110-2002, Standard for Emergency and Standby Power Systems.

7.0.1.2 Application of Other Articles. Except as modified by this article, all applicable articles of this Code shall apply.

7.0.1.3 Equipment Approval. All equipment shall be approved for use on emergency systems.

7.0.1.4 Tests and Maintenance.

(a) Conduct or Witness Test. The authority having jurisdiction shall conduct or witness a test of the complete system upon installation and periodically afterward.

(b) Tested Periodically. Systems shall be tested periodically on a schedule acceptable to the authority having jurisdiction to ensure the systems are maintained in proper operating condition.

(c) Battery Systems Maintenance. Where battery systems or unit equipments are involved, including batteries used for starting, control, or ignition in auxiliary engines, the authority having jurisdiction shall require periodic maintenance.

(d) Written Record. A written record shall be kept of such tests and maintenance.

(e) Testing Under Load. Means for testing all emergency lighting and power systems during maximum anticipated load conditions shall be provided.

FPN: For testing and maintenance procedures of emergency power supply systems (EPSSs), see NFPA 110-2002, Standard for Emergency and Standby Power Systems.

7.0.1.5 Capacity.

(a) Capacity and Rating. An emergency system shall have adequate capacity and rating for all loads to be operated simultaneously. The emergency system equipment shall be suitable for the maximum available fault current at its terminals.

(b) Selective Load Pickup, Load Shedding, and Peak Load Shaving. The alternate power source shall be permitted to supply

emergency, legally required standby, and optional standby system loads where the source has adequate capacity or where automatic selective load pickup and load shedding is provided as needed to ensure adequate power to (1) the emergency circuits, (2) the legally required standby circuits, and (3) the optional standby circuits, in that order of priority. The alternate power source shall be permitted to be used for peak load shaving, provided these conditions are met.

Peak load-shaving operation shall be permitted for satisfying the test requirement of 7.0.1.4(b), provided all other conditions of 7.0.1.4 are met.

A portable or temporary alternate source shall be available whenever the emergency generator is out of service for major maintenance or repair.

7.0.1.6 Transfer Equipment.

(a) General. Transfer equipment, including automatic transfer switches, shall be automatic, identified for emergency use, and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and emergency sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 7.5.

(b) Bypass Isolation Switches. Means shall be permitted to bypass and isolate the transfer equipment. Where bypass isolation switches are used, inadvertent parallel operation shall be avoided.

(c) Automatic Transfer Switches. Automatic transfer switches shall be electrically operated and mechanically held.

(d) Use. Transfer equipment shall supply only emergency loads.

7.0.1.7 Signals. Audible and visual signal devices shall be provided, where practicable, for the purpose described in 7.0.1.7(a) through 7.0.1.7(d).

(a) Derangement. To indicate derangement of the emergency source.

(b) Carrying Load. To indicate that the battery is carrying load.

(c) Not Functioning. To indicate that the battery charger is not functioning.

(d) Ground Fault. To indicate a ground fault in solidly grounded wye emergency systems of more than 150 volts to ground and circuit-protective devices rated 1 000 amperes or more. The sensor for the ground-fault signal devices shall be located at, or ahead of, the main system disconnecting means for the emergency source, and the maximum setting of the signal devices shall be for a ground-fault current of 1 200 amperes. Instructions on the course of action to be taken in event of indicated ground fault shall be located at or near the sensor location.

FPN: For signals for generator sets, see NFPA 110-2002, Standard for Emergency and Standby Power Systems.

7.0.1.8 Signs.

(a) Emergency Sources. A sign shall be placed at the service entrance equipment, indicating type and location of on-site emergency power sources.

Exception: A sign shall not be required for individual unit equipment as specified in 7.0.3.1(f).

(b) Grounding. Where the grounded circuit conductor connected to the emergency source is connected to a grounding electrode conductor at a location remote from the emergency source, there shall be a sign at the grounding location that shall identify all emergency and normal sources connected at that location.

7.0.2 Circuit Wiring

7.0.2.1 Wiring, Emergency System.

(a) Identification. All boxes and enclosures (including transfer switches, generators, and power panels) for emergency circuits shall be permanently marked so they will be readily identified as a component of an emergency circuit or system.

(b) Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (4):

(1) Wiring from the normal power source located in transfer equipment enclosures

(2) Wiring supplied from two sources in exit or emergency luminaires (lighting fixtures)

(3) Wiring from two sources in a common junction box, attached to exit or emergency luminaires (lighting fixtures)

(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the emergency circuit supplied by the unit equipment

(c) Wiring Design and Location. Emergency wiring circuits shall be designed and located so as to minimize the hazards that might cause failure due to flooding, fire, icing, vandalism, and other adverse conditions.

(d) Fire Protection. Emergency systems shall meet the additional requirements in 7.0.2.1(d)(1) and (d)(2) assembly occupancies for not less than 1 000 persons or in buildings above 23 m in height with any of the following occupancy classes: assembly, educational, residential, detention and correctional, business, and mercantile.

(1) Feeder-Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:

a. Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system

b. Be a listed electrical circuit protective system with a minimum 1-hour fire rating

c. Be protected by a listed thermal barrier system for electrical system components

d. Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hour

e. Be embedded in not less than 50 mm of concrete

f. Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirements

(2) Feeder-Circuit Equipment. Equipment for feeder circuits (including transfer switches, transformers, and panelboards) shall be located either in spaces fully protected by approved automatic fire suppression systems (including sprinklers, carbon dioxide systems) or in spaces with a 1-hour fire resistance rating.

FPN: For the definition of occupancy classification, see Section 6.1 of NFPA 101-2003, Life Safety Code.

7.0.3 Sources of Power

7.0.3.1 General Requirements. Current supply shall be such that, in the event of failure of the normal supply to, or within, the building or group of buildings concerned, emergency lighting, emergency power, or both shall be available within the time required for the application but not to exceed 10 seconds. The supply system for emergency purposes, in addition to the normal services to the building and meeting the general requirements of this section, shall be one or more of the types of systems described in 7.0.3.1(a) through 7.0.3.1(e). Unit equipment in accordance with 7.0.3.1(f) shall satisfy the applicable requirements of this article.

In selecting an emergency source of power, consideration shall be given to the occupancy and the type of service to be rendered, whether of minimum duration, as for evacuation of a theater, or longer duration, as for supplying emergency power and lighting due to an indefinite period of current failure from trouble either inside or outside the building.

Equipment shall be designed and located so as to minimize the hazards that might cause complete failure due to flooding, fires, icing, and vandalism.

Equipment for sources of power as described in 7.0.3.1(a) through 7.0.3.1(e) where located within assembly occupancies for greater than 1 000 persons or in buildings above 23 m in height with any of the following occupancy classes — assembly, educational, residential, detention and correctional, business, and mercantile — shall be installed either in spaces fully protected by approved automatic fire suppression systems (sprinklers, carbon dioxide systems, and so forth) or in spaces with a 1-hour fire rating.

FPN No. 1: For the definition of occupancy classification, see Section 6.1 of NFPA 101-2003, Life Safety Code.

FPN No. 2: Assignment of degree of reliability of the recognized emergency supply system depends on the careful evaluation of the variables at each particular installation.

(a) Storage Battery. Storage batteries used as a source of power for emergency systems shall be of suitable rating and capacity to supply and maintain the total load for a minimum period of 1½ hours, without the voltage applied to the load falling below 87½ percent of normal.

Batteries, whether of the acid or alkali type, shall be designed and constructed to meet the requirements of emergency service and shall be compatible with the charger for that particular installation.

For a sealed battery, the container shall not be required to be transparent. However, for the lead acid battery that requires water additions, transparent or translucent jars shall be furnished. Automotive-type batteries shall not be used.

An automatic battery charging means shall be provided.

(b) Generator Set.

(1) Prime Mover-Driven. For a generator set driven by a prime mover acceptable to the authority having jurisdiction and sized in accordance with 7.0.1.5, means shall be provided for automatically starting the prime mover on failure of the normal service and for automatic transfer and operation of all required electrical circuits. A time-delay feature permitting a 15-minute setting shall be provided to avoid retransfer in case of short-time reestablishment of the normal source.

(2) Internal Combustion as Prime Movers. Where internal combustion engines are used as the prime mover, an on-site fuel supply shall be provided with an on-premise fuel supply sufficient for not less than 2 hours' full-demand operation of the system. Where power is needed for the operation of the fuel transfer pumps to deliver fuel to a generator set day tank, this pump shall be connected to the emergency power system.

(3) Dual Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.

Exception: Where acceptable to the authority having jurisdiction, the use of other than on-site fuels shall be permitted where there is a low probability of a simultaneous failure of both the off-site fuel delivery system and power from the outside electrical utility company.

(4) Battery Power and Dampers. Where a storage battery is used for control or signal power or as the means of starting the prime mover, it shall be suitable for the purpose and shall be equipped with an automatic charging means independent of the generator set. Where the battery charger is required for the operation of the generator set, it shall be connected to the emergency system. Where power is required for the operation of dampers used to ventilate the generator set, the dampers shall be connected to the emergency system.

(5) Auxiliary Power Supply. Generator sets that require more than 10 seconds to develop power shall be permitted if an auxiliary power supply energizes the emergency system until the generator can pick up the load.

(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

(c) Uninterruptible Power Supplies. Uninterruptible power supplies used to provide power for emergency systems shall comply with the applicable provisions of 7.0.3.1(a) and 7.0.3.1(b).

(d) Separate Service. Where acceptable to the authority having jurisdiction as suitable for use as an emergency source of power, an additional service shall be permitted. This service shall be in accordance with the applicable provisions of Article 2.30 and the following additional requirements:

- (1) Separate service drop or service lateral
- (2) Service conductors sufficiently remote electrically and physically from any other service conductors to minimize the possibility of simultaneous interruption of supply

(e) Fuel Cell System. Fuel cell systems used as a source of power for emergency systems shall be of suitable rating and capacity to

supply and maintain the total load for not less than 2 hours of full-demand operation.

Installation of a fuel cell system shall meet the requirements of Parts 6.92.2 through 6.92.8.

Where a single fuel cell system serves as the normal supply for the building or group of buildings concerned, it shall not serve as the sole source of power for the emergency standby system.

(f) Unit Equipment. Individual unit equipment for emergency illumination shall consist of the following:

- (1) A rechargeable battery
- (2) A battery charging means
- (3) Provisions for one or more lamps mounted on the equipment, or shall be permitted to have terminals for remote lamps, or both
- (4) A relaying device arranged to energize the lamps automatically upon failure of the supply to the unit equipment

The batteries shall be of suitable rating and capacity to supply and maintain at not less than 87½ percent of the nominal battery voltage for the total lamp load associated with the unit for a period of at least 1½ hours, or the unit equipment shall supply and maintain not less than 60 percent of the initial emergency illumination for a period of at least 1½ hours. Storage batteries, whether of the acid or alkali type, shall be designed and constructed to meet the requirements of emergency service.

Unit equipment shall be permanently fixed in place (i.e., not portable) and shall have all wiring to each unit installed in accordance with the requirements of any of the wiring methods in Chapter 3. Flexible cord-and-plug connection shall be permitted, provided that the cord does not exceed 900 mm in length. The branch circuit feeding the unit equipment shall be the same branch circuit as that serving the normal lighting in the area and connected ahead of any local switches. The branch circuit that feeds unit equipment shall be clearly identified at the distribution panel. Emergency luminaires (illumination fixtures) that obtain power from a unit equipment and are not part of the unit equipment shall be wired to the unit equipment as required by 7.0.2.1 and by one of the wiring methods of Chapter 3.

Exception: In a separate and uninterrupted area supplied by a minimum of three normal lighting circuits, a separate branch circuit

for unit equipment shall be permitted if it originates from the same panelboard as that of the normal lighting circuits and is provided with a lock-on feature.

7.0.4 Emergency System Circuits for Lighting and Power

7.0.4.1 Loads on Emergency Branch Circuits. No appliances and no lamps, other than those specified as required for emergency use, shall be supplied by emergency lighting circuits.

7.0.4.2 Emergency Illumination. Emergency illumination shall include all required means of egress lighting, illuminated exit signs, and all other lights specified as necessary to provide required illumination.

Emergency lighting systems shall be designed and installed so that the failure of any individual lighting element, such as the burning out of a light bulb, cannot leave in total darkness any space that requires emergency illumination.

Where high-intensity discharge lighting such as high- and low-pressure sodium, mercury vapor, and metal halide is used as the sole source of normal illumination, the emergency lighting system shall be required to operate until normal illumination has been restored.

Exception: Alternative means that ensure emergency lighting illumination level is maintained shall be permitted.

7.0.4.3 Circuits for Emergency Lighting. Branch circuits that supply emergency lighting shall be installed to provide service from a source complying with 7.0.3.1 when the normal supply for lighting is interrupted. Such installations shall provide either of the following:

- (1) An emergency lighting supply, independent of the general lighting supply, with provisions for automatically transferring the emergency lights upon the event of failure of the general lighting system supply
- (2) Two or more separate and complete systems with independent power supply, each system providing sufficient current for emergency lighting purposes

Unless both systems are used for regular lighting purposes and are both kept lighted, means shall be provided for automatically

energizing either system upon failure of the other. Either or both systems shall be permitted to be a part of the general lighting system of the protected occupancy if circuits supplying lights for emergency illumination are installed in accordance with other sections of this article.

7.0.4.4 Circuits for Emergency Power. For branch circuits that supply equipment classed as emergency, there shall be an emergency supply source to which the load will be transferred automatically upon the failure of the normal supply.

7.0.5 Control — Emergency Lighting Circuits

7.0.5.1 Switch Requirements. The switch or switches installed in emergency lighting circuits shall be arranged so that only authorized persons have control of emergency lighting.

Exception No. 1: Where two or more single-throw switches are connected in parallel to control a single circuit, at least one of these switches shall be accessible only to authorized persons.

Exception No. 2: Additional switches that act only to put emergency lights into operation but not disconnect them shall be permissible.

Switches connected in series or 3- and 4-way switches shall not be used.

7.0.5.2 Switch Location. All manual switches for controlling emergency circuits shall be in locations convenient to authorized persons responsible for their actuation. In facilities covered by Articles 5.18 and 5.20, a switch for controlling emergency lighting systems shall be located in the lobby or at a place conveniently accessible thereto.

In no case shall a control switch for emergency lighting be placed in a motion-picture projection booth or on a stage or platform.

Exception: Where multiple switches are provided, one such switch shall be permitted in such locations where arranged so that it can only energize the circuit, but cannot de-energize the circuit.

7.0.5.3 Exterior Lights. Those lights on the exterior of a building that

are not required for illumination when there is sufficient daylight shall be permitted to be controlled by an automatic light-actuated device.

7.0.6 Overcurrent Protection

7.0.6.1 Accessibility. The branch-circuit overcurrent devices in emergency circuits shall be accessible to authorized persons only.

7.0.6.2 Ground-Fault Protection of Equipment. The alternate source for emergency systems shall not be required to have ground-fault protection of equipment with automatic disconnecting means. Ground-fault indication of the emergency source shall be provided per 7.0.1.7(d).

7.0.6.3 Coordination. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

ARTICLE 7.1 — LEGALLY REQUIRED STANDBY SYSTEMS

7.1.1 General

7.1.1.1 Scope. The provisions of this article apply to the electrical safety of the installation, operation, and maintenance of legally required standby systems consisting of circuits and equipment intended to supply, distribute, and control electricity to required facilities for illumination or power, or both, when the normal electrical supply or system is interrupted.

The systems covered by this article consist only of those that are permanently installed in their entirety, including the power source.

FPN No. 1: For additional information, see NFPA 99-2002, Standard for Health Care Facilities.

FPN No. 2: For further information regarding performance of emergency and standby power systems, see NFPA 110-2002, Standard for Emergency and Standby Power Systems.

FPN No. 3: For further information, see ANSI/IEEE 446-1995, Recommended Practice for Emergency and Standby Power Systems for Industrial and Commercial Applications.

7.1.1.2 Definition. Legally Required Standby Systems. Those systems required and so classed as legally required standby by municipal, state, federal, or other codes or by any governmental agency having jurisdiction. These systems are intended to automatically supply power to selected loads (other than those classed as emergency systems) in the event of failure of the normal source.

FPN: Legally required standby systems are typically installed to serve loads, such as heating and refrigeration systems, communications systems, ventilation and smoke removal systems, sewage disposal, lighting systems, and industrial processes, that, when stopped during any interruption of the normal electrical supply, could create hazards or hamper rescue or fire-fighting operations.

7.1.1.3 Application of Other Articles. Except as modified by this article, all applicable articles of this Code shall apply.

7.1.1.4 Equipment Approval. All equipment shall be approved for the intended use.

7.1.1.5 Tests and Maintenance for Legally Required Standby Systems.

(a) **Conduct or Witness Test.** The authority having jurisdiction shall conduct or witness a test of the complete system upon installation.

(b) **Tested Periodically.** Systems shall be tested periodically on a schedule and in a manner acceptable to the authority having jurisdiction to ensure the systems are maintained in proper operating condition.

(c) **Battery Systems Maintenance.** Where batteries are used for control, starting, or ignition of prime movers, the authority having jurisdiction shall require periodic maintenance.

(d) **Written Record.** A written record shall be kept on such tests and maintenance.

(e) **Testing Under Load.** Means for testing legally required standby systems under load shall be provided.

FPN: For testing and maintenance procedures of emergency power supply systems (EPSSs), see NFPA 110-2002, Standard for Emergency and Standby

Power Systems.

7.1.1.6 Capacity and Rating. A legally required standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. Legally required standby system equipment shall be suitable for the maximum available fault current at its terminals.

The legally required standby alternate power source shall be permitted to supply both legally required standby and optional standby system loads under either of the following conditions:

- (1) Where the alternate source has adequate capacity to handle all connected loads
- (2) Where automatic selective load pickup and load shedding is provided that will ensure adequate power to the legally required standby circuits

7.1.1.7 Transfer Equipment.

(a) **General.** Transfer equipment, including automatic transfer switches, shall be automatic and identified for standby use and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 7.5.

(b) **Bypass Isolation Switches.** Means to bypass and isolate the transfer switch equipment shall be permitted. Where bypass isolation switches are used, inadvertent parallel operation shall be avoided.

(c) **Automatic Transfer Switches.** Automatic transfer switches shall be electrically operated and mechanically held.

7.1.1.8 Signals. Audible and visual signal devices shall be provided, where practicable, for the purposes described in 7.1.1.8(a), (b), and (c).

(a) **Derangement.** To indicate derangement of the standby source.

(b) Carrying Load. To indicate that the standby source is carrying load.

(c) Not Functioning. To indicate that the battery charger is not functioning.

FPN: For signals for generator sets, see NFPA 110-2002, Standard for Emergency and Standby Power Systems.

7.1.1.9 Signs.

(a) Mandated Standby. A sign shall be placed at the service entrance indicating type and location of on-site legally required standby power sources.

Exception: A sign shall not be required for individual unit equipment as specified in 7.1.3.1(g).

(b) Grounding. Where the grounded circuit conductor connected to the legally required standby power source is connected to a grounding electrode conductor at a location remote from the legally required standby power source, there shall be a sign at the grounding location that shall identify all legally required standby power and normal sources connected at that location.

7.1.2 Circuit Wiring

7.1.2.1 Wiring Legally Required Standby Systems. The legally required standby system wiring shall be permitted to occupy the same raceways, cables, boxes, and cabinets with other general wiring.

7.1.3 Sources of Power

7.1.3.1 Legally Required Standby Systems. Current supply shall be such that, in the event of failure of the normal supply to, or within, the building or group of buildings concerned, legally required standby power will be available within the time required for the application but not to exceed 60 seconds. The supply system for legally required standby purposes, in addition to the normal services to the building, shall be permitted to comprise one or more of the types of systems described in 7.1.3.1(a) through 7.1.3.1(f). Unit equipment in

accordance with 7.1.3.1(g) shall satisfy the applicable requirements of this article.

In selecting a legally required standby source of power, consideration shall be given to the type of service to be rendered, whether of short-time duration or long duration.

Consideration shall be given to the location or design, or both, of all equipment to minimize the hazards that might cause complete failure due to floods, fires, icing, and vandalism.

FPN: Assignment of degree of reliability of the recognized legally required standby supply system depends on the careful evaluation of the variables at each particular installation.

(a) Storage Battery. A storage battery shall be of suitable rating and capacity to supply and maintain at not less than 87½ percent of system voltage the total load of the circuits supplying legally required standby power for a period of at least 1½ hours.

Batteries, whether of the acid or alkali type, shall be designed and constructed to meet the service requirements of emergency service and shall be compatible with the charger for that particular installation.

For a sealed battery, the container shall not be required to be transparent. However, for the lead acid battery that requires water additions, transparent or translucent jars shall be furnished. Automotive-type batteries shall not be used.

An automatic battery charging means shall be provided.

(b) Generator Set.

(1) Prime Mover-Driven. For a generator set driven by a prime mover acceptable to the authority having jurisdiction and sized in accordance with 7.1.1.6, means shall be provided for automatically starting the prime mover upon failure of the normal service and for automatic transfer and operation of all required electrical circuits. A time-delay feature permitting a 15-minute setting shall be provided to avoid retransfer in case of short-time re-establishment of the normal source.

(2) Internal Combustion Engines as Prime Mover. Where internal combustion engines are used as the prime mover, an on-site fuel supply shall be provided with an on-premise fuel supply sufficient for not less than 2 hours' full-demand operation of the system.

(3) Dual Fuel Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or

municipal water supply for their cooling systems. Means shall be provided for automatically transferring one fuel supply to another where dual fuel supplies are used.

Exception: Where acceptable to the authority having jurisdiction, the use of other than on-site fuels shall be permitted where there is a low probability of a simultaneous failure of both the off-site fuel delivery system and power from the outside electrical utility company.

(4) **Battery Power.** Where a storage battery is used for control or signal power or as the means of starting the prime mover, it shall be suitable for the purpose and shall be equipped with an automatic charging means independent of the generator set.

(5) **Outdoor Generator Sets.** Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

(c) **Uninterruptible Power Supplies.** Uninterruptible power supplies used to provide power for legally required standby systems shall comply with the applicable provisions of 7.1.3.1(a) and 7.1.3.1(b).

(d) **Separate Service.** Where acceptable to the authority having jurisdiction as a source of power, an additional service shall be permitted. This service shall be in accordance with the applicable provisions of Article 2.30, with separate service drop or lateral sufficiently remote electrically and physically from any other service to minimize the possibility of simultaneous interruption of supply from an occurrence in another service.

(e) **Connection Ahead of Service Disconnecting Means.** Where acceptable to the authority having jurisdiction, connections located ahead of and not within the same cabinet, enclosure, or vertical switchboard section as the service disconnecting means shall be permitted. The legally required standby service shall be sufficiently separated from the normal main service disconnecting means to prevent simultaneous interruption of supply through an occurrence within the building or groups of buildings served.

FPN: See 2.30.6.13 for equipment permitted on the supply side of a service disconnecting means.

(f) **Fuel Cell System.** Fuel cell systems used as a source of power for legally required standby systems shall be of suitable rating and capacity to supply and maintain the total load for not less than 2 hours of full-demand operation.

Installation of a fuel cell system shall meet the requirements of Parts 6.92.2 through 6.92.8.

Where a single fuel cell system serves as the normal supply for the building or group of buildings concerned, it shall not serve as the sole source of power for the legally required standby system.

(g) **Unit Equipment.** Individual unit equipment for legally required standby illumination shall consist of the following:

- (1) A rechargeable battery
- (2) A battery charging means
- (3) Provisions for one or more lamps mounted on the equipment and shall be permitted to have terminals for remote lamps
- (4) A relaying device arranged to energize the lamps automatically upon failure of the supply to the unit equipment

The batteries shall be of suitable rating and capacity to supply and maintain at not less than 87½ percent of the nominal battery voltage for the total lamp load associated with the unit for a period of at least 1½ hours, or the unit equipment shall supply and maintain not less than 60 percent of the initial legally required standby illumination for a period of at least 1½ hours. Storage batteries, whether of the acid or alkali type, shall be designed and constructed to meet the requirements of emergency service.

Unit equipment shall be permanently fixed in place (i.e., not portable) and shall have all wiring to each unit installed in accordance with the requirements of any of the wiring methods in Chapter 3. Flexible cord-and-plug connection shall be permitted, provided that the cord does not exceed 900 mm in length. The branch circuit feeding the unit equipment shall be the same branch circuit as that serving the normal lighting in the area and connected ahead of any local switches. Legally required standby luminaires (illumination fixtures) that obtain power from a unit equipment and are not part of the unit equipment shall be wired to the unit equipment by one of the wiring methods of

Chapter 3.

