Prefabricated homes:

Prefabricated homes or houses are casually called prefab homes. When it comes to prefab homes, most of the work is done off-site, preventing pollution to a great extent. When it comes to prefab building, there are several homes which come under it- wooden homes, **container homes**, prefab cottages and more! It's cheaper to build these homes as there's no wastage of materials, there's not much labor cost and time consumed. Above all, prefab building takes care of everything- the plumbing, attachment of cabinets, sinks and more- everything is done by your prefab home builder. They have their own reasons like- the connections may have to be done prior to the set-up. This implies less money being spent from your wallet!

Manufactured homes are also built off-site- no construction takes place on-site. They mostly build **steel structures homes**, steel frames which are shipped on their wheels. Also, these homes don't age very soon and are open to any maintenance problems and are considered to be like a house in a sort of a scenario if you plan on living in it!

The difference:

Building codes- **Prefabricated homes** have to go through multiple quality checks before they're open for their customers to live in. On the other hand, manufactured homes have a very lenient HUD checks, which cannot be trusted much

Building limitations:

Prefab building is very diverse, creative, customizable to any extent. However, **manufactured homes** have not developed too that extent- they're still limited, stuck with the basics

Appearance:

Prefab homes concentrate on styling with sustainability, biggest example being wooden homes! They're lovely to look at and eco- friendly too. **Manufactured homes** haven't even reached close to that

Quality:

FEMA says that prefab homes stand very well in extreme weather conditions. Manufactured homes are built with factory precision using 25% extra material in comparison to prefab homes

To be honest, prefabricated houses are just the right homes to be built in today's time- they're eco- friendly, unique and customizable homes with a lot more within it. What more do you need? Above all, they are affordable homes, saving a lot of space to build more **prefabricated homes in Bangalore** and other cities in India.
