

# How do I use the Bareskin laser hair removal device?

You first need to clear the skin of any hair. You should shave it off before using the device on your skin. Plug in the device and press the power button. The device has 5 settings from low to high.

When you are starting out, you should start with the lowest setting and increase the power as you get used to the laser hair removal device.

Remember to wear your protective eyewear when using the laser as the light may damage your eyes. Place the head of the laser on the skin where you have shaven. You can now go in circles for about 2 - 3 minutes. Do not go back to this area until the next time you use the device.