Exception: In a separate and uninterrupted area supplied by a minimum of three normal lighting circuits, a separate branch circuit for unit equipment shall be permitted if it originates from the same panelboard as that of the normal lighting circuits and is provided with a lock-on feature.

7.1.4 Overcurrent Protection

7.1.4.1 Accessibility. The branch-circuit overcurrent devices in legally required standby circuits shall be accessible to authorized persons only.

7.1.4.3 Ground-Fault Protection of Equipment. The alternate source for legally required standby systems shall not be required to have ground-fault protection of equipment.

7.1.4.4 Coordination. Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

ARTICLE 7.2 — OPTIONAL STANDBY SYSTEMS

7.2.1 General

7.2.1.1 Scope. The provisions of this article apply to the installation and operation of optional standby systems.

The systems covered by this article consist of those that are permanently installed in their entirety, including prime movers, and those that are arranged for a connection to a premises wiring system from a portable alternate power supply.

7.2.1.2 Definition.

Optional Standby Systems. Those systems intended to supply power to public or private facilities or property where life safety does not depend on the performance of the system. Optional standby systems are intended to supply on-site generated power to selected loads either automatically or manually.

FPN: Optional standby systems are typically installed to provide an alternate source of electric power for such facilities as industrial and commercial buildings, farms, and residences and to serve loads such as heating and refrigeration systems, data processing and communications systems, and industrial processes that, when stopped during any power outage, could cause discomfort, serious interruption of the process, damage to the product or process, or the like.

7.2.1.3 Application of Other Articles. Except as modified by this article, all applicable articles of this Code shall apply.

7.2.1.4 Equipment Approval. All equipment shall be approved for the intended use.

7.2.1.5 Capacity and Rating. An optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. Optional standby system equipment shall be suitable for the maximum available fault current at its terminals. The user of the optional standby system shall be permitted to select the load connected to the system.

7.2.1.6 Transfer Equipment. Transfer equipment shall be suitable for the intended use and designed and installed so as to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 7.5.

Transfer equipment, located on the load side of branch circuit protection, shall be permitted to contain supplementary overcurrent protection having an interrupting rating sufficient for the available fault current that the generator can deliver. The supplementary overcurrent protection devices shall be part of a listed transfer equipment.

Transfer equipment shall be required for all standby systems subject to the provisions of this article and for which an electric-utility supply is either the normal or standby source.

Exception: Temporary connection of a portable generator without transfer equipment shall be permitted where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation

and where the normal supply is physically isolated by a lockable disconnect means or by disconnection of the normal supply conductors.

7.2.1.7 Signals. Audible and visual signal devices shall be provided, where practicable, for the following purposes.

(1) Derangement. To indicate derangement of the optional standby source.

(2) Carrying Load. To indicate that the optional standby source is carrying load.

Exception: Signals shall not be required for portable standby power sources.

7.2.1.8 Signs.

(a) **Standby.** A sign shall be placed at the service-entrance equipment that indicates the type and location of on-site optional standby power sources. A sign shall not be required for individual unit equipment for standby illumination.

(b) **Grounding.** Where the grounded circuit conductor connected to the optional standby power source is connected to a grounding electrode conductor at a location remote from the optional standby power source, there shall be a sign at the grounding location that shall identify all optional standby power and normal sources connected at that location.

7.2.2 Circuit Wiring

7.2.2.1 Wiring Optional Standby Systems. The optional standby system wiring shall be permitted to occupy the same raceways, cables, boxes, and cabinets with other general wiring.

7.2.3 Grounding

7.2.3.1 Portable Generator Grounding.

(a) **Separately Derived System.** Where a portable optional standby source is used as a separately derived system, it shall be grounded to a

grounding electrode in accordance with 2.50.2.11.

(b) **Nonseparately Derived System.** Where a portable optional standby source is used as a nonseparately derived system, the equipment grounding conductor shall be bonded to the system grounding electrode.

7.2.4 Sources of Power

7.2.4.1 Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

ARTICLE 7.5 — INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCES

7.5.1.1 Scope. This article covers installation of one or more electric power production sources operating in parallel with a primary source(s) of electricity.

FPN: Examples of the types of primary sources are a utility supply, on-site electric power source(s), or other sources.

7.5.1.2 Definition.

Interactive System. An electric power production system that is operating in parallel with and capable of delivering energy to an electric primary source supply system.

7.5.1.3 Other Articles. Interconnected electric power production sources shall comply with this article and also with the applicable requirements of the articles in Table 7.5.1.3.

Exception No. 1: Installation of solar photovoltaic systems operated as interconnected power sources shall be in accordance with Article 6.90.

Exception No. 2: Installation of fuel cell systems operated as interconnected power sources shall be in accordance with Article

6.92.

Table 7.5.1.3 Other Articles

Equipment/System	Article
Generators	4.45
Emergency systems	7.0
Legally required standby systems	7.1
Optional standby systems	7.2

7.5.1.10 Directory. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location and at locations of all electric power production sources capable of being interconnected.

Exception: Installations with large numbers of power production sources shall be permitted to be designated by groups.

7.5.1.12 Point of Connection. The outputs of electric power production systems shall be interconnected at the premises service disconnecting means.

(a) Integrated Electric System. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 6.85.

(b) General. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met:

(1) The aggregate of nonutility sources of electricity has a capacity in excess of 100 kW, or the service is above 1 000 volts.

(2) The conditions of maintenance and supervision ensure that licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service and operate the system.

(3) Safeguards and protective equipment are established and maintained.

7.5.1.14 Output Characteristics. The output of a generator or other electric power production source operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term compatible does not necessarily mean matching the primary source wave shape.

7.5.1.16 Interrupting and Short-Circuit Current Rating. Consideration shall be given to the contribution of fault currents from all interconnected power sources for the interrupting and short-circuit current ratings of equipment on interactive systems.

7.5.1.20 Disconnecting Means, Sources. Means shall be provided to disconnect all ungrounded conductors of an electric power production source(s) from all other conductors.

7.5.1.21 Disconnecting Means, Equipment. Means shall be provided to disconnect equipment, such as inverters or transformers associated with a power production source, from all ungrounded conductors of all sources of supply. Equipment intended to be operated and maintained as an integral part of a power production source exceeding 1 000 volts shall not be required to have a disconnecting means.

7.5.1.22 Disconnect Device. The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch(es) or circuit breaker(s) with the following features:

- (1) Located where accessible
- (2) Externally operable without exposing the operator to contact with live parts and, if power operable, of a type that can be opened by hand in the event of a power supply failure
- (3) Plainly indicating whether in the open or closed position
- (4) Having ratings not less than the load to be carried and the fault current to be interrupted

For disconnect equipment energized from both sides, a marking shall be provided to indicate that all contacts of the disconnect equipment

may be energized.

FPN No. 1: In parallel generation systems, some equipment, including knife blade switches and fuses, is likely to be energized from both directions. See 240.40.

FPN No. 2: Interconnection to an off-premises primary source could require a visibly verifiable disconnecting device.

7.5.1.30 Overcurrent Protection. Conductors shall be protected in accordance with Article 2.40. Equipment and conductors connected to more than one electrical source shall have a sufficient number of overcurrent devices located so as to provide protection from all sources.

(a) Generators. Generators shall be protected in accordance with 4.45.1.12.

(b) Solar Photovoltaic Systems. Solar photovoltaic systems shall be protected in accordance with Article 6.90.

(c) Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 4.50.1.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

(d) Fuel Cell Systems. Fuel cell systems shall be protected in accordance with Article 6.92.

7.5.1.32 Ground-Fault Protection. Where ground-fault protection is used, the output of an interactive system shall be connected to the supply side of the ground-fault protection.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

7.5.1.40 Loss of Primary Source. Upon loss of primary source, an electric power production source shall be automatically disconnected from all ungrounded conductors of the primary source and shall not be reconnected until the primary source is restored.

FPN No. 1: Risks to personnel and equipment associated with the primary source could occur if an interactive electric power production source can operate as an island. Special detection methods can be required to determine that a primary

source supply system outage has occurred and whether there should be automatic disconnection. When the primary source supply system is restored, special detection methods can be required to limit exposure of power production sources to out-of-phase reconnection.

FPN No. 2: Induction-generating equipment on systems with significant capacitance can become self-excited upon loss of primary source and experience severe overvoltage as a result.

7.5.1.42 Unbalanced Interconnections. A 3-phase electric power production source shall be automatically disconnected from all ungrounded conductors of the interconnected systems when one of the phases of that source opens. This requirement shall not be applicable to an electric power production source providing power for an emergency or legally required standby system.

7.5.1.43 Synchronous Generators. Synchronous generators in a parallel system shall be provided with the necessary equipment to establish and maintain a synchronous condition.

7.5.1.50 Grounding. Interconnected electric power production sources shall be grounded in accordance with Article 2.50.

Exception: For direct-current systems connected through an inverter directly to a grounded service, other methods that accomplish equivalent system protection and that utilize equipment listed and identified for the use shall be permitted.

ARTICLE 7.20 — CIRCUITS AND EQUIPMENT OPERATING AT LESS THAN 50 VOLTS

7.20.1.1 Scope. This article covers installations operating at less than 50 volts, direct current or alternating current.

7.20.1.2 Other Articles. Installations operating at less than 50 volts, direct current or alternating current, as covered in Articles 4.11, 5.17, 5.50, 5.51, 5.52, 6.50, 6.69, 6.90, 7.25, and 7.60 shall not be required to comply with this article.

7.20.1.3 Hazardous (Classified) Locations. Installations coming within the scope of this article and installed in hazardous (classified) locations shall also comply with the appropriate provisions of Articles 5.0 through 5.17.

7.20.1.4 Conductors. Conductors shall not be smaller than 3.5 mm² (2.0 mm dia.) copper or equivalent. Conductors for appliance branch circuits supplying more than one appliance or appliance receptacle shall not be smaller than 5.5 mm² (2.6 mm dia.) copper or equivalent.

7.20.1.5 Lampholders. Standard lampholders that have a rating of not less than 660 watts shall be used.

7.20.1.6 Receptacle Rating. Receptacles shall have a rating of not less than 15 amperes.

7.20.1.7 Receptacles Required. Receptacles of not less than 20-ampere rating shall be provided in kitchens, laundries, and other locations where portable appliances are likely to be used.

7.20.1.8 Overcurrent Protection. Overcurrent protection shall comply with Article 2.40.

7.20.1.9 Batteries. Installations of storage batteries shall comply with Article 4.80.

7.20.1.10 Grounding. Grounding shall be as provided in Article 2.50.

7.20.1.11 Mechanical Execution of Work. Circuits operating at less than 50 volts shall be installed in a neat and workmanlike manner. Cables shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use.

ARTICLE 7.25 — CLASS 1, CLASS 2, AND CLASS 3 REMOTE-CONTROL, SIGNALING, AND POWER-LIMITED CIRCUITS

7.25.1 General

7.25.1.1 Scope. This article covers remote-control, signaling, and power-limited circuits that are not an integral part of a device or appliance.

FPN: The circuits described herein are characterized by usage and electrical power limitations that differentiate them from electric light and power circuits; therefore, alternative requirements to those of Chapters 1 through 4 are given with regard to minimum wire sizes, derating factors, overcurrent protection, insulation requirements, and wiring methods and materials.

7.25.1.2 Definitions.

Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

Circuit Integrity (CI) Cable. Cable(s) used for remote control, signaling, or power-limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

Class 1 Circuit. The portion of the wiring system between the load side of the overcurrent device or power-limited supply and the connected equipment. The voltage and power limitations of the source are in accordance with 7.25.2.1.

Class 2 Circuit. The portion of the wiring system between the load side of a Class 2 power source and the connected equipment. Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock.

Class 3 Circuit. The portion of the wiring system between the load side of a Class 3 power source and the connected equipment. Due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. Since higher levels of voltage and current than for Class 2 are permitted, additional safeguards are specified to provide protection from an electric shock hazard that could be encountered.

7.25.1.3 Other Articles. Circuits and equipment shall comply with the articles or sections listed in 7.25.1.3(a) through 7.25.1.3(g). Only those sections of Article 3.0 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.

(a) Number and Size of Conductors in Raceway. Section 3.0.1.17.

(b) Spread of Fire or Products of Combustion. Section 3.0.1.21. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.

(c) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 3.0.1.22. Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.

(d) Hazardous (Classified) Locations. Articles 5.0 through 5.16 and Part 5.17.4, where installed in hazardous (classified) locations.

(e) Cable Trays. Article 3.92, where installed in cable tray.

(f) Motor Control Circuits. Part 4.30.6 where tapped from the load side of the motor branch-circuit protective device(s) as specified in 4.30.6.2(a).

(g) Instrumentation Tray Cable. See Article 7.27.

7.25.1.7 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.

7.25.1.8 Mechanical Execution of Work. Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 3.0.1.4(d).

7.25.1.10 Class 1, Class 2, and Class 3 Circuit Identification. Class 1, Class 2, and Class 3 circuits shall be identified at terminal and junction locations, in a manner that prevents unintentional interference with other circuits during testing and servicing.

7.25.1.11 Safety-Control Equipment.

(a) Remote-Control Circuits. Remote-control circuits for safety-control equipment shall be classified as Class 1 if the failure of the equipment to operate introduces a direct fire or life hazard. Room thermostats, water temperature regulating devices, and similar controls used in conjunction with electrically controlled household heating and air conditioning shall not be considered safety-control equipment.

(b) Physical Protection. Where damage to remote-control circuits of safety control equipment would introduce a hazard, as covered in 7.25.1.11(a), all conductors of such remote-control circuits shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, Type MI cable, Type MC cable, or be otherwise suitably protected from physical damage.

7.25.1.15 Class 1, Class 2, and Class 3 Circuit Requirements. A remote-control, signaling, or power-limited circuit shall comply with the following parts of this article:

- (1) Class 1 Circuits: Parts I and II
- (2) Class 2 and Class 3 Circuits: Parts I and III

7.25.2 Class 1 Circuits

7.25.2.1 Class 1 Circuit Classifications and Power Source Requirements. Class 1 circuits shall be classified as either Class 1 power-limited circuits where they comply with the power limitations of 7.25.2.1(a) or as Class 1 remote-control and signaling circuits where they are used for remote-control or signaling purposes and comply with the power limitations of 7.25.2.1(b).

(a) Class 1 Power-Limited Circuits. These circuits shall be supplied from a source that has a rated output of not more than 30 volts and 1 000 volt-amperes.

(1) Class 1 Transformers. Transformers used to supply power-limited Class 1 circuits shall comply with the applicable sections within Parts 4.50.1 and 4.50.2.

(2) Other Class 1 Power Sources. Power sources other than transformers shall be protected by overcurrent devices rated at not more than 167 percent of the volt-ampere rating of the source divided by the rated voltage. The overcurrent devices shall not be

interchangeable with overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power supply.

To comply with the 1 000 volt-ampere limitation of 7.25.2.1(a), the maximum output (V_{Amax}) of power sources other than transformers shall be limited to 2500 volt-amperes, and the product of the maximum current (I_{max}) and maximum voltage (V_{max}) shall not exceed 10 000 volt-amperes. These ratings shall be determined with any overcurrent-protective device bypassed.

V_{Amax} is the maximum volt-ampere output after one minute of operation regardless of load and with overcurrent protection bypassed, if used. Current-limiting impedance shall not be bypassed when determining V_{Amax}.

I_{max} is the maximum output current under any noncapacitive load, including short circuit, and with overcurrent protection bypassed, if used. Current-limiting impedance should not be bypassed when determining I_{max}. Where a current-limiting impedance, listed for the purpose or as part of a listed product, is used in combination with a stored energy source, for example, storage battery, to limit the output current, I_{max} limits apply after 5 seconds.

V_{max} is the maximum output voltage regardless of load with rated input applied.

(b) Class 1 Remote-Control and Signaling Circuits. These circuits shall not exceed 600 volts. The power output of the source shall not be required to be limited.

7.25.2.3 Class 1 Circuit Overcurrent Protection. Overcurrent protection for conductors 2.0 mm² (1.6 mm dia.) and larger shall be provided in accordance with the conductor ampacity, without applying the derating factors of 3.10.1.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG.

Exception: Where other articles of this Code permit or require other overcurrent protection.

FPN: For example, see 4.30.6.2 for motors, 6.10.6.3 for cranes and hoists, and 5.17.5.4(b) and 6.60.1.9 for X-ray equipment.

▼ **7.25.2.4 Class 1 Circuit Overcurrent Device Location.** Overcurrent

devices shall be located as specified in 7.25.2.4(a), (b), (c), (d), or (e).

(a) Point of Supply. Overcurrent devices shall be located at the point where the conductor to be protected receives its supply.

(b) Feeder Taps. Class 1 circuit conductors shall be permitted to be tapped, without overcurrent protection at the tap, where the overcurrent device protecting the circuit conductor is sized to protect the tap conductor.

(c) Branch Circuit Taps. Class 1 circuit conductors 2.0 mm² (1.6 mm dia.) and larger that are tapped from the load side of the overcurrent-protective device(s) of a controlled light and power circuit shall require only short-circuit and ground-fault protection and shall be permitted to be protected by the branch-circuit overcurrent protective device(s) where the rating of the protective device(s) is not more than 300 percent of the ampacity of the Class 1 circuit conductor.

(d) Primary Side of Transformer. Class 1 circuit conductors supplied by the secondary of a single-phase transformer having only a 2-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided on the primary side of the transformer, provided this protection is in accordance with 4.50.1.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio. Transformer secondary conductors other than 2 wire shall not be considered to be protected by the primary overcurrent protection.

(e) Input Side of Electronic Power Source. Class 1 circuit conductors supplied by the output of a single-phase, listed electronic power source, other than a transformer, having only a 2-wire (single voltage) output for connection to Class 1 circuits shall be permitted to be protected by overcurrent protection provided on the input side of the electronic power source, provided this protection does not exceed the value determined by multiplying the Class 1 circuit conductor ampacity by the output-to-input voltage ratio. Electronic power source outputs, other than 2 wire (single voltage), shall not be considered to be protected by the primary overcurrent protection.

7.25.2.5 Class 1 Circuit Wiring Methods. Class 1 circuits shall be installed in accordance with Part 3.0.1 and with the wiring methods

from the appropriate articles in Chapter 3.

Exception No. 1: The provisions of 7.25.2.6 through 7.25.2.8 shall be permitted to apply in installations of Class 1 circuits.

Exception No. 2: Methods permitted or required by other articles of this Code shall apply to installations of Class 1 circuits.

7.25.2.6 Conductors of Different Circuits in the Same Cable, Cable Tray, Enclosure, or Raceway. Class 1 circuits shall be permitted to be installed with other circuits as specified in 7.25.2.6(a) and 7.25.2.6(b).

(a) Two or More Class 1 Circuits. Class 1 circuits shall be permitted to occupy the same cable, cable tray, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the cable, cable tray, enclosure, or raceway.

(b) Class 1 Circuits with Power Supply Circuits. Class 1 circuits shall be permitted to be installed with power supply conductors as specified in 7.25.2.6(b)(1) through (b)(4).

(1) In a Cable, Enclosure, or Raceway. Class 1 circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.

(2) In Factory- or Field-Assembled Control Centers. Class 1 circuits and power supply circuits shall be permitted to be installed in factory- or field-assembled control centers.

(3) In a Manhole. Class 1 circuits and power supply circuits shall be permitted to be installed as underground conductors in a manhole in accordance with one of the following:

a. The power-supply or Class 1 circuit conductors are in a metal-enclosed cable or Type UF cable.

b. The conductors are permanently separated from the power-supply conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.

c. The conductors are permanently and effectively separated from the power supply conductors and securely fastened to racks, insulators, or other approved supports.

(4) In Cable Trays. In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.

7.25.2.7 Class 1 Circuit Conductors.

(a) Sizes and Use. Conductors of sizes **18 AWG** and **16 AWG** shall be permitted to be used, provided they supply loads that do not exceed the ampacities given in 4.2.1.5 and are installed in a raceway, an approved enclosure, or a listed cable. Conductors larger than **16 AWG** shall not supply loads greater than the ampacities given in 3.10.1.15. Flexible cords shall comply with Article 4.0.

(b) Insulation. Insulation on conductors shall be suitable for 600 volts. Conductors larger than **16 AWG** shall comply with Article 310. Conductors in sizes **18 AWG** and **16 AWG** shall be Type FFH-2, KF-2, KFF-2, PAF, PAFF, PF, PFF, PGF, PGFF, PTF, PTFF, RFH-2, RFHH-2, RFHH-3, SF-2, SFF-2, TF, TFF, TFFN, TFN, ZF, or ZFF. Conductors with other types and thicknesses of insulation shall be permitted if listed for Class 1 circuit use.

7.25.2.8 Number of Conductors in Cable Trays and Raceway, and Derating.

(a) Class 1 Circuit Conductors. Where only Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 3.0.1.17. The derating factors given in 3.10.1.15(b)(2)a shall apply only if such conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor.

(b) Power-Supply Conductors and Class 1 Circuit Conductors. Where power-supply conductors and Class 1 circuit conductors are permitted in a raceway in accordance with 7.25.2.6, the number of conductors shall be determined in accordance with 3.0.1.17. The derating factors given in 3.10.1.15(b)(2)a shall apply as follows:

(1) To all conductors where the Class 1 circuit conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the total number of conductors is more than three

(2) To the power-supply conductors only, where the Class 1 circuit conductors do not carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the number of power-supply conductors is more than three

(c) Class 1 Circuit Conductors in Cable Trays. Where Class 1 circuit conductors are installed in cable trays, they shall comply with the provisions of 3.92.1.9 through 3.92.1.11.

7.25.2.9 Circuits Extending Beyond One Building. Class 1 circuits that extend aerially beyond one building shall also meet the requirements of Article 2.25.

7.25.3 Class 2 and Class 3 Circuits

7.25.3.1 Power Sources for Class 2 and Class 3 Circuits.

(a) Power Source. The power source for a Class 2 or a Class 3 circuit shall be as specified in 7.25.3.1(a)(1), (a)(2), (a)(3), (a)(4), or (a)(5):

FPN No. 1: Figure 7.25.3.1 illustrates the relationships between Class 2 or Class 3 power sources, their supply, and the Class 2 or Class 3 circuits.

FPN No. 2: Table 11(a) and Table 11(b) in Chapter 9 provide the requirements for listed Class 2 and Class 3 power sources.

- (1) A listed Class 2 or Class 3 transformer
- (2) A listed Class 2 or Class 3 power supply
- (3) Other listed equipment marked to identify the Class 2 or Class 3 power source

Exception No. 1: Thermocouples shall not require listing as a Class 2 power source.

Exception No. 2: Limited power circuits of listed equipment where these circuits have energy levels rated at or below the limits established in Chapter 9, Table 11(a) and Table 11(b).

FPN: Examples of other listed equipment are as follows:

- (1) A circuit card listed for use as a Class 2 or Class 3 power source where used as part of a listed assembly

(2) A current-limiting impedance, listed for the purpose, or part of a listed product, used in conjunction with a non-power-limited transformer or a stored energy source, for example, storage battery, to limit the output current

(3) A thermocouple

(4) Limited voltage/current or limited impedance secondary communications circuits of listed industrial control equipment

(4) Listed information technology (computer) equipment limited power circuits.

FPN: One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 1950-1995, Standard for Safety of Information Technology Equipment, Including Electrical Business Equipment. Typically such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data).

(5) A dry cell battery shall be considered an inherently limited Class 2 power source, provided the voltage is 30 volts or less and the capacity is equal to or less than that available from series connected No. 6 carbon zinc cells.

(b) Interconnection of Power Sources. Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection.

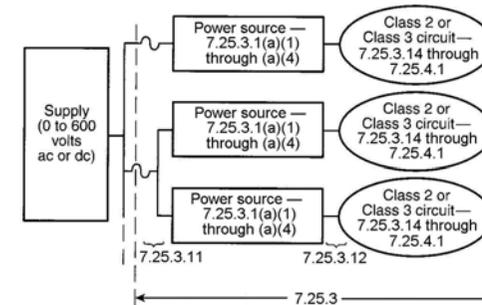

Figure 7.25.3.1 Class 2 and Class 3 Circuits.

7.25.3.2 Circuit Marking. The equipment supplying the circuits shall be durably marked where plainly visible to indicate each circuit that is a Class 2 or Class 3 circuit.

7.25.3.11 Wiring Methods on Supply Side of the Class 2 or Class 3 Power Source. Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Chapters 1 through 4. Transformers or other devices supplied from electric light or power circuits shall be protected by an overcurrent device rated not over 20 amperes.

Exception: The input leads of a transformer or other power source supplying Class 2 and Class 3 circuits shall be permitted to be smaller than 2.0 mm^2 (1.6 mm dia.), but not smaller than **18 AWG** if they are not over 300 mm long and if they have insulation that complies with 7.25.2.7(b).

7.25.3.12 Wiring Methods and Materials on Load Side of the Class 2 or Class 3 Power Source. Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either 7.25.3.12(a) or 7.25.3.12(b).

(a) Class 1 Wiring Methods and Materials. Installation shall be in accordance with 7.25.2.5.

Exception No. 1: The derating factors given in 3.10.1.15(b)(2)a shall not apply.

Exception No. 2: Class 2 and Class 3 circuits shall be permitted to be reclassified and installed as Class 1 circuits if the Class 2 and Class 3 markings required in 7.25.3.2 are eliminated and the entire circuit is installed using the wiring methods and materials in accordance with Part II, Class 1 circuits.

FPN: Class 2 and Class 3 circuits reclassified and installed as Class 1 circuits are no longer Class 2 or Class 3 circuits, regardless of the continued connection to a Class 2 or Class 3 power source.

(b) Class 2 and Class 3 Wiring Methods. Conductors on the load side of the power source shall be insulated at not less than the requirements of 7.25.4.1 and shall be installed in accordance with 7.25.3.14 and 7.25.3.21.

Exception No. 1: As provided for in 6.20.3.1 for elevators and similar equipment.

Exception No. 2: Other wiring methods and materials installed in accordance with the requirements of 7.25.1.3 shall be permitted to extend or replace the conductors and cables described in 7.25.4.1 and permitted by 7.25.3.12(b).

7.25.3.14 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways for Class 2 and Class 3 Circuits. Conductors and equipment for Class 2 and Class 3 circuits shall be installed in accordance with 7.25.3.15 through 7.25.3.18.

7.25.3.15 Separation from Electric Light, Power, Class 1, Non-Power-Limited Fire Alarm Circuit Conductors, and Medium Power Network-Powered Broadband Communications Cables.

(a) General. Cables and conductors of Class 2 and Class 3 circuits shall not be placed in any cable, cable tray, compartment, enclosure, manhole, outlet box, device box, raceway, or similar fitting with conductors of electric light, power, Class 1, non-power-limited fire alarm circuits, and medium power network-powered broadband communications circuits unless permitted by 7.25.3.15(b) through 7.25.3.15(j).

(b) Separated by Barriers. Class 2 and Class 3 circuits shall be permitted to be installed together with the conductors of electric light, power, Class 1, non-power-limited fire alarm and medium power network-powered broadband communications circuits where they are separated by a barrier.

(c) Raceways Within Enclosures. In enclosures, Class 2 and Class 3 circuits shall be permitted to be installed in a raceway to separate them from Class 1, non-power-limited fire alarm and medium power network-powered broadband communications circuits.

(d) Associated Systems Within Enclosures. Class 2 and Class 3 circuit conductors in compartments, enclosures, device boxes, outlet boxes, or similar fittings shall be permitted to be installed with electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuits where they are introduced solely to connect the equipment connected to Class 2 and Class 3 circuits, and where (1) or (2) applies:

(1) The electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband

communications circuit conductors are routed to maintain a minimum of 6 mm separation from the conductors and cables of Class 2 and Class 3 circuits.

(2) The circuit conductors operate at 150 volts or less to ground and also comply with one of the following:

a. The Class 2 and Class 3 circuits are installed using Type CL3, CL3R, or CL3P or permitted substitute cables, provided these Class 3 cable conductors extending beyond the jacket are separated by a minimum of 6 mm or by a nonconductive sleeve or nonconductive barrier from all other conductors.

b. The Class 2 and Class 3 circuit conductors are installed as a Class 1 circuit in accordance with 7.25.2.1.

(e) Enclosures with Single Opening. Class 2 and Class 3 circuit conductors entering compartments, enclosures, device boxes, outlet boxes, or similar fittings shall be permitted to be installed with Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuits where they are introduced solely to connect the equipment connected to Class 2 and Class 3 circuits. Where Class 2 and Class 3 circuit conductors must enter an enclosure that is provided with a single opening, they shall be permitted to enter through a single fitting (such as a tee), provided the conductors are separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing.

(f) Manholes. Underground Class 2 and Class 3 circuit conductors in a manhole shall be permitted to be installed with Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuits where one of the following conditions is met:

(1) The electric light, power, Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuit conductors are in a metal-enclosed cable or Type UF cable.

(2) The Class 2 and Class 3 circuit conductors are permanently and effectively separated from the conductors of other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing, in addition to the insulation or covering on the wire.

(3) The Class 2 and Class 3 circuit conductors are permanently and effectively separated from conductors of the other circuits and securely fastened to racks, insulators, or other approved supports.

(g) Closed-Loop and Programmed Power Distribution. Class 2 and Class 3 conductors shall be permitted to be installed in accordance with 7.80.1.6.

(h) Cable Trays. Class 2 and Class 3 circuit conductors shall be permitted to be installed in cable trays, where the conductors of the electric light, Class 1, and non–power-limited fire alarm circuits are separated by a solid fixed barrier of a material compatible with the cable tray or where the Class 2 or Class 3 circuits are installed in Type MC cable.

(i) In Hoistways. In hoistways, Class 2 or Class 3 circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing. For elevators or similar equipment, these conductors shall be permitted to be installed as provided in 6.20.3.1.

(j) Other Applications. For other applications, conductors of Class 2 and Class 3 circuits shall be separated by at least 50 mm (2 in.) from conductors of any electric light, power, Class 1 non–power-limited fire alarm or medium power network-powered broadband communications circuits unless one of the following conditions is met:

(1) Either (a) all of the electric light, power, Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuit conductors or (b) all of the Class 2 and Class 3 circuit conductors are in a raceway or in metal-sheathed, metal-clad, non–metallic-sheathed, or Type UF cables.

(2) All of the electric light, power, Class 1 non–power-limited fire alarm, and medium power network-powered broadband communications circuit conductors are permanently separated from all of the Class 2 and Class 3 circuit conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the conductors.

7.25.3.16 Installation of Conductors of Different Circuits in the Same Cable, Enclosure, or Raceway.

(a) Two or More Class 2 Circuits. Conductors of two or more Class 2 circuits shall be permitted within the same cable, enclosure, or

raceway.

(b) Two or More Class 3 Circuits. Conductors of two or more Class 3 circuits shall be permitted within the same cable, enclosure, or raceway.

(c) Class 2 Circuits with Class 3 Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway with conductors of Class 3 circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required for Class 3 circuits.

(d) Class 2 and Class 3 Circuits with Communications Circuits.

(1) Classified as Communications Circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall be installed in accordance with the requirements of Article 8.0. The cables shall be listed as communications cables or multipurpose cables.

(2) Composite Cables. Cables constructed of individually listed Class 2, Class 3, and communications cables under a common jacket shall be permitted to be classified as communications cables. The fire resistance rating of the composite cable shall be determined by the performance of the composite cable.

(e) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure or raceway with jacketed cables of any of the following:

(1) Power-limited fire alarm systems in compliance with Article 7.60

(2) Nonconductive and conductive optical fiber cables in compliance with Article 7.70

(3) Communications circuits in compliance with Article 8.0

(4) Community antenna television and radio distribution systems in compliance with Article 8.20

(5) Low-power, network-powered broadband communications in compliance with Article 8.30

(f) Class 2 or Class 3 Conductors or Cables and Audio System Circuits. Audio system circuits described in 6.40.1.9(c), and installed

using Class 2 or Class 3 wiring methods in compliance with Sections 7.25.3.14 and 7.25.3.21, shall not be permitted to be installed in the same cable or raceway with Class 2 or Class 3 conductors or cables.

7.25.3.17 Installation of Circuit Conductors Extending Beyond One Building. Where Class 2 or Class 3 circuit conductors extend beyond one building and are run so as to be subject to accidental contact with electric light or power conductors operating over 300 volts to ground, or are exposed to lightning on interbuilding circuits on the same premises, the requirements of the following shall also apply:

(1) Sections 8.0.2.1, 8.0.2.7, 8.0.2.10, 8.0.3.4, 8.0.4.1, 8.0.6.1(a), and 8.0.6.1(b) for other than coaxial conductors

(2) Sections 8.20.2.1, 8.20.3.1, and 8.20.4.1 for coaxial conductors

7.25.3.18 Support of Conductors. Class 2 or Class 3 circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support. These conductors shall be permitted to be installed as permitted by 3.0.1.11(b)(2).

7.25.3.21 Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 7.25.3.21(a) through 7.25.3.21(h).

(a) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 3.0.1.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 3.0.1.22(c). Only Type CL2P or CL3P cable shall be permitted to be installed in these raceways.

(b) Riser. Cables installed in risers shall be as described in any of (b)(1), (b)(2), or (b)(3):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways shall be permitted to be installed in vertical riser

runs in a shaft from floor to floor. Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways.

(2) Other cables as covered in Table 7.25.3.21 and other listed wiring methods as covered in Chapter 3 shall be installed in metal raceways, or located in a fireproof shaft having firestops at each floor.

(3) Type CL2, CL3, CL2X, and CL3X cables shall be permitted in one- and two-family dwellings. Listed general purpose signaling raceways shall be permitted for use with Type CL2, CL3, CL2X and CL3X cables.

FPN: See 3.0.1.21 for firestop requirements for floor penetrations.

(c) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. Cables installed in cable trays indoors shall be Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2.

Listed signaling raceways shall be permitted for use with cable trays.

FPN: See 8.0.5.24(b) for cables permitted in cable trays.

(d) Hazardous (Classified) Locations. Cables installed in hazardous locations shall be as described in 7.25.3.21(d)(1) through (d)(4).

(1) Type PLTC. Cables installed in hazardous (classified) locations shall be Type PLTC. Where the use of Type PLTC cable is permitted by 5.1.2.1(b), 5.2.2.1(b), and 5.4.1.20, the cable shall be installed in cable trays, in raceways, supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. The cable shall be permitted to be directly buried where the cable is listed for this use.

(2) Intrinsically Safe Circuits and Nonincendive Field Wiring. Wiring for nonincendive circuits as permitted by 5.1.2.1(b)(3), and wiring for intrinsically safe circuits as permitted by 5.4.1.20, shall be permitted for circuits derived from Class 2 sources.

(3) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner

under the supervision of a licensed electrical practitioner service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed between the cable tray and utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1 800 mm.

(e) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 7.25.3.21(a) through 7.25.3.21(d) shall be as described in any of (1) through (7).

(1) Type CL2 or CL3 shall be permitted.

(2) Type CL2X or CL3X shall be permitted to be installed in a raceway or in accordance with other wiring methods covered in Chapter 3.

(3) Cables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 000 mm.

(4) Listed Type CL2X cables less than 6 mm in diameter and listed Type CL3X cables less than 6 mm in diameter shall be permitted to be installed in one- and two-family dwellings.

(5) Listed Type CL2X cables less than 6 mm in diameter and listed Type CL3X cables less than 6 mm in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.

(6) Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet.

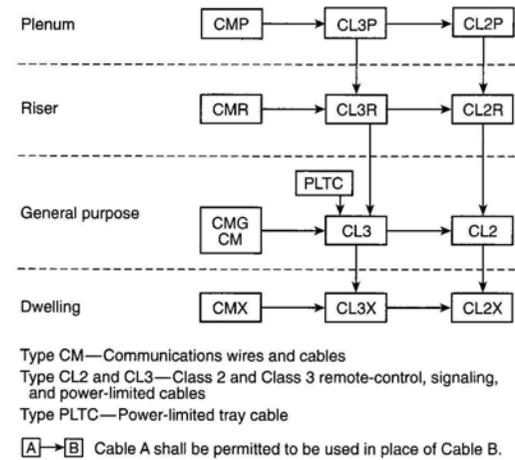

(7) In industrial establishments where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1 800 mm.

(f) **Cross-Connect Arrays.** Type CL2 or CL3 conductors or cables shall be used for cross-connect arrays.

(g) **Class 2 and Class 3 Cable Substitutions.** The substitutions for Class 2 and Class 3 cables listed in Table 7.25.3.21 shall be permitted. Where substitute cables are installed, the wiring requirements of Parts 7.25.1 and 7.25.3, shall apply.

FPN: For information on Types CMP, CMR, CM, and CMX cables, see 8.0.6.10.

(h) **Class 2, Class 3, PLTC Circuit Integrity (CI) Cable or Electrical Circuit Protective System.** Circuit integrity (CI) cable or a listed electrical circuit protective system shall be permitted for use in remote control, signaling, or power limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

y

Table 7.25.3.21 Cable Substitutions

Cable Type	Permitted Substitutions
CL3P	CMP
CL2P	CMP, CL3P
CL3R	CMP, CL3P, CMR
CL2R	CMP, CL3P, CL2P, CMR, CL3R
PLTC	
CL3	CMP, CL3P, CMR, CL3R, CMG, CM, PLTC
CL2	CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC, CL3
CL3X	CMP, CL3P, CMR, CL3R, CMG, CM, PLTC, CL3, CMX
CL2X	CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC, CL3, CL2, CMX, CL3X

7.25.4 Listing Requirements

7.25.4.1 Listing and Marking of Class 2, Class 3, and Type PLTC Cables. Class 2, Class 3, and Type PLTC cables and nonmetallic signaling raceways installed as wiring methods within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 7.25.4.1(a) through 7.25.4.1(k) and shall be marked in accordance with 7.25.4.1(l).

(a) **Types CL2P and CL3P.** Types CL2P and CL3P plenum cable shall be listed as being suitable for use in ducts, plenums, and other space for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1 500 mm when tested in accordance with the same test.

(b) **Types CL2R and CL3R.** Types CL2R and CL3R riser cables shall be marked as Type CL2R or CL3R, respectively, and be listed as

suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(c) Types CL2 and CL3. Types CL2 and CL3 cables shall be marked as Type CL2 or CL3, respectively, and be listed as suitable for general-purpose use, with the exception of risers, ducts, plenums, and other space used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 480 mm when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(d) Types CL2X and CL3X. Types CL2X and CL3X limited-use cables shall be marked as Type CL2X or CL3X respectively, and be listed as being suitable for use in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical wire) flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

(e) Type PLTC. Type PLTC nonmetallic-sheathed, power-limited tray cable shall be listed as being suitable for cable trays and shall consist of a factory assembly of two or more insulated conductors under a nonmetallic jacket. The insulated conductors shall be **22 AWG** through 3.5 mm² (2.0 mm dia.). The conductor material shall be copper (solid or stranded). Insulation on conductors shall be suitable for 300 volts. The cable core shall be either (1) two or more parallel conductors, (2) one or more group assemblies of twisted or parallel conductors, or (3) a combination thereof. A metallic shield or a metallized foil shield with drain wire(s) shall be permitted to be applied either over the cable core, over groups of conductors, or both. The cable shall be listed as being resistant to the spread of fire. The

outer jacket shall be a sunlight- and moisture-resistant nonmetallic material.

Exception No. 1: Where a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor is applied over the nonmetallic jacket, an overall nonmetallic jacket shall not be required. On metallic-sheathed cable without an overall nonmetallic jacket, the information required in 3.10.1.11 shall be located on the nonmetallic jacket under the sheath.

Exception No. 2: Conductors in PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 480 mm when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(f) Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables used for survivability of critical circuits shall be listed as circuit integrity (CI) cable. Cables specified in 7.25.3.21(a), (b), (d)(1), and (e), and used for circuit integrity, shall have the additional classification using the suffix “-CI”. Cables that are part of a listed electrical circuit protective system shall be considered to meet the requirements of survivability.

FPN: One method of defining circuit integrity is by establishing a minimum 2-hour fire resistance rating when tested in accordance with UL 2196-2002, Standard for Tests of Fire Resistive Cables.

(g) Class 2 and Class 3 Cable Voltage Ratings. Class 2 cables shall have a voltage rating of not less than 150 volts. Class 3 cables shall have a voltage rating of not less than 300 volts.

(h) Class 3 Single Conductors. Class 3 single conductors used as other wiring within buildings shall not be smaller than **18 AWG** and shall be Type CL3. Conductor types described in 7.25.2.7(b) that are also listed as Type CL3 shall be permitted.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 480 mm when performing the CSA vertical flame test for cables in cable trays as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(i) Plenum Signaling Raceways. Plenum signaling raceways shall be listed as having adequate fire-resistant and low smoke-producing characteristics.

(j) Riser Signaling Raceways. Riser signaling raceways shall be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the Test for Flame Propagation (Riser) in UL 2024, Standard for Optical Fiber Cable Raceway.

(k) General-Purpose Signaling Raceways. General-purpose signaling raceways shall be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General use) in UL 2024, Standard for Optical Fiber Cable Raceway.

(l) Marking. Cables shall be marked in accordance with 3.10.1.11(a)(2), (a)(3), (a)(4), and (a)(5) and Table 7.25.4.1. Voltage ratings shall not be marked on the cables.

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

Table 7.25.4.1 Cable Marking

Cable Marking	Type
CL3P	Class 3 plenum cable
CL2P	Class 2 plenum cable
CL3R	Class 3 riser cable
CL2R	Class 2 riser cable
PLTC	Power-limited tray cable
CL3	Class 3 cable
CL2	Class 2 cable
CL3X	Class 3 cable, limited use
CL2X	Class 2 cable, limited use

FPN: Class 2 and Class 3 cable types are listed in descending order of fire resistance rating, and Class 3 cables are listed above Class 2 cables because Class 3 cables can substitute for Class 2 cables.

ARTICLE 7.27 — INSTRUMENTATION TRAY CABLE: TYPE ITC

7.27.1.1 Scope. This article covers the use, installation, and construction specifications of instrumentation tray cable for application to instrumentation and control circuits operating at 150 volts or less and 5 amperes or less.

7.27.1.2 Definition. Type ITC Instrumentation Tray Cable. A factory assembly of two or more insulated conductors, with or without a grounding conductor(s), enclosed in a nonmetallic sheath.

7.27.1.3 Other Articles. In addition to the provisions of this article, installation of Type ITC cable shall comply with other applicable articles of this Code, such as Articles 2.40, 2.50, 3.0, and 3.92.

7.27.1.4 Uses Permitted. Type ITC cable shall be permitted to be used as follows in industrial establishments where the conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation:

- (1) In cable trays.
- (2) In raceways.
- (3) In hazardous locations as permitted in 5.1.2.1, 5.2.2.1, 5.3.2.1, 5.4.1.20, 5.4.1.30, 5.4.1.80, and 5.5.1.15.
- (4) Enclosed in a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor applied over the nonmetallic sheath in accordance with 7.27.1.6. The cable shall be supported and secured at intervals not exceeding 1 800 mm.
- (5) Without a metallic sheath or armor between cable tray and equipment in lengths not to exceed 15 m, where the cable is supported and protected against physical damage using mechanical protection, such as struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1 800 mm.
- (6) Between cable tray and equipment in lengths not to exceed 15 m, where the cable complies with the crush and impact requirements of Type MC cable and is identified for such use. The cable shall be supported and secured at intervals not exceeding 1 800 mm.
- (7) As aerial cable on a messenger.
- (8) Direct buried where identified for the use.
- (9) Under raised floors in rooms containing industrial process control equipment and rack rooms where arranged to prevent damage to the cable.
- (10) Under raised floors in information technology equipment rooms in accordance with 6.45.1.5(d)(5)c.

7.27.1.5 Uses Not Permitted. Type ITC cable shall not be installed on circuits operating at more than 150 volts or more than 5 amperes. Installation of Type ITC cable with other cables shall be subject to the stated provisions of the specific articles for the other cables. Where the governing articles do not contain stated provisions for installation with Type ITC cable, the installation of Type ITC cable with the other cables shall not be permitted. Type ITC cable shall not be installed with power, lighting, Class 1, or non-power-limited circuits.

Exception No. 1: Where terminated within equipment or junction boxes and separations are maintained by insulating barriers or other means.

Exception No. 2: Where a metallic sheath or armor is applied over the nonmetallic sheath of the Type ITC cable.

7.27.1.6 Construction. The insulated conductors of Type ITC cable shall be in sizes **22 AWG** through 3.5 mm² (2.0 mm dia.). The conductor material shall be copper or thermocouple alloy. Insulation on the conductors shall be rated for 300 volts. Shielding shall be permitted.

The cable shall be listed as being resistant to the spread of fire. The outer jacket shall be sunlight and moisture resistant.

Where a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor is applied over the nonmetallic sheath, an overall nonmetallic jacket shall not be required.

7.27.1.7 Marking. The cable shall be marked in accordance with 3.10.1.11(a)(2), (a)(3), (a)(4), and (a)(5). Voltage ratings shall not be marked on the cable.

7.27.1.8 Allowable Ampacity. The allowable ampacity of the conductors shall be 5 amperes, except for **22 AWG** conductors, which shall have an allowable ampacity of 3 amperes.

7.27.1.9 Overcurrent Protection. Overcurrent protection shall not exceed 5 amperes for **20 AWG** and larger conductors, and 3 amperes for **22 AWG** conductors.

7.27.1.10 Bends. Bends in Type ITC cables shall be made so as not to damage the cable.

ARTICLE 7.60 — FIRE ALARM SYSTEMS

7.60.1 General

7.60.1.1 Scope. This article covers the installation of wiring and equipment of fire alarm systems including all circuits controlled and powered by the fire alarm system.

FPN No. 1: Fire alarm systems include fire detection and alarm notification, guard's tour, sprinkler waterflow, and sprinkler supervisory systems. Circuits controlled and powered by the fire alarm system include circuits for the control of building systems safety functions, elevator capture, elevator shutdown, door release, smoke doors and damper control, fire doors and damper control and fan shutdown, but only where these circuits are powered by and controlled by the fire alarm system. For further information on the installation and monitoring for integrity requirements for fire alarm systems, refer to the NFPA 72®-2002, National Fire Alarm Code®.

FPN No. 2: Class 1, 2, and 3 circuits are defined in Article 7.25.

7.60.1.2 Definitions.

Abandoned Fire Alarm Cable. Installed fire alarm cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

Fire Alarm Circuit. The portion of the wiring system between the load side of the overcurrent device or the power-limited supply and the connected equipment of all circuits powered and controlled by the fire alarm system. Fire alarm circuits are classified as either non-power-limited or power-limited.

Fire Alarm Circuit Integrity (CI) Cable. Cable used in fire alarm systems to ensure continued operation of critical circuits during a specified time under fire conditions.

Non-Power-Limited Fire Alarm Circuit (NPLFA). A fire alarm circuit powered by a source that complies with 7.60.2.1 and 7.60.2.3.

Power-Limited Fire Alarm Circuit (PLFA). A fire alarm circuit powered by a source that complies with 7.60.3.1.

7.60.1.3 Other Articles. Circuits and equipment shall comply with 7.60.1.3(a) through 7.60.1.3(f). Only those sections of Article 3.0 referenced in this article shall apply to fire alarm systems.

(a) Spread of Fire or Products of Combustion. Section 3.0.1.21. The accessible portion of abandoned fire alarm cables shall be removed.

(b) Ducts, Plenums, and Other Air-Handling Spaces. Section 3.0.1.22, where installed in ducts or plenums or other spaces used for environmental air.

Exception: As permitted in 7.60.2.10(b)(1) and (b)(2) and 7.60.3.21(a).

(c) Hazardous (Classified) Locations. Articles 500 through 516 and Part 5.17.4, where installed in hazardous (classified) locations.

(d) Corrosive, Damp, or Wet Locations. Sections 1.10.1.11, 3.0.1.6, and 3.10.1.9 where installed in corrosive, damp, or wet locations.

(e) Building Control Circuits. Article 7.25 where building control circuits (e.g., elevator capture, fan shutdown) are associated with the fire alarm system.

(f) Optical Fiber Cables. Where optical fiber cables are utilized for fire alarm circuits, the cables shall be installed in accordance with Article 7.70.

7.60.1.7 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of conductors and cables that prevents removal of panels, including suspended ceiling panels.

7.60.1.8 Mechanical Execution of Work. Fire alarm circuits shall be installed in a neat workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 3.0.1.4(d).

7.60.1.9 Fire Alarm Circuit and Equipment Grounding. Fire alarm circuits and equipment shall be grounded in accordance with Article 2.50.

7.60.1.10 Fire Alarm Circuit Identification. Fire alarm circuits shall be identified at terminal and junction locations in a manner that will prevent unintentional interference with the signaling circuit during testing and servicing.

7.60.1.11 Fire Alarm Circuits Extending Beyond One Building. Power-limited fire alarm circuits that extend beyond one building and run outdoors either shall meet the installation requirements of Parts 8.0.2, 8.0.3, and 8.0.4 or shall meet the installation requirements of Part 3.0.1. Non-power-limited fire alarm circuits that extend beyond

one building and run outdoors shall meet the installation requirements of Part 3.0.1 and the applicable sections of Part 2.25.1.

7.60.1.15 Fire Alarm Circuit Requirements. Fire alarm circuits shall comply with 7.60.1.15(a) and 7.60.1.15(b).

(a) Non–Power-Limited Fire Alarm (NPLFA) Circuits. See Parts 7.60.1 and 7.60.2.

(b) Power-Limited Fire Alarm (PLFA) Circuits. See Parts 7.60.1 and 7.60.3.

7.60.2 Non–Power-Limited Fire Alarm (NPLFA) Circuits

7.60.2.1 NPLFA Circuit Power Source Requirements. The power source of non–power-limited fire alarm circuits shall comply with Chapters 1 through 4, and the output voltage shall not be more than 600 volts, nominal. These circuits shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN: See 2.10.1.8(a)(5), Exception No. 3, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems.

7.60.2.3 NPLFA Circuit Overcurrent Protection. Overcurrent protection for conductors 2.0 mm² (1.6 mm dia.) and larger shall be provided in accordance with the conductor ampacity without applying the derating factors of 3.10.1.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG conductors.

Exception: Where other articles of this Code permit or require other overcurrent protection.

7.60.2.4 NPLFA Circuit Overcurrent Device Location. Overcurrent devices shall be located at the point where the conductor to be protected receives its supply.

Exception No. 1: Where the overcurrent device protecting the larger conductor also protects the smaller conductor.

Exception No. 2: Transformer secondary conductors. Non–power-limited fire alarm circuit conductors supplied by the secondary of a

single-phase transformer that has only a 2-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided by the primary (supply) side of the transformer, provided the protection is in accordance with 4.50.1.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio. Transformer secondary conductors other than 2-wire shall not be considered to be protected by the primary overcurrent protection.

Exception No. 3: Electronic power source output conductors. Non–power-limited circuit conductors supplied by the output of a single-phase, listed electronic power source, other than a transformer, having only a 2-wire (single-voltage) output for connection to non–power-limited circuits shall be permitted to be protected by overcurrent protection provided on the input side of the electronic power source, provided this protection does not exceed the value determined by multiplying the non–power-limited circuit conductor ampacity by the output-to-input voltage ratio. Electronic power source outputs, other than 2-wire (single voltage), connected to non–power-limited circuits shall not be considered to be protected by overcurrent protection on the input of the electronic power source.

FPN: A single-phase, listed electronic power supply whose output supplies a 2-wire (single-voltage) circuit is an example of a non–power-limited power source that meets the requirements of 7.60.2.1.

7.60.2.5 NPLFA Circuit Wiring Methods. Installation of non–power-limited fire alarm circuits shall be in accordance with 1.10.1.3(b), 3.0.1.11, 3.0.1.15, 3.0.1.17, and other appropriate articles of Chapter 3.

Exception No. 1: As provided in 7.60.2.6 through 7.60.2.10.

Exception No. 2: Where other articles of this Code require other methods.

7.60.2.6 Conductors of Different Circuits in Same Cable, Enclosure, or Raceway.

(a) Class 1 with NPLFA Circuits. Class 1 and non–power-limited fire alarm circuits shall be permitted to occupy the same cable, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are

insulated for the maximum voltage of any conductor in the enclosure or raceway.

(b) Fire Alarm with Power-Supply Circuits. Power-supply and fire alarm circuit conductors shall be permitted in the same cable, enclosure, or raceway only where connected to the same equipment.

7.60.2.7 NPLFA Circuit Conductors.

(a) Sizes and Use. Only copper conductors shall be permitted to be used for fire alarm systems. Size **18 AWG** and **16 AWG** conductors shall be permitted to be used, provided they supply loads that do not exceed the ampacities given in Table 4.2.1.5 and are installed in a raceway, an approved enclosure, or a listed cable. Conductors larger than **16 AWG** shall not supply loads greater than the ampacities given in 3.10.1.15, as applicable.

(b) Insulation. Insulation on conductors shall be suitable for 600 volts. Conductors larger than **16 AWG** shall comply with Article 3.10. Conductors **18 AWG** and **16 AWG** shall be Type KF-2, KFF-2, PAFF, PTFE, PF, PFF, PGF, PGFF, RFH-2, RFHH-2, RFHH-3, SF-2, SFF-2, TF, TFF, TFN, TFFN, ZF, or ZFF. Conductors with other types and thickness of insulation shall be permitted if listed for non-power-limited fire alarm circuit use.

FPN: For application provisions, see Table 4.2.1.3.

(c) Conductor Materials. Conductors shall be solid or stranded copper.

Exception to (b) and (c): Wire Types PAF and PTF shall be permitted only for high-temperature applications between 90°C (194°F) and 250°C (482°F).

7.60.2.8 Number of Conductors in Cable Trays and Raceways, and Derating.

(a) NPLFA Circuits and Class 1 Circuits. Where only non-power-limited fire alarm circuit and Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 3.0.1.17. The derating factors given in 3.10.1.15(b)(2)a shall apply if such conductors carry continuous load in excess of 10 percent of the ampacity of each conductor.

(b) Power-Supply Conductors and Fire Alarm Circuit Conductors. Where power-supply conductors and fire alarm circuit conductors are permitted in a raceway in accordance with 7.60.2.6, the number of conductors shall be determined in accordance with 3.0.1.17. The derating factors given in 3.10.1.15(b)(2)a shall apply as follows:

(1) To all conductors where the fire alarm circuit conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the total number of conductors is more than three

(2) To the power-supply conductors only, where the fire alarm circuit conductors do not carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the number of power-supply conductors is more than three

(c) Cable Trays. Where fire alarm circuit conductors are installed in cable trays, they shall comply with 3.92.1.9 through 3.92.1.11.

7.60.2.10 Multiconductor NPLFA Cables. Multiconductor non-power-limited fire alarm cables that meet the requirements of 7.60.4.1 shall be permitted to be used on fire alarm circuits operating at 150 volts or less and shall be installed in accordance with 7.60.2.10(a) and 7.60.2.10(b).

(a) NPLFA Wiring Method. Multiconductor non-power-limited fire alarm circuit cables shall be installed in accordance with 7.60.2.10(a)(1), (a)(2), and (a)(3).

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2 100 mm of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm.

(2) Passing Through a Floor or Wall. In metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 2 100 mm above the floor unless adequate protection can be

afforded by building construction such as detailed in 7.60.2.10(a)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 6.20.3.1 for elevators and similar equipment.

(b) Applications of Listed NPLFA Cables. The use of non-power-limited fire alarm circuit cables shall comply with 7.60.2.10(b)(1) through (b)(4).

(1) Ducts and Plenums. Multiconductor non-power-limited fire alarm circuit cables, Types NPLFP, NPLFR, and NPLF, shall not be installed exposed in ducts or plenums.

FPN: See 3.0.1.22(b).

(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type NPLFP.

Exception No. 1: Types NPLFR and NPLF cables installed in compliance with 3.0.1.22(c).

Exception No. 2: Other wiring methods in accordance with 3.0.1.22(c) and conductors in compliance with 7.60.2.7(c).

Exception No. 3: Type NPLFP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(3) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Type NPLFR. Floor penetrations requiring Type NPLFR shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type NPLF or other cables that are specified in Chapter 3 and are in compliance with 7.60.2.7(c) and encased in metal raceway.

Exception No. 2: Type NPLF cables located in a fireproof shaft having firestops at each floor.

FPN: See 3.0.1.21 for firestop requirements for floor penetrations.

Exception No. 3: Type NPLFR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(4) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 7.60.2.10(b)(1), (b)(2), and (b)(3) shall be Type NPLF.

Exception No. 1: Chapter 3 wiring methods with conductors in compliance with 7.60.2.7(c).

Exception No. 2: Type NPLFP or Type NPLFR cables shall be permitted.

Exception No. 3: Type NPLF-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

7.60.3 Power-Limited Fire Alarm (PLFA) Circuits

7.60.3.1 Power Sources for PLFA Circuits. The power source for a power-limited fire alarm circuit shall be as specified in 7.60.3.1(a), (b), or (c). These circuits shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN No. 1: Tables 12(a) and 12(b) in Chapter 9 provide the listing requirements for power-limited fire alarm circuit sources.

FPN No. 2: See 2.10.1.8(a)(5), Exception No. 3, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems.

(a) Transformers. A listed PLFA or Class 3 transformer.

(b) Power Supplies. A listed PLFA or Class 3 power supply.

(c) Listed Equipment. Listed equipment marked to identify the PLFA power source.

FPN: Examples of listed equipment are a fire alarm control panel with integral power source; a circuit card listed for use as a PLFA source, where used as part of a listed assembly; a current-limiting impedance, listed for the purpose or part of a listed product, used in conjunction with a non-power-limited transformer or a stored energy source, for example, storage battery, to limit the output current.

7.60.3.2 Circuit Marking. The equipment supplying PLFA circuits shall be durably marked where plainly visible to indicate each circuit that is a power-limited fire alarm circuit.

FPN: See 7.60.3.12(a), Exception No. 3, where a power-limited circuit is to be reclassified as a non-power-limited circuit.

7.60.3.11 Wiring Methods on Supply Side of the PLFA Power Source. Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Part 7.60.2 and Chapters 1 through 4. Transformers or other devices supplied from power-supply conductors shall be protected by an overcurrent device rated not over 20 amperes.

Exception: The input leads of a transformer or other power source supplying power-limited fire alarm circuits shall be permitted to be smaller than 2.0 mm² (1.6 mm dia.), but not smaller than 18 AWG, if they are not over 300 mm long and if they have insulation that complies with 7.60.2.7(b).

7.60.3.12 Wiring Methods and Materials on Load Side of the PLFA Power Source. Fire alarm circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with 7.60.3.12(a), 7.60.3.12(b), or a combination of (a) and (b).

(a) NPLFA Wiring Methods and Materials. Installation shall be in accordance with 7.60.2.5, and conductors shall be solid or stranded copper.

Exception No. 1: The derating factors given in 3.10.1.15(b)(2)a shall not apply.

Exception No. 2: Conductors and multiconductor cables described in and installed in accordance with 7.60.2.7 and 7.60.2.10 shall be permitted.

Exception No. 3: Power-limited circuits shall be permitted to be reclassified and installed as non-power-limited circuits if the power-limited fire alarm circuit markings required by 7.60.3.2 are eliminated and the entire circuit is installed using the wiring methods and materials in accordance with Part 7.60.2, Non-Power-Limited Fire Alarm Circuits.

FPN: Power-limited circuits reclassified and installed as non-power-limited circuits are no longer power-limited circuits, regardless of the continued connection to a power-limited source.

(b) PLFA Wiring Methods and Materials. Power-limited fire alarm conductors and cables described in 7.60.4.2 shall be installed as detailed in 7.60.3.12(b)(1), (b)(2), or (b)(3) of this section. Devices shall be installed in accordance with 1.10.1.3(b), 3.0.1.11(a), and 3.0.1.15.

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on the surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2 100 mm of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm.

(2) Passing Through a Floor or Wall. In metal raceways or rigid nonmetallic conduit where passing through a floor or wall to a height of 2 100 mm above the floor, unless adequate protection can be afforded by building construction such as detailed in 7.60.3.12(b)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 6.20.3.1 for elevators and similar equipment.

7.60.3.14 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways for Power-Limited Circuits. Conductors and equipment for power-limited fire alarm circuits shall be installed in accordance with 7.60.3.15 through 7.60.3.18.

7.60.3.15 Separation from Electric Light, Power, Class 1, NPLFA, and Medium Power Network-Powered Broadband Communications Circuit Conductors.

(a) General. Power-limited fire alarm circuit cables and conductors shall not be placed in any cable, cable tray, compartment, enclosure,

manhole, outlet box, device box, raceway, or similar fitting with conductors of electric light, power, Class 1, non-power-limited fire alarm circuits, and medium power network-powered broadband communications circuits unless permitted by 7.60.3.15(b) through 7.60.3.15(g).

(b) Separated by Barriers. Power-limited fire alarm circuit cables shall be permitted to be installed together with Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuits where they are separated by a barrier.

(c) Raceways Within Enclosures. In enclosures, power-limited fire alarm circuits shall be permitted to be installed in a raceway within the enclosure to separate them from Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuits.

(d) Associated Systems Within Enclosures. Power-limited fire alarm conductors in compartments, enclosures, device boxes, outlet boxes, or similar fittings shall be permitted to be installed with electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuits where they are introduced solely to connect the equipment connected to power-limited fire alarm circuits, and comply with either of the following conditions:

(1) The electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuit conductors are routed to maintain a minimum of 6 mm separation from the conductors and cables of power-limited fire alarm circuits.

(2) The circuit conductors operate at 150 volts or less to ground and also comply with one of the following:

a. The fire alarm power-limited circuits are installed using Type FPL, FPLR, FPLP, or permitted substitute cables, provided these power-limited cable conductors extending beyond the jacket are separated by a minimum of 6 mm or by a nonconductive sleeve or nonconductive barrier from all other conductors.

b. The power-limited fire alarm circuit conductors are installed as non-power-limited circuits in accordance with 7.60.2.5.

(e) Enclosures with Single Opening. Power-limited fire alarm circuit conductors entering compartments, enclosures, device boxes, outlet boxes, or similar fittings shall be permitted to be installed with electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuits where they are introduced solely to connect the equipment connected to power-limited fire alarm circuits or to other circuits controlled by the fire alarm system to which the other conductors in the enclosure are connected. Where power-limited fire alarm circuit conductors must enter an enclosure that is provided with a single opening, they shall be permitted to enter through a single fitting (such as a tee), provided the conductors are separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing.

(f) In Hoistways. In hoistways, power-limited fire alarm circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing. For elevators or similar equipment, these conductors shall be permitted to be installed as provided in 6.20.3.1.

(g) Other Applications. For other applications, power-limited fire alarm circuit conductors shall be separated by at least 50 mm from conductors of any electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuits unless one of the following conditions is met:

(1) Either (a) all of the electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuit conductors or (b) all of the power-limited fire alarm circuit conductors are in a raceway or in metal-sheathed, metal-clad, nonmetallic-sheathed, or Type UF cables.

(2) All of the electric light, power, Class 1, non-power-limited fire alarm, and medium power network-powered broadband communications circuit conductors are permanently separated from all of the power-limited fire alarm circuit conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the conductors.

7.60.3.16 Installation of Conductors of Different PLFA Circuits, Class 2, Class 3, and Communications Circuits in the Same Cable, Enclosure, or Raceway.

(a) **Two or More PLFA Circuits.** Cable and conductors of two or more power-limited fire alarm circuits, communications circuits, or Class 3 circuits shall be permitted within the same cable, enclosure, or raceway.

(b) **Class 2 Circuits with PLFA Circuits.** Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway with conductors of power-limited fire alarm circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required by the power-limited fire alarm circuits.

(c) **Low-Power Network-Powered Broadband Communications Cables and PLFA Cables.** Low-power network-powered broadband communications circuits shall be permitted in the same enclosure or raceway with PLFA cables.

(d) **Audio System Circuits and PLFA Circuits.** Audio system circuits described in 6.40.1.9(c) and installed using Class 2 or Class 3 wiring methods in compliance with 7.25.3.14 and 7.25.3.21 shall not be permitted to be installed in the same cable or raceway with power-limited conductors or cables.

7.60.3.17 Conductor Size. Conductors of 26 AWG shall be permitted only where spliced with a connector listed as suitable for 26 AWG to 24 AWG or larger conductors that are terminated on equipment or where the 26 AWG conductors are terminated on equipment listed as suitable for 26 AWG conductors. Single conductors shall not be smaller than 18 AWG.

7.60.3.18 Support of Conductors. Power-limited fire alarm circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support.

7.60.3.19 Current-Carrying Continuous Line-Type Fire Detectors.

(a) **Application.** Listed continuous line-type fire detectors,

including insulated copper tubing of pneumatically operated detectors, employed for both detection and carrying signaling currents shall be permitted to be used in power-limited circuits.

(b) **Installation.** Continuous line-type fire detectors shall be installed in accordance with 7.60.3.2 through 7.60.3.12 and 7.60.3.14.

7.60.3.21 Applications of Listed PLFA Cables. PLFA cables shall comply with the requirements described in either 7.60.3.21(a), (b), or (c) or where cable substitutions are made as shown in 7.60.3.21(d).

(a) **Plenum.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 3.0.1.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(b) **Riser.** Cables installed in risers shall be as described in either (1), (2), or (3):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.

(3) Type FPL cable shall be permitted in one- and two-family dwellings.

FPN: See 3.0.1.21 for firestop requirements for floor penetrations.

(c) **Other Wiring Within Buildings.** Cables installed in building locations other than those covered in 7.60.3.21(a) or 7.60.3.21(b) shall be as described in either (1), (2), (3), or (4). Type FPL-CI cable shall be permitted to be installed as described in either (1), (2), (3), or (4) to provide a 2-hour circuit integrity rated cable.

(1) Type FPL shall be permitted.

(2) Cables shall be permitted to be installed in raceways.

(3) Cables specified in Chapter 3 and meeting the requirements of 7.60.4.2(a) and 7.60.4.2(b) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m.

(4) A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 5.30.2.2.

(d) Fire Alarm Cable Substitutions. The substitutions for fire alarm cables listed in Table 7.60.3.21 shall be permitted. Where substitute cables are installed, the wiring requirements of Parts 7.60.1 and 7.60.3 shall apply.

FPN: For information on communications cables (CMP, CMR, CMG, CM), see 8.0.6.10.

7.60.4 Listing Requirements

7.60.4.1 Listing and Marking of NPLFA Cables. Non-power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 7.60.4.1(a) and 7.60.4.1(b) and as being resistant to the spread of fire in accordance with 7.60.4.1(c) through 7.60.4.1(f), and shall be marked in accordance with 7.60.4.1(g).

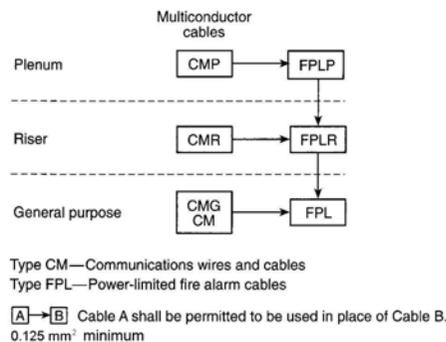

Figure 7.60.3.21 Cable Substitution Hierarchy.

Table 7.60.3.21 Cable Substitutions

Cable Type	References	Permitted Substitutions
FPLP	7.60.3.21(a)	CMP
FPLR	7.60.3.21(b)	CMP, FPLP, CMR
FPL	7.60.3.21(c)	CMP, FPLP, CMR, FPLR, CMG, CM

(a) NPLFA Conductor Materials. Conductors shall be 18 AWG or larger solid or stranded copper.

(b) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors 2.0 mm² (1.6 mm dia.) and larger shall be one of the types listed in Table 3.10.1.13 or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 7.60.2.7.

(c) Type NPLFP. Type NPLFP non-power-limited fire alarm cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in 3.0.1.22(c) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.

(d) Type NPLFR. Type NPLFR non-power-limited fire alarm riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass ANSI/UL 1666-2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.

(e) **Type NPLF.** Type NPLF non-power-limited fire alarm cable shall be listed as being suitable for general-purpose fire alarm use, with the exception of risers, ducts, plenums, and other space used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN No. 1: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

FPN No. 2: Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 480 mm when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(f) **Fire Alarm Circuit Integrity (CI) Cable or Electrical Circuit Protective System.** Cables used for survivability of critical circuits shall be listed as circuit integrity (CI) cable. Cables specified in 7.60.4.1(c), (d), and (e), and used for circuit integrity shall have the additional classification using the suffix “-CI.” Cables that are part of a listed electrical circuit protective system shall be considered to meet the requirements of survivability.

FPN No. 1: Fire alarm circuit integrity (CI) cable and electrical circuit protective systems may be used for fire alarm circuits to comply with the survivability requirements of NFPA 72®-2002, National Fire Alarm Code®, 6.9.4.3 and 6.9.4.6, that the circuit maintain its electrical function during fire conditions for a defined period of time.

FPN No. 2: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, Standard for Tests of Fire Resistive Cables.

(g) **NPLFA Cable Markings.** Multiconductor non-power-limited fire alarm cables shall be marked in accordance with Table 7.60.4.1(g). Non-power-limited fire alarm circuit cables shall be permitted to be marked with a maximum usage voltage rating of 150 volts. Cables that are listed for circuit integrity shall be identified with the suffix “CI” as defined in 7.60.4.1(f).

FPN: Cable types are listed in descending order of fire resistance rating.

7.60.4.2 Listing and Marking of PLFA Cables and Insulated Continuous Line-Type Fire Detectors. Type FPL cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 7.60.4.2(a) through

7.60.4.2(h) and shall be marked in accordance with 7.60.4.2(i). Insulated continuous line-type fire detectors shall be listed in accordance with 7.60.4.2(j).

Table 7.60.4.1(g) NPLFA Cable Markings

Cable Marking	Type	Reference
NPLFP	Non-power-limited fire alarm circuit cable for use in “other space used for environmental air”	760.31(d) and (h)
NPLFR	Non-power-limited fire alarm circuit riser cable	760.31(e) and (h)
NPLF	Non-power-limited fire alarm circuit cable	760.31(f) and (h)

Note: Cables identified in 7.60.4.1(c), (d), and (e) and meeting the requirements for circuit integrity shall have the additional classification using the suffix “CI” (for example, NPLFP-CI, NPLFR-CI, and NPLF-CI).

(a) **Conductor Materials.** Conductors shall be solid or stranded copper.

(b) **Conductor Size.** The size of conductors in a multiconductor cable shall not be smaller than **26 AWG**. Single conductors shall not be smaller than **18 AWG**.

(c) **Ratings.** The cable shall have a voltage rating of not less than 300 volts.

(d) **Type FPLP.** Type FPLP power-limited fire alarm plenum cable shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining

fire-resistant cables is by establishing a maximum allowable flame travel distance of 1 500 mm when tested in accordance with the same test.

(e) Type FPLR. Type FPLR power-limited fire alarm riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(f) Type FPL. Type FPL power-limited fire alarm cable shall be listed as being suitable for general-purpose fire alarm use, with the exception of risers, ducts, plenums, and other spaces used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 480 mm when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(g) Fire Alarm Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables used for survivability of critical circuits shall be listed as circuit integrity (CI) cable. Cables specified in 7.60.4.2(d), (e), (f), and (h) and used for circuit integrity shall have the additional classification using the suffix “-CI.” Cables that are part of a listed electrical circuit protective system shall be considered to meet the requirements of survivability.

FPN No. 1: Fire alarm circuit integrity (CI) cable and electrical circuit protective systems may be used for fire alarm circuits to comply with the survivability requirements of NFPA 72®-2002, National Fire Alarm Code®, 6.9.4.3 and 6.9.4.6, that the circuit maintain its electrical function during fire conditions for a defined period of time.

FPN No. 2: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, Standard for Tests of Fire Resistive Cables.

(h) Coaxial Cables. Coaxial cables shall be permitted to use 30 percent conductivity copper-covered steel center conductor wire and shall be listed as Type FPLP, FPLR, or FPL cable.

(i) Cable Marking. The cable shall be marked in accordance with Table 7.60.4.2(i). The voltage rating shall not be marked on the cable. Cables that are listed for circuit integrity shall be identified with the suffix CI as defined in 7.60.4.2(g).

FPN: Voltage ratings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

FPN: Cable types are listed in descending order of fire-resistance rating.

(j) Insulated Continuous Line-Type Fire Detectors. Insulated continuous line-type fire detectors shall be rated in accordance with 7.60.4.2(c), listed as being resistant to the spread of fire in accordance with 7.60.4.2(d) through 7.60.4.2(f), marked in accordance with 7.60.4.2(i), and the jacket compound shall have a high degree of abrasion resistance.

Table 7.60.4.2(i) Cable Markings

Cable Marking	Type
FPLP	Power-limited fire alarm plenum cable
FPLR	Power-limited fire alarm riser cable
FPL	Power-limited fire alarm cable

Note: Cables identified in 7.60.4.2(d), (e), and (f) as meeting the requirements for circuit integrity shall have the additional classification using the suffix “CI” (for example, FPLP-CI, FPLR-CI, and FPL-CI).

ARTICLE 7.70 — OPTICAL FIBER CABLES AND RACEWAYS

7.70.1 General

7.70.1.1 Scope. The provisions of this article apply to the installation of optical fiber cables and raceways. This article does not cover the construction of optical fiber cables and raceways.

7.70.1.2 Definitions.

Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

Exposed. The circuit is in such a position that, in case of failure of supports and insulation, contact with another circuit may result.

FPN: See Article 1.0 for two other definitions of Exposed.

Optical Fiber Raceway. A raceway designed for enclosing and routing listed optical fiber cables.

Point of Entrance. The point at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 8.0.4.1(b).

7.70.1.3 Other Articles. Circuits and equipment shall comply with 7.70.1.3(a) and 7.70.1.3(b). Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.

(a) Spread of Fire or Products of Combustion. The requirements of 3.0.1.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.

(b) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 3.0.1.22 for electric wiring shall also apply to

installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.

Exception: As permitted in 7.70.3.42(a).

7.70.1.6 Optical Fiber Cables. Optical fiber cables transmit light for control, signaling, and communications through an optical fiber.

7.70.1.9 Types. Optical fiber cables can be grouped into three types.

(a) Nonconductive. These cables contain no metallic members and no other electrically conductive materials.

(b) Conductive. These cables contain non-current-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.

(c) Composite. These cables contain optical fibers and current-carrying electrical conductors, and shall be permitted to contain non-current-carrying conductive members such as metallic strength members and metallic vapor barriers. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors.

7.70.1.12 Raceways for Optical Fiber Cables. Installations of raceways shall comply with 7.70.1.12(a) through 7.70.1.12(d).

(a) Listed Chapter 3 Raceways. Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3. Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.

(b) Optical Fiber Raceways. Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 7.70.3.42 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing shall apply.

(c) **Innerduct.** Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 7.70.3.42 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.

(d) **Entering Buildings.** Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.

7.70.1.21 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of cables that prevents removal of panels, including suspended ceiling panels.

7.70.1.24 Mechanical Execution of Work. Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 3.0.1.4(d) and 3.0.1.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

7.70.2 Protection

7.70.2.1 Grounding of Entrance Cables. Where exposed to contact with electric light or power conductors, the non-current-carrying metallic members of optical fiber cables entering buildings shall be grounded as close to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.

7.70.3 Cables Within Buildings

7.70.3.1 Installation and Marking of Listed Optical Fiber Cables. Listed optical fiber cables shall be installed as wiring within buildings. Optical fiber cables shall be marked in accordance with Table

7.70.3.1.

Exception No. 1: Optical fiber cables shall not be required to be listed and marked where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m and the cable enters the building from the outside and is terminated in an enclosure.

FPN: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.

Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 3.42, Intermediate Metal Conduit: Type IMC; Article 3.44, Rigid Metal Conduit: Type RMC; Article 3.52, Rigid Nonmetallic Conduit: Type RNC; and Article .358, Electrical Metallic Tubing: Type EMT.

FPN No. 1: Cables types are listed in descending order of fire resistance rating. Within each fire resistance rating, nonconductive cable is listed first because it may substitute for the conductive cable.

FPN No. 2: See the referenced sections for requirements and permitted uses.

7.70.3.21 Installation of Optical Fibers and Electrical Conductors.

(a) **With Conductors for Electric Light, Power, Class 1, Non-Power-Limited Fire Alarm, or Medium Power Network-Powered Broadband Communications Circuits.** Optical fibers shall be permitted within the same composite cable for electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuits operating at 600 volts or less only where the functions of the optical fibers and the electrical conductors are associated.

Nonconductive optical fiber cables shall be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, non-power-limited fire alarm, Type ITC, or medium power network-powered broadband communications circuits, operating at 600 volts or less. Conductive optical fiber cables shall not be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, non-power-limited fire alarm, Type ITC, or medium power network-powered broadband communications circuits.

Composite optical fiber cables containing only current-carrying conductors for electric light, power, Class 1 circuits rated 600 volts or less shall be permitted to occupy the same cabinet, cable tray, outlet box, panel, raceway, or other termination enclosure with conductors for electric light, power, or Class 1 circuits operating at 600 volts or less.

Nonconductive optical fiber cables shall not be permitted to occupy the same cabinet, outlet box, panel, or similar enclosure housing the electrical terminations of an electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuit.

Exception No. 1: Occupancy of the same cabinet, outlet box, panel, or similar enclosure shall be permitted where nonconductive optical fiber cable is functionally associated with the electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuit.

Exception No. 2: Occupancy of the same cabinet, outlet box, panel, or similar enclosure shall be permitted where nonconductive optical fiber cables are installed in factory- or field-assembled control centers.

Exception No. 3: In industrial establishments only, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, nonconductive optical fiber cables shall be permitted with circuits exceeding 600 volts.

Exception No. 4: In industrial establishments only, where conditions of maintenance and supervision ensure that only licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner service the installation, composite optical fiber cables shall be permitted to contain current-carrying conductors operating over 600 volts.

(b) With Other Conductors. Optical fibers shall be permitted in the same cable, and conductive and nonconductive optical fiber cables shall be permitted in the same cable tray, enclosure, or raceway with conductors of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 7.25

(2) Power-limited fire alarm systems in compliance with Article 7.60

(3) Communications circuits in compliance with Article 8.0

(4) Community antenna television and radio distribution systems in compliance with Article 8.20

(5) Low-power network-powered broadband communications circuits in compliance with Article 8.30

(c) Grounding. Non-current-carrying conductive members of optical fiber cables shall be grounded in accordance with Article 2.50.

Table 7.70.3.1 Cable Markings

Cable Marking	Type	Reference
OFNP	Nonconductive optical fiber plenum cable	7.70.4.1(a) and 7.70.3.42
OFCP	Conductive optical fiber plenum cable	7.70.4.1(a) and 7.70.3.42(a)
OFNR	Nonconductive optical fiber riser cable	7.70.4.1(b) and 7.70.3.42(b)
OFCR	Conductive optical fiber riser cable	7.70.4.1(b) and 7.70.3.42(b)
OFNG	Nonconductive optical fiber general-purpose cable	7.70.4.1(c) and 7.70.3.42(c)
OF CG	Conductive optical fiber general-purpose cable	7.70.4.1(c) and 7.70.3.42(c)
OFN	Nonconductive optical fiber general-purpose cable	7.70.4.1(d) and 7.70.3.42(c)
OFC	Conductive optical fiber general-purpose cable	7.70.4.1(d) and 7.70.3.42(c)

7.70.3.42 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 7.70.3.42(a) through 7.70.3.42(e) or where cable substitutions are made as shown in 7.70.3.42(f).

(a) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 3.0.1.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 3.0.1.22(b) and in other spaces used for environmental air as described in 3.0.1.22(c). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(b) Riser. Cables installed in risers shall be as described in any of the following:

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain. Listed riser optical fiber raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.

(2) Type OFNG, OFN, OFCG, and OFC cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) Type OFNG, OFN, OFCG, and OFC cables shall be permitted in one- and two-family dwellings.

FPN: See 3.0.1.21 for firestop requirements for floor penetrations.

(c) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 7.70.3.42(a) and 7.70.3.42(b) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways.

(d) Hazardous (Classified) Locations. Cables installed in hazardous (classified) locations shall be any type indicated in Table 7.70.3.42.

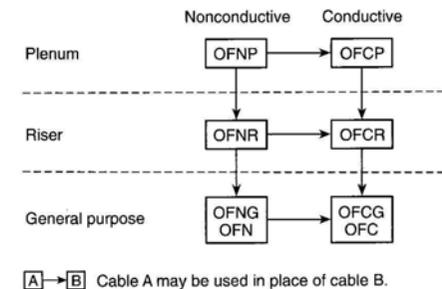

(e) Cable Trays. Optical fiber cables of the types listed in Table 7.70.3.1 shall be permitted to be installed in cable trays.

FPN: It is not the intent to require that these optical fiber cables be listed specifically for use in cable trays.

(f) Cable Substitutions. The substitutions for optical fiber cables listed in Table 7.70.3.42 shall be permitted.

Table 7.70.3.42 Cable Substitutions

Cable Type	Permitted Substitutions
OFNP	None
OFCP	OFNP
OFNR	OFNP
OFCR	OFNP, OFCP, OFNR
OFNG, OFN	OFNP, OFNR
OFCG, OFC	OFNP, OFCP, OFNR, OFCR, OFNG, OFN

I

hy.

7.70.4 Listing Requirements

7.70.4.1 Optical Fiber Cables. Optical fiber cables shall be listed in accordance with 7.70.4.1(a) through 7.70.4.1(d).

(a) Types OFND and OFCD. Types OFNP and OFCP. Types OFNP and OFCP nonconductive and conductive optical fiber plenum cables shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire resistant and low smoke producing characteristics.

FPN: One method of defining a cable that is low smoke producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

(b) Types OFNR and OFCR. Types OFNR and OFCR nonconductive and conductive optical fiber riser cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having the fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(c) Types OFNG and OFCG. Types OFNG and OFCG nonconductive and conductive general-purpose optical fiber cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is for the damage (char length) not to exceed 1 480 m when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(d) Types OFN and OFC. Types OFN and OFC nonconductive and conductive optical fiber cables shall be listed as being suitable for general-purpose use, with the exception of risers, plenums, and other spaces used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables, and Flexible Cords.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 480 mm when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

7.70.4.4 Optical Fiber Raceways. Optical fiber raceways shall be listed in accordance with 7.70.4.4(a) through 7.70.4.4(c).

(a) Plenum Optical Fiber Raceway. Plenum optical fiber raceways shall be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.

(b) Riser Optical Fiber Raceway. Riser optical fiber raceways shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.

(c) General-Purpose Optical Fiber Cable Raceway. General-purpose optical fiber cable raceway shall be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical Fiber Cable Raceway.

ARTICLE 7.80 — CLOSED-LOOP AND PROGRAMMED POWER DISTRIBUTION

7.80.1.1 Scope. The provisions of this article apply to premise power distribution systems jointly controlled by a signaling between the energy controlling equipment and utilization equipment.

7.80.1.2 General.

(a) **Other Articles.** Except as modified by the requirements of this article, all other applicable articles of this Code shall apply.

(b) **Component Parts.** All equipment and conductors shall be listed and identified.

7.80.1.3 Control. The control equipment and all power switching devices operated by the control equipment shall be listed and identified. The system shall operate in accordance with 7.80.1.3(a) through 7.80.1.3(d).

(a) **Characteristic Electrical Identification Required.** Outlets shall not be energized unless the utilization equipment first exhibits a characteristic electrical identification.

(b) **Conditions for De-Energization.** Outlets shall be de-energized when any of the following conditions occur:

- (1) A nominal-operation acknowledgment signal is not being received from the utilization equipment connected to the outlet.
- (2) A ground-fault condition exists.
- (3) An overcurrent condition exists.

(c) **Additional Conditions for De-Energization** When an Alternate Source of Power Is Used. In addition to the requirements in 7.80.1.3(b), outlets shall be de-energized when any of the following conditions occur:

- (1) The grounded conductor is not properly grounded.
- (2) Any ungrounded conductor is not at nominal voltage.

(d) **Controller Malfunction.** In the event of a controller malfunction, all associated outlets shall be de-energized.

7.80.1.5 Power Limitation in Signaling Circuits. For signaling circuits not exceeding 24 volts, the current required shall not exceed 1 ampere where protected by an overcurrent device or an inherently limited power source.

7.80.1.6 Cables and Conductors.

(a) **Hybrid Cable.** Listed hybrid cable consisting of power, communications, and signaling conductors shall be permitted under a common jacket. The jacket shall be applied so as to separate the power conductors from the communications and signaling conductors. An optional outer jacket shall be permitted to be applied. The individual conductors of a hybrid cable shall conform to the Code provisions applicable to their current, voltage, and insulation rating. The signaling conductors shall not be smaller than 24 AWG copper.

(b) **Cables and Conductors in the Same Cabinet, Panel, or Box.** The power, communications, and signaling conductors of listed hybrid cable are permitted to occupy the same cabinet, panel, or outlet box (or similar enclosure housing the electrical terminations of electric light or power circuits) only if connectors specifically listed for hybrid cable are employed.

7.80.1.7 Noninterchangeability. Receptacles, cord connectors, and attachment plugs used on closed-loop power distribution systems shall be constructed so that they are not interchangeable with other receptacles, cord connectors, and attachment plugs.

Chapter 8. Communications Systems

ARTICLE 8.0 — COMMUNICATIONS CIRCUITS

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 97–2003, Standard Glossary of Terms Relating to Chimneys, Vents, and Heat-Producing Appliances. Only editorial changes were made to the extracted text to make it consistent with this Code.

8.0.1 General

8.0.1.1 Scope. This article covers telephone, telegraph (except radio), outside wiring for fire alarm and burglar alarm, and similar central station systems; and telephone systems not connected to a central station system but using similar types of equipment, methods of installation, and maintenance.

FPN No. 1: For further information for fire alarm, sprinkler waterflow, and sprinkler supervisory systems, see Article 7.60.

FPN No. 2: For installation requirements of optical fiber cables, see Article 7.70.

FPN No. 3: For installation requirements for network-powered broadband communications circuits, see Article 8.30.

8.0.1.2 Definitions. See Article 1.1. For purposes of this article, the following additional definitions apply.

Block. A square or portion of a city, town, or village enclosed by streets and including the alleys so enclosed, but not any street.

Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6].

Cable. A factory assembly of two or more conductors having an overall covering.

Cable Sheath. A covering over the conductor assembly that may include one or more metallic members, strength members, or jackets

Communications Circuit Integrity (CI) Cable. Cable used in communications systems to ensure continued operation of critical circuits during a specified time under fire conditions.

Communications Equipment. The electronic equipment that performs the telecommunications operations for the transmission of audio, video, and data, and including power equipment (e.g., dc converters, inverters and batteries) and technical support equipment (e.g., computers).

Exposed. A circuit that is in such a position that, in case of failure of supports and insulation, contact with another circuit may result.

FPN: See Article 1.1 for two other definitions of Exposed.

Point of Entrance. The point of entrance within a building is the point at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 8.0.4.1(b).

Premises. The land and buildings of a user located on the user side of the utility-user network point of demarcation.

Wire. A factory assembly of one or more insulated conductors without an overall covering.

8.0.1.3 Other Articles

(a) Hybrid Power and Communications Cables. The provisions of 7.80.1.6 shall apply for listed hybrid power and communications cables in closed-loop and programmed power distribution.

FPN: See 8.0.6.10(j) for hybrid power and communications cable in other applications.

(b) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with Article 5.0 shall comply with the applicable requirements of Chapter 5.

(c) Spread of Fire or Products of Combustion. Section 3.0.1.21

shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain.

(d) Equipment in Other Space Used for Environmental Air. Section 3.0.1.22(c) shall apply.

8.0.1.18 Installation of Equipment. Equipment electrically connected to a telecommunications network shall be listed in accordance with 8.0.6.1. Installation of equipment shall also comply with 1.10.1.3(b).

Exception: This listing requirement shall not apply to test equipment that is intended for temporary connection to a telecommunications network by licensed electrical practitioner or non licensed electrical practitioner under the supervision of a licensed electrical practitioner during the course of installation, maintenance, or repair of telecommunications equipment or systems.

8.0.1.21 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.

8.0.1.24 Mechanical Execution of Work. Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 3.0.1.4(d) and 3.0.1.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards

8.0.2 Wires and Cables Outside and Entering Buildings

8.0.2.1 Overhead Communications Wires and Cables. Overhead communications wires and cables entering buildings shall comply with 8.0.2.1(a) and 8.0.2.1(b).

(a) On Poles and In-Span. Where communications wires and cables and electric light or power conductors are supported by the same pole or run parallel to each other in-span, the conditions described in 8.0.2.1(a)(1) through (a)(4) shall be met.

(1) Relative Location. Where practicable, the communications wires and cables shall be located below the electric light or power conductors.

(2) Attachment to Crossarms. Communications wires and cables shall not be attached to a crossarm that carries electric light or power conductors.

(3) Climbing Space. The climbing space through communications wires and cables shall comply with the requirements of 2.25.1.14(d).

(4) Clearance. Supply service drops of 0–750 volts running above and parallel to communications service drops shall have a minimum separation of 300 mm at any point in the span, including the point of and at their attachment to the building, provided the nongrounded conductors are insulated and that a clearance of not less than 1 000 mm is maintained between the two services at the pole.

(b) Above Roofs. Communications wires and cables shall have a vertical clearance of not less than 2 500 mm from all points of roofs above which they pass.

Exception No. 1: Auxiliary buildings, such as garages and the like.

Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm shall be permitted if (1) not more than 1 200 mm of communications service-drop conductors pass above the roof overhang and (2) they are terminated at a through- or above-the-roof raceway or approved support.

Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm, a reduction in clearance to not less than 900 mm shall be permitted.

FPN: See Article 1: For additional information regarding overhead wires and cables, see ANSI C2-2002, Philippine Electrical Code, Part 2, Safety Rules for Overhead Lines.

8.0.2.4 Underground Circuits Entering Buildings. Underground communications wires and cables entering buildings shall comply with

(a) and (b).

(a) With Electric Light or Power Conductors. Underground communications wires and cables in a raceway, handhole enclosure, or manhole containing electric light, power, Class 1, or nonpower-limited fire alarm circuit conductors shall be in a section separated from such conductors by means of brick, concrete, or tile partitions or by means of a suitable barrier.

(b) Underground Block Distribution. Where the entire street circuit is run underground and the circuit within the block is placed so as to be free from likelihood of accidental contact with electric light or power circuits of over 300 volts to ground, the insulation requirements of 8.0.2.7(a) and 8.0.2.7(c) shall not apply, insulating supports shall not be required for the conductors, and bushings shall not be required where the conductors enter the building.

8.0.2.7 Circuits Requiring Primary Protectors. Circuits that require primary protectors as provided in Section 8.0.3.1 shall comply with the following.

(a) Insulation, Wires, and Cables. Communications wires and cables without a metallic shield, running from the last outdoor support to the primary protector, shall be listed .

(b) On Buildings. Communications wires and cables in accordance with 8.0.2.7(a) shall be separated at least 100 mm from electric light or power conductors not in a raceway or cable, or be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the insulation on the wires, such as porcelain tubes or flexible tubing. Communications wires and cables in accordance with 8.0.2.7(a) exposed to accidental contact with electric light and power conductors operating at over 300 volts to ground and attached to buildings shall be separated from woodwork by being supported on glass, porcelain, or other insulating material.

Exception: Separation from woodwork shall not be required where fuses are omitted as provided for in 8.0.3.1(a)(1), or where conductors are used to extend circuits to a building from a cable having a grounded metal sheath.

(c) Entering Buildings. Where a primary protector is installed inside the building, the communications wires and cables shall enter the building either through a noncombustible, nonabsorbent insulating bushing or through a metal raceway. The insulating bushing shall not be required where the entering communications wires and cables (1) are in metal-sheathed cable, (2) pass through masonry, (3) meet the requirements of 8.0.2.7(a) and fuses are omitted as provided in 8.0.3.1(a)(1), or (a)(4) meet the requirements of 8.0.2.7(a) and are used to extend circuits to a building from a cable having a grounded metallic sheath. Raceways or bushings shall slope upward from the outside or, where this cannot be done, drip loops shall be formed in the communications wires and cables immediately before they enter the building.

Raceways shall be equipped with an approved service head. More than one communications wire and cable shall be permitted to enter through a single raceway or bushing. Conduits or other metal raceways located ahead of the primary protector shall be grounded.

8.0.2.10 Lightning Conductors. Where practicable, a separation of at least 1 800 mm shall be maintained between communications wires and cables on buildings and lightning conductors.

8.0.3 Protection

8.0.3.1 Protective Devices.

(a) Application. A listed primary protector shall be provided on each circuit run partly or entirely in aerial wire or aerial cable not confined within a block. Also, a listed primary protector shall be provided on each circuit, aerial or underground, located within the block containing the building served so as to be exposed to accidental contact with electric light or power conductors operating at over 300 volts to ground. In addition, where there exists a lightning exposure, each interbuilding circuit on a premises shall be protected by a listed primary protector at each end of the interbuilding circuit. Installation of primary protectors shall also comply with 1.10.1.3(b).

FPN No. 1: On a circuit not exposed to accidental contact with power conductors, providing a listed primary protector in accordance with this article helps protect against other hazards, such as lightning and above-normal voltages induced by fault currents on power circuits in proximity to the communications circuit.

FPN No. 2: Interbuilding circuits are considered to have a lightning exposure unless one or more of the following conditions exist.

(1) Circuits in large metropolitan areas where buildings are close together and sufficiently high to intercept lightning.

(2) Interbuilding cable runs of 42 m or less, directly buried or in underground conduit, where a continuous metallic cable shield or a continuous metallic conduit containing the cable is bonded to each building grounding electrode system.

(3) Areas having an average of five or fewer thunderstorm days per year and earth resistivity of less than 100 ohm-meters.

(1) Fuseless Primary Protectors. Fuseless-type primary protectors shall be permitted under any of the following conditions:

a. Where conductors enter a building through a cable with grounded metallic sheath member(s) and where the conductors in the cable safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor

b. Where insulated conductors in accordance with 8.0.2.7(a) are used to extend circuits to a building from a cable with an effectively grounded metallic sheath member(s) and where the conductors in the cable or cable stub, or the connections between the insulated conductors and the exposed plant, safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector grounding conductor

c. Where insulated conductors in accordance with 8.0.2.7(a) or 8.0.2.7(b) are used to extend circuits to a building from other than a cable with a metallic sheath member(s) where (1) the primary protector is listed as being suitable for this purpose for application with circuits extending from other than a cable with metallic sheath members, and (2) the connections of the insulated conductors to the exposed plant or the conductors of the exposed plant safely fuse on all currents greater than the current-carrying capacity of the primary protector, or associated insulated conductors and of the primary protector grounding conductor

d. Where insulated conductors in accordance with 8.0.2.7(a) are used to extend circuits aerially to a building from an unexposed buried or underground circuit

e. Where insulated conductors in accordance with 8.0.2.7(a) are used to extend circuits to a building from cable with an effectively grounded metallic sheath member(s) and where (1) the combination of the primary protector and insulated conductors is listed as being

suitable for this purpose for application with circuits extending from a cable with an effectively grounded metallic sheath member(s), and (2) the insulated conductors safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor

(2) Fused Primary Protectors. Where the requirements listed under 8.0.3.1(a)(1)a through 8.0.3.1(a)(1)e are not met, fused-type primary protectors shall be used. Fused-type primary protectors shall consist of an arrester connected between each line conductor and ground, a fuse in series with each line conductor, and an appropriate mounting arrangement. Primary protector terminals shall be marked to indicate line, instrument, and ground, as applicable.

(b) Location. The primary protector shall be located in, on, or immediately adjacent to the structure or building served and as close as practicable to the point of entrance.

FPN: See 8.0.1.2 for the definition of point of entrance.

For purposes of this section, primary protectors located at mobile home service equipment located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 2.50.2.13 and located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN: Selecting a primary protector location to achieve the shortest practicable primary protector grounding conductor helps limit potential differences between communications circuits and other metallic systems.

(c) Hazardous (Classified) Locations. The primary protector shall not be located in any hazardous (classified) location as defined in Article 5.0, nor in the vicinity of easily ignitable material.

Exception: As permitted in 5.1.3.51, 5.2.3.51, and 5.3.3.51.

(d) Secondary Protectors . Where a secondary protector is installed in series with the indoor communications wire and cable between the primary protector and the equipment, it shall be listed for the purpose in accordance with 8.0.6.1(b).

FPN: Secondary protectors on exposed circuits are not intended for use without primary protectors.

8.0.3.4 Cable Grounding. The metallic sheath of communications cables entering buildings shall be grounded as close as practicable to the point of entrance or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.

FPN: See 8.0.1.2 for the definition of point of entrance.

8.0.4 Grounding Methods

8.0.4.1 Cable and Primary Protector Grounding. The metallic member(s) of the cable sheath, where required to be grounded by 8.0.3.4, and primary protectors shall be grounded as specified in 8.0.4.1(a) through 8.0.4.1(d).

(a) Grounding Conductor.

(1) Insulation. The grounding conductor shall be insulated and shall be listed as suitable for the purpose.

(2) Material. The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding conductor shall not be smaller than 2.0 mm^2 (1.6 mm dia.).

(4) Length. The primary protector grounding conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector grounding conductor shall be as short as practicable, not to exceed 6 000 mm in length.

FPN: Similar grounding conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 6 000 mm, a separate communications ground rod meeting the minimum dimensional criteria of 8.0.4.1(b)(2)b shall be driven, the primary protector shall be grounded to the communications ground rod in accordance with 8.0.4.1(c), and the communications ground rod shall be bonded to the power grounding electrode system in accordance with 8.0.4.1(d).

(5) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Damage. Where necessary, the grounding conductor shall be guarded from physical damage. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

(b) Electrode. The grounding conductor shall be connected as follows.

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

a. The building or structure grounding electrode system as covered in 2.50.3.1

b. The grounded interior metal water piping system within 1 500 mm from its point of entrance to the building as covered in 2.50.3.3

c. The power service accessible means external to enclosures as covered in 2.50.5.5

d. The metallic power service raceway

e. The service equipment enclosure

f. The grounding electrode conductor or the grounding electrode conductor metal enclosure

g. To the grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 2.50.2.13

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in Section 8.0.3.1(b), shall be considered accessible.

(2) If the building or structure served has no grounding means the grounding conductor shall be connected, as described in 8.0.4.1(b)(1), the grounding conductor shall be connected to either of the following:

a. To any one of the individual electrodes described in 2.50.3.3(a)(1), (a)(2), (a)(3), or (a)(4)

b. If the building or structure served has no grounding means, as

described in 8.0.4.1(b)(1) or (b)(2)a, to an effectively grounded metal structure or to a ground rod or pipe not less than 1 500 mm in length and 13 mm in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 8.0.2.10 and at least 1 800 mm from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors.

(c) Electrode Connection. Connections to grounding electrodes shall comply with 2.50.3.21.

(d) Bonding of Electrodes. A bonding jumper not smaller than 14 mm² copper or equivalent shall be connected between the communications grounding electrode and power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 8.0.4.7.

FPN No. 1: See Section 2.50.3.11 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

8.0.4.7 Primary Protector Grounding and Bonding at Mobile Homes.

(a) Grounding. Where there is no mobile home service equipment located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, or there is no mobile home disconnecting means grounded in accordance with 2.50.2.13 and located within sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, the primary protector ground shall be in accordance with 8.0.4.1(b)(2).

(b) Bonding. The primary protector grounding terminal or grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 3.5 mm² (2.0 mm dia.) under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 8.0.4.7(a)

(2) Where the mobile home is supplied by cord and plug.

8.0.5 Communications Wires and Cables Within Buildings

8.0.5.1 Raceways for Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be of a type permitted in Chapter 3 or a listed nonmetallic raceway complying with 8.0.6.13, and installed in accordance with 3.62.2.15 through 3.62.2.47, where the requirements applicable to electrical nonmetallic tubing apply.

Exception: Conduit fill restrictions shall not apply.

8.0.5.4 Installation and Marking of Communications Wires and Cables. Listed communications wires and cables and listed multipurpose cables shall be installed as wiring within buildings. Communications cables and under-carpet communications wires shall be marked in accordance with Table 8.0.5.4. The cable voltage rating shall not be marked on the cable or on the under-carpet communications wire.

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception No. 1: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

Exception No. 2: Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.

FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.

FPN No. 2: This exception limits the length of unlisted outside plant cable to 15 m, while 8.0.3.1(b) requires that the primary protector shall be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m into the building if it is practicable to place the primary protector closer 15 m to the entrance point.

FPN No. 1: Cable types are listed in descending order of fire resistance rating.

FPN No. 2: See the referenced sections for permitted uses.

Table 8.0.5.4 Cable Markings

Cable Marking	Type	References
CMP	Communication plenum cable	8.0.6.10(a) and 8.0.5.45(a)
CMR	Communication riser cable	8.0.6.10(b) and 8.0.5.45(b)
CMG	Communication general-purpose cable	8.0.6.10(c) and 8.0.5.45(d) and (e)(1)
CM	Communication general-purpose cable	8.0.6.10(d) and 8.0.5.45(d) and (e)(1)
CMX	Communication cable, limited use	8.0.6.10(e) and 8.0.5.45(e)(2), (3), (4), and (5)
CMUC	Under-carpet communication wire and cable	8.0.6.10(f) and 8.0.5.45(e)(6)

8.0.5.24 Installation of Communications Wires, Cables, and Equipment. Communications wires and cables from the protector to the equipment or, where no protector is required, communications wires and cables attached to the outside or inside of the building shall comply with 8.0.5.24(a) through 8.0.5.24(d).

(a) Separation from Other Conductors.

(1) In Raceways, Boxes, and Cables.

a. Other Power-Limited Circuits. Communications cables shall be permitted in the same raceway or enclosure with cables of any of the following:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 7.25
2. Power-limited fire alarm systems in compliance with

Article 7.60

3. Nonconductive and conductive optical fiber cables in compliance with Article 7.70

4. Community antenna television and radio distribution systems in compliance with Article 8.20

5. Low power network-powered broadband communications circuits in compliance with Article 8.30

b. Class 2 and Class 3 Circuits. Class 1 circuits shall not be run in the same cable with communications circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall meet the requirements of this article. The cables shall be listed as communications cables or multipurpose cables.

Exception: Cables constructed of individually listed Class 2, Class 3, and communications cables under a common jacket shall not be required to be classified as communications cable. The fire-resistance rating of the composite cable shall be determined by the performance of the composite cable.

c. Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm, and Medium Power Network-Powered Broadband Communications Circuits in Raceways, Compartments, and Boxes. Communications conductors shall not be placed in any raceway, compartment, outlet box, junction box, or similar fitting with conductors of electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuits.

Exception No. 1: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated from all of the conductors of communications circuits by a permanent barrier or listed divider.

Exception No. 2: Power conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to communications equipment. The power circuit conductors shall be routed within the enclosure to

maintain a minimum of 6 mm separation from the communications circuit conductors.

Exception No. 3: As permitted by 6.20.4.5.

(2) Other Applications. Communications wires and cables shall be separated at least 50 mm from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, or medium power network-powered broadband communications circuits.

Exception No. 1: Where either (1) all of the conductors of the electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are in a raceway or in metal-sheathed, metal-clad, nonmetallic-sheathed, Type AC, or Type UF cables, or (2) all of the conductors of communications circuits are encased in raceway.

Exception No. 2: Where the communications wires and cables are permanently separated from the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the wire.

(b) Cable Trays. Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays. Communications raceways, as described in 8.0.6.10, shall be permitted to be installed in cable trays.

(c) Support of Conductors. Raceways shall be used for their intended purpose. Communications cables or wires shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.

Exception: Overhead (aerial) spans of communications cables or wires shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such conductors.

(d) Wiring in Ducts for Dust, Loose Stock, or Vapor Removal. 3.0.1.22(a) shall apply.

8.0.5.45 Applications of Listed Communications Wires and Cables, and Communications Raceways. Communications wires and cables shall comply with the requirements of 8.0.5.45(a) through 8.0.5.45(f) or where cable substitutions are made in accordance with 8.0.5.45(g).

(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 3.0.1.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 3.0.1.22(b) and in other spaces used for environmental air as described in 3.0.1.22(c). Only Type CMP cable shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(b) Riser. Cables installed in risers shall comply with the following:

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain. Listed riser communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.

(2) Metal Raceways or Fireproof Shafts. Listed communications cables shall be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) One- and Two-Family Dwellings. Type CM and CMX cable shall be permitted in one- and two-family dwellings

FPN: See 8.0.1.3(c) for firestop requirements for floor penetrations.

(c) Distributing Frames and Cross-Connect Arrays. Listed communications wire and Types CMP, CMR, CMG, and CM communications cables shall be used in distributing frames and cross-

connect arrays.

(d) Cable Trays. Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays.

(e) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 8.0.5.45(a) through 8.0.5.45(d) shall be in accordance with 8.0.5.45(e)(1) through (e)(6).

(1) General. Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in general purpose communications raceways.

(2) In Raceways. Listed communications wires that are enclosed in a raceway of a type included in Chapter 3 shall be permitted.

(3) Nonconcealed Spaces. Type CMX communications cable shall be permitted to be installed in non-concealed spaces where the exposed length of cable does not exceed 3 000 mm.

(4) One- and Two-Family Dwellings. Type CMX communications cables that are less than 6 mm in diameter shall be permitted to be installed in one- or two-family dwellings.

(5) Multi-Family Dwellings. Type CMX communications cables that are less than 6 mm in diameter and installed in non-concealed spaces in multifamily dwellings.

(6) Under Carpets. Type CMUC under-carpet communications wires and cables shall be permitted to be installed under carpet.

(f) Hybrid Power and Communications Cable. Hybrid power and communications cable listed in accordance with 8.0.6.10(i) shall be permitted to be installed in one-and two-family dwellings.

(g) Cable Substitutions. Substitutions for communications cables listed in Table 8.0.5.45 shall be considered suitable for the purpose and shall be permitted.

FPN: For information on Types CMP, CMR, CMG, CM, and CMX cables, see 8.0.6.10.

Table 8.0.5.6 Cable Uses and Permitted Substitutions

Cable Type	Use	References	Permitted Substitution
CMR	Communications riser cable	8.0.5.45(b)	CMP
CMG, CM, CMX	Communications general-purpose cable, limited use	8.0.5.45(e)(1) 8.0.5.45(e)	CMP, CMR CMP, CMR, CMG, CM

FPN: See Figure 8.0.5.45, Cable Substitution Hierarchy.

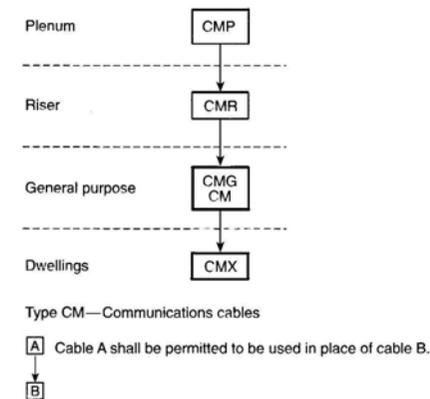

Figure 8.0.5.45 Cable Substitution Hierarchy

8.0.6 Listing Requirements

8.0.6.1 Equipment. Communications equipment shall be listed as being suitable for electrical connection to a telecommunications network.

FPN: One way to determine applicable requirements is to refer to UL 1950-1993, Standard for Safety of Information Technology Equipment, Including Electrical

Business Equipment, third edition; UL 1459-1995, Standard for Safety, Telephone Equipment, third edition; or UL 1863-1995, Standard for Safety, Communications Circuit Accessories, second edition. For information on listing requirements for communications raceways, see UL 2024-1995, Standard for Optical Fiber Raceways.

(a) Primary Protectors. The primary protector shall consist of an arrester connected between each line conductor and ground in an appropriate mounting. Primary protector terminals shall be marked to indicate line and ground as applicable.

FPN: One way to determine applicable requirements for a listed primary protector is to refer to ANSI/UL 497-1995, Standard for Protectors for Paired Conductor Communications Circuits.

(b) Secondary Protectors. The secondary protector shall be listed as suitable to provide means to safely limit currents to less than the current-carrying capacity of listed indoor communications wire and cable, listed telephone set line cords, and listed communications terminal equipment having ports for external wire line communications circuits. Any overvoltage protection, arresters, or grounding connection shall be connected on the equipment terminals side of the secondary protector current-limiting means.

FPN: One way to determine applicable requirements for a listed secondary protector is to refer to UL 497A-1996, Standard for Secondary Protectors for Communications Circuits.

8.0.6.4 Drop Wire and Cable. Communications wires and cables without a metallic shield, running from the last outdoor support to the primary protector, shall be listed as being suitable for the purpose and shall have current-carrying capacity as specified in 8.0.3.1(a)(1)b or (a)(1)c.

8.0.6.10 Communications Wires and Cables. Communications wires and cables shall have a voltage rating of not less than 300 volts and shall be listed in accordance with 8.0.6.10(a) through 8.0.6.10(j). Conductors in communications cables, other than in a coaxial cable, shall be copper.

FPN: See 8.0.6.1 for listing requirement for equipment.

(a) Type CMP. Type CMP communications plenum cable shall be listed as being suitable for use in ducts, plenums, and other spaces

used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

(b) Type CMR. Type CMR communications riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of the Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts, ANSI/UL 1666-2002.

(c) Type CMG. Type CMG general-purpose communications cable shall be listed as being suitable for general-purpose communications use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 500 mm when performing the vertical flame test for cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M 1985.

(d) Type CM. Type CM communications cable shall be listed as being suitable for general-purpose communications use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 500 mm when performing the vertical flame test for cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

(e) Type CMX. Type CMX limited use communications cable shall be listed as being suitable for use in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991.

(f) Type CMUC Under-Carpet Wire and Cable. Type CMUC under-carpet communications wire and cable shall be listed as being suitable for under-carpet use and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in the Reference Standard for Electrical Wires, Cable and Flexible Cord, ANSI/UL 1581-1991

(g) Multipurpose (MP) Cables. Cables that meet the requirements for Types CMP, CMR, CMG, and CM and also satisfy the requirements of 7.60.4.2(b) for multiconductor cables and 7.60.4.2(h) for coaxial cables shall be permitted to be listed and marked as multipurpose cable Types MPP, MPR, MPG, and MP, respectively.

(h) Communications Circuit Integrity (CI) Cable. Cables suitable for use in communications systems to ensure survivability of critical circuits during a specified time under fire conditions shall be listed as circuit integrity (CI) cable. Cables identified in 8.0.3.1(a), (b), (c), (d), and (e) that meet the requirements for circuit integrity shall have the additional classification using the suffix “CI.”

FPN: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, Standard for Tests of Fire Resistive Cables.

(i) Communications Wires. Communications wires, such as distributing frame wire and jumper wire, shall be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991. Another method of defining resistant to the spread of fire is for the damage (char length) not to 1 500 mm when performing the vertical flame test — cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

(j) Hybrid Power and Communications Cable. Listed hybrid power and communications cable shall be permitted where the power cable is a listed Type NM or NM-B conforming to the provisions of

Article 3.34, and the communications cable is a listed Type CM, the jackets on the listed NM or NM-B and listed CM cables are rated for 600 volts minimum, and the hybrid cable is listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 500 mm when performing the vertical flame test for cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

8.0.6.13 Communications Raceways. Communications raceways shall be listed in accordance with 8.0.6.13(a) through 8.0.6.13(c).

(a) Plenum Communications Raceways. Plenum communications raceways listed as plenum optical fiber raceways shall be permitted for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low-smoke producing characteristics.

FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.

(b) Riser Communications Raceway. Riser communications raceways shall be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, Standard for Optical Fiber Cable Raceway.

(c) General-Purpose Communications Raceway. General-purpose communications raceways shall be listed as having adequate fire-resistant characteristics.

FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, Standard for Optical Fiber Cable Raceway.

ARTICLE 8.10 — RADIO AND TELEVISION EQUIPMENT

8.10.1 General

8.10.1.1 Scope. This article covers antenna systems for radio and television receiving equipment, amateur radio transmitting and receiving equipment, and certain features of transmitter safety. This article covers antennas such as multi-element, vertical rod, and dish, and also covers the wiring and cabling that connects them to equipment. This article does not cover equipment and antennas used for coupling carrier current to power line conductors.

8.10.1.2 Definitions. For definitions applicable to this article, see Article 1.1.

8.10.1.3 Other Articles. Wiring from the source of power to and between devices connected to the interior wiring system shall comply with Chapters 1 through 4 other than as modified by Parts 6.40.1 and 6.40.2. Wiring for audio signal processing, amplification, and reproduction equipment shall comply with Article 6.40. Coaxial cables that connect antennas to equipment shall comply with Article 8.20.

8.10.1.4 Community Television Antenna. The antenna shall comply with this article. The distribution system shall comply with Article 8.20.

8.10.1.5 Radio Noise Suppressors. Radio interference eliminators, interference capacitors, or noise suppressors connected to power-supply leads shall be of a listed type. They shall not be exposed to physical damage.

8.10.2 Receiving Equipment — Antenna Systems

8.10.2.1 Material. Antennas and lead-in conductors shall be of hard-drawn copper, bronze, aluminum alloy, copper-clad steel, or other high-strength, corrosion-resistant material.

Exception: Soft-drawn or medium-drawn copper shall be permitted for lead-in conductors where the maximum span between points of

support is less than 11 m.

8.10.2.2 Supports. Outdoor antennas and lead-in conductors shall be securely supported. The antennas or lead-in conductors shall not be attached to the electric service mast. They shall not be attached to poles or similar structures carrying open electric light or power wires or trolley wires of over 250 volts between conductors. Insulators supporting the antenna conductors shall have sufficient mechanical strength to safely support the conductors. Lead-in conductors shall be securely attached to the antennas.

8.10.2.3 Avoidance of Contacts with Conductors of Other Systems. Outdoor antennas and lead-in conductors from an antenna to a building shall not cross over open conductors of electric light or power circuits and shall be kept well away from all such circuits so as to avoid the possibility of accidental contact. Where proximity to open electric light or power service conductors of less than 250 volts between conductors cannot be avoided, the installation shall be such as to provide a clearance of at least 600 mm. Where practicable, antenna conductors shall be installed so as not to cross under open electric light or power conductors.

8.10.2.4 Splices. Splices and joints in antenna spans shall be made mechanically secure with approved splicing devices or by such other means as will not appreciably weaken the conductors.

8.10.2.5 Grounding. Masts and metal structures supporting antennas shall be grounded in accordance with 8.10.2.11.

8.10.2.6 Size of Wire-Strung Antenna — Receiving Station.

(a) Size of Antenna Conductors. Outdoor antenna conductors for receiving stations shall be of a size not less than given in Table 8.10.2.6(a).

(b) Self-Supporting Antennas. Outdoor antennas, such as vertical rods, dishes, or dipole structures, shall be of corrosion-resistant materials and of strength suitable to withstand wind loading conditions, and shall be located well away from overhead conductors of electric light and power circuits of over 150 volts to ground, so as to

avoid the possibility of the antenna or structure falling into or making accidental contact with such circuits.

**Table 8.10.2.6(a) Size of Receiving Station
Outdoor Antenna Conductors**

Material	Minimum Size of Conductors Where [mm ² (mm dia.)] Maximum Open Span Length Is		
	Less than 11 m	11m to 45 m	Over 45 m
Aluminum alloy, hard drawn copper	0.65 (0.9)	2.0 (1.6)	3.5 (2.0)
Copper-clad steel, bronze, or other high-strength material	0.50 (0.8)	0.90 (1.1)	2.0 (1.6)

8.10.2.7 Size of Lead-in — Receiving Station. Lead-in conductors from outside antennas for receiving stations shall, for various maximum open span lengths, be of such size as to have a tensile strength at least as great as that of the conductors for antennas as specified in 8.10.2.6. Where the lead-in consists of two or more conductors that are twisted together, are enclosed in the same covering, or are concentric, the conductor size shall, for various maximum open span lengths, be such that the tensile strength of the combination will be at least as great as that of the conductors for antennas as specified in 8.10.2.6.

8.10.2.8 Clearances — Receiving Stations.

(a) Outside of Buildings. Lead-in conductors attached to buildings shall be installed so that they cannot swing closer than 600 mm to the conductors of circuits of 250 volts or less between conductors, or 3 000 mm to the conductors of circuits of over 250 volts between conductors, except that in the case of circuits not over 150 volts between conductors, where all conductors involved are supported so as to ensure permanent separation, the clearance shall be permitted to be

reduced but shall not be less than 100 mm. The clearance between lead-in conductors and any conductor forming a part of a lightning rod system shall not be less than 1 800 mm unless the bonding referred to in 2.50.3.11 is accomplished. Underground conductors shall be separated at least 300 mm from conductors of any light or power circuits or Class 1 circuits.

Exception: Where the electric light or power conductors, Class 1 conductors, or lead-in conductors are installed in raceways or metal cable armor.

(b) Antennas and Lead-ins — Indoors. Indoor antennas and indoor lead-ins shall not be run nearer than 50 mm to conductors of other wiring systems in the premises.

Exception No. 1: Where such other conductors are in metal raceways or cable armor.

Exception No. 2: Where permanently separated from such other conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing.

(c) In Boxes or Other Enclosures. Indoor antennas and indoor lead-ins shall be permitted to occupy the same box or enclosure with conductors of other wiring systems where separated from such other conductors by an effective permanently installed barrier.

8.10.2.9 Electric Supply Circuits Used in Lieu of Antenna — Receiving Stations. Where an electric supply circuit is used in lieu of an antenna, the device by which the radio receiving set is connected to the supply circuit shall be listed.

8.10.2.10 Antenna Discharge Units — Receiving Stations.

(a) Where Required. Each conductor of a lead-in from an outdoor antenna shall be provided with a listed antenna discharge unit.

Exception: Where the lead-in conductors are enclosed in a continuous metallic shield that is either permanently and effectively grounded or is protected by an antenna discharge unit.

(b) Location. Antenna discharge units shall be located outside the building or inside the building between the point of entrance of the lead-in and the radio set or transformers, and as near as practicable to the entrance of the conductors to the building. The antenna discharge unit shall not be located near combustible material or in a hazardous (classified) location as defined in Article 5.0.

(c) Grounding. The antenna discharge unit shall be grounded in accordance with 8.10.2.11.

8.10.2.11 Grounding Conductors — Receiving Stations. Grounding conductors shall comply with 8.10.2.11(a) through 8.10.2.11(k).

(a) Material. The grounding conductor shall be of copper, aluminum, copper-clad steel, bronze, or similar corrosion-resistant material. Aluminum or copper-clad aluminum grounding conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum shall not be installed within 450 mm of the earth.

(b) Insulation. Insulation on grounding conductors shall not be required.

(c) Supports. The grounding conductors shall be securely fastened in place and shall be permitted to be directly attached to the surface wired over without the use of insulating supports.

Exception: Where proper support cannot be provided, the size of the grounding conductors shall be increased proportionately.

(d) Mechanical Protection. The grounding conductor shall be protected where exposed to physical damage, or the size of the grounding conductors shall be increased proportionately to compensate for the lack of protection. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or to the same terminal or electrode to which the grounding conductor is connected.

(e) Run in Straight Line. The grounding conductor for an antenna mast or antenna discharge unit shall be run in as straight a line as

practicable from the mast or discharge unit to the grounding electrode.

(f) Electrode. The grounding conductor shall be connected as follows.

(1) To the nearest accessible location on the following:

a. The building or structure grounding electrode system as covered in 2.50.3.1

b. The grounded interior metal water piping system within 1 500 mm from its point of entrance to the building, as covered in 2.50.3.3

c. The power service accessible means external to the building, as covered in 2.50.5.5

d. The metallic power service raceway

e. The service equipment enclosure, or

f. The grounding electrode conductor or the grounding electrode conductor metal enclosures; or

(2) If the building or structure served has no grounding means, as described in 8.10.2.11(f)(1), to any one of the individual electrodes described in 2.50.3.3; or

(3) If the building or structure served has no grounding means, as described in 8.10.2.11(f)(1) or (f)(2), to an effectively grounded metal structure or to any of the individual electrodes described in 2.50.3.3.

(g) Inside or Outside Building. The grounding conductor shall be permitted to be run either inside or outside the building.

(h) Size. The grounding conductor shall not be smaller than 5.5 mm² (2.6 mm dia.) copper, 8.0 mm² (3.2 mm dia.) aluminum, or 0.90 mm² (1.1 mm dia.) copper-clad steel or bronze.

(i) Common Ground. A single grounding conductor shall be permitted for both protective and operating purposes.

(j) Bonding of Electrodes. A bonding jumper not smaller than 14 mm² copper or equivalent shall be connected between the radio and television equipment grounding electrode and the power grounding

electrode system at the building or structure served where separate electrodes are used.

(k) Electrode Connection. Connections to grounding electrodes shall comply with 2.50.3.21.

8.10.3 Amateur Transmitting and Receiving Stations — Antenna Systems

8.10.3.1 Other Sections. In addition to complying with Part 8.10.3, antenna systems for amateur transmitting and receiving stations shall also comply with 8.10.2.1 through 8.10.2.5.

8.10.3.2 Size of Antenna. Antenna conductors for transmitting and receiving stations shall be of a size not less than given in Table 8.10.3.2.

Table 8.10.3.2 Size of Amateur Station Outdoor Antenna Conductors

Material	Minimum Size of Conductors [mm ² (mm dia.)] Where Maximum Open Span Length Is	
	Less than 45 m	Over 45 m
	Hard-drawn copper	2.0 (1.6)
Copper-clad steel, bronze, or other high-strength material	2.0 (1.6)	3.5 (2.0)

8.10.3.3 Size of Lead-in Conductors. Lead-in conductors for transmitting stations shall, for various maximum span lengths, be of a size at least as great as that of conductors for antennas as specified in 8.10.3.2.

8.10.3.4 Clearance on Building. Antenna conductors for transmitting stations, attached to buildings, shall be firmly mounted at least 75 mm clear of the surface of the building on nonabsorbent insulating supports, such as treated pins or brackets equipped with insulators having not less than 75 mm creepage and airgap distances. Lead-in

conductors attached to buildings shall also comply with these requirements.

Exception: Where the lead-in conductors are enclosed in a continuous metallic shield that is permanently and effectively grounded, they shall not be required to comply with these requirements. Where grounded, the metallic shield shall also be permitted to be used as a conductor.

8.10.3.5 Entrance to Building. Except where protected with a continuous metallic shield that is permanently and effectively grounded, lead-in conductors for transmitting stations shall enter buildings by one of the following methods:

- (1) Through a rigid, noncombustible, nonabsorbent insulating tube or bushing
- (2) Through an opening provided for the purpose in which the entrance conductors are firmly secured so as to provide a clearance of at least 50 mm, or
- (3) Through a drilled window panel.

8.10.3.6 Protection Against Accidental Contact. Lead-in conductors to radio transmitters shall be located or installed so as to make accidental contact with them difficult.

8.10.3.7 Antenna Discharge Units — Transmitting Stations. Each conductor of a lead-in for outdoor antennas shall be provided with an antenna discharge unit or other suitable means that will drain static charges from the antenna system.

Exception No. 1: Where protected by a continuous metallic shield that is permanently and effectively grounded.

Exception No. 2: Where the antenna is permanently and effectively grounded.

8.10.3.8 Grounding Conductors—Amateur Transmitting and Receiving Stations. Grounding conductors shall comply with 8.10.3.8(a) through 8.10.3.8(c).

(a) Other Sections. All grounding conductors for amateur transmitting and receiving stations shall comply with 8.10.2.11(a)

through 8.10.2.11(k).

(b) Size of Protective Grounding Conductor. The protective grounding conductor for transmitting stations shall be as large as the lead-in, but not smaller than 5.5 mm² (2.6 mm dia.) copper, bronze, or copper-clad steel.

(c) Size of Operating Grounding Conductor. The operating grounding conductor for transmitting stations shall not be less than 2.0 mm² (1.6 mm dia.) copper or its equivalent.

8.10.4 Interior Installation — Transmitting Stations

8.10.4.1 Clearance from Other Conductors. All conductors inside the building shall be separated at least 100 mm from the conductors of any electric light, power, or signaling circuit.

Exception No. 1: As provided in Article 6.40.

Exception No. 2: Where separated from other conductors by raceway or some firmly fixed nonconductor, such as porcelain tubes or flexible tubing.

8.10.4.2 General. Transmitters shall comply with 8.10.4.2(a) through 8.10.4.2(c).

(a) Enclosing. The transmitter shall be enclosed in a metal frame or grille, or separated from the operating space by a barrier or other equivalent means, all metallic parts of which are effectively connected to ground.

(b) Grounding of Controls. All external metal handles and controls accessible to the operating personnel shall be effectively grounded.

(c) Interlocks on Doors. All access doors shall be provided with interlocks that will disconnect all voltages of over 350 volts between conductors when any access door is opened.

ARTICLE 8.20 — COMMUNITY ANTENNA TELEVISION AND RADIO DISTRIBUTION SYSTEMS

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 97-2003, Standard Glossary of Terms Relating to Chimneys, Vents, and Heat-Producing Appliances. Only editorial changes were made to the extracted text to make it consistent with this Code

8.20.1 General

8.20.1.1 Scope. This article covers coaxial cable distribution of radio frequency signals typically employed in community antenna television (CATV) systems.

8.20.1.2 Definitions. See Article 1.1. For the purposes of this article, the following additional definitions apply.

Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.

Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]

Exposed. An exposed cable is one that is in such a position that, in case of failure of supports and insulation, contact with another circuit could result.

FPN: See Article 1.1 for two other definitions of Exposed.

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 8.20.4.1(b).

Premises. The land and buildings of a user located on the user side of utility-user network point of demarcation.

8.20.1.3 Other Articles. Circuits and equipment shall comply with 8.20.1.3(a) through 8.20.1.3(g).

(a) Spread of Fire or Products of Combustion. Section 3.0.1.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.

(b) Ducts, Plenums, and Other Air-Handling Spaces. Section 3.0.1.22, where installed in ducts, plenums or other spaces used for environmental air shall apply.

Exception: As permitted in 8.20.5.45(a).

(c) Installation and Use. Section 1.10.1.3 shall apply.

(d) Installations of Conductive and Nonconductive Optical Fiber Cables. Article 7.70 shall apply.

(e) Communications Circuits. Article 8.0.

(f) Network-Powered Broadband Communications Systems. Article 8.30 shall apply.

(g) Alternate Wiring Methods. The wiring methods of Article 8.30 shall be permitted to substitute for the wiring methods of Article 8.20.

FPN: Use of Article 8.30 wiring methods will facilitate the upgrading of Article 8.20 installations to network-powered broadband applications.

8.20.1.15 Energy Limitations. Coaxial cable shall be permitted to deliver low-energy power to equipment that is directly associated with the radio frequency distribution system if the voltage is not over 60 volts and if the current supply is from a transformer or other device that has energy-limiting characteristics.

8.20.1.21 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.

8.20.1.24 Mechanical Execution of Work. Community antenna television and radio distribution systems shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the building structure in

such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 3.0.1.4(d) and 3.0.1.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

8.20.2 Cables Outside and Entering Buildings

8.20.2.1 Overhead Cables. Coaxial cables, prior to the point of grounding, as defined in 8.20.3.1, shall comply with 8.20.2.1(a) through 8.20.2.1(f).

(a) On Poles. Where practicable, conductors on poles shall be located below the electric light, power, Class 1, or nonpower-limited fire alarm circuit conductors and shall not be attached to a crossarm that carries electric light or power conductors.

(b) Lead-in Clearance. Lead-in or aerial-drop cables from a pole or other support, including the point of initial attachment to a building or structure, shall be kept away from electric light, power, Class 1, or nonpower-limited fire alarm circuit conductors so as to avoid the possibility of accidental contact.

Exception: Where proximity to electric light, power, Class 1, or nonpower-limited fire alarm circuit service conductors cannot be avoided, the installation shall be such as to provide clearances of not less than 300 mm from light, power, Class 1, or nonpower-limited fire alarm circuit service drops. The clearance requirement shall apply at all points along the drop, and it shall increase to 1 000 mm at the pole.

(c) On Masts. Aerial cable shall be permitted to be attached to an above-the-roof raceway mast that does not enclose or support conductors of electric light or power circuits.

(d) Above Roofs. Cables shall have a vertical clearance of not less than 2 400 mm from all points of roofs above which they pass.

Exception No. 1: Auxiliary buildings such as garages and the like.

Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm shall be permitted if (1) not more than 1 200 mm of communications service drop conductors pass above the roof overhang, and (2) they are terminated at a raceway mast or other approved support.

Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm, a reduction in clearance to not less than 900 mm shall be permitted.

(e) Between Buildings. Cables extending between buildings and also the supports or attachment fixtures shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

Exception: Where a cable does not have sufficient strength to be self-supporting, it shall be attached to a supporting messenger cable that, together with the attachment fixtures or supports, shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

(f) On Buildings. Where attached to buildings, cables shall be securely fastened in such a manner that they will be separated from other conductors as follows.

(1) Electric Light or Power. The coaxial cable shall have a separation of at least 100 mm from electric light, power, Class 1, or nonpower-limited fire alarm circuit conductors not in raceway or cable, or be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the insulation on the wires.

(2) Other Communications Systems. Coaxial cable shall be installed so that there will be no unnecessary interference in the maintenance of the separate systems. In no case shall the conductors, cables, messenger strand, or equipment of one system cause abrasion to the conductors, cable, messenger strand, or equipment of any other system.

(3) Lightning Conductors. Where practicable, a separation of at least 1 800mm shall be maintained between any coaxial cable and lightning conductors.

FPN: For additional information regarding overhead wires and cables, see ANSI C2-2002, Philippine Electrical Code, Part 2, Safety Rules for Overhead Lines.

8.20.2.4 Underground Circuits Entering Buildings.

(a) Underground Systems. Underground coaxial cables in a duct, pedestal, handhole enclosure, or manhole that contains electric light or power conductors or Class 1 circuits shall be in a section permanently separated from such conductors by means of a suitable barrier.

(b) Direct-Buried Cables and Raceways. Direct-buried coaxial cable shall be separated at least 300 mm from conductors of any light or power or Class 1 circuit.

Exception No. 1: Where electric service conductors or coaxial cables are installed in raceways or have metal cable armor.

Exception No. 2: Where electric light or power branch-circuit or feeder conductors or Class 1 circuit conductors are installed in a raceway or in metal-sheathed, metal-clad, or Type UF or Type USE cables; or the coaxial cables have metal cable armor or are installed in a raceway.

8.20.3 Protection

8.20.3.1 Grounding of Outer Conductive Shield of a Coaxial Cable. The outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable entrance or attachment as practicable.

For purposes of this section, grounding located at mobile home service equipment located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 2.50.2.13 and located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between CATV and other metallic systems.

(a) Shield Grounding. Where the outer conductive shield of a coaxial cable is grounded, no other protective devices shall be required.

(b) Shield Protection Devices. Grounding of a coaxial drop cable shield by means of a protective device that does not interrupt the grounding system within the premises shall be permitted.

8.20.4 Grounding Methods

8.20.4.1 Cable Grounding. Where required by 8.20.3.1, the shield of the coaxial cable shall be grounded as specified in 8.20.4.1(a) through 8.20.4.1(d).

(a) Grounding Conductor.

(1) Insulation. The grounding conductor shall be insulated and shall be listed as suitable for the purpose.

(2) Material. The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding conductor shall not be smaller than 2.0 mm² (1.6 mm dia.). It shall have a current-carrying capacity approximately equal to that of the outer conductor of the coaxial cable. The grounding conductor shall not be required to exceed 14 mm².

(4) Length. The grounding conductor shall be as short as practicable. In one- and two-family dwellings, the grounding conductor shall be as short as practicable, not to exceed 6 000 mm in length.

FPN: Similar grounding conductor length limitations applied at apartment buildings and commercial buildings will help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding conductor length of 6 000mm, a separate ground as specified in 2.50.3.3(a)(5), (a)(6), or (a)(7) shall be used, the grounding conductor shall be grounded to the separate ground in accordance with 2.50.3.21, and the separate ground bonded to the power grounding electrode system in accordance with 8.20.4.1(d).

(5) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. Where subject to physical damage, the grounding conductor shall be adequately protected. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

(b) Electrode. The grounding conductor shall be connected as follows.

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

a. The building or structure grounding electrode system as covered in 2.50.3.1

b. The grounded interior metal water piping system, within 1 500 mm from its point of entrance to the building, as covered in 2.50.3.3

c. The power service accessible means external to enclosures as covered in 2.50.5.5

d. The metallic power service raceway

e. The service equipment enclosure

f. The grounding electrode conductor or the grounding electrode conductor metal enclosure, or

g. To the grounding conductor or to the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 2.50.2.13

(2) In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in 8.20.4.1(b)(1):

a. To any one of the individual electrodes described in 2.50.3.3(a)(1), (a)(2), (a)(3), (a)(4); or,

b. If the building or structure served has no grounding means, as described in 8.20.4.1(b)(1) or (b)(2)a, to an effectively grounded metal structure or to any one of the individual electrodes described in 2.50.3.3(a)(5), (a)(6), and (a)(7).

(c) **Electrode Connection.** Connections to grounding electrodes shall comply with 2.50.3.21.

(d) **Bonding of Electrodes.** A bonding jumper not smaller than 14 mm² copper or equivalent shall be connected between the community antenna television systems grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 8.20.4.7.

FPN No. 1: See 2.50.3.11 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes will limit potential differences between them and between their associated wiring systems.

8.20.4.4 Equipment Grounding. Unpowered equipment and enclosures or equipment powered by the coaxial cable shall be considered grounded where connected to the metallic cable shield.

8.20.4.7 Bonding and Grounding at Mobile Homes.

(a) **Grounding.** Where there is no mobile home service equipment located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, or there is no mobile home disconnecting means grounded in accordance with 2.50.2.13 and located within sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be in accordance with 8.20.4.1(b)(2) and (3).

(b) **Bonding.** The coaxial cable shield grounding terminal, surge arrester grounding terminal, or grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 3.5 mm² (2.0 mm dia.) under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 8.20.4.7(a), or

(2) Where the mobile home is supplied by cord and plug.

8.20.5 Cables Within Buildings

8.20.5.1 Raceways for Coaxial Cables. Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed nonmetallic raceway complying with 8.20.6.4(a), (b) or (c), as applicable, and installed in accordance with 3.62.2.15 through 3.62.2.47, where the requirements applicable to electrical nonmetallic tubing apply.

Exception No. 1: Conduit fill restrictions shall not apply.

8.20.5.2 Installation and Marking of Coaxial Cables. Listed coaxial cables shall be installed as wiring within buildings. Cables shall be marked in accordance with Table 8.20.5.4. The cable voltage rating shall not be marked on the cable.

FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception No. 1: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

Exception No. 2: Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m and the cable enters the building from the outside and is terminated at a grounding block.

Table 8.20.5.4 Cable Markings

Cable Marking	Type	Reference
CATVP	CATV plenum cable	8.20.6.1(a) and 8.20.5.45(a)
CATVR CATV	CATV riser cable CATV cable	8.20.6.1(b) and 8.20.5.45(b)
CATVX	CATV cable, limited use	8.20.6.1(c) and 8.20.5.45(c) 8.20.6.1(d) and 8.20.5.45(c)

FPN No. 1: Cable type are listed in descending order of fire-resistance rating
FPN No. 2: See the referenced sections for listing requirements and permitted uses.

8.20.5.24 Installation of Cables and Equipment. Beyond the point of grounding, as defined in 8.20.3.1, the cable installation shall comply with 8.20.5.24(a) through 8.20.5.24(c).

(a) Separation from Other Conductors.

(1) In Raceways and Boxes.

a. Other Circuits. Coaxial cables shall be permitted in the same raceway or enclosure with jacketed cables of any of the following:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 7.25
2. Power-limited fire alarm systems in compliance with Article 7.60
3. Nonconductive and conductive optical fiber cables in compliance with Article 7.70
4. Communications circuits in compliance with Article 8.0
5. Low power network-powered broadband communications circuits in compliance with Article 8.30

b. Electric Light, Power, Class 1, Nonpower-Limited Fire Alarm, and Medium Power Network-Powered Broadband Communications Circuits. Coaxial cable shall not be placed in any raceway, compartment, outlet box, junction box, or other enclosures with conductors of electric light, power, Class 1, nonpower-limited fire alarm, or medium power network-powered broadband communications circuits.

Exception No. 1: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated from all of the coaxial cables by a permanent barrier or listed divider.

Exception No. 2: Power circuit conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to the coaxial cable system

distribution equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum 6.0 mm separation from coaxial cables.

(2) Other Applications. Coaxial cable shall be separated at least 50 mm from conductors of any electric light, power, Class 1, nonpower-limited fire alarm, or medium power network-powered broadband communications circuits.

Exception No. 1: Where either (1) all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications and circuits are in a raceway, or in metal-sheathed, metal-clad, nonmetallic-sheathed, Type AC, or Type UF cables, or (2) all of the coaxial cables are encased in raceway.

Exception No. 2: Where the coaxial cables are permanently separated from the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the wire.

(b) Hybrid Power and Coaxial Cabling. The provisions of 7.80.1.6 shall apply for listed hybrid power and coaxial cabling in closed-loop and programmed power distribution.

(c) Support of Cables. Raceways shall be used for their intended purpose. Coaxial cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.

Exception No. 1: Overhead (aerial) spans of coaxial cables shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such cables.

8.20.5.45 Applications of Listed CATV Cables and CATV Raceways. CATV cables shall comply with 8.20.5.45(a) through 8.20.5.45(d) or where cable substitutions are made as shown in Table 8.20.5.45.

(a) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 3.0.1.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 3.0.1.22(b) and in other spaces used for environmental air as described in 3.0.1.22(c). Only Type CATVP cable shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(b) Riser. Cables installed in risers shall comply with any of the requirements of the following:

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain. Listed riser CATV raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.

(2) Metal Raceways or Fireproof Shafts. Types CATV and CATVX cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having fire-stops at each floor.

(3) One- and Two-Family Dwellings. Types CATV and CATVX cables shall be permitted in one- and two-family dwellings.

FPN: See 8.20.1.3(a) for the firestop requirements for floor penetrations.

(c) Cable Trays. Cables installed in cable trays shall be Types CATVP, CATVR, and CATV.

(d) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 8.20.5.45(a) and 8.20.5.45(b) shall be with any of the requirements in 8.20.5.45(d)(1) through (d)(5). Abandoned cables in hollow spaces shall not be permitted to remain.

(1) General. Type CATV shall be permitted. Listed CATV general-purpose raceways shall be permitted. Only Types CATV, CATVX, CATVR, or CATVP cables shall be permitted to be installed in general-purpose communications raceways.

(2) In Raceways. Type CATVX shall be permitted to be installed in raceway.

(3) Nonconcealed Spaces. Type CATVX shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 000 mm.

(4) One- and Two-Family Dwellings. Type CATVX cables that are less than 10 mm in diameter shall be permitted to be installed in one- and two-family dwellings.

(5) Multifamily Dwellings. Type CATVX cables that are less than 10 mm in diameter shall be permitted to be installed in multifamily dwellings.

FPN No. 1: See Figure 8.20.5.45, Cable Substitution Hierarchy.

FPN No. 2: The substitute cables in Table 8.20.5.45 are only coaxial-type cables.

Table 8.20.5.45 Coaxial Cable Uses and Permitted Substitutions

Cable Type	Permitted Substitution
CATVP	CMP, BLP
CATVR	CATVP, CMP, CMR, BMR, BLP, BLR
CATV	CATVP, CMP, CATVR, CMR, CMG, CM, BMR, BM, BLP, BLR, BL
CATVX	CATVP, CMP, CATVR, CMR, CATV, CMG, CM, BMR, BM, BLP, BLR, BL, BLX

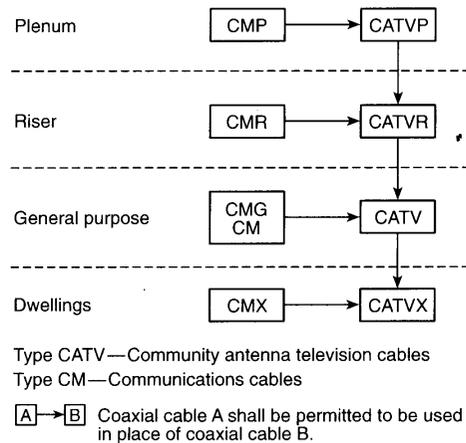

Figure 8.20.5.45 Cable Substitution Hierarchy

8.20.6 Listing Requirements

8.20.6.1 Coaxial Cables. Cables shall be listed in accordance with 8.20.6.1(a) through 8.20.6.1(d).

(a) Type CATVP. Type CATVP community antenna television plenum cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air Handling Spaces.

(b) Type CATVR. Type CATVR community antenna television riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-

resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of the Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts, ANSI/UL 1666-2002.

(c) Type CATV. Type CATV community antenna television cable shall be listed as being suitable for general purpose CATV use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 500 mm when performing the vertical flame test for cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

(d) Type CATVX. Type CATVX limited-use community antenna television cable shall be listed as being suitable for use in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991.

8.20.6.4 CATV Raceways. CATV raceways shall be listed in accordance with 8.20.6.4(a) through 8.20.6.4(c).

(a) Plenum CATV Raceways. Plenum CATV raceways shall be listed for use in other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with the plenum test in Standard for Optical-Fiber Cable Raceway, UL 2024.

(b) Riser CATV Raceways. Riser CATV raceways shall be listed for use in risers and shall also be listed as having adequate fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the Test for Flame Propagation (Riser) in Standard for Optical-Fiber Cable Raceway, UL 2024.

(c) General-Purpose CATV Raceways. General purpose CATV raceways shall be listed suitable for general-purpose use and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is that the raceway pass the requirements of the Vertical-Tray Flame Test (General Use) in Standard for Optical-Fiber Cable Raceway, UL 2024.

ARTICLE 8.30 — NETWORK-POWERED BROADBAND COMMUNICATIONS SYSTEMS

8.30.1 General

8.30.1.1 Scope. This article covers network-powered broadband communications systems that provide any combination of voice, audio, video, data, and interactive services through a network interface unit.

FPN No. 1: A typical basic system configuration includes a cable supplying power and broadband signal to a network interface unit that converts the broadband signal to the component signals. Typical cables are coaxial cable with both broadband signal and power on the center conductor, composite metallic cable with a coaxial member for the broadband signal and a twisted pair for power, and composite optical fiber cable with a pair of conductors for power. Larger systems may also include network components such as amplifiers that require network power.

FPN No. 2: See Introduction for installations of broadband communications systems that are not covered.

8.30.1.2 Definitions. See Article 1.1. For purposes of this article, the following additional definitions apply.

Abandoned Network-Powered Broadband Communications Cable. Installed network-powered broadband communications cable

that is not terminated at equipment other than a connector and not identified for future use with a tag.

Block. A square or portion of a city, town, or village enclosed by streets and including the alleys so enclosed, but not any street.

Exposed to Accidental Contact with Electrical Light or Power Conductors. The circuit is in such a position that, in case of failure of supports or insulation, contact with another circuit may result.

Fault Protection Device. An electronic device intended for the protection of personnel and functions under fault conditions, such as network-powered broadband communications cable short or open circuit, to limit the current or voltage, or both, for a low power network-powered broadband communications circuit and provide acceptable protection from electric shock.

Network Interface Unit (NIU). A device that converts a broadband signal into component voice, audio, video, data, and interactive services signals. The NIU provides isolation between the network power and the premises signal circuits. The NIU may also contain primary and secondary protectors.

Network-Powered Broadband Communications Circuit. The circuit extending from the communications utility's serving terminal or tap up to and including the NIU.

FPN: A typical single-family network-powered communications circuit consists of a communications drop or communications service cable and an NIU, and includes the communications utility's serving terminal or tap where it is not under the exclusive control of the communications utility.

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 8.30.4.1(b).

Premises Wiring. The circuits located on the user side of the network interface unit.

8.30.1.3 Other Articles. Circuits and equipment shall comply with 8.30.1.3(a) through 8.30.1.3(e).

(a) Spread of Fire or Products of Combustion. Section 3.0.1.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.

(b) Ducts, Plenums, and Other Air-Handling Spaces. Section 3.0.1.22 shall apply, where installed in ducts, plenums or other spaces used for environmental air.

Exception: As permitted in 8.30.5.22(b).

(c) Equipment in Other Space Used for Environmental Air. Section 3.0.1.22(c) shall apply.

(d) Output Circuits. As appropriate for the services provided, the output circuits derived from the network interface unit shall comply with the requirements of the following:

(1) Installations of communications circuits — Article 8.0

(2) Installations of community antenna television and radio distribution circuits — Article 8.20

Exception: 8.30.3.1(b)(3) shall apply where protection is provided in the output of the NIU.

(3) Installations of optical fiber cables — Article 7.70

(4) Installations of Class 2 and Class 3 circuits — Article 7.25

(5) Installations of power-limited fire alarm circuits—Article 7.60

(e) Hazardous (Classified) Locations. Network-powered broadband communications circuits and equipment installed in a location that is classified in accordance with Article 5.0 shall comply with the applicable requirements of Chapter 5.

8.30.1.15 Power Limitations. Network-powered broadband communications systems shall be classified as having low or medium power sources as defined in Table 8.30.1.15.

8.30.1.21 Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to electrical equipment shall not be denied by

an accumulation of wires and cables that prevent removal of panels, including suspended ceiling panels.

Table 8.30.1.15 Limitations for Network-Powered Broadband Communications Systems

Network Power Source	Low	Medium
Circuit voltage, V_{\max} (volts) ¹	0 – 100	0-150
Power limitation, VA_{\max} (volt-amperes) ¹	250	250
Current limitations, I_{\max} (amperes) ¹	1 000/ V_{\max}	1 000/ V_{\max}
Maximum power rating (volt-amperes)	100	100
Maximum voltage rating (volts)	100	150
Maximum overcurrent protection (amperes) ²	100/ V_{\max}	NA

¹ V_{\max} , I_{\max} , and VA_{\max} are determined with the current-limiting impedance in the circuit (not bypassed) as follows:

V_{\max} — Maximum system voltage regardless of load with rated input applied.

i_{\max} — Maximum system current under any noncapacitive load, including short circuit, and with overcurrent protection bypassed if used. I_{\max} limits apply after 1 minute of operation.

VA_{\max} — Maximum volt-ampere output after 1 minute of operation regardless of load and overcurrent protection bypassed if used.

²Overcurrent protection is not required where the current-limiting device provides equivalent current limitation and the current-limiting device does not reset until power or the load is removed.

8.30.1.24 Mechanical Execution of Work. Network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 3.0.1.4(d) and 3.0.1.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

8.30.2 Cables Outside and Entering Buildings

8.30.2.1 Entrance Cables. Cables installed outdoors shall be listed as suitable for the application. In addition, network-powered broadband communications cables located outside and entering buildings shall comply with 8.30.2.1(a) and 8.30.2.1(b).

(a) Medium Power Circuits. Medium power network-powered broadband communications circuits located outside and entering buildings shall be installed using Type BMU, Type BM, or Type BMR network-powered broadband communications medium power cables.

(b) Low Power Circuits. Low power network-powered broadband communications circuits located outside and entering buildings shall be installed using Type BLU or Type BLX low power network-powered broadband communications cables. Cables shown in Table 8.30.5.1 shall be permitted to substitute.

Exception: Outdoor community antenna television and radio distribution system coaxial cables installed prior to January 1, 2000, and installed in accordance with Article 8.20, shall be permitted for low-power type, network-powered broadband communications circuits.

8.30.2.5 Aerial Cables. Aerial network-powered broadband communications cables shall comply with 8.30.2.5(a) through 8.30.2.5(i).

FPN: For additional information regarding overhead wires and cables, see ANSI C2-2002, Philippine Electrical Code, Part 2, Safety Rules For Overhead Lines.

(a) On Poles. Where practicable, network-powered broadband communications cables on poles shall be located below the electric light, power, Class 1, or non-power-limited fire alarm circuit conductors and shall not be attached to a crossarm that carries electric light or power conductors.

(b) Climbing Space. The climbing space through network-powered broadband communications cables shall comply with the requirements of 2.25.1.14(d).

(c) Lead-in Clearance. Lead-in or aerial-drop network-powered broadband communications cables from a pole or other support, including the point of initial attachment to a building or structure, shall be kept away from electric light, power, Class 1, or non-power-limited fire alarm circuit conductors so as to avoid the possibility of accidental contact.

Exception: Where proximity to electric light, power, Class 1, or non-power-limited fire alarm circuit service conductors cannot be avoided, the installation shall be such as to provide clearances of not less than 300 mm from light, power, Class 1, or non-power-limited fire alarm circuit service drops. The clearance requirement shall apply to all points along the drop, and it shall increase to 1 000 mm at the pole.

(d) Clearance from Ground. Overhead spans of network-powered broadband communication cables shall conform to not less than the following:

(1) 2 900 mm — above finished grade, sidewalks, or from any platform or projection from which they might be reached and accessible to pedestrians only

(2) 3 500 mm — over residential property and driveways, and those commercial areas not subject to truck traffic

(3) 4 700 mm — over public streets, alleys, roads, parking areas subject to truck traffic, driveways on other than residential property, and other land traversed by vehicles such as cultivated, grazing, forest, and orchard

FPN: These clearances have been specifically chosen to correlate with the latest edition of the Philippine Electrical Code, Part 2, which provides for clearances of wires, conductors, and cables above ground and roadways, rather than using the clearances referenced in 2.25.1.18. Because Article 8.0 and Article 8.20 have had no required clearances, the communications industry has used the clearances from the PEC 2 for their installed cable plant.

(e) Over Pools. Clearance of network-powered broadband communications cable in any direction from the water level, edge of pool, base of diving platform, or anchored raft shall comply with those clearances in 6.80.1.8.

(f) Above Roofs. Network-powered broadband communications

cables shall have a vertical clearance of not less than 2 400 mm from all points of roofs above which they pass.

Exception No. 1: Auxiliary buildings such as garages and the like.

Exception No. 2: A reduction in clearance above only the overhanging portion of the roof to not less than 450 mm shall be permitted if (1) not more than 1 200 mm of the broadband communications drop cables pass above the roof overhang, and (2) they are terminated at a through-the-roof raceway or support.

Exception No. 3: Where the roof has a slope of not less than 100 mm in 300 mm, a reduction in clearance to not less than 900 mm shall be permitted.

(g) Final Spans. Final spans of network-powered broadband communications cables without an outer jacket shall be permitted to be attached to the building, but they shall be kept not less than 900 mm from windows that are designed to be opened, doors, porches, balconies, ladders, stairs, fire escapes, or similar locations.

Exception: Conductors run above the top level of a window shall be permitted to be less than 900 mm requirement above.

Overhead network-powered broadband communications cables shall not be installed beneath openings through which materials may be moved, such as openings in farm and commercial buildings, and shall not be installed where they will obstruct entrance to these building openings.

(h) Between Buildings. Network-powered broadband communications cables extending between buildings and also the supports or attachment fixtures shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

Exception: Where a network-powered broadband communications cable does not have sufficient strength to be self-supporting, it shall be attached to a supporting messenger cable that, together with the attachment fixtures or supports, shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they

may be subjected.

(i) On Buildings. Where attached to buildings, network-powered broadband communications cables shall be securely fastened in such a manner that they will be separated from other conductors in accordance with 8.30.2.5(i)(1) through (i)(4).

(1) Electric Light or Power. The network-powered broadband communications cable shall have a separation of at least 100 mm from electric light, power, Class 1, or non-power-limited fire alarm circuit conductors not in raceway or cable, or be permanently separated from conductors of the other system by a continuous and firmly fixed nonconductor in addition to the insulation on the wires.

(2) Other Communications Systems. Network-powered broadband communications cables shall be installed so that there will be no unnecessary interference in the maintenance of the separate systems. In no case shall the conductors, cables, messenger strand, or equipment of one system cause abrasion to the conductors, cables, messenger strand, or equipment of any other system.

(3) Lightning Conductors. Where practicable, a separation of at least 1 800 mm shall be maintained between any network-powered broadband communications cable and lightning conductors.

(4) Protection from Damage. Network-powered broadband communications cables attached to buildings and located within 2 400 mm of finished grade shall be protected by enclosures, raceways, or other approved means.

Exception: A low power network-powered broadband communications circuit that is equipped with a listed fault protection device, appropriate to the network-powered broadband communications cable used, and located on the network side of the network-powered broadband communications cable being protected.

8.30.2.8 Underground Circuits Entering Buildings.

(a) Underground Systems. Underground network-powered broadband communications cables in a duct, pedestal, handhole enclosure, or manhole that contains electric light, power conductors,

non-power-limited fire alarm circuit conductors, or Class 1 circuits shall be in a section permanently separated from such conductors by means of a suitable barrier.

(b) Direct-Buried Cables and Raceways. Direct-buried network-powered broadband communications cables shall be separated at least 300 mm from conductors of any light, power, non-power-limited fire alarm circuit conductors or Class 1 circuit.

Exception No. 1: Where electric service conductors or network-powered broadband communications cables are installed in raceways or have metal cable armor.

Exception No. 2: Where electric light or power branch-circuit or feeder conductors, nonpower-limited fire alarm circuit conductors, or Class 1 circuit conductors are installed in a raceway or in metal-sheathed, metal-clad, or Type UF or Type USE cables; or the network-powered broadband communications cables have metal cable armor or are installed in a raceway.

(c) Mechanical Protection. Direct-buried cable, conduit, or other raceways shall be installed to meet the minimum cover requirements of Table 8.30.2.8. In addition, direct-buried cables emerging from the ground shall be protected by enclosures, raceways, or other approved means extending from the minimum cover distance required by Table 8.30.2.8 below grade to a point at least 2 400 mm above finished grade. In no case shall the protection be required to exceed 450 mm below finished grade. Type BMU and BLU direct-buried cables emerging from the ground shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or other approved means extending from the minimum cover distance required by Table 8.30.2.8 below grade to the point of entrance.

Exception: A low power network-powered broadband communications circuit that is equipped with a listed fault protection device, appropriate to the network-powered broadband communications cable used, and located on the network side of the network-powered broadband communications cable being protected.

Table 8.30.2.8 Network-Powered Broadband Communications Systems Minimum Cover Requirements, Burial in Millimetres (*Cover* is the shortest distance measured between a point on the top surface of any direct-buried cable, conduit, or other raceway and the top surface of finished grade, concrete, or similar cover.)

Location of Wiring Method or Circuit	Direct Burial Cables (mm)	Rigid Metal Conduit or Intermediate Metal Conduit (mm)	Nonmetallic Raceways Listed or Direct Burial; Without Concrete Encasement or Other Approved Raceways (mm)
All locations not specified below	450	150	300
In trench below 50 mm thick concrete or equivalent	300	150	150
Under a building (in raceways only)	0	0	0
Under minimum of 100 mm thick concrete exterior slab with no vehicular traffic and the slab extending not less than 150 mm beyond the underground installation	300	100	100
One- and two-family dwelling driveways and outdoor parking areas and used only for dwelling related purposes	300	300	300

Notes:

1. Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm thick.
2. Lesser depths shall be permitted where cables rise for terminations or splices or where access is otherwise required.
3. Where solid rock is encountered, all wiring shall be installed in metal or nonmetallic raceway permitted for direct burial. The raceways shall be covered by a minimum of 50 mm of concrete extending down to rock.
4. Low power network-powered broadband communications circuits using directly buried community antenna television and radio distribution system coaxial cables that were installed outside and entering buildings prior to January 1, 2000, in accordance with Article 8.20 shall be permitted where buried to a minimum depth of 300 mm.

(d) **Pools.** Cables located under the pool or within the area extending 1 500 mm horizontally from the inside wall of the pool shall meet those clearances and requirements specified in 6.80.1.10.

8.30.3 Protection

8.30.3.1 Primary Electrical Protection.

(a) **Application.** Primary electrical protection shall be provided on all network-powered broadband communications conductors that are neither grounded nor interrupted and are run partly or entirely in aerial cable not confined within a block. Also, primary electrical protection shall be provided on all aerial or underground network-powered broadband communications conductors that are neither grounded nor interrupted and are located within the block containing the building served so as to be exposed to lightning or accidental contact with electric light or power conductors operating at over 300 volts to ground

Exception: Where electrical protection is provided on the derived circuit(s) (output side of the NIU) in accordance with 8.30.3.1(b)(3).

FPN No. 1: On network-powered broadband communications conductors not exposed to lightning or accidental contact with power conductors, providing primary electrical protection in accordance with this article will help protect against other hazards, such as ground potential rise caused by power fault currents, and above-normal voltages induced by fault currents on power circuits in proximity to the network-powered broadband communications conductors.

FPN No. 2: Network-powered broadband communications circuits are considered to have a lightning exposure unless one or more of the following conditions exist.

(1) Circuits in large metropolitan areas where buildings are close together and sufficiently high to intercept lightning.

(2) Areas having an average of five or fewer thunderstorm days per year and earth resistivity of less than 100 ohm-metres.

(1) **Fuseless Primary Protectors.** Fuseless-type primary protectors shall be permitted where power fault currents on all protected conductors in the cable are safely limited to a value no greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor.

(2) **Fused Primary Protectors.** Where the requirements listed under 8.30.3.1(a)(1) are not met, fused-type primary protectors shall be used. Fused-type primary protectors shall consist of an arrester

connected between each conductor to be protected and ground, a fuse in series with each conductor to be protected, and an appropriate mounting arrangement. Fused primary protector terminals shall be marked to indicate line, instrument, and ground, as applicable.

(b) **Location.** The location of the primary protector, where required, shall comply with (b)(1), (b)(2), or (b)(3).

(1) A listed primary protector shall be applied on each network-powered broadband communications cable external to and on the network side of the network interface unit.

(2) The primary protector function shall be an integral part of and contained in the network interface unit. The network interface unit shall be listed as being suitable for application with network-powered broadband communications systems and shall have an external marking indicating that it contains primary electrical protection.

(3) The primary protector(s) shall be provided on the derived circuit(s) (output side of the NIU), and the combination of the NIU and the protector(s) shall be listed as being suitable for application with network-powered broadband communications systems.

A primary protector, whether provided integrally or external to the network interface unit, shall be located as close as practicable to the point of entrance.

For purposes of this section, a network interface unit and any externally provided primary protectors located at mobile home service equipment located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 2.50.2.13 and located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN: Selecting a network interface unit and primary protector location to achieve the shortest practicable primary protector grounding conductor helps limit potential differences between communications circuits and other metallic systems.

(c) **Hazardous (Classified) Locations.** The primary protector or equipment providing the primary protection function shall not be located in any hazardous (classified) location as defined in Article 5.0 or in the vicinity of easily ignitable material.

Exception: As permitted in 5.1.3.51, 5.2.3.51, and 5.3.3.51.

8.30.3.4 Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables. The shields of network-powered broadband communications cables used for communications or powering shall be grounded at the building as close as practicable to the point of entrance or attachment of the NIU. Metallic cable members not used for communications or powering shall be grounded or interrupted by an insulating joint or equivalent device as close as practicable to the point of entrance or attachment of the NIU.

For purposes of this section, grounding or interruption of network-powered broadband communications cable metallic members installed at mobile home service equipment located in sight from and no more than 9 000 mm from the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 2.50.2.13 and located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between the network-powered broadband communications circuits and other metallic systems.

8.30.4 Grounding Methods

8.30.4.1 Cable, Network Interface Unit, and Primary Protector Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 8.30.4.1(a) through 8.30.4.1(d).

(a) Grounding Conductor.

(1) Insulation. The grounding conductor shall be insulated and shall be listed as suitable for the purpose.

(2) Material. The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding conductor shall not be smaller than 2.0 mm² (1.6 mm dia.), and shall have a current-carrying capacity approximately equal to that of the grounded metallic member(s) and

protected conductor(s) of the network-powered broadband communications cable. The grounding conductor shall not be required to exceed 14 mm².

(4) Length. The grounding conductor shall be as short as practicable. In one-family and multifamily dwellings, the grounding conductor shall be as short as permissible, not to exceed 6 000 mm in length.

FPN: Similar grounding conductor length limitations applied at apartment buildings and commercial buildings will help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding conductor length of 6 000 mm, a separate communications ground rod meeting the minimum dimensional criteria of 8.30.4.1(b)(2)b shall be driven, and the grounding conductor shall be connected to the communications ground rod in accordance with 8.30.4.1(c). The communications ground rod shall be bonded to the power grounding electrode system in accordance with 8.30.4.1(d).

(5) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. Where subject to physical damage, the grounding conductor shall be adequately protected. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

(b) Electrode. The grounding conductor shall be connected as follows.

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

a. The building or structure grounding electrode system as covered in 2.50.3.1

b. The grounded interior metal water piping system, within 1 500 mm from its point of entrance to the building, as covered in 2.50.3.1

c. The power service accessible means external to enclosures as

covered in 2.50.5.5

- d. The metallic power service raceway
- e. The service equipment enclosure
- f. The grounding electrode conductor or the grounding electrode conductor metal enclosure, or
- g. To the grounding conductor or to the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 2.50.2.13

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 8.30.3.4, shall be considered accessible.

(2) In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in (b)(1), the grounding conductor shall be connected to either of the following:

a. To any one of the individual electrodes described in 2.50.3.3(a)(1), (a)(2), (a)(3), or (a)(4)

b. If the building or structure served has no grounding means, as described in 8.30.4.1(b)(1) or (b)(2)a, to an effectively grounded metal structure or to a ground rod or pipe not less than 1 500 mm in length and 13 mm in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 8.0.2.10 and at least 1 800 mm from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.

(c) Electrode Connection. Connections to grounding electrodes shall comply with Section 2.50.3.21. Connectors, clamps, fittings, or lugs used to attach grounding conductors and bonding jumpers to grounding electrodes or to each other that are to be concrete encased or buried in the earth shall be suitable for its application.

(d) Bonding of Electrodes. A bonding jumper not smaller than 14 mm² copper or equivalent shall be connected between the network-powered broadband communications system grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 8.30.4.2.

FPN No. 1: See 2.50.3.11 for use of lightning rods.

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

8.30.4.2 Bonding and Grounding at Mobile Homes.

(a) Grounding. Where there is no mobile home service equipment located in sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, or there is no mobile home disconnecting means grounded in accordance with 2.50.2.13 and located within sight from and not more than 9 000 mm from the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground, shall be installed in accordance with 8.30.4.1(b)(2).

(b) Bonding. The network-powered broadband communications cable grounding terminal, network interface unit grounding terminal, if present, and primary protector grounding terminal shall be bonded together with a copper bonding conductor not smaller than 3.5 mm² (2.0 mm dia.). The network-powered broadband communications cable grounding terminal, network interface unit grounding terminal, primary protector grounding terminal, or the grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper bonding conductor not smaller than 3.5 mm² (2.0 mm dia.) under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 8.30.4.2(a), or

(2) Where the mobile home is supplied by cord and plug

8.30.5 Wiring Methods Within Buildings

8.30.5.1 Installation of Network-Powered Broadband Communications Cables and Equipment. Cable and equipment installations within buildings shall comply with 8.30.5.1(a) through 8.30.5.1(d), as applicable.

(a) Separation of Conductors.

(1) In Raceways and Enclosures.

a. Low and Medium Power Network-Powered Broadband Communications Circuit Cables. Low and medium power network-powered broadband communications cables shall be permitted in the same raceway or enclosure.

b. Low Power Network-Powered Broadband Communications Circuit Cables. Low power network-powered broadband communications cables shall be permitted in the same raceway or enclosure with jacketed cables of any of the circuits shown below:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 7.25
2. Power-limited fire alarm systems in compliance with Article 7.60
3. Communications circuits in compliance with Article 8.0
4. Nonconductive and conductive optical fiber cables in compliance with Article 7.70
5. Community antenna television and radio distribution systems in compliance with Article 8.20

c. Medium Power Network-Powered Broadband Communications Circuit Cables. Medium power network-powered broadband communications cables shall not be permitted in the same raceway or enclosure with conductors of any of the circuits shown below:

1. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 7.25
2. Power-limited fire alarm systems in compliance with Article 7.60
3. Communications circuits in compliance with Article 8.0
4. Conductive optical fiber cables in compliance with Article 7.70
5. Community antenna television and radio distribution systems in compliance with Article 8.20

d. Electric Light, Power, Class 1, Non-Powered Broadband Communications Circuit Cables. Network-powered broadband

communications cable shall not be placed in any raceway, compartment, outlet box, junction box, or similar fittings with conductors of electric light, power, Class 1, or nonpower-limited fire alarm circuit cables.

Exception No. 1: Where all of the conductors of electric light, power, Class 1, non-power-limited fire alarm circuits are separated from all of the network-powered broadband communications cables by a permanent barrier or listed divider.

Exception No. 2: Power circuit conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to the network-powered broadband communications system distribution equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum 6-mm separation from network-powered broadband communications cables.

(2) Other Applications. Network-powered broadband communications cable shall be separated at least 50 mm from conductors of any electric light, power, Class 1, and non-power-limited fire alarm circuits.

Exception No. 1: Where either (1) all of the conductors of electric light, power, Class 1, and non-power-limited fire alarm circuits are in a raceway, or in metal-sheathed, metal-clad, nonmetallic-sheathed, Type AC, or Type UF cables, or (2) all of the network-powered broadband communications cables are encased in raceway.

Exception No. 2: Where the network-powered broadband communications cables are permanently separated from the conductors of electric light, power, Class 1, and non-power-limited fire alarm circuits by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the wire.

(b) Support of Conductors. Raceways shall be used for their intended purpose. Network-powered broadband communications cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.

(c) **Cable Substitutions.** The substitutions for network-powered broadband cables listed in Table 8.30.5.1 shall be permitted. All cables in Table 8.30.5.1, other than network-powered broadband cables, shall be coaxial cables.

Table 8.30.5.1 Cable Substitutions

Cable Type	Permitted Cable Substitutions
BM	BMR
BLP	CMP, CL3P
BLR	CMP, CL3P, CMR, CL3R, BLP, BMR
BL	CMP, CMR, CM, CMG, CL3P, CL3R, CL3, BMR, BM, BLP, BLR
BLX	CMP, CMR, CM, CMG, CMX, CL3P, CL3R, CL3, CL3X, BMR, BM, BLP, BRP, BL

(d) **Installation and Use.** Section 1.10.1.3(b) shall apply.

8.30.5.19 Medium Power Network-Powered Broadband Communications System Wiring Methods. Medium power network-powered broadband communications systems shall be installed within buildings using listed Type BM or Type BMR, network-powered broadband communications medium power cables.

(a) **Ducts, Plenums, and Other Air-Handling Spaces.** Section 3.0.1.22 shall apply.

(b) **Riser.** Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BMR. Floor penetrations requiring Type BMR shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type BM cables encased in metal raceway or located in a fireproof shaft that has firestops at each floor.

Exception No. 2: Type BM cables in one- and two-family dwellings.

(c) **Other Wiring.** Cables installed in locations other than the locations covered in 8.30.5.19(a) and 8.30.5.19(b) shall be Type BM.

Exception: Type BMU cable where the cable enters the building from the outside and is run in rigid metal conduit or intermediate metal conduit, and such conduits are grounded to an electrode in accordance with 8.30.4.1(b).

8.30.5.22 Low Power Network-Powered Broadband Communications System Wiring Methods. Low power network-powered broadband communications systems shall comply with any of the requirements of 8.30.5.22(a) through 8.30.5.22(d).

(a) **In Buildings.** Low-power network-powered broadband communications systems shall be installed within buildings using listed Type BLX, Type BL, Type BLR, or Type BLP network-powered broadband communications low-power cables.

(b) **Ducts, Plenums, and Other Air-Handling Spaces.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Type BLX cable installed in compliance with 3.0.1.22.

(c) **Riser.** Cables installed in risers shall comply with any of the requirements in 8.30.5.22(c)(1), (c)(2), or (c)(3).

(1) **Cables in Vertical Runs.** Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BLP, BLR or BMR. Floor penetrations requiring Type BMR or BLR shall contain only cables suitable for riser or plenum use.

(2) **Metal Raceways or Fireproof Shafts.** Type BLX cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) **One- and Two-Family Dwellings.** Type BLX or BL cables less than 10 mm in diameter shall be permitted in one- and two-family dwellings.

(d) **Other Wiring.** Cables installed in locations other than the locations covered in 8.30.5.22(a), (b) and (c) shall comply with the requirements of 8.30.5.22(d)(1) through (d)(5).

(1) **General.** Type BLP, BL, or BM shall be permitted.

(2) **In Raceways.** Type BLX shall be permitted to be installed in a raceway.

(3) **Type BLU Cable.** Type BLU cable entering the building from outside shall be permitted to be run in rigid metal conduit or intermediate metal conduit. Such conduits shall be grounded to an electrode in accordance with 8.30.4.1(b).

(4) **One- and Two-Family Dwellings.** Type BLX or BL cables less than 10 mm in diameter shall be permitted to be installed in one- and two-family dwellings.

(5) **Type BLX Cable.** Type BLX cable entering the building from outside and terminated at a grounding block or a primary protection location shall be permitted to be installed, provided that the length of cable within the building does not exceed 15 m.

FPN: This provision limits the length of Type BLX cable to 15 m, while 8.30.3.1(b) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m into the building if it is practicable to place the primary protector closer than 15 m to the entrance point.

8.30.5.25 Protection Against Physical Damage. Section 3.0.1.4 shall apply.

8.30.5.28 Bends. Bends in network broadband cable shall be made so as not to damage the cable.

8.30.6 Listing Requirements

8.30.6.1 Network-Powered Broadband Communications Equipment and Cables. Network-powered broadband communications equipment and cables shall be listed as suitable for the purpose.

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance

with Article 8.20 and are used for low power network-powered broadband communications circuits.

Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 8.30.5.1.

(a) **Listing and Marking.** Listing and marking of network-powered broadband communications cables shall comply with 8.30.6.1(a)(1) or (a)(2).

(1) **Type BMU, Type BM, and Type BMR Cables.** Network-powered broadband communications medium power underground cable, Type BMU; network-powered broadband communications medium power cable, Type BM; and network-powered broadband communications medium power riser cable, Type BMR, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 3.10.1.11. Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BM cables shall be listed as being suitable for general purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN No. 1: One method of defining resistant to spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991. Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1 500 mm when performing the CSA vertical flame test for cables in cable trays, as described in Test Methods for Electrical Wires and Cables, CSA C22.2 No. 0.3-M-1985.

FPN No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of the Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts, ANSI/UL 1666-2002.

(2) **Type BLU, Type BLX, and Type BLP Cables.** Network-

powered broadband communications low power underground cable, Type BLU; limited use network-powered broadband communications low power cable, Type BLX; network-powered broadband communications low-power cable, Type BL; network-powered broadband communications low-power riser cable, Type BLR; and network-powered broadband communications low-power plenum cable, Type BLP, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 3.10.1.11. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN No. 1: One method of determining that cable is flame retardant is by testing the cable to VW-1 (vertical-wire) flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991.

FPN No. 2: One method of defining resistant to spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1584-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1 500 mm or less when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air Handling Spaces.
